Farid Ahmad repairs bicycles in Kabul, Afghanistan, but dreams of becoming a doctor. The 16 year old lost his leg at age three after detonating a mine left in an abandoned tank where he was playing. His family was displaced because of conflict and they were unable to afford the medical care he needed. After returning to Afghanistan he joined the family bicycle repair business. He realized that "there are many disabled people in Afghanistan and we need to work hard and show people our abilities, which is not easy." Farid would like to study to become a doctor to help lift his family out of poverty and help his community.

Landmine Monitor Report

TOWARD A MINE-FREE WORLD

2009

Annual Report

2009

TOWARD A MINE-FREE WORLD

The Landmine Monitor initiative is coordinated by an Editorial Board of five organizations: Mines Action Canada, Handicap International, Human Rights Watch, Landmine Action, and Norwegian People's Aid. Mines Action Canada serves as the lead agency.

Landmine Monitor Report Annual Report 2009

Landmine Monitor Report 2009 is the eleventh annual report by Landmine Monitor, an unprecedented civil society initiative providing research and monitoring for the International Campaign to Ban Landmines and the Cluster Munition Coalition.

Landmine Monitor collects information and assesses the international community's response to the global landmine, cluster munition, and explosive remnants of war problem, especially with regard to the 1997 Mine Ban Treaty. Since 1999, Landmine Monitor has assessed and reported annual progress in the implementation of the Mine Ban Treaty. *Landmine Monitor Report 2009* presents information on activities in 2008 and key developments from January to May 2009. It also includes a special ten-year review of progress since the entry into force of the Mine Ban Treaty in 1999. Reports cover every country in the world and eight other areas not internationally recognized as states, and include information on ban policy, mine action, casualties, risk education, victim assistance, and support for mine action.

Landmine Monitor provides research and monitoring for the International Campaign to Ban Landmines (ICBL) and the Cluster Munition Coalition (CMC). For more information visit www.lm.icbl.org or email lm@icbl.org.

The ICBL is committed to limiting the environmental footprint of Landmine Monitor reports.

This report is printed on paper manufactured from 100% post-consumer recycled fiber that has been processed without using chlorine. Biogas Energy, an energy source produced from decomposing waste collected from landfill sites, was used in paper production to reduce greenhouse emissions and depletion of the ozone layer. Using one ton (1,000 kg) of this paper instead of virgin paper reduces our ecological footprint by: 17 mature trees, 490 kg of solid waste, 46,352 L of water, and 1,076 kg of air emissions.

Our printer, St. Joseph Communications, is certified by the EcoLogo Environmental Choice Program. St. Joseph Communications uses vegetable-based inks that are less toxic than chemical inks, and runs the Partners in Growth Program. For every ton of paper used on our behalf, they contribute three seedlings to Scouts Canada for planting in parks, recreation and conservation areas, and other public spaces across Canada. Since its inception, the program has planted more than two million trees.

This report is available online at www.lm.icbl.org/lm/2009. Please use the online version whenever possible. If you have unused print copies of this report, please share them with others, donate them to a local library or recycle them.

International Campaign to Ban Landmines

The International Campaign to Ban Landmines is committed to an international ban on the use, production, stockpiling, and transfer of antipersonnel landmines. The 1997 Mine Ban Treaty (or “Ottawa Convention”) offers the best framework for putting the mine ban into practice, clearing mined areas, and assisting affected communities. The ICBL calls for:

- universalization of the 1997 Mine Ban Treaty;
- full and timely implementation of all treaty provisions;
- increased resources for stockpile destruction, demining, mine/ERW risk education, and victim assistance sustained over the long-term; and
- firm establishment of the antipersonnel landmine ban as an international standard of behavior by all.

Cluster Munition Coalition

The Cluster Munition Coalition’s goal is to protect civilians from the effects of cluster munitions.

The CMC has a number of strategic objectives to achieve this goal:

- promotion of universal adherence to the Convention on Cluster Munitions and the emerging global norm against the use, production, stockpiling, and transfer of cluster munitions;
- promotion of the maximum number of signatures to and ratifications of the convention in the shortest possible time to ensure its rapid entry into force;
- promotion of effective implementation of and full compliance with the convention by States Parties, and compatible steps by states not party to the treaty, and to ensure effective monitoring of all such efforts by civil society; and
- raising public awareness of the harm to civilians caused by cluster munitions and efforts made by civil society and concerned states to eliminate this harm.

Dedication

On 10 August 2009 Landmine Monitor's researcher for Chechnya, Zarema "Rayana" Sadulayeva, was abducted from her office in Grozny along with her husband, Alik Dzhabrailov. Their bodies were found riddled with gunshot wounds on 11 August 2009.

Landmine Monitor would like to dedicate this report to Zarema Sadulayeva, who tirelessly campaigned to promote the rights of children and persons with disabilities through the provision of social, psychological, financial, and legal support primarily to conflict-affected children and landmine survivors. She dedicated her life to improving the quality of life for some of Chechnya's most vulnerable people.

We would also like to dedicate this report to others like her, who continue to defend human rights in Chechnya and around the world.

PREFACE

Landmines and Explosive Remnants of War

Peace agreements may be signed, and hostilities may cease, but landmines and explosive remnants of war (ERW) are an enduring legacy of conflict.

Antipersonnel mines are munitions designed to explode from the presence, proximity, or contact of a person. Antivehicle mines are munitions designed to explode from the presence, proximity, or contact of a vehicle as opposed to a person. Landmines are victim-activated and indiscriminate; whoever triggers the mine, whether a child or a soldier, becomes its victim. Mines emplaced during a conflict against enemy forces can still kill or injure civilians decades later.

Cluster munitions consist of containers and submunitions. Launched from the ground or the air, the containers open and disperse submunitions over a wide area, putting civilians at risk both during attacks due to their wide area effect and after attacks due to unexploded ordnance.

ERW refer to ordnance left behind after a conflict. Explosive weapons that for some reason fail to detonate as intended become unexploded ordnance (UXO). These unstable explosive devices are left behind during and after conflicts and pose dangers similar to landmines. Abandoned explosive ordnance (AXO) is explosive ordnance that has not been used during armed conflict but has been left behind and is no longer effectively controlled. ERW can include artillery shells, grenades, mortars, rockets, air-dropped bombs, and cluster munition remnants. Under the international legal definition, ERW consist of UXO and AXO, but not mines.

Both landmines and ERW pose a serious and ongoing threat to civilians. These weapons can be found on roads, footpaths, farmers' fields, forests, deserts, along borders, in and surrounding houses and schools, and in other places where people are carrying out their daily activities. They deny access to food, water, and other basic needs, and inhibit freedom of movement. They prevent the repatriation of refugees and internally displaced people, and hamper the delivery of humanitarian aid.

These weapons instill fear in communities, whose citizens often know they are walking in mined areas, but have no possibility to farm other land, or take another route to school. When land cannot be cultivated, when medical systems are drained by the cost of attending to landmine/ERW casualties, and when countries must spend money clearing mines rather than paying for education, it is clear that these weapons not only cause appalling human suffering, they are also a lethal barrier to development and post-conflict reconstruction.

There are solutions to the global landmine and ERW problem. The 1997 Mine Ban Treaty provides the best framework for governments to alleviate the suffering of civilians living in areas affected by antipersonnel mines. Governments who join this treaty must stop the use, stockpiling, production, and transfer of antipersonnel mines immediately. They must destroy all stockpiled antipersonnel mines within four years, and clear all antipersonnel landmines in all mined areas under their jurisdiction or control within 10 years. In addition, States Parties in a position to do so must provide assistance for the care and treatment of landmine survivors, their families and communities, and support for mine/ERW risk education programs to help prevent mine incidents.

The Convention on Cluster Munitions was opened for signature on 3 December 2008 and is a legally-binding agreement prohibiting cluster munitions because of their indiscriminate area effects and risk of unexploded ordnance. The treaty also provides a framework for tackling the problems that cluster munitions have caused. For an overview of government policies and practices on cluster munitions see www.lm.icbl.org/cm/2009. The treaty obliges states to stop the use, production, and transfer of cluster munitions immediately. States must destroy all stockpiled cluster munitions within eight years of becoming party to the treaty, and clear all unexploded cluster munition remnants in areas under their jurisdiction or control within 10 years. Building on the Convention on the Rights of Persons with Disabilities, the Convention

on Cluster Munitions includes ground-breaking provisions for victim assistance, and includes those killed or injured by cluster munitions, their families and communities in the definition of a cluster munition victim. In addition, States Parties in a position to do so must provide assistance for the clearance of cluster munition remnant, risk education programs to help prevent cluster munition casualties, and for the assistance of victims.

The only international legislation explicitly covering ERW in general is Protocol V of the Convention on Conventional Weapons (CCW). While its provisions have been recognized as insufficient to address the problems caused by cluster munitions, Protocol V does establish general responsibilities for ERW clearance, information sharing to facilitate clearance and risk education, victim assistance, and for support to mine action. Protocol V establishes a special responsibility on the users of explosive weapons to work to address the post-conflict humanitarian problems that these weapons may cause.

These legal instruments provide a framework for taking action, but it is up to governments to implement treaty obligations, and it is the task of NGOs to work together with governments to ensure they uphold their treaty obligations.

The ultimate goal of the ICBL and the CMC is a world free of landmines, cluster munitions and ERW, where civilians can walk freely without the fear of stepping on a mine, and where children can play without mistaking an unexploded submunition for a toy.

International Campaign to Ban Landmines

The ICBL is a coalition of more than 1,000 organizations in over 70 countries, working locally, nationally, and internationally to eradicate antipersonnel mines. It received the 1997 Nobel Peace Prize, jointly with its founding coordinator Jody Williams, in recognition of its efforts to bring about the Mine Ban Treaty.

The campaign is a loose, flexible network, whose members share the common goal of working to eliminate antipersonnel landmines and cluster munitions.

The ICBL was launched in October 1992 by a group of six NGOs: Handicap International, Human Rights Watch, Medico International, Mines Advisory Group, Physicians for Human Rights, and Vietnam Veterans of America Foundation. These founding organizations witnessed the horrendous effects of mines on the communities they were working with in Africa, Asia, the Middle East, and Latin America, and saw how mines hampered and even prevented their development efforts in these countries. They realized that a comprehensive solution was needed to address the crisis caused by landmines, and that the solution was a complete ban on antipersonnel landmines.

The founding organizations brought to the international campaign practical experience of the impact of landmines. They also brought the perspective of the different sectors they represented: human rights, children's rights, development issues, refugee issues, and medical and humanitarian relief. ICBL member campaigns contacted other NGOs, who spread the word through their networks; news of this new coalition and the need for a treaty banning antipersonnel landmines soon stretched throughout the world. The ICBL organized conferences and campaigning events in many countries to raise awareness of the landmine problem and the need for a ban, and to provide training to new campaigners to enable them to be effective advocates in their respective countries.

Campaign members worked at the local, national, regional and global level to encourage their governments to support the mine ban. The ICBL's membership grew rapidly, and today there are campaigns in more than 70 countries.

The Mine Ban Treaty was opened for signature on 3 December 1997 in Ottawa, Canada. It is in part due to sustained and coordinated action by the ICBL that the Mine Ban Treaty became a reality.

Part of the ICBL's success is its ability to evolve with changing circumstances. The early days of the campaign were focused on developing a comprehensive treaty banning antipersonnel landmines. Once this goal was achieved, attention shifted to ensuring that all countries join the treaty, and that all States Parties fully implement their treaty obligations.

The ICBL works to promote the global norm against mine use, and advocates for countries who have not joined the treaty to take steps to join the treaty. The campaign also urges non-state armed groups to abide by the spirit of the treaty.

Much of the ICBL's work is focused on promoting implementation of the Mine Ban Treaty, which provides the most effective framework for eliminating antipersonnel landmines. This includes working in partnership with governments and international organizations on all aspects of treaty implementation, from stockpile destruction to mine clearance to victim assistance.

In 2007, the ICBL began actively campaigning in support of the Oslo Process to negotiate a treaty prohibiting cluster munitions. This marked the first time that the ICBL engaged substantively on an issue other than antipersonnel mines. The ICBL began working with other CMC member organizations to address the cluster munition threat at the beginning of the Convention on Cluster Munitions negotiation process. The goal was to help prevent another humanitarian crisis similar to the global mine problem, because cluster munitions leave behind unexploded submunitions with effects similar to antipersonnel mines. The ICBL is dedicated to working toward the full universalization and implementation of the Convention on Cluster Munitions, and many ICBL member organizations are also actively campaigning against cluster munitions.

The ICBL is committed to pushing for the complete eradication of antipersonnel mines and cluster munitions. The campaign has been successful in part because it has a clear campaign message and goal; a non-bureaucratic campaign structure and flexible strategy; and an effective partnership with other NGOs, international organizations, and governments.

Cluster Munition Coalition

The CMC is an international coalition working to protect civilians from the effects of cluster munitions by promoting universal adherence to and full implementation of the Convention on Cluster Munitions. The CMC has a membership of around 300 civil society organizations from more than 80 countries, and includes organizations working on disarmament, peace and security, human rights, victim assistance, clearance, women's rights, and faith issues. The CMC facilitates the efforts of NGOs worldwide to educate governments, the public and the media about the global cluster munition problem and its solutions.

Like the ICBL, the CMC was established by a group of NGOs in response to a global problem, in this case the suffering caused by cluster munitions. From 2003 to 2006 the CMC called for negotiations towards new international law to address the cluster munition problem. Throughout 2007 and 2008 the CMC actively participated in the diplomatic Oslo Process facilitating and leading the global civil society action in favor of a ban on cluster munitions. This effort resulted in the adoption and signature of the Convention on Cluster Munitions in 2008 and has been recognized as a largely preventive effort, given that only a tiny fraction of the cluster munitions in global stockpiles have ever been used.

In 2009, the CMC's priority was to conclude an intensive global ratification campaign to ensure that 30 countries ratify the convention without delay in order to bring the convention into force and begin the formal process of implementation. The CMC will also continue to campaign in countries that have not yet signed the convention to encourage them to sign the treaty as soon as possible at the UN in New York. Beyond this the CMC is preparing for the First Meeting of States Parties to the convention and working with states to ensure their early and effective implementation of the convention's obligations.

Landmine Monitor

Landmine Monitor Report 2009 is the eleventh annual Landmine Monitor report. Since 1999, each of the ten previous reports has been presented to the respective annual meeting of States Parties to the Mine Ban Treaty. Landmine Monitor is the ICBL's research and monitoring program and it provides research and monitoring for the CMC. It is the *de facto* monitoring regime for the Mine Ban Treaty, a role it plans to undertake for the Convention on Cluster Munitions. It monitors and reports on States Parties' implementation of, and compliance with,

the Mine Ban Treaty, and more generally, it assesses the international community's response to the humanitarian problem caused by landmines and ERW. Landmine Monitor represents the first time that NGOs have come together in a coordinated, systematic, and sustained way to monitor a humanitarian law or disarmament treaty, and to regularly document progress and problems, thereby successfully putting into practice the concept of civil society-based verification.

In June 1998, the ICBL formally agreed to create Landmine Monitor as an ICBL initiative. In 2008, Landmine Monitor also functionally became the research and monitoring arm of the CMC. A five-member Editorial Board coordinates the Landmine Monitor system: Mines Action Canada, Handicap International, Human Rights Watch, Landmine Action, and Norwegian People's Aid. Mines Action Canada serves as the lead agency. The Editorial Board assumes overall responsibility for, and decision-making on, the Landmine Monitor system.

Landmine Monitor is not a technical verification system or a formal inspection regime. It is an attempt by civil society to hold governments accountable to the obligations they have taken on with respect to antipersonnel mines and cluster munitions. This is done through extensive collection, analysis, and distribution of publicly available information. Although in some cases it does entail investigative missions, Landmine Monitor is not designed to send researchers into harm's way and does not include hot war-zone reporting.

The Landmine Monitor report is designed to complement the States Parties' transparency reporting required under Article 7 of the Mine Ban Treaty. It reflects the shared view that transparency, trust and mutual collaboration are crucial elements for the successful eradication of antipersonnel mines. Landmine Monitor was also established in recognition of the need for independent reporting and evaluation.

Landmine Monitor aims to promote and advance discussion on mine and ERW-related issues, and to seek clarifications, to help reach the goal of a world free of mines, cluster munitions, and other ERW. Landmine Monitor works in good faith to provide factual information about issues it is monitoring, in order to benefit the international community as a whole.

The Landmine Monitor system features a global reporting network and an annual report. A network of 60 Landmine Monitor researchers from 45 countries and other areas, and a 20-person Editorial Team gathered information to prepare this report. The researchers come from the ICBL's campaigning coalition and from other elements of civil society, including journalists, academics, and research institutions.

Landmine Monitor Report 2009 presents information on activities in 2008 and key developments in January–May 2009. A special ten-year review assesses progress in implementing and universalizing the Mine Ban Treaty since its entry into force on 1 March 2009. Reports cover every country in the world and eight other areas not internationally recognized as states, and include information on ban policy (policy, use, production, trade, stockpiling), mine action, casualties, risk education, victim assistance, and support for mine action. All report contents are available online at www.lm.icbl.org/lm/2009.

Unless otherwise specified all translations were done by Landmine Monitor.

As was the case in previous years, Landmine Monitor acknowledges that this ambitious report is limited by the time, resources, and information sources available. Landmine Monitor is a system that is continuously updated, corrected, and improved. Comments, clarifications, and corrections from governments and others are sought, in the spirit of dialogue, and in the common search for accurate and reliable information on an important subject.

Acknowledgements

A broad-based network of individuals, campaigns, and organizations produced this eleventh annual Landmine Monitor report. It was assembled by a dedicated team of research coordinators and editors, with the support of a significant number of donors.

This report contains country and area updates researched by 60 Landmine Monitor researchers from 45 countries and other areas, selected by the Landmine Monitor Editorial Board with input from the Editorial Team. The researchers are cited separately in the List of Contributors. Landmine Monitor is grateful to everyone who contributed research to this report. We wish

to thank the scores of individuals, campaigns, NGOs, international organizations, mine action practitioners, and governments who provided us with essential information.

We are grateful to ICBL staff for their continued and crucial assistance in the release, distribution, and promotion of Landmine Monitor reports.

Responsibility for the coordination of Landmine Monitor's reporting network lies with the five Editorial Board organizations: Mines Action Canada (Paul Hannon) manages Landmine Monitor's production and editing, and coordinates research on support for mine action and non-state armed groups; Handicap International (Stan Brabant) coordinates research on mine/ERW risk education, casualty data, and victim assistance; Human Rights Watch (Stephen Goose) is responsible for ban policy; Landmine Action (Richard Moyes) specializes in research on cluster munitions; and Norwegian People's Aid (Stuart Casey-Maslen and Atle Karlsen) coordinates research on mine action. Jacqueline Hansen manages Landmine Monitor.

The Editorial Team undertook research and initial country report edits for *Landmine Monitor Report 2009* from March to August 2009. The Editorial Team was led by five principal editors: Stephen Goose (ban policy), Stuart Casey-Maslen (mine action), Katleen Maes (casualties and victim assistance), Jenny Najar (risk education), and Anthony Forrest (support for mine action).

Stuart Casey-Maslen, Nick Cumming-Bruce, and Mark Hiznay provided final editing from July to August 2009 with assistance from Jacqueline Hansen (Program Manager); Jack Glattbach (Copy Editor); Maureen Hollingworth (Editing Consultant); Katie Pitts and Tatiana Stephens (Project Officers); Kerri West and Katherine Harrison (Ban policy team); and Carly Ackerman, Zain Esseghaier, Zachary Fellman, and Marc Gagnier (Mines Action Canada Interns).

Report formatting and the online version of the report at www.lm.icbl.org/lm/2009 were undertaken by Lixar I.T. Inc. and St. Joseph Communications printed the report. Rafael Jiménez provided design. Sébastien Grolet provided cartography services.

We extend our gratitude to Landmine Monitor contributors. Landmine Monitor's supporters are in no way responsible for, and do not necessarily endorse, the material contained in this report. It was only possible to carry out this work with the aid of grants from:

- Government of Australia
- Government of Austria
- Government of Belgium
- Government of Canada
- Government of Cyprus
- Government of France
- Government of Germany
- Government of Ireland
- Government of Luxembourg
- Government of the Netherlands
- Government of New Zealand
- Government of Norway
- Government of Spain
- Government of Sweden
- Government of Switzerland
- European Commission
- Holy See
- UNICEF

We also thank the donors who have contributed to the individual members of the Landmine Monitor Editorial Board and other participating organizations.

LIST OF CONTRIBUTORS

Editorial Team

Thematic research teams contributed to the researching, writing, and editing of all country reports.

Ban Policy

- Coordinator: Stephen Goose, Human Rights Watch
- Human Rights Watch: Mark Hiznay, Mary Wareham, Kerri West
- ICBL: Anders Fink
- Landmine Action: Katherine Harrison
- Mines Action Canada: Anthony Forrest, Yeshua Moser-Puangsuwan

Mine Action

- Coordinator: Stuart Casey-Maslen, Norwegian People's Aid
- ICBL: Emil Hasanov, Mike Kendellen
- Norwegian People's Aid: Nick Cumming-Bruce

Casualties, Risk Education, and Victim Assistance

- Coordinator: Katleen Maes, Handicap International
- Handicap International: Matthew Bolton, Megan Burke, Kerry Clarke, Hugh Hosman, Melissa Lombardo, Jenny Najar, Loren Persi, Patrizia Pompili

Editing and Production

- Program Manager: Jacqueline Hansen, Mines Action Canada
- Final Editors: Stuart Casey-Maslen, Nick Cumming-Bruce, and Mark Hiznay, Mines Action Canada
- Copy Editor: Jack Glattbach, Mines Action Canada
- Editing Consultant: Maureen Hollingworth

EXECUTIVE SUMMARY

MAJOR FINDINGS

Major Findings: 1999–2009

- Government use of antipersonnel mines has greatly decreased over the last decade. In 1999, Landmine Monitor recorded probable use of antipersonnel mines by 15 states, compared to just two since 2007: Myanmar and Russia.
- Use by non-state armed groups (NSAGs) has also decreased; at least 59 NSAGs across 13 countries have committed to halt use of antipersonnel mines in the last 10 years.
- One hundred and fifty-six states—more than three-quarters of the world’s states—are party to the Mine Ban Treaty. A total of 39 countries, including China, India, Pakistan, Russia, and the United States, have still to join. Two of these are signatories: the Marshall Islands and Poland.
- At least 38 former producers of antipersonnel mines have stopped, leaving only 13 states as actual or potential producers.
- For the past decade, global trade in antipersonnel mines has consisted solely of a low-level of illicit and unacknowledged transfers.
- The only confirmed serious violations of the treaty have been in stockpile destruction. Belarus, Greece, and Turkey missed their stockpile destruction deadlines of 1 March 2008, and all three remained in serious violation of the treaty as of September 2009.
- Eighty-six States Parties have completed the destruction of their stockpiles, and four more are in the process. Together, they have destroyed about 44 million antipersonnel mines.
- Eleven states have cleared all known mined areas from their territory: Bulgaria, Costa Rica, El Salvador, France, Guatemala, Honduras, FYR Macedonia, Malawi, Suriname, Swaziland, and Tunisia.
- Since 1999, at least 1,100km² of mined areas and a further 2,100km² of battle areas, an area twice the size of London, have been cleared in more than 90 states and other areas. Operations have resulted in the destruction of more than 2.2 million emplaced antipersonnel mines, 250,000 antivehicle mines, and 17 million explosive remnants of war (ERW).
- As of August 2009, more than 70 states were believed to be mine-affected.
- Mine and ERW risk education (RE) has evolved significantly in the last decade. Many programs have shifted from a purely message-based approach to more engaged efforts to bring about broader behavior change and risk reduction.
- Clearance, supported by RE, has resulted in a significant reduction in casualties. Casualties are at a level far below earlier estimates of more than 20,000 casualties per year, with recorded casualties down to under 5,200 in 2008.
- Despite data collection challenges, Landmine Monitor has identified at least 73,576 casualties of landmines, ERW, and victim-activated improvised explosive devices in 119 states and areas in the past 10 years.
- Total international support for mine action for 1992–2008 was US\$4.27 billion.
- Despite this high level of overall funding, over the past decade victim assistance has made the least progress of all the major sectors of mine action, with funding and action falling far short of what was needed. Most efforts remained focused on medical care and physical rehabilitation, often only when supported by international organizations and funding, rather than on promoting economic self-reliance for survivors, their families, and communities.

- At the First Review Conference of the treaty, States Parties agreed that 23 States Parties with significant numbers of survivors should make special efforts to meet their needs. Throughout 2005–2009, progress among the now VA26 States Parties has been variable. Progress was most visible in coordination, rather than in implementation of actual services. Progress on activities was often unrelated to the plans the 26 countries set for themselves.

Major Findings: 2008–2009

- Only two states have used antipersonnel mines in 2008–2009: Myanmar and Russia. NSAGs used antipersonnel mines in at least seven countries, two fewer than the previous year.
- As few as three countries may have been producing antipersonnel mines in 2008: India, Myanmar, and Pakistan. Landmine Monitor has identified 10 other producing countries, but it is not known if they were actively manufacturing mines in the past year.
- Belarus, Greece, and Turkey missed their stockpile destruction deadlines of 1 March 2008, and all three remained in serious violation of the treaty as of September 2009.
- Three countries completed stockpile destruction: Indonesia (November 2008), Ethiopia (April 2009), and Kuwait (declared in July 2009).
- In December 2008, 94 states signed the Convention on Cluster Munitions, which comprehensively bans the use, production, stockpiling, and transfer of cluster munitions, and requires clearance of contaminated areas and assistance to victims and affected communities. As of September 2009, 17 states had ratified the convention, which required 30 ratifications to trigger entry into force.
- Mine-affected states are required to clear all antipersonnel mines from mined areas under their jurisdiction or control within 10 years of becoming party to the Mine Ban Treaty. The first deadlines expired on 1 March 2009, but 15 States Parties with 2009 deadlines failed to meet them and were granted extensions: Bosnia and Herzegovina, Chad, Croatia, Denmark, Ecuador, Jordan, Mozambique, Nicaragua, Peru, Senegal, Thailand, the United Kingdom, Venezuela, Yemen, and Zimbabwe. All of the requests (which ranged from one to 10 years, the maximum period permitted for any extension period) were granted by the Ninth Meeting of States Parties in Geneva in November 2008.
- In 2009, four more States Parties (Argentina, Cambodia, Tajikistan, and Uganda) formally requested extensions for periods ranging from three to 10 years.
- In 2008, mine action programs cleared almost 160km² of mined areas—the size of Brussels—the highest total ever recorded by Landmine Monitor.
- In May 2009, Tunisia became the eleventh State Party to formally declare completion of clearance obligations under the treaty.
- There were at least 5,197 casualties caused by mines, ERW, and victim-activated IEDs in 2008, which continued a downward trend of the last few years.
- In 2008, RE was provided in 57 states and areas, compared to 61 states and areas in 2007. RE activities increased significantly in Yemen and Somaliland, and also increased to some degree in 10 other states. In Palestine, RE decreased in 2008 but rose sharply in response to conflict in Gaza in December 2008–January 2009.
- In 2008 in at least 26 states and areas, RE programs were still being implemented without comprehensive needs assessments. In Afghanistan, for instance, which has the world's oldest mine action program, a European Union evaluation in 2008 found that RE was not based on a good understanding of the target audience.
- For 2008 Landmine Monitor identified a total of US\$626 million in funding for mine action worldwide, combining international and national funding. The almost \$518 million (some €346 million) of international funding allocated for mine action in 2008 from 23 countries and the European Commission was the highest reported total to date, surpassing the previously highest total—\$475 million in 2006.

- Funding in 2008 was channeled to at least 54 recipient states and other areas. The top five recipients of mine action funding in 2008 were, in descending order: Afghanistan, Sudan, Iraq, Lebanon, and Cambodia.
- In 2008–2009, there was a continued lack of psychosocial support and economic reintegration for survivors even where there were improvements to national health-care, physical rehabilitation, or disability laws/policies. Pakistan and Sri Lanka saw deterioration of services nationwide or in certain areas because of conflict and natural disasters. The period also saw the closure of several national NGOs/disabled people’s organizations, continued capacity problems for others, and persistent funding challenges.
- Other trends included the continuing handover of physical rehabilitation programs to national management and a continued increase of survivor associations and/or their capacities.

BAN POLICY

1999–2009 Overview

More than three-quarters (156 countries) of the world's states are party to the Mine Ban Treaty, although the most recent to join (**Palau**) was in November 2007. Major powers such as **China, India, Pakistan, Russia,** and the **United States** have still to join, yet one of the treaty's most significant achievements has been the degree to which any use of antipersonnel mines by anyone has been stigmatized throughout the world.

During the course of the past decade, the use of antipersonnel mines, especially by governments, has become rare. In 1999, Landmine Monitor recorded probable use of landmines by 15 states. In the decade since then a total of 21 governments have likely used antipersonnel mines, but only four since 2004 (**Georgia, Nepal, Myanmar,** and the **Russian Federation**). This year's report, as in 2007 and 2008, confirms use by only two states: Myanmar and Russia. The normative effect of the treaty's comprehensive ban has also resulted in decreased use by non-state armed groups (NSAGs). Over the past 10 years, at least 59 NSAGs across 13 countries have committed to halt use of antipersonnel mines.

There have been no confirmed instances of use of antipersonnel mines by States Parties to the Mine Ban Treaty. However, Landmine Monitor reported that there were serious and credible allegations that **Ugandan** forces used antipersonnel mines in the **Democratic Republic of the Congo (DRC)** in 2000, and that **Zimbabwean** forces used mines in the DRC in 1999 and 2000, although both strongly denied it.

The only confirmed serious violations of the treaty have been in stockpile destruction. **Belarus, Greece,** and **Turkey** missed their stockpile destruction deadlines of 1 March 2008, and all three remained in serious violation of the treaty as of September 2009. Through 2007, only four States Parties missed their stockpile destruction deadlines: **Afghanistan, Cape Verde, Guinea,** and **Turkmenistan.**

More than 50 states are known to have produced antipersonnel mines, but 38 have since ceased production, including four countries that are not party to the Mine Ban Treaty: **Egypt, Finland, Israel,** and **Poland.** Landmine Monitor identifies 13 states as producers of antipersonnel mines: **China, Cuba, India, Iran, Myanmar, Nepal, North Korea, Pakistan, Russia, Singapore, South Korea, the US,** and **Vietnam.** In some cases, the country is not actively producing mines, but reserves the right to do so. As few as three countries may have been producing antipersonnel mines in 2008.

A *de facto* ban on the transfer of antipersonnel mines has been in effect since the mid-1990s; this prohibition is attributable to the mine ban movement and the stigma that the Mine Ban Treaty has attached to the weapon. Landmine Monitor has never conclusively documented any state-to-state transfers of antipersonnel mines. For the past decade, global trade in antipersonnel mines has consisted solely of a low-level of illicit and unacknowledged transfers.

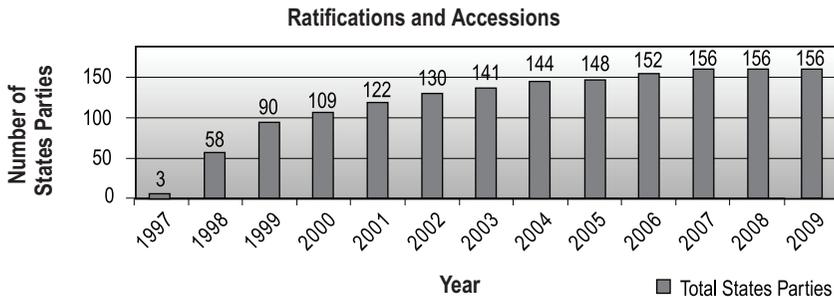

In the mid-1990s, prior to the Mine Ban Treaty, more than 130 states possessed stockpiles estimated at more than 260 million antipersonnel mines. Landmine Monitor now estimates that as many as 35 states not party to the treaty stockpile about 160 million antipersonnel mines. In addition, four States Parties are still in the process of destroying some 12 million stockpiled antipersonnel mines.

2008–2009 Key Developments

- Three States Parties completed stockpile destruction: **Ethiopia, Indonesia, and Kuwait**.
- No use, production, or transfer of antipersonnel mines was recorded by any State Party.
- States not party **Myanmar and Russia** continued to use antipersonnel mines, as did non-state armed groups in at least seven countries, including three States Parties (**Afghanistan, Colombia, and Peru**) and four states not party to the treaty (**Myanmar, India, Pakistan, and Sri Lanka**).
- In December 2008, 94 states signed the Convention on Cluster Munitions which comprehensively bans the use, production, stockpiling, and transfer of cluster munitions. The number of signatories stood at 98 as of 1 September 2009, of which 17 had ratified.

Universalization

The Mine Ban Treaty entered into force on 1 March 1999, becoming binding international law. Since entry into force, states must accede and cannot simply sign the treaty with intent to ratify later.¹ Outreach by States Parties to the treaty, the ICBL, and others has helped to expand the ban on antipersonnel mines to many countries that at one time expressed difficulties with joining. Of the 156 States Parties, 131 signed and ratified the treaty, and 25 acceded.² Thirty-nine countries are not yet States Parties, including two that signed long ago but have not yet ratified (**Marshall Islands and Poland**).

Not a single state has joined the Mine Ban Treaty since Palau acceded on 18 November 2007; the treaty entered into force for Palau on 1 May 2008. Others which have joined since the First Review Conference of the Mine Ban Treaty in 2004 are **Iraq** (adherence in August 2007), **Kuwait** (July 2007), **Indonesia** (February 2007), **Montenegro** (October 2006), **Brunei** (April 2006), **Cook Islands** (March 2006), **Haiti** (February 2006), **Ukraine** (December 2005), **Vanuatu** (September 2005), **Bhutan** (August 2005), **Latvia** (July 2005), and **Ethiopia** (December 2004). Most of these nations were stockpilers of antipersonnel mines, several were users of the weapon, and several are contaminated by antipersonnel mines.

¹ For a state that ratifies (having become a signatory prior to 1 March 1999) or accedes now, the treaty enters into force for that state on the first day of the sixth month after the date on which it deposited its instrument of ratification with the Depositary. That state (now a party) is then required to make its initial transparency report to the UN Secretary-General within 180 days (and annually thereafter), destroy stockpiled antipersonnel mines within four years, and destroy antipersonnel mines in the ground in areas under its jurisdiction or control within 10 years. It is also required to take appropriate domestic implementation measures, including imposition of penal sanctions.

² The 25 accessions include Montenegro, which technically “succeeded” to the treaty after the dissolution of Serbia and Montenegro. Of the 131 ratifications, 43 came on or before entry into force of the treaty on 1 March 1999 and 88 came afterward.

Of the two remaining signatories, **Poland** decided in February 2009 that it would ratify in 2012, rather than 2015 as it had announced in January 2007. The **Marshall Islands** re-engaged in the Mine Ban Treaty process in 2008 by attending key treaty meetings, but it has not committed to ratify within a specific period.

For the tenth anniversary of the entry into force of the Mine Ban Treaty, a series of regional conferences was held to promote universalization and effective implementation of the treaty in the lead-up to the Second Review Conference (also known as the Cartagena Summit) in Cartagena, Colombia, 30 November–4 December 2009. Regional conferences took place in Nicaragua (February), Thailand (April), Tajikistan (July), South Africa (September), and Albania (October).

UN General Assembly Resolution 63/42

One opportunity for states to indicate their support for the ban on antipersonnel mines is their vote on the annual UN General Assembly (UNGA) resolution calling for universalization and full implementation of the Mine Ban Treaty. UNGA Resolution 63/42 was adopted on 2 December 2008 by a vote of 163 in favor, none opposed, and 18 abstentions.³ Of the 39 states not party to the treaty, 18 voted in favor,⁴ 18 abstained, and three were absent.⁵

Since the first UNGA resolution supporting the Mine Ban Treaty in 1997, the number of states voting in favor has ranged from a low of 139 in 1999 to a high of 164 in 2007. The number of states abstaining has ranged from a high of 23 in 2002 and 2003 to a low of 17 in 2005 and 2006.⁶ Several states that used to consistently abstain or be absent now vote in favor, including **Azerbaijan, China, Kazakhstan, Lao People's Democratic Republic** (Lao PDR), the **Marshall Islands**, and **Morocco**.

Ten-year review by region: universalization

As of 1 September 2009, the percentage of nations in each region that were States Parties to the Mine Ban Treaty was as follows: Africa 98%; Europe 95%; Americas 94%; Asia-Pacific 60%; Commonwealth of Independent States (CIS) 42%; and Middle East and North Africa 39% (see table below).

Africa: **Somalia** is the only country in the region that has not joined the Mine Ban Treaty. By the First Review Conference in November 2004, all signatories had ratified except **Ethiopia**, and all non-signatories had acceded except Somalia. Ethiopia ratified in December 2004. Somalia voted in favor of the pro-Mine Ban Treaty UNGA resolution for the first time in December 2007.

Americas: **Cuba** and the **US** are the only countries in the region that have not joined the Mine Ban Treaty. By the First Review Conference in November 2004, all signatories had ratified, except **Haiti**, which did so in February 2006. In February 2004, the Bush Administration

³ Eighteen States abstained from voting on UNGA Resolution 63/42 in December 2008: Cuba, Egypt, India, Iran, Israel, Kyrgyzstan, Lebanon, Libya, Myanmar, Nepal, North Korea, Pakistan, Russia, South Korea, Syria, US, Uzbekistan, and Vietnam. With the exception of Nepal, none of these states have voted in favor of a pro-Mine Ban Treaty resolution since 1999. Nepal abstained for the first time in 2007, after voting in favor of the resolution in past years, except in 2004 and 2006 when it was absent.

⁴ This included two signatory countries (Marshall Islands and Poland) and 16 non-signatories: Armenia, Azerbaijan, Bahrain, China, Finland, Georgia, Kazakhstan, Lao PDR, Micronesia, Mongolia, Morocco, Oman, Singapore, Sri Lanka, Tuvalu, and UAE.

⁵ The three absent were Saudi Arabia, Somalia, and Tonga. Somalia and Tonga have supported the resolution in the past, while Saudi Arabia has always been absent. Eight States Parties were also absent: Central African Republic, Chad, Fiji, Gambia, Kiribati, Seychelles, Sierra Leone, and Saint Kitts and Nevis.

⁶ Voting results by year on the annual UNGA resolution calling for the universalization and full implementation of the Mine Ban Treaty: 1997 (Resolution 52/38 A) – 142 in favor, none against, 18 abstaining; 1998 (Resolution 53/77 N) – 147 in favor, none against, 21 abstaining; 1999 (Resolution 54/54 B) – 139 in favor, one against, 20 abstaining; 2000 (Resolution 55/33 V) – 143 in favor, none against, 22 abstaining; 2001 (Resolution 56/24 M) – 138 in favor, none against, 19 abstaining; 2002 (Resolution 57/74) – 143 in favor, none against, 23 abstaining; 2003 (Resolution 58/53) – 153 in favor, none against, 23 abstaining; 2004 (Resolution 59/84) – 157 in favor, none against, 22 abstaining; 2005 (Resolution 60/80) – 158 in favor, none against, 17 abstaining; 2006 (Resolution 61/84) – 161 in favor, none against, 17 abstaining; and 2007 (Resolution 62/41) – 164 in favor, none against, and 18 abstaining.

completed a review of US landmine policy, announcing that the US did not intend to join the Mine Ban Treaty at any point, abandoning the objective of the previous administration to join in 2006. Cuba's policy has not changed in the past decade.

Asia-Pacific: 16 countries remain outside the Mine Ban Treaty, more than in any other region. However, since 2004, six Asia-Pacific states have joined—more than in any other region. This includes ratification by four signatories (**Brunei, Cook Islands, Indonesia, and Vanuatu**) and two accessions (**Bhutan and Palau**).

Since 2003, **China** has shown increased interest in the Mine Ban Treaty, and has voted in favor of the annual pro-ban treaty UNGA resolution since 2005. Since the First Review Conference in 2004, **India** has sent an observer to every Meeting of States Parties and every intersessional Standing Committee meeting. Since 2007, **Vietnam** has more frequently attended meetings of the Mine Ban Treaty, and welcomed the efforts of others to ban the weapon.

In 2004, **Lao PDR** decided that it would join the Mine Ban Treaty at some point, but did not set a timeline. Lao PDR voted in favor of the annual UNGA resolution for the first time in 2007 and did so again in 2008. **Mongolia** announced in 2004 its intention to accede to the Mine Ban Treaty by 2008, but did not do so.

Commonwealth of Independent States: Five of the 12 countries in the region are States Parties. At entry into force in March 1999, only one was a State Party (**Turkmenistan**), and another two were signatories (**Moldova and Ukraine**). By the First Review Conference in November 2004, there were four States Parties, as **Tajikistan** acceded in October 1999, **Moldova** ratified in September 2000, and **Belarus** acceded in September 2003. **Ukraine** ratified in December 2005. **Armenia** and **Georgia** have consistently supported the annual pro-ban UNGA resolution and attended Mine Ban Treaty meetings. **Azerbaijan** has shown greater support for the treaty in recent years, notably by submitting voluntary Article 7 reports in 2008 and 2009, and voting in favor of the UNGA resolution every year since 2005. **Kazakhstan** voted in favor of the UNGA resolution in 2007 and 2008, after abstaining every previous year.

Europe: Finland and Poland, which has signed but not ratified, are the only countries in the region that are not party to the treaty. By the First Review Conference in November 2004, 39 were States Parties. All of the signatories had ratified except Poland. Three of the non-signatories had acceded (**Estonia, Serbia and Montenegro, and Turkey**). **Latvia** acceded in July 2005, and **Montenegro** joined in October 2006 after its separation from Serbia. In September 2004, Finland announced that it would join the Mine Ban Treaty in 2012, six years later than its previously stated goal. In February 2009, Poland also set 2012 as the year it would join.

Middle East and North Africa: Seven of the 18 countries in the Middle East and North Africa are States Parties. At entry into force in March 1999, three countries were States Parties (**Jordan, Qatar, and Yemen**) and two were signatories (**Algeria and Tunisia**). Tunisia ratified in July 1999 and Algeria in October 2001. **Kuwait** acceded in July 2007 and **Iraq** in August 2007. **Morocco** has declared itself in *de facto* compliance with the Mine Ban Treaty: it has submitted three voluntary Article 7 reports and voted in favor of the annual pro-ban UNGA resolution each year since 2004. **Bahrain, Oman, and the United Arab Emirates (UAE)** have also expressed support for the treaty and regularly voted for the UNGA resolution.

2008–2009 key developments by region: universalization

Africa: Somalia, the only state outside the Mine Ban Treaty in Sub-Saharan Africa, did not make any notable steps towards joining the treaty, and was absent from the pro-ban UNGA vote in December 2008. Somalia did not attend the September 2009 regional conference in South Africa for the lead-up to the Second Review Conference.

Americas: **Nicaragua** hosted the Managua Workshop in February 2009, the first in the series of regional meetings prior to the Review Conference, which neither **Cuba** nor the **US** attended. As of August 2009, the Obama Administration had not made a statement on its landmine policy.

Asia-Pacific: **Thailand** hosted the Bangkok Workshop in April 2009, the second regional meeting prior to the Review Conference. Eighteen countries participated, including non-signatories **Lao PDR, Myanmar, Singapore, Sri Lanka, and Vietnam**.

Having signed and then ratified the Convention on Cluster Munitions, **Lao PDR** appeared to be moving closer to joining the Mine Ban Treaty. It attended the Ninth Meeting of States Parties in November 2008, the intersessional Standing Committee meetings in May 2009, and the Bangkok Workshop. For the second consecutive year, it voted in favor of the pro-ban UNGA resolution in December 2008. In May 2009, Lao PDR said it was considering submission of a voluntary Article 7 transparency report.

In 2008, the **Marshall Islands** re-engaged in the Mine Ban Treaty process, including attending its first annual Meeting of States Parties in November. The **Federated States of Micronesia** said in December 2008 that it was very close to acceding to the Mine Ban Treaty; a draft resolution approving accession has been awaiting congressional approval since mid-2008.

Mongolia did not meet its stated objective of joining the Mine Ban Treaty in 2008, but in mid-2009, Mongolia's Defense Minister and Foreign Minister told the ICBL that they would work to accelerate the accession process. **Vietnam** attended as an observer the Ninth Meeting of States Parties, as well as the Bangkok Workshop.

Commonwealth of Independent States: In July 2009, **Tajikistan** hosted the third regional meeting leading up to the Second Review Conference, and Kazakhstan, Kyrgyzstan and Uzbekistan attended.

Middle East and North Africa: **Egypt** attended the regional conference in South Africa but **Libya** did not. **Morocco** submitted its third voluntary Article 7 report and voted for the annual pro-ban UNGA resolution.

Ten-year review: universalization and non-state armed groups

There has been a growing awareness of the need to involve NSAGs in the global efforts to ban antipersonnel mines. In the past five years, States Parties to the Mine Ban Treaty have discussed the issue more regularly.

A significant number of NSAGs have indicated their willingness to observe a ban on antipersonnel mines. This has taken place through unilateral statements, bilateral agreements, signature to the Deed of Commitment administered by Geneva Call,⁷ and most recently through the "Rebel Group Declaration of Adherence to International Humanitarian Law on Landmines" developed by the Philippines Campaign to Ban Landmines.⁸

At least 59 NSAGs have committed to halt use of antipersonnel mines over the past 10 years.⁹ The exact number is difficult to determine, since NSAGs may split into factions with different policies, go out of existence, or merge with a state.¹⁰

⁷ Geneva Call is a Swiss-based NGO. Under the Deed of Commitment a signatory agrees to prohibit use, production, stockpiling, and transfer of antipersonnel mines, and to undertake and cooperate in mine action. Geneva Call has received signatures from NSAGs in Burundi, India, Iran, Iraq, Myanmar/Burma, the Philippines, Somalia, Sudan, Turkey, and Western Sahara.

⁸ This declaration of adherence unilaterally commits the signatory to the spirit of the Mine Ban Treaty, CCW Amended Protocol II on landmines, and Protocol V on Explosive Remnants of War (ERW) (see below), as well as customary international humanitarian law rules regarding use of mines and explosive devices. As of July 2008, it had been signed by three rebel groups in the Philippines. In February 2008, the Rebolusyonaryong Partido ng Manggagawa-Mindanao/Revolutionary People's Army (RPMM/RPA) was the first group to sign the declaration, followed by the Rebolusyonaryong Partido ng Manggagawa-Pilipinas/Revolutionary People's Army (RPMP/RPA) (Nilo de la Cruz faction) in May 2008, and the Marxista-Leninistang Partido ng Pilipinas (MLPP) and its Rebolusyonaryong Hukbong Bayan (RHB) military wing in July 2008.

⁹ As of 2009, 39 have through the Deed of Commitment, 18 by self declaration, and 4 by Rebel Declaration (two signed both the Rebel Declaration and the Deed of Commitment). Prior to 2000 several declarations were issued regarding the landmine ban by non-state armed groups, some of whom later signed the Deed of Commitment and the Rebel Declaration.

¹⁰ Of 17 Somali groups which signed the Deed of Commitment from 2002–2005, Geneva Call considers 10 to be active as of 2009. Four other former Deed of Commitment signatories are now part of governments which are parties to the Mine Ban Treaty, and therefore bound by the Mine Ban Treaty. At least two other Deed of Commitment signatories in Myanmar/Burma are no longer militarily active.

Since 1999, NSAGs in 13 countries have agreed to abide by either a comprehensive ban on antipersonnel mines or a ban on use. Geneva Call has received signatures to the Deed of Commitment from NSAGs in Burundi, India, Iran, Iraq, Myanmar/Burma, the Philippines, Somalia, Sudan, and Turkey, as well as Western Sahara. NSAGs have agreed to a ban on use of antipersonnel mines through bilateral agreements with governments in Angola, Burundi, DRC, Nepal, the Philippines, Senegal, and Sudan. Four armed groups which had indicated their willingness to ban antipersonnel mines are now part of state governing structures in three States Parties: Burundi, Iraq, and Sudan.

Since the First Review Conference, NSAGs agreeing to ban antipersonnel mines include: the Juba Valley Alliance in Somalia (January 2005), the Polisario Front in Western Sahara (November 2005), the Kurdistan Workers Party (Partiya Karkerên Kurdistan, PKK) in Turkey (July 2006), the Chin National Front/Army of Burma (July 2006), the Kuki National Organization in India (August 2006), the National Forces of Liberation (Forces Nationales de Libération) in Burundi (September 2006), the Communist Party of Nepal/Maoist (November 2006), three more Myanmar/Burma groups—Lahu Democratic Front, Palaung State Liberation Army, Pa’O People’s Liberation Organization/Pa’O Peoples Liberation Army (April 2007), the 18 members of the United Jihad Council in Kashmir (October 2007), the Democratic Party of Iranian Kurdistan (December 2007), the Rebolusyonyaryong Partido ng Manggagawa-Mindanao/Revolutionary People’s Army in the Philippines (February 2008), the Rebolusyonyaryong Partido ng Manggagawa-Pilipinas/Revolutionary Proletarian Army-Alex Boncaya Brigade in the Philippines (May 2008), the Marxista-Leninistang Partido ng Pilipinas/Rebolusyonyaryong Hukbong Bayan in the Philippines (July 2008), plus the groups in the following section on key developments in 2008–2009.

2008–2009 key developments: universalization and non-state armed groups

In October 2008, the Moro Islamic Liberation Front (MILF) signed the “Rebel Group Declaration of Adherence to International Humanitarian Law on Landmines.” In March 2009, in northeast India, the Zomi Re-unification Organisation signed the Geneva Call Deed of Commitment. In April and June 2009, three factions of the Komala party (the Kurdistan Organization of the Communist Party of Iran, the Komala Party of Kurdistan, and the Komala Party of Iranian Kurdistan) signed the Geneva Call Deed of Commitment.

Use of Antipersonnel Mines

Ten-year review: use by government forces

One of the most significant achievements of the Mine Ban Treaty has been the degree to which any use of antipersonnel mines by any actor has been stigmatized throughout the world. During the course of the past decade, the use of antipersonnel mines, especially by governments, has become a rare phenomenon. Landmine Monitor identified the probable use of antipersonnel mines by 15 governments in its initial report in 1999; 12 in its 2000 report; 13 in its 2001 report; 14 in its 2002 report; nine in its 2003 report; four in its 2004 report; four in its 2005 report; three in its 2006 report; two in its 2007 report; two in its 2008 report; and two in this 2009 report.

Landmine Monitor has identified 21 governments that have probably used antipersonnel mines since 1999, but only four since 2004 (**Georgia**, **Nepal**, **Myanmar**, and **Russia**).¹¹ The armed forces of Myanmar and Russia have used antipersonnel mines each year over the past decade. It appears that Georgian armed forces used antipersonnel mines on occasion every year from 2001 to 2004, and again in 2006, although the government has denied using them. In **Nepal**, government forces used antipersonnel mines and improvised explosive devises (IEDs) in the decade-long conflict that ended in 2006.

¹¹ Since 1999 there has been confirmed use by 16 governments: Afghanistan, Angola, DRC, Eritrea, Ethiopia, India, Iraq, Israel, Kyrgyzstan, Myanmar, Nepal, Pakistan, Russia, Sri Lanka, Uzbekistan, and FR Yugoslavia. There is compelling evidence that five more used antipersonnel mines: Burundi, Georgia, Rwanda, Sudan, and Uganda. All five of these states denied use.

Since 1999, there have been three instances in which government forces have made very extensive use of antipersonnel mines: **India** and **Pakistan** during the period of tensions from December 2001 to mid-2002; **Russia** in Chechnya in 1999 and 2000; and **Ethiopia** and **Eritrea** in their border conflict from 1998 to mid-2000.

There have been no confirmed instances of use of antipersonnel mines by States Parties to the Mine Ban Treaty. However, Landmine Monitor reported that there were strong and credible allegations that forces of **Uganda** used antipersonnel mines in the DRC in 2000, and that **Zimbabwe** forces used mines in the DRC in 1999 and 2000, although both denied it. In addition, a number of countries used antipersonnel mines after signing the Mine Ban Treaty, but before ratification and entry into force. **Angola** openly admitted using antipersonnel mines until 2002, **Ecuador's** Article 7 reporting on mined areas indicated that it laid mines in 1995–1998, and **Ethiopia** tacitly acknowledged use during its 1998–2000 border war. There were also credible use allegations concerning signatories **Burundi**, **Guinea-Bissau**, **Rwanda**, **Senegal**, and **Sudan**, although all denied it.¹²

Ten-year review: use by non-state armed groups

The number of countries in which NSAGs have been using antipersonnel mines has also decreased markedly over the past decade. Landmine Monitor identified use by NSAGs in 13 countries in its first annual report in 1999, then in 18 countries in its 2000 report, 19 countries in its 2001 report, 14 countries in its 2002 report, 11 countries in its 2003 report, 16 countries in its 2004 report, 13 countries in its 2005 report, 10 countries in its 2006 report, eight countries in its 2007 report, nine countries in its 2008 report, and seven countries in this 2009 report.

Since 1999, Landmine Monitor has identified NSAG use of antipersonnel mines in at least 28 countries, as follows:

- **Africa:** Angola, Burundi, DRC, Guinea-Bissau, Namibia, Senegal, Somalia, Sudan, and Uganda;
- **Americas:** Bolivia, Colombia, Ecuador, and Peru;
- **Asia-Pacific:** Afghanistan, Bhutan, India, Myanmar, Nepal, Pakistan, the Philippines, and Sri Lanka;
- **Commonwealth of Independent States:** Georgia (including Abkhazia) and Russia (including Chechnya, Dagestan, and North Ossetia);
- **Europe:** Former Yugoslav Republic of Macedonia (FYR Macedonia), Turkey, and the Former Republic of Yugoslavia (FR Yugoslavia); and
- **Middle East and North Africa:** Iraq and Lebanon.

There have also been very sporadic and isolated incidents of new use in a number of other countries by rebel groups, criminal elements, and other NSAGs.

The rebel groups that have made the most extensive use of antipersonnel mines and mine-like IEDs since 1999 are probably the Revolutionary Armed Forces of Colombia (FARC) and the Liberation Tigers of Tamil Elam (LTTE) in Sri Lanka, followed by the Karen National Liberation Army (KNLA) in Myanmar/Burma.

Since 2004, Landmine Monitor has identified NSAG use each year only in **Colombia**, **India**, **Myanmar/Burma**, and **Pakistan**. In addition, it noted NSAG use in **Iraq** in its reports issued from 2005–2008; in **Chechnya** in reports issued from 2005–2007; in **Afghanistan** in reports issued from 2007–2009; in **Peru** and **Sri Lanka** in reports issued from 2008–2009; and in **Burundi**, **Nepal**, and **Somalia** in reports issued from 2005–2006.

2008–2009 key developments: use

Government forces

From 2008–2009, the armed forces of **Myanmar** and **Russia** continued to use antipersonnel mines. Myanmar's military forces used antipersonnel mines extensively, in numerous areas of the country, as they have every year since Landmine Monitor began reporting in 1999. Among

¹² For more details on government use of antipersonnel mines from 1999–2004 see *Landmine Monitor Report 2004*.

government forces, the security forces of Myanmar have probably been the most prolific users of antipersonnel mines in the world since 2004.

In June 2006, Russian officials confirmed to Landmine Monitor that Russian forces continued to use antipersonnel mines in Chechnya, both newly emplaced mines and existing defensive minefields. In discussions with Landmine Monitor since 2006, Russian officials have declined to state that use of antipersonnel mines has stopped. Landmine Monitor will continue to cite Russia as an ongoing user of antipersonnel mines until an official denial is made and confirmed by the facts on the ground.

Thailand made a serious allegation of new use of antipersonnel mines by **Cambodia** on their border in October 2008 in an incident in which two Thai Rangers were injured. Cambodia stated that the incident occurred in a confirmed minefield on Cambodian territory, and it created a Fact Finding Commission to review the incident. It would appear from available evidence that this incident may have involved new use of antipersonnel mines, but Landmine Monitor is not able to determine who was responsible for laying the mines.

Georgia and **Russia** accused each other of using antipersonnel mines during their conflict in August 2008, but several investigations by Human Rights Watch found no evidence of mine use. There were also allegations, mostly by opposition forces, of use since May 2008 by the armed forces of **Armenia**, **Sri Lanka**, and **Yemen**, but Landmine Monitor could not verify them.¹³

Non-state armed groups

Use of antipersonnel mines by NSAGs declined modestly in the past year. NSAGs used antipersonnel mines or mine-like IEDs in at least seven countries, including three States Parties (Afghanistan, Colombia, and Peru) and four states not party to the treaty (India, Myanmar/Burma, Pakistan, and Sri Lanka). This is two fewer countries than cited in the previous edition of Landmine Monitor, with the removal of Ecuador and Iraq.

Some NSAG use may have taken place in Iraq, the Philippines, Somalia, Thailand, Turkey, and Yemen, but Landmine Monitor has been unable to confirm from available information.

Insurgent and rebel groups have used improvised explosive devices (IEDs) in increasing numbers. An IED that is victim-activated (i.e. it explodes from the contact, presence, or proximity of a person) is considered an antipersonnel mine and prohibited under the Mine Ban Treaty. An IED that is command-detonated (i.e. the user decides when to explode it) is not prohibited by the treaty, but use of such devices is often in violation of international humanitarian law, such as when civilians are directly targeted. Command-detonated bombs and IEDs have been frequently reported by the media, militaries and governments as “landmines.” This has led to some confusion, and Landmine Monitor has consistently attempted to determine if an IED was victim-activated or detonated by some other means.

In **Afghanistan**, new use of antipersonnel mines by the Taliban has been reported. Notably, in June 2008, there were several reports of Taliban mine use in the Arghandab district of Kandahar province. In **Colombia**, FARC continued to be the largest user of landmines in the country, and among the largest in the world, causing hundreds of casualties each year. The National Liberation Army (ELN) also used mines. In **India**, there were a few reports of victim-activated explosive weapons being used, including in Manipur in an area known to be a United National Liberation Front stronghold. Government forces reportedly recovered antipersonnel mines from other armed groups in the northeast of India during the year. In **Myanmar/Burma**, the Karen National Liberation Army, the Karenni Army, the Democratic Karen Buddhist Army, and several other NSAGs continued to use antipersonnel mines.

¹³ Last year, Landmine Monitor noted that knowledgeable sources in Sri Lanka who wished to remain anonymous, including those engaged in mine action activities in the field, alleged that Sri Lankan security forces used antipersonnel landmines in 2007 and 2008. Although Landmine Monitor was not able to confirm the allegations, it said it considered this the first serious charge of use of antipersonnel mines by government forces in Sri Lanka since the 2002 Cease Fire Agreement. Representatives of the Ministry of Foreign Affairs and the Sri Lanka Army strongly denied the allegations when asked by Landmine Monitor.

In **Pakistan**, NSAGs sporadically used antipersonnel mines in Balochistan, some districts of the North-West Frontier Province, and the Federally Administered Tribal Areas in attacks on Pakistani security forces and civil administration, and in sectarian, inter-tribal and inter-family conflicts. In May 2009, Taliban groups were reported to have used antipersonnel landmines in the Swat Valley. In **Peru**, remnants of Shining Path (Sendero Luminoso) have reportedly used victim-activated explosive devices, referred to as “explosive traps,” to protect illegal coca fields. In August 2008, Peru launched an offensive in Vizcatan province against the Shining Path during which members of the security forces were reportedly injured by these explosive traps. In **Sri Lanka**, as the war intensified in 2008 and 2009, culminating in the defeat of the LTTE in May 2009, it appears that the LTTE laid very large numbers of antipersonnel mines in defense of its military installations throughout the north of the island. The Sri Lanka Army reportedly found many newly laid mines, IEDs, and booby-traps, especially between late November 2008 and March 2009.

In **Iraq**, insurgent forces used command-detonated IEDs extensively, but no specific incidence of victim-activated mine use was found during the year, despite documented instances of discoveries and seizures of antipersonnel mines by Iraqi and foreign forces. In the **Philippines**, there were no confirmed instances of use of antipersonnel mines by NSAGs, although some incidents in news reports appear to have involved victim-activated devices. The Armed Forces of the Philippines (AFP) continued to allege use of banned explosive devices by the New People’s Army. In August 2008, the AFP also alleged use of antipersonnel mines by the MILF in North Cotabato and Maguindanao. Both the New People’s Army and MILF rejected the allegations. In **Somalia**, despite the ready availability of antipersonnel mines, Landmine Monitor has not identified any confirmed reports of new use of antipersonnel mines in several years by any armed organization operating in the country. Landmine Monitor analysis of news reports indicates that most if not all of the explosive attacks were command-detonated.

In **Thailand**, the insurgency in the south has made extensive use of command-detonated IEDs and there may have been isolated instances of use of homemade landmines or victim-activated IEDs. **Turkey** reported that in 2008, 158 military personnel and civilians were killed or injured by landmines laid by the PKK/Kurdish Freedom and Democracy Congress (Kongreya Azad z Demokrasiya Kurdistana)/Kurdistan People’s Congress (Kongra Gel). But it did not differentiate between casualties caused by antipersonnel mines, antivehicle mines or IEDs, nor between victim-activated and command-detonated mines/IEDs. There were also media reports of use of antipersonnel mines, but it has not been possible to verify the nature of the devices, who laid them, or the date of placement. In **Yemen**, the government has on a few occasions accused the Al-Houthi rebels of using antipersonnel mines, but there has been no independent confirmation.

There were reports of NSAG use of antivehicle mines in Afghanistan, Iraq, Niger, Pakistan, Palestine, Somalia, and Sri Lanka.

NSAGs reportedly used command-detonated IEDs in Afghanistan, Algeria, Iraq, India, Pakistan, the Philippines, Russia, Somalia, Sri Lanka, Thailand, and Turkey.

Production of Antipersonnel Mines

More than 50 states are known to have produced antipersonnel mines.¹⁴ Thirty-eight states have ceased production of antipersonnel mines,¹⁵ including four countries that are not party to the Mine Ban Treaty: **Egypt**, **Finland**, **Israel**, and **Poland**. **Taiwan** passed legislation banning production in June 2006. Among those who have stopped manufacturing are a majority of the

¹⁴ There are 51 confirmed current and past producers. Not included in that total are five States Parties that have been cited by some sources as past producers, but deny it: Croatia, Nicaragua, Philippines, Thailand, and Venezuela. In addition, Jordan declared possessing a small number of mines of Syrian origin in 2000. It is unclear if this represents the result of production, export, or capture.

¹⁵ Thirty-four States Parties to the Mine Ban Treaty that once produced antipersonnel mines include: Albania, Argentina, Australia, Austria, Belgium, BiH, Brazil, Bulgaria, Canada, Chile, Colombia, Czech Republic, Denmark, France, Germany, Greece, Hungary, Iraq, Italy, Japan, Netherlands, Norway, Peru, Portugal, Romania, Serbia, South Africa, Spain, Sweden, Switzerland, Turkey, Uganda, UK, and Zimbabwe.

big producers from the 1970s to 1990s. With the notable exceptions of **China, Russia** and the **US**, the former biggest producers and exporters are now States Parties to the Mine Ban Treaty.

Landmine Monitor identifies 13 states as producers of antipersonnel mines: **China, Cuba, India, Iran, Myanmar, Nepal, North Korea, Pakistan, Russia, Singapore, South Korea, the US, and Vietnam**. In some cases, the country is not actively producing mines, but reserves the right to do so. As few as three countries may have been producing antipersonnel mines in 2008.¹⁶

No countries were added or removed from the list of producers in this reporting period. Since it began reporting in 1999, Landmine Monitor removed **Egypt, Iraq, Turkey, and FR Yugoslavia** from its list of producers. **Nepal** was added to the list in 2003 following admissions by military officers that production was occurring in state factories. More recently, Nepal officials have denied past or current production, and the situation remains unclear (see 2008–2009 key developments: production section below).

NSAGs in **Colombia, India, Myanmar/Burma, and Peru** are known to produce victim-activated improvised mines. The sophistication of such mines varies greatly. Prior to its defeat in 2009, the LTTE in **Sri Lanka** probably produced the most sophisticated antipersonnel mines among NSAGs.

2008–2009 key developments: production

- **China:** In April 2008, several sources in Beijing told Landmine Monitor that facilities to produce antipersonnel mines are idle, or have shut down, or have been converted for production of other products. There has been no official confirmation of this information.
- **India:** In its first ever response to a Right to Information Act (RTI) request on landmines, the Ministry of Defence confirmed that it was actively producing antipersonnel mines in 2007 and 2008, including NM-14 and NM-16 mines, as well as the APER 1B mine. Landmine Monitor is not familiar with the APER 1B mine, presumably an antipersonnel mine. India has in the past informed Landmine Monitor that it does not produce remotely-delivered mines.
- **Nepal:** In December 2008, an Army General told the ICBL that Nepal had no capacity to produce landmines, nor did it ever have such capacity. Similarly, in March 2008, an army official told Landmine Monitor that Nepal did not produce or use any victim-activated mines or IEDs, and in 2007, an army officer denied any past or current antipersonnel mine production, while acknowledging that soldiers frequently made command-detonated IEDs. These comments contradicted statements made in 2003 and 2005, when Nepali officials told Landmine Monitor that Nepal produced antipersonnel mines. While it does not appear that Nepal is currently producing antipersonnel mines, the conflicting information about past production remains to be clarified. Landmine Monitor will continue to list Nepal as a producer until Nepal makes an official, formal statement that it does not produce antipersonnel mines and does not intend to do so in the future.
- **South Korea:** South Korea reported that it did not engage in any production of antipersonnel mines in 2008. In June 2008, South Korea told Landmine Monitor that a government-managed research project on alternatives to antipersonnel mines was scheduled for 2009 to 2012. A private company, the Hanwha Corporation, began production of self-destructing antipersonnel mines in 2006, manufacturing 18,900 in 2006 and 2007.
- **US:** In May 2008, the Vice Chief of Staff of the US Army stated that the XM-7 Spider Networked Munition would be procured in a configuration that only allowed command detonation. Previously, the Spider system contained a feature that would

¹⁶ India and Pakistan acknowledge ongoing production, and it seems certain Myanmar is actively producing. South Korea reported production in 2006 and 2007, but not in 2008. China, Iran, Nepal, the US, and Vietnam have all said they are not currently producing. It is unclear if Cuba, North Korea, Russia, and Singapore are actively producing.

permit it to function in a victim-activated mode, making it incompatible with the Mine Ban Treaty. This would have constituted the first production of antipersonnel mines by the US since 1997.

- **Vietnam:** In May 2008, representatives of the Army and the Ministry of Foreign Affairs told a visiting Canadian governmental delegation that Vietnam has not produced mines since the Mine Ban Treaty came into force. However, the Ministry of Foreign Affairs official also emphasized that Vietnam reserves the right to use and produce landmines in the future.

Ten-year review: production

- **Cuba:** Cuba has not provided any information about its production of antipersonnel mines. The state-owned Union of Military Industries is believed, in the absence of any denial or clarification from the government, to continue to produce antipersonnel mines.
- **Egypt:** At the First Review Conference of the Mine Ban Treaty in 2004, Egypt's Deputy Assistant Foreign Minister stated that the Egyptian government had imposed a moratorium on all production activities related to antipersonnel mines. This was the first time that Egypt publicly and officially announced a moratorium on production. Egyptian officials had unofficially said for a number of years that Egypt stopped producing antipersonnel mines in 1988.
- **India:** India has been actively producing antipersonnel mines that are compliant with Convention on Conventional Weapons (CCW) Amended Protocol II. In October 2000, India said that it had designed a remotely-delivered antipersonnel mine system, for trial evaluation and prototype production. But, in August 2005, India told Landmine Monitor that it was not producing remotely-delivered antipersonnel mines.
- **Iran:** The Director of the Iran Mine Action Center told Landmine Monitor in August 2005 that Iran does not produce landmines, echoing an assertion from the Ministry of Defense in 2002 that Iran had not produced antipersonnel mines since 1988. However, mine clearance organizations in Afghanistan have since 2002 found many hundreds of Iranian antipersonnel mines date-stamped 1999 and 2000.
- **Iraq:** Iraq produced antipersonnel mines in the past, including in the period leading up to the 2003 invasion. An Iraqi diplomat told Landmine Monitor in 2004 that all mine production capacity had been destroyed in the Coalition bombing campaign. Iraq confirmed this in its initial Article 7 report in August 2008.
- **Myanmar:** In 2007, Landmine Monitor learned that Myanmar was producing blast mines based on the US M-14 plastic mine design, in addition to the previously identified MM1 (modeled on the Chinese Type 59 stake-mounted fragmentation mine), the MM2 (similar to the Chinese Type 58 blast mine), and a Claymore-type directional fragmentation mine.
- **Pakistan:** Pakistan has been actively producing antipersonnel mines that are compliant with CCW Amended Protocol II, including for the first time, remotely-delivered mine systems.
- **Russia:** Russia stated in December 2000 that it was decommissioning facilities for the production of antipersonnel blast mines.
- **Singapore:** In 2002, the Norwegian Petroleum Fund removed Singapore Technologies Engineering (STE) from its investment portfolio due to STE's involvement in the production of antipersonnel mines. The New Zealand Superannuation Fund divested from STE in 2006. In April 2007, the Netherlands' biggest pension fund, ABP, announced that it had stopped investing in landmine-producing companies, including STE.

- **South Korea:** South Korea reported that it did not produce any antipersonnel mines, other than Claymore mines, from 2000 to 2005. It gave assurances only command-detonated Claymores were made. It produced self-destructing antipersonnel mines for the first time in 2006, and again in 2007.
- **US:** The US cancelled planned production of two weapons that would have been inconsistent with the Mine Ban Treaty: RADAM in fiscal year 2002 and Spider with battlefield override feature in 2008.
- **Vietnam:** Vietnam began stating in 2005 that it no longer produces antipersonnel mines, but it reserves the right to do so in the future.

Global Trade in Antipersonnel Mines

A *de facto* ban on the transfer of antipersonnel mines has been in effect since the mid-1990s. For the past decade, global trade in antipersonnel mines has consisted solely of a low-level of illicit and unacknowledged transfers.

A significant number of states outside the Mine Ban Treaty have formal moratoria on the export of antipersonnel mines, including **China, India, Israel, Kazakhstan, Pakistan, Poland, Russia, Singapore, South Korea,** and the US. In December 2007, the US extended its comprehensive antipersonnel mine export moratorium, in place since 1992, for another six years, until 2014. In July 2008, Israel extended its export moratorium for another three years. Other past exporters have made statements declaring that they do not export now, including **Cuba, Egypt,** and **Vietnam.** **Iran** also claims to have stopped exporting, despite evidence to the contrary.

In this reporting period, there were only a small number of reports of trafficking in antipersonnel mines. Perhaps most notably, in 2008 **Niger** discovered more than 1,000 abandoned mines on the Niger-Chad border, which it believed were lifted from minefields by smugglers for resale. Niger also initiated a program to buy mines from arms traffickers to prevent them from falling into the hands of rebels.

Ten-year review: trade

The most disturbing developments regarding transfers of antipersonnel mines were the reports by the UN Monitoring Group on Somalia that both **Ethiopia and Eritrea**—States Parties to the Mine Ban Treaty—provided antipersonnel mines to forces in **Somalia** in 2006, and possibly in other years as well.¹⁷ Both Ethiopia and Eritrea strongly denied the allegations. The Monitoring Group also reported that mines continued to be available at arms markets in Somalia.

Local inhabitants and the media have reported that antipersonnel mines are available on the clandestine market in the Federally Administrated Tribal Areas of Pakistan. There have been reports of mines being smuggled from Afghanistan into Pakistan, and from Sudan into the DRC.

Landmine Monitor received information in 2002, 2003, and 2004 that demining organizations in Afghanistan were removing and destroying many hundreds of Iranian YM-I and YM-I-B antipersonnel mines, date-stamped 1999 and 2000, from abandoned Northern Alliance frontlines.

There were reports of attempts by representatives of Pakistan Ordnance Factories to sell antipersonnel mines to British journalists posing as representatives of private companies in both November 1999 and April 2002.

¹⁷ Two Presidents of the Meetings of States Parties made inquiries about these reports, but the ICBL has regretted the fact that States Parties have not vigorously pursued these serious and specific allegations as potential violations of the Mine Ban Treaty.

Antipersonnel Mine Stockpiles and Their Destruction (Article 4)

States Parties

As of August 2009, 149 of the 156 States Parties to the Mine Ban Treaty have stated that they do not have stockpiles of antipersonnel mines. Eighty-six States Parties have completed the destruction of their stockpiles.¹⁸ Sixty-three States Parties declared that they did not possess stockpiles of antipersonnel mines, except in some cases those retained for research and training purposes.¹⁹

An additional two states, **Equatorial Guinea** and the **Gambia**, have not yet formally declared the presence or absence of stockpiles, but are not believed to possess any mines. One other state, **Iraq**, has reported uncertainty about the existence of a stockpile (see below). Four States Parties are in the process of destroying stocks: **Belarus**, **Greece**, **Turkey**, and **Ukraine**.

States Parties collectively have destroyed about 44 million stockpiled antipersonnel mines, including more than 1.6 million from May 2008 to May 2009.²⁰ In addition, treaty signatory **Poland** destroyed 651,117 antipersonnel mines in 2008. The most recent States Parties to complete their stockpile destruction obligation are **Kuwait** (declared in July 2009), **Ethiopia** (April 2009), and **Indonesia** (November 2008).

Overall, compliance with this core obligation of the treaty has been impressive. Most States Parties have completed destruction far in advance of their deadlines. Through 2007, only four States Parties missed their deadlines: **Turkmenistan**, **Guinea**, **Cape Verde**, and **Afghanistan**.²¹

¹⁸ New to this list are Ethiopia, Indonesia, and Kuwait. As of 31 August 2009, the following states have completed the destruction of their antipersonnel mine stockpiles: Afghanistan, Albania, Algeria, Angola, Argentina, Australia, Austria, Bangladesh, Belgium, Bosnia and Herzegovina, Brazil, Bulgaria, Burundi, Cambodia, Cameroon, Canada, Cape Verde, Chad, Chile, Colombia, DRC, Republic of the Congo, Croatia, Cyprus, Czech Republic, Denmark, Djibouti, Ecuador, El Salvador, Ethiopia, France, Gabon, Germany, Guinea, Guinea-Bissau, Honduras, Hungary, Indonesia, Italy, Japan, Jordan, Kenya, Kuwait, Latvia, Lithuania, Luxembourg, FYR Macedonia, Malaysia, Mali, Mauritania, Mauritius, Moldova, Montenegro, Mozambique, Namibia, Netherlands, New Zealand, Nicaragua, Nigeria, Norway, Peru, Philippines, Portugal, Romania, Serbia, Sierra Leone, Slovakia, Slovenia, South Africa, Spain, Sudan, Suriname, Sweden, Switzerland, Tajikistan, Tanzania, Thailand, Tunisia, Turkmenistan, Uganda, UK, Uruguay, Yemen, Venezuela, Zambia, and Zimbabwe.

¹⁹ New to this list are Haiti and Palau. The following States Parties have declared not possessing antipersonnel mine stockpiles (note: a number of these apparently had stockpiles in the past, but used or destroyed them prior to joining the Mine Ban Treaty, including Eritrea, Rwanda, and Senegal): Andorra, Antigua and Barbuda, Bahamas, Barbados, Belize, Benin, Bhutan, Bolivia, Botswana, Brunei, Burkina Faso, Central African Republic, Comoros, Cook Islands, Costa Rica, Côte d'Ivoire, Dominica, Dominican Republic, Eritrea, Estonia, Fiji, Ghana, Grenada, Guatemala, Guyana, Haiti, Holy See, Iceland, Ireland, Jamaica, Kiribati, Lesotho, Liberia, Liechtenstein, Madagascar, Malawi, Maldives, Malta, Mexico, Monaco, Nauru, Niger, Niue, Panama, Palau, Papua New Guinea, Paraguay, Qatar, Rwanda, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Samoa, San Marino, São Tomé e Príncipe, Senegal, Seychelles, Solomon Islands, Swaziland, Timor-Leste, Togo, Trinidad and Tobago, and Vanuatu.

²⁰ Turkey destroyed most of the mines, nearly 1.3 million. Greece destroyed 225,962; Kuwait 91,432; Ethiopia 32,650; and Indonesia 11,603. In addition, Iraq reported in July 2008 that it had destroyed 200,125 stockpiled antipersonnel mines since 2003, but did not indicate how many each year.

²¹ Turkmenistan reported the completion of its stockpile destruction on 28 February 2003, just ahead of its deadline, but also reported that it was retaining 69,200 antipersonnel mines for training purposes. The ICBL and a number of States Parties severely criticized this as an unacceptably high number of retained mines that constituted continued stockpiling of the weapon. In February 2004, Turkmenistan said it would destroy the mines, which it did later in the year. It turned out Turkmenistan had in fact been retaining 572,200 individual antipersonnel mines, as most of the retained mines were of the remotely-delivered type and Turkmenistan had been counting only the containers and not the mines inside. Guinea and Cape Verde had not revealed that they possessed small stockpiles of antipersonnel mines. This fact was discovered only when reports came out of the completion of destruction, in Guinea's case seven months after its April 2003 deadline, and in Cape Verde's case eight months after its November 2005 deadline. Guinea's mines were destroyed with the assistance of the US, and Cape Verde's with NATO assistance. Afghanistan was unable to meet its March 2007 deadline for stockpile destruction, telling States Parties that while it had destroyed 486,226 stockpiled antipersonnel mines, two depots of antipersonnel mines still remained in Panjsher province. The provincial authorities apparently did not make the mines available for destruction in a timely fashion. Afghanistan then finished destruction in October 2007. For more details, see Stephen D. Goose, "Goodwill Yields Good Results: Cooperative Compliance and the Mine Ban Treaty," in Jody Williams, Stephen D. Goose and Mary Wareham, (eds.), *Banning Landmines: Disarmament, Citizen Diplomacy, and Human Security* (Lanham: Rowman & Littlefield, 2008), pp. 105–126.

However, this record has been tarnished by three States Parties—**Belarus, Greece, and Turkey**—that missed their stockpile destruction deadlines of 1 March 2008. All three remain in serious violation of the treaty.

Belarus finished destroying its 294,775 non-PFM type antipersonnel mines in 2006, but still possesses 3.37 million PFM-type mines. It is in the process of finalizing a new joint project with the European Commission to complete stockpile destruction. It has not established a new completion date. **Greece** did not even begin destroying mines until November 2008, and had destroyed only 225,962 mines as of May 2009. It hoped to destroy the remaining 1.36 million mines by the end of 2009. **Turkey** destroyed 1.6 million antipersonnel mines between 2006 and April 2009, leaving a total of 1.32 million to destroy. It intends to complete destruction in 2010.

Ukraine informed States Parties in May 2009 that it was unlikely to meet its 1 June 2010 stockpile destruction deadline. It still possesses 5.95 million PFM-type mines and 149,096 POM-2 mines. It destroyed 101,088 PFM-1 mines in 1999 and 404,903 PMN-type mines in 2002 and 2003, as well as more than 254,000 other antipersonnel mines.

Thus, as of mid-2009, more than 12 million antipersonnel mines remained to be destroyed by four States Parties, including **Belarus** (3.4 million), **Greece** (1.4 million), **Turkey** (1.3 million), and **Ukraine** (6.1 million).

It is not clear if **Iraq** has a stockpile of antipersonnel mines. In its initial Article 7 report, dated 31 July 2008, Iraq stated that while it had not yet identified any stockpiles, “this matter will be further investigated and if required, corrected in the next report.” Its subsequent report in May 2009 did not include any information on stockpiles or destruction. Iraq stated in its July 2008 report that it had destroyed 200,125 stockpiled antipersonnel mines since 2003.

Stockpile Destruction Deadlines

Belarus	1 March 2008
Greece	1 March 2008
Turkey	1 March 2008
Ukraine	1 June 2010
Iraq	1 February 2012

States not party

Landmine Monitor estimates that as many as 35 states not party to the Mine Ban Treaty stockpile more than 160 million antipersonnel mines.²² The vast majority of these stockpiles belong to just three states: **China** (estimated 110 million), **Russia** (estimated 24.5 million), and the **US** (10.4 million). Other states with large stockpiles include **Pakistan** (estimated six million) and **India** (estimated four to five million).

Poland, a signatory state, declared a stockpile of 1,055,971 mines at the end of 2002, but had reduced it to 333,573 mines by the end of 2008, including the destruction of 651,117 mines in 2008.

In 2008, **China** continued to destroy stockpiled antipersonnel mines that had either expired or were not compliant with CCW Amended Protocol II. It has reported destruction of more than 2 million such mines since the late 1990s. It reported in September 2008 that new techniques would allow it to accelerate the process of destroying obsolete mines.

In November 2008, **Russia** stated that “about 10 million anti-personnel mines” had been destroyed in “recent years.” It has apparently been destroying about one million mines per year since 2005. In November 2004, Russia for the first time revealed that it had a stockpile of 26.5 million antipersonnel mines, stating that it had destroyed 19.5 million since 2000.

In May 2008, an army official in **Vietnam** informed a Canadian delegation that Vietnam’s stockpile of antipersonnel mines will expire in a few years, and stated that Vietnam has gradually started to destroy the mines.

²² Of the 39 states not party, four have stated that they do not stockpile any antipersonnel mines: Marshall Islands, Micronesia, Tonga, and Tuvalu. Some other states not party may not have stocks. Officials from the UAE have provided contradictory information regarding its possession of stocks. A Libyan defense official said in 2004 that Libya no longer stockpiles, but that information has not been confirmed. Bahrain and Morocco state that they only have small stockpiles used solely for training purposes.

Non-state armed groups

Compared to a decade ago, very few NSAGs today have access to factory-made antipersonnel landmines. This is directly linked to the halt in trade and production, and the destruction of stocks, brought about by the Mine Ban Treaty. Some NSAGs have access to the mine stocks of previous regimes (such as in **Afghanistan, Iraq, and Somalia**).

In addition to producing their own improvised mines, NSAGs in states not party to the Mine Ban Treaty have also acquired mines by lifting them from the ground, capturing them, stealing them from arsenals, and purchasing them from corrupt officials.

During this reporting period, NSAGs and criminal groups were reported to possess stocks of antipersonnel mines in **Afghanistan, Colombia, India, Iraq, Myanmar/Burma, Pakistan, Peru, Sri Lanka, and Turkey**. Most often, Landmine Monitor identifies whether an NSAG possesses stocks through reports of seizures by government forces.

At least two NSAGs which have signed the Geneva Call Deed of Commitment destroyed some stocks of antipersonnel mines during the reporting period. In Puntland (**Somalia**), in April 2009, Mines Advisory Group and a Puntland police explosive ordnance disposal team destroyed 78 Pakistani-made P4 mines in Bosasso. In **Iraq**, in September 2008, the PDKI destroyed 392 antipersonnel mines in Koya, northern Iraq.

Reporting on and destroying captured, seized, or newly discovered stockpiles

Action #15 of the Nairobi Action Plan states: “When previously unknown stockpiles are discovered after stockpile destruction deadlines have passed, [all States Parties will] report such discoveries in accordance with their obligations under Article 7, take advantage of other informal means to share such information, and destroy these mines as a matter of urgent priority.” States Parties took this a step further by agreeing to adopt a modified voluntary reporting format for reporting on these mines.

Some States Parties routinely discover, capture, seize, or receive turned-in arms caches containing antipersonnel mines. In this reporting period, the following countries officially noted new discoveries or seizures of antipersonnel mines in their Article 7 reports: **Afghanistan, Bulgaria, Burundi, Cambodia, Republic of the Congo, Niger, Sudan, Tajikistan, and Uganda**. In addition, there were government or media reports of discoveries or seizures of antipersonnel mines in **Colombia, Iraq, Peru, and Turkey**, although these were not included in Article 7 reporting.

Afghanistan reported that 62,498 stockpiled antipersonnel mines were discovered and destroyed during calendar year 2008, in 160 events in 20 provinces. It previously reported that 81,595 stockpiled antipersonnel mines were destroyed in 2007, including many that were discovered, seized, or handed over during the year. **Cambodia** has declared that a total of 133,478 antipersonnel mines were newly found and destroyed from 2000–2008, including 13,665 in 2008.

The **Republic of the Congo** reported that on 3 April 2009 it destroyed 4,000 PPM-2 and PMN mines discovered in abandoned ammunition storage areas. **Niger** destroyed 1,772 antipersonnel mines in August and October 2008. The mines apparently came from two sources, with some discovered on the border with Chad and some purchased from traffickers. **Sudan** reported that caches containing 523 antipersonnel mines were discovered in various locations of Southern Sudan and destroyed from October–December 2008.

Since the First Review Conference in 2004, the following States Parties have reported new discoveries or seizures of mines in their Article 7 reports: **Afghanistan, Angola, Bangladesh, Bosnia and Herzegovina (BiH), Bulgaria, Burundi, Cambodia, Republic of the Congo, Niger, Senegal, Serbia, Sudan, Tajikistan, Uganda, and Yemen**. There have also been official or media reports of new discoveries or seizures of antipersonnel mines in **Algeria, DRC, Kenya, and the Philippines**, in addition to **Colombia, Iraq, Peru, and Turkey**.

It is a State Party’s responsibility to account for the disposition of captured, seized, or turned-in antipersonnel landmines. States Parties should reveal in Article 7 reports the details of newly found antipersonnel landmines, depending on whether they are maintained for a period as stockpiled mines (Form B), transferred for destruction or training purposes (Form D), actually

destroyed (Form G), or retained for training purposes (Form D). This reporting should occur for discoveries and seizures made both before and after the completion of stockpile destruction programs.

Mines Retained for Research and Training (Article 3)

Article 3 of the Mine Ban Treaty allows a State Party to retain or transfer “a number of anti-personnel mines for the development of and training in mine detection, mine clearance, or mine destruction techniques...The amount of such mines shall not exceed the minimum number absolutely necessary for the above-mentioned purposes.”

Ten-year review: mines retained

The ICBL, and a number of States Parties, have consistently questioned the need for live mines for training purposes. At least 23 states that once stockpiled antipersonnel mines have declared that they no longer possess any mines, even for research and training purposes. Several states have indicated that some or all of their retained mines are fuzeless.

Over the years, States Parties have had extensive discussions about “the minimum number absolutely necessary.” During the Oslo negotiations in 1997 and during Standing Committee discussions since 1999, most States Parties have agreed that, for those that decide to retain mines, the minimum number of mines retained should be in the hundreds or thousands or less, but not tens of thousands.

With strong urging from the ICBL, State Parties agreed at the First Review Conference in 2004 that those retaining mines should report in detail each year on the intended purposes and actual uses of those mines. In 2005, States Parties agreed to a new, voluntary Article 7 form to facilitate such reporting.

Despite these measures, the ICBL has continued to express concern in recent years that a large number of States Parties are still retaining mines, but apparently not using them for permitted purposes. For these States Parties, the number of mines retained remains the same year after year, indicating none are consumed (destroyed) during training or research activities, and no or few details are provided about how the mines are being used. Some states retain mines even though they are not known to engage in any research or training activities.

Mines Retained for Research and Training, 2002–2008

Reporting Period	No. of States Parties reporting retained mines	No. of retained mines (approximately)	No. of States Parties reporting retained mines consumed	No. of retained mines consumed	No. of States Parties not retaining mines
2008	71	197,000	29	20,449	at least 78
2007	71	216,000	35	14,758	at least 77
2006	69	228,000	29	12,416	at least 77
2005	69	227,000	14	3,702	at least 71
2004	74	248,000	24	6,761	at least 64
2003	66	233,000	17	3,112	at least 62
2002	62	280,000	15	3,806	at least 55

The ICBL told States Parties in April 2007 that it “is increasingly convinced that there is widespread abuse” of the Article 3 exception. It said, “It appears that many States Parties are retaining more antipersonnel mines than ‘absolutely necessary’ and are not using mines... for the permitted purposes. It is time for States Parties to think about this as a serious compliance issue,

and not just a reporting or transparency issue... Some States Parties have yet to use their retained mines at all; they are simply sitting in storage—the equivalent to continued stockpiling... Unless a State Party is clearly retaining the minimum number of antipersonnel mines, is actively utilizing the mines for the permitted purposes, and is being fully transparent about the process, there may rightly be concerns that the mines are in essence still being stockpiled and could be used for war fighting purposes.²³

At least 15% of States Parties retaining mines in 2008 have not reported a reduction in mines retained since the treaty's entry into force for these states. Even more states have reported consuming mines only sporadically, with many reporting no consumption for two or more consecutive years.

Since 2005, the number of States Parties not retaining mines for research and training purposes has exceeded the number choosing to retain. The total number of mines retained has decreased substantially, from about 280,000 in 2002 to about 197,000 in 2008. This has reflected not only the consumption of retained mines during training and development activities, but also the decision by many states to significantly reduce—and in some cases completely eliminate—mines retained as they have deemed the mines excessive to their needs.

At least 30 States Parties have reviewed and decided to reduce their number of retained mines, or even eliminate the mines altogether (as **Moldova** and **FYR Macedonia** did in 2006).²⁴ Among those who decided to significantly reduce their number of retained mines in 2007 and 2008 were **Algeria, Ecuador, Guinea-Bissau, Iraq, Serbia, Sudan, Thailand, Ukraine, and Zambia**.

2008 key developments: mines retained

In 2008, 71 of the 156 States Parties retained a total of more than 197,000 antipersonnel mines in accordance with Article 3.

At least 78 States Parties have chosen not to retain any mines for training. During this reporting period, **Haiti** and **Palau** formally indicated for the first time in their initial Article 7 reports that they were not retaining any antipersonnel mines. Seven other States Parties may not retain mines, but greater clarity and confirmation of their status is needed. **Botswana, Cape Verde, and Equatorial Guinea** have never declared a number of mines retained in an Article 7 report.²⁵ **Cambodia, DRC, Nigeria, and Senegal** have declared in the past that they were not retaining any mines for research and training, but have reported information in their recent Article 7 reports that makes their status uncertain.²⁶

²³ ICBL Intervention on Article 3—Mines Retained for Training, delivered by Stephen D. Goose, Head of ICBL Delegation, Standing Committee on the General Status and Operation of the Convention, Geneva, 27 April 2007.

²⁴ States that decided to reduce the number of mines they retained include: Argentina, Algeria, Australia, Bulgaria, Chile, Croatia, Denmark, Ecuador, Guinea-Bissau, Iraq, Italy, Lithuania, Macedonia, Mauritania, Moldova, Peru, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sudan, Thailand, Turkmenistan, Uganda, Ukraine, UK, Venezuela, and Zambia. Eleven of these originally intended to keep 10,000 or more mines.

²⁵ Cape Verde and Equatorial Guinea are thought not to possess any antipersonnel mines for training, but have never submitted their initial Article 7 reports formally declaring this fact. Botswana indicated in its 2001 Article 7 report, the only one it has ever submitted, that it would retain a “small quantity” of antipersonnel mines, without providing details. An official told Landmine Monitor in 2001 that this consisted of seven inert antipersonnel mines.

²⁶ Cambodia has not reported any mines retained for training, but has indicated that antipersonnel mines removed from the ground each year have been used for research and training purposes. In past years, the DRC has reported that information on mines retained for training purposes was “not applicable,” but in 2008 and 2009 it reported instead that the information was not yet available, leaving it unknown as to whether the DRC is considering retaining or has already retained an unspecified number of mines for research and training purposes. Nigeria listed 3,364 “British made [antipersonnel] AP mines” as retained in its most recent Article 7 report, but Nigeria had previously reported destroying all 3,364 of its retained mines in 2005 and declared that it was no longer retaining mines. Senegal for the first time reported in its 2007 Article 7 report that 24 antipersonnel mines, taken from demining operations or discovered among rebel stockpiles, were used for training purposes before their destruction. It has repeated this in its 2008 and 2009 reports, identifying the same mine types each year; it is unclear if this indicates additional mines used for training or refers to the initial instance.

Three States Parties retain more than 10,000 antipersonnel mines: **Turkey, Bangladesh, and Brazil** (ordered by number of mines retained). Together, these three states account for almost 20% of all mines retained under the treaty. A further six States Parties retain between 5,000 and 10,000 mines: **Sweden, Greece, Australia, Algeria, Croatia, and Belarus**. (See table below for details).

States Parties with highest number of retained mines under Article 3

State Party	No. of retained mines	No. of mines previously destroyed in 2008
Turkey	15,125	50
Bangladesh	12,500	0
Brazil	10,986	1,395
Sweden	7,364	167
Greece	7,224	0
Australia	6,785	213
Algeria	6,090	8,940
Croatia	6,038	65
Belarus	6,030	0
Total	78,142	10,830

The majority of States Parties that retain mines, a total of 38, retain between 1,000 and 5,000 mines.²⁷ Another 24 States Parties retain fewer than 1,000 mines.²⁸

In 2008, 29 States Parties reported retaining fewer mines than in 2007, resulting in an overall decrease of 20,449 mines.²⁹ This includes mines consumed during training and research activities, as well as reductions of mines considered excess to needs. **Algeria**, which in 2007 had the second highest number of retained mines of all States Parties, destroyed 8,940 mines, leaving 6,090 remaining. **Guinea-Bissau** destroyed 100 of its 109 retained mines, indicating that no research or training activities were currently underway. **Iraq** decided to retain 297 mines, 937 less than the total previously reported. **Serbia** reported a reduction of 1,976 mines, to a total of 3,589. **Sudan**, which completed its stockpile destruction in March 2008, reported retaining 1,938 mines, which is 3,059 less than last reported. Additionally, **Brazil** and the **Czech Republic** reported consuming a significant number of mines in 2008 in the course of training activities, reducing their totals by 1,395 and 2,156 respectively.

²⁷ Thirty-eight States Parties retain between 1,000 and 5,000 antipersonnel mines: Afghanistan, Angola, Argentina, Belgium, Bhutan, BiH, Bulgaria, Canada, Chile, Cyprus, Czech Republic, Denmark, Djibouti, Ecuador, France, Germany, Indonesia, Japan, Kenya, Mozambique, Namibia, Netherlands, Nicaragua, Peru, Romania, Serbia, Slovakia, Slovenia, South Africa, Spain, Sudan, Tanzania, Thailand, Tunisia, Uganda, Venezuela, Yemen, and Zambia.

²⁸ Twenty-four States Parties retain fewer than 1,000 antipersonnel mines: Benin, Burundi, Colombia, Republic of the Congo, El Salvador, Eritrea, Ethiopia, Guinea-Bissau, Honduras, Iraq, Ireland, Italy, Jordan, Latvia, Luxembourg, Mali, Mauritania, Portugal, Rwanda, Togo, UK, Ukraine, Uruguay, and Zimbabwe.

²⁹ Twenty-nine states reported retaining fewer mines than in 2007: Afghanistan (62), Algeria (8,940), Argentina (112), Australia (213), Belgium (42), Brazil (1,395), Canada (24), Chile (70), Republic of Congo (50), Croatia (65), Czech Republic (2,156), France (8), Germany (7), Guinea-Bissau (100), Iraq (937), Ireland (3), Italy (32), Japan (392), Serbia (1,976), Slovenia (1), Spain (197), Sudan (3,059), Sweden (167), Tanzania (322), Thailand (12), Tunisia (20), Turkey (25), Ukraine (12), and Zimbabwe (50). Of these 29 states, 22 explicitly reported the number of mines consumed since 2007, while seven listed a lower total number of retained mines without any further explanation.

At least 42 States Parties did not report consuming any mines for permitted purposes in 2008.³⁰ In 2007, a total of 38 states did not report consuming any mines; in 2006, 44 states; in 2005, 51 states; in 2004, 36 states; in 2003, 26 states; and in 2002, 29 states did not consume any mines.

Twelve States Parties have not reported consuming any mines for permitted purposes since entry into force for that country: **Angola, Bangladesh, Belarus, Benin, Bhutan, Burundi, Cyprus, Djibouti, Greece, Indonesia, Togo, and Venezuela**. During this reporting period, several states, including **Algeria, Republic of the Congo, Guinea-Bissau, and Serbia** reported a reduction in the number of their retained mines for the first time since the treaty entered into force for them.

For 2008, at least two states reported an increase in retained antipersonnel mines through the discovery of previously unknown stocks, including **Peru** (increase of 47) and **Mozambique** (520). Another two states—**BiH** (655) and the **United Kingdom** (UK) (294)—reported an increase in the number of mines retained without explanation.³¹

In 2008, only 18 States Parties made use of the expanded voluntary Form D in their Article 7 reports to provide details on the intended purposes and actual uses on mines retained: **Afghanistan, Argentina, Belgium, Canada, Chile, Croatia, Czech Republic, Germany, Guinea-Bissau, Indonesia, Japan, Latvia, Mauritania, Portugal, Rwanda, Serbia, Turkey, and the UK**.³² However, several other States Parties provided such information on regular Form D or elsewhere in their Article 7 reports.

Transparency Reporting (Article 7)

The overall compliance rate of States Parties submitting initial transparency measures reports is an impressive 98%. This compares to 97% in 2007, 96% in 2006 and 2005, 91% in 2004, 88% in 2003, and 75% in 2002. Three States Parties have yet to submit long overdue initial reports: **Equatorial Guinea** (due 28 August 1999), **Cape Verde** (due 30 April 2002), and the **Gambia** (due 28 August 2003).

Two States Parties have submitted initial reports since the publication of *Landmine Monitor Report 2008*: **Haiti** and **Palau**. Haiti submitted its initial report in March 2009, over two years late, and Palau submitted its report by its October 2008 deadline. There are no States Parties with pending deadlines for an initial report.

As of the end of August 2009, only 88 States Parties had submitted annual updates for calendar year 2008. A total of 64 states had not submitted updates.³³ This equates to a compliance rate of 58%, a rate that will likely go up somewhat in the coming months.

³⁰ The number cannot be precise because as of the end of August 2009, 15 states that previously declared retained mines had not submitted an Article 7 update for calendar year 2008. The 42 States Parties that did not report consuming retained antipersonnel mines in 2008 are: Angola, Bangladesh, Belarus, Benin, Bhutan, BiH, Bulgaria, Burundi, Colombia, Cyprus, Denmark, Djibouti, Ecuador, El Salvador, Eritrea, Ethiopia, Greece, Honduras, Indonesia, Jordan, Kenya, Latvia, Luxembourg, Mali, Mauritania, Mozambique, Namibia, Netherlands, Nicaragua, Peru, Portugal, Romania, Rwanda, Slovakia, South Africa, Togo, Uganda, UK, Uruguay, Venezuela, Yemen, and Zambia.

³¹ The total number of retained mines reported in Denmark's Article 7 report submitted in 2009 is one higher than last year. However, the actual total is unclear, as the types of mines listed add up to the same number as in its previous report.

³² Additionally, other states, including France, Moldova, Nicaragua, Peru, Romania, Sudan, Tajikistan, and Tunisia, have used the voluntary Form D in past years.

³³ The 64 States Parties not submitting updates were: Angola, Antigua and Barbuda, Barbados, Belize, Benin, Bhutan, Bolivia, Botswana, Brunei, Burkina Faso, Cameroon, Central African Republic, Comoros, Cook Islands, Costa Rica, Djibouti, Dominica, El Salvador, Fiji, Gabon, Ghana, Grenada, Guinea, Guyana, Honduras, Iceland, Jamaica, Kenya, Kiribati, Lesotho, Liberia, Luxembourg, Madagascar, Malawi, Maldives, Mali, Malta, Mauritius, Namibia, Nauru, Netherlands, Niue, Palau, Panama, Papua New Guinea, Paraguay, Philippines, Rwanda, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Samoa, São Tomé e Príncipe, Seychelles, Sierra Leone, Solomon Islands, South Africa, Suriname, Swaziland, Timor-Leste, Togo, Turkmenistan, Uruguay, and Vanuatu.

The compliance rate for annual updates has been dropping steadily in recent years. The final rate of compliance was 62% for calendar year 2007, 64% for 2006, 71% for 2005, 74% for 2004, 79% for 2003, and 70% for 2002.

Several states not party to the Mine Ban Treaty have submitted voluntary Article 7 reports as a demonstration of their commitment to the goals of the Mine Ban Treaty.³⁴ **Poland**, a signatory, has submitted voluntary reports every year since 2003, most recently in April 2009. **Morocco** submitted its third voluntary report in April 2009, and **Azerbaijan** submitted its second voluntary report in July 2009. **Mongolia** (in 2007) and **Sri Lanka** (in 2005) have also submitted voluntary reports. In these reports, only Poland and Mongolia have included information on their stockpiles of antipersonnel mines, while Morocco, Azerbaijan, and Sri Lanka have not done so.³⁵ Other countries have stated their intention to submit voluntary reports, including **Armenia**, **China**, and, in May 2009, **Lao PDR**.

National Implementation Measures (Article 9)

Article 9 of the 1997 Mine Ban Treaty states, “Each State Party shall take all appropriate legal, administrative and other measures, including the imposition of penal sanctions, to prevent and suppress any activity prohibited” by the treaty. The ICBL believes that all States Parties should have legislation that includes penal sanctions for any potential future violations of the treaty, and provides for full implementation of all aspects of the treaty.

Only 59 of the 156 States Parties have passed new domestic laws to implement the treaty and fulfill the obligations of Article 9.³⁶ This is an increase of two States Parties in this reporting period: **Burundi** and **Togo**. Additionally, **Ireland**, which originally enacted domestic legislation to enforce the treaty in 1996, passed updated legislation in 2008 (the Cluster Munitions and Anti-Personnel Landmines Act, 2008).

A total of 26 States Parties report that steps to enact legislation are underway. **Sudan** joined this group this year. Some states have been reporting legislation is underway for a number of years without any specific updates on progress.³⁷

³⁴ While still signatories, a number of current States Parties submitted voluntary reports, including Cameroon in 2001, Gambia in 2002, and Lithuania in 2002. Before becoming a State Party, Latvia submitted voluntary reports in 2003, 2004, and 2005.

³⁵ In May 2009, Morocco told Landmine Monitor that this was because Morocco has no stocks. Permanent Mission of Morocco to the UN in Geneva, “Response to Questions from the Canadian NGO Mines Action Canada,” 18 May 2009. In December 2008, Sri Lanka told the ICBL that it would endeavor in 2009 to submit an update to its report including information on stockpiles, but it has not done so. Interview with Sumede Ekanayake, Counsellor, Permanent Mission of Sri Lanka to the UN in Geneva, Geneva, 28 November 2008.

³⁶ A total of 59 States Parties have enacted implementation legislation: Albania, Australia, Austria, Belgium, Belize, BiH, Brazil, Burkina Faso, Burundi, Cambodia, Canada, Chad, Colombia, Cook Islands, Costa Rica, Croatia, Czech Republic, Djibouti, El Salvador, France, Germany, Guatemala, Honduras, Hungary, Iceland, Ireland, Italy, Japan, Jordan, Latvia, Liechtenstein, Lithuania, Luxembourg, Malaysia, Mali, Malta, Mauritania, Mauritius, Monaco, New Zealand, Nicaragua, Niger, Norway, Peru, Saint Vincent and the Grenadines, Senegal, Serbia, Seychelles, South Africa, Spain, Sweden, Switzerland, Tanzania, Togo, Trinidad and Tobago, UK, Yemen, Zambia, and Zimbabwe.

³⁷ Legislation has been reported to be in progress for more than two years in the following states: Bangladesh, Benin, Bolivia, Republic of the Congo, DRC, Jamaica, Kenya, Madagascar, Malawi, Mozambique, Namibia, Nigeria, Philippines, Rwanda, Suriname, Swaziland, Thailand, and Uganda. Among these, only the DRC, Mozambique, Philippines, and Thailand reported specific progress in 2008, indicating that they hoped to have legislation enacted soon. Other states reported to be in progress more recently include: Brunei, Ecuador, Haiti, Kuwait, Palau, Sudan, and Vanuatu. Chile, while stating in May 2009 that it believes its existing laws to be sufficient, has also reported that it is in the process of enacting additional legislation.

A total of 40 States Parties have indicated that they do not believe any new law is required to implement the treaty.³⁸ **Ethiopia and Ukraine** joined this category in the past year.³⁹

Landmine Monitor is unaware of any progress in 31 States Parties to enact appropriate domestic measures to implement the Mine Ban Treaty.⁴⁰

Special Issues of Concern

Since the inception of the Mine Ban Treaty, the ICBL has identified special issues of concern regarding interpretation and implementation of aspects of Articles 1, 2, and 3. These have included: what acts are permitted or not under the treaty's ban on assistance with prohibited acts, especially in the context of joint military operations with states not party; foreign stockpiling and transit of antipersonnel mines; the applicability of the treaty to antivehicle mines with sensitive fuzes or sensitive antihandling devices; and the acceptable number of mines retained for training purposes (see Mines Retained for Research and Training section above).

Ever since the treaty entered into force in 1999, States Parties have regularly discussed these issues at the intersessional Standing Committee meetings and Meetings of States Parties, and many have tried to reach common understandings, as urged by the ICBL and the ICRC.⁴¹ States Parties agreed in the Nairobi Action Plan in 2004, and in the subsequent Progress Reports from the annual Meetings of States Parties, that there should be ongoing discussion and exchange of views on these matters.⁴²

However, too few states have expressed their views in recent years, especially with respect to Articles 1 and 2. For detailed information on States Parties policies and practices on these matters of interpretation and implementation, which the ICBL considers essential to the integrity of the Mine Ban Treaty, see past editions of Landmine Monitor.

Article 1: Joint military operations and the prohibition on assistance

Article 1 of the 1997 Mine Ban Treaty obligates State Parties to "never under any circumstances ...assist, encourage or induce, in any way, anyone to engage in any activity prohibited to a State Party under this Convention."

Initially, there was a lack of clarity, however, regarding what types of acts are permitted or prohibited within the context of the prohibition on assistance, particularly with respect to joint military operations with states not party to the treaty. States Parties recognized the need to

³⁸ A total of 40 States Parties have deemed existing law sufficient or do not consider new legislation necessary: Algeria, Andorra, Antigua and Barbuda, Argentina, Belarus, Bhutan, Bulgaria, Central African Republic, Cyprus, Denmark, Dominican Republic, Estonia, Ethiopia, Greece, Guinea-Bissau, Holy See, Indonesia, Kiribati, Lesotho, FYR Macedonia, Mexico, Moldova, Montenegro, Netherlands, Panama, Papua New Guinea, Paraguay, Portugal, Qatar, Romania, Samoa, San Marino, Slovakia, Slovenia, Solomon Islands, Tajikistan, Tunisia, Turkey, Ukraine, and Venezuela.

³⁹ Ethiopia indicated this in its 2009 Article 7 report. Ukraine is listed in this category in the draft Review of the Operation and Status of the Convention for the Second Review Conference, Annex X, and in the ICRC's Article 9 table, citing information provided by its mission in October 2008.

⁴⁰ The 31 states without progress toward national implementation measures include: Angola, Afghanistan, Bahamas, Barbados, Botswana, Cameroon, Cape Verde, Comoros, Côte d'Ivoire, Dominica, Equatorial Guinea, Eritrea, Fiji, Gambia, Gabon, Ghana, Grenada, Guinea, Guyana, Iraq, Liberia, Maldives, Nauru, Niue, Saint Kitts and Nevis, Saint Lucia, São Tomé e Príncipe, Sierra Leone, Timor-Leste, Turkmenistan, and Uruguay. Several of these states have reported legislation in progress in the past, but they have provided no recent updates, leaving it unclear as to whether work is still underway.

⁴¹ The Final Report and President's Action Program agreed upon at the Fifth Meeting of States Parties in Bangkok in September 2003 states that "the meeting called upon States Parties to continue to share information and views, particularly with respect to articles 1, 2, and 3, with a view to developing understandings on various matters by the First Review Conference." The co-chairs of the Standing Committee on the General Status and Operation of the Convention (Mexico and the Netherlands) at the February and June 2004 intersessional meetings undertook significant consultations on reaching understandings or conclusions on these issues, but a number of States Parties remained opposed, and no formal understanding was reached at the First Review Conference.

⁴² The Nairobi Action Plan 2005–2009 indicates that the States Parties will "exchange views and share their experiences in a cooperative and informal manner on the practical implementation of the various provisions of the Convention, including Articles 1, 2 and 3, to continue to promote effective and consistent application of these provisions."

address ambiguities about the prohibition and over the years have shared views on policy and practice. A general, albeit informal, understanding of how Article 1 applies to joint military operations and the meaning of “assist” has emerged during the years of discussion.

A total of 44 States Parties have declared that they will not participate in planning and implementation of activities related to the use of antipersonnel mines in joint operations with a state not party to the Mine Ban Treaty who may use antipersonnel mines.⁴³ Among those who have made statements consistent with this since the First Review Conference in 2004 are **Albania, Chad, Estonia, FYR Macedonia, Moldova, Slovenia, and Yemen**. More specifically, a prevailing view has emerged that States Parties may not:

- participate in the planning for use of antipersonnel mines;
- agree to rules of engagement that permit use of the weapon;
- accept orders to use, request others to use, or train others to use the weapon;
- knowingly derive military benefit from the use of the weapon by others; or
- provide security, storage, or transportation for antipersonnel mines.

In terms of state practice, no State Party is known to have engaged in any of these activities since the First Review Conference but, in the period from 1999 to 2004, Landmine Monitor expressed concerns about a number of States Parties assisting with the use of antipersonnel mines by others, including **Rwanda, Uganda, and Zimbabwe** with various forces in the **DRC**; **Sudan** with militia in the south of the country; and **Namibia** with Angolan troops before **Angola** became a State Party.

Eight States Parties have declared that only “active” or “direct” participation in joint operations in which antipersonnel mines are used is prohibited: **Australia, Canada, Czech Republic, New Zealand, Sweden, the UK, Zambia, and Zimbabwe**. However, each country’s understanding of what constitutes “active” or “direct” assistance varies.⁴⁴ Over the years, the ICBL has raised concerns with these states about their national declarations and/or clauses in their national implementation legislation with respect to joint operations and “assist.”⁴⁵

Statements since May 2008

In November 2008, Algerian officials told Landmine Monitor that **Algeria** does not participate in joint military operations, but should it ever do so with a state not party, it will under no circumstances use antipersonnel mines.

In July 2008, **BiH** told Landmine Monitor that during joint military operations with its allies, it cannot be engaged in the process of planning and preparing military action where antipersonnel mines will be used.

⁴³ Forty-four States Parties have declared that they will not participate in planning and implementation of activities related to the use of antipersonnel mines in joint operations with a state not party to the Mine Ban Treaty who may use antipersonnel mines: Albania, Australia, Belgium, BiH, Brazil, Bulgaria, Canada, Chad, Croatia, Cyprus, Czech Republic, Denmark, Estonia, France, Germany, Hungary, Italy, Japan, Kenya, Luxembourg, FYR Macedonia, Malaysia, Mexico, Moldova, Namibia, Netherlands, New Zealand, Norway, Portugal, Qatar, Senegal, Slovenia, South Africa, Spain, Sweden, Switzerland, Tajikistan, Tanzania, Turkey, UK, Uruguay, Yemen, Zambia, and Zimbabwe.

⁴⁴ In May 2009, Landmine Monitor produced an eight-page fact sheet, “The Prohibition on Assistance in the Mine Ban Treaty (Article 1,)” that contains a summary of state practice and the views of the individual States Parties that have addressed the issue. See www.lm.icbl.org.

⁴⁵ A highly regarded legal commentary on the Mine Ban Treaty examined Australia’s National Declaration and a statement by Zimbabwe on the prohibition on “assist,” and concluded that “it is not clear how these interpretations can be legally sustained. Reservations are prohibited by Article 19” of the treaty. The commentary draws particular attention to Australia’s position that the treaty would allow “indirect support such as the provision of security for the personnel of a State not party to the Convention engaging in such [prohibited] activities,” including presumably the laying of antipersonnel mines by the state not party. Stuart Maslen, *Commentaries on Arms Control Treaties, Volume 1, The Convention on the Prohibition of the Use, Stockpiling, Production, and Transfer of Anti-Personnel Mines and on their Destruction* (Oxford: Oxford University Press: 2004), pp. 92–95.

Foreign stockpiling and transit of antipersonnel mines

With a few exceptions, States Parties have agreed that the Mine Ban Treaty prohibits “transit” and foreign stockpiling of antipersonnel mines. With respect to transit, the main issue is whether a state not party’s aircraft, ships, or vehicles carrying antipersonnel mines can pass through (and presumably depart from, refuel in, restock in) a State Party, including on their way to a conflict in which those mines would be used. Nearly all states that have addressed the issue, as well as the ICBL and ICRC, believe that if a State Party permits transit of antipersonnel mines, it is violating the Article 1 ban on assistance to an act prohibited by the treaty, and possibly violating the Article 1 prohibition on transfer.

A total of 32 States Parties have declared they prohibit transfer through, foreign stockpiling on, or authorizing foreign antipersonnel mines on national territory.⁴⁶ **Canada, Germany, Japan, and Norway** believe that the Mine Ban Treaty does not prohibit the transit of antipersonnel mines, at least in certain circumstances. Canada has stated that it nevertheless discourages the use of Canadian territory, equipment, or personnel for the purpose of transit of antipersonnel mines. Germany and Japan view the issue in terms of the US mines stored in their countries, and maintain that because they do not exercise jurisdiction or control over the mines, they cannot prohibit transit.

With respect to foreign stockpiling of antipersonnel mines, three States Parties required the US to remove US stocks on their soil: **Italy** (announced in May 2000), **Norway** (November 2002), and **Spain** (November 1999). **Tajikistan** has reported it is negotiating with Russia regarding removal of its 18,200 stockpiled mines. Tajikistan is the only State Party to declare in its Article 7 report the number of antipersonnel mines stockpiled on its territory by a state not party. However, **Germany, Japan, Qatar,** and the **UK** have stated that US antipersonnel mine stocks in their countries are not under their national jurisdiction or control, and thus not covered by the Mine Ban Treaty.

Statements since May 2008

In March 2009, an official of **Indonesia** wrote to Landmine Monitor that “transit is also an activity that is prohibited under the Convention.”⁴⁷

At the June 2008 intersessional Standing Committee meetings, **Zambia** stated its understanding that transit of antipersonnel mines is prohibited. In July 2007 (but not previously reported by Landmine Monitor), **Nigeria** wrote that its draft implementation legislation “prohibits transfer of anti-personnel mines through any part of the Nigerian territory.”⁴⁸

Article 2: Mines with sensitive fuzes and sensitive antihandling devices

Since the conclusion of the negotiations of the Mine Ban Treaty, many States Parties, the ICBL, and the ICRC have emphasized that, according to the treaty’s definitions, any mine—even if it is labeled as an antivehicle mine—equipped with a fuze or antihandling device that causes the mine to explode from an unintentional or innocent act of a person is considered to be an antipersonnel mine and therefore prohibited.

However, for a small number of States Parties this remains a contentious issue. The way that States Parties agree—or disagree—on what mines are banned may have a significant impact on how the Mine Ban Treaty is implemented and universalized.

⁴⁶ Thirty-two States Parties prohibit transfer or foreign stockpiling: Albania, Austria, BiH, Brazil, Cameroon, Croatia, Cyprus, Czech Republic, Denmark, Estonia, France, Guinea, Hungary, Italy, FYR Macedonia, Malaysia, Mexico, Moldova, Namibia, New Zealand, Portugal, Samoa, Senegal, Slovakia, South Africa, Spain, Sweden, Switzerland, Turkey, UK, Yemen, and Zambia.

⁴⁷ Email from Andy Rachmianto, Deputy Director, Directorate for International Security and Disarmament, Indonesian Department of Foreign Affairs, 23 March 2009.

⁴⁸ Letter from Dr. Martin I. Uhoimbi, Ambassador of Nigeria to the UN in Geneva, 10 July 2007.

At least 28 States Parties have expressed the view that any mine, despite its label or design intent, capable of being detonated by the unintentional act of a person is an antipersonnel mine and is prohibited.⁴⁹ Among those that have made statements consistent with this view since the First Review Conference are **Argentina, BiH, Croatia, Estonia, Germany, Guatemala, Kenya, FYR Macedonia, Moldova, Slovenia, and Yemen.**

Five States Parties (**Czech Republic, Denmark, France, Japan, and the UK**) have said that the Mine Ban Treaty does not apply to antivehicle mines at all, regardless of their employment with sensitive fuzes or antihandling devices.

There appears to be agreement, with some exceptions, that a mine that relies on a tripwire, breakwire, or a tilt rod as its sole firing mechanism should be considered an antipersonnel mine. However, the **Czech Republic** has stated it does not consider the use of tripwires with an antivehicle mine to be a violation of the Mine Ban Treaty.⁵⁰ **Sweden** has antivehicle mines with tilt rods, but has not formally expressed a view on their legality under the Mine Ban Treaty.

Several States Parties have reported that they have removed from service and destroyed certain antivehicle mines and/or ordnance items that, when used with mines, can cause them to function as antipersonnel mines. **Belgium** has banned pressure and tension release firing devices (igniters) used as booby-traps. **Bulgaria** destroyed its stock of antivehicle mines with antihandling devices. **Canada, France, Hungary, Mali, and the UK** have removed tilt rod fuzes from their inventories. The **Netherlands** and the **UK** retired from service mines with breakwire fuzes. **France** has destroyed other unspecified pressure and tension release fuzes. **Germany** and **Slovakia** have retired and destroyed antilift mechanisms that could be attached to mines. **Slovakia** has prohibited the use of the Ro-3 fuze as an antihandling device.

Statements since May 2008

At the intersessional Standing Committee meetings in June 2008, five countries spoke on Article 2: **Austria, Canada, the Netherlands, Norway, and Zambia.**

Austria expressed its view that if a mine explodes from the presence, proximity or contact of a person, it is banned, regardless of any other purpose or design of the mine, and that States Parties should remove any such mines from their inventories and destroy them. It stated its willingness to have States Parties elaborate a formal understanding on the matter.

Canada stated that any mine that can be victim-activated is an antipersonnel mine and prohibited.

The Netherlands agreed that any mine that functions as an antipersonnel mine is banned, including antivehicle mines with sensitive fuzes and antihandling devices that can explode from the unintentional act of a person.

Norway also stressed that any mine that functions as an antipersonnel mine, that can explode from human contact, is banned. It stated, "It does not matter whether the main purpose of usage for that mine is directed toward vehicles. It does not matter whether it is called something else than anti-personnel mine." It called for the issue to be dealt with directly within the framework of the Mine Ban Treaty.

Zambia stated that it joins others in calling for a common understanding that any mine that can be set off unintentionally by a person, thereby functioning as an antipersonnel mine, is banned, including antivehicle mines with sensitive fuzes or sensitive antihandling devices.

⁴⁹ The 28 States Parties expressing the view that any mine that functions as an antipersonnel mine is prohibited are: Argentina, Australia, Austria, Bolivia, BiH, Brazil, Canada, Colombia, Croatia, Estonia, Germany, Guatemala, Kenya, Ireland, FYR Macedonia, Mexico, Moldova, Mozambique, Netherlands, New Zealand, Norway, Peru, Slovakia, Slovenia, South Africa, Switzerland, Yemen, and Zambia. In addition, Albania has not taken a legal position, but has stated that it is destroying its antivehicle mines with sensitive fuzes.

⁵⁰ The Czech Republic has also acknowledged possessing tilt rod fuzes, but has stated that the mines that are capable of using them are considered to be obsolete and will be retired within 15 years. Slovenia, while stating that antivehicle mines with fuzes that cause them to function as an antipersonnel mines are prohibited, has also acknowledged possessing TMRP-6 mines that are equipped with both pressure and tilt rod fuzes; it is considering how to deal with them.

In July 2008, **BiH** told Landmine Monitor that it will consider ways to ensure that mines such as TMRP-6 antivehicle mines with tilt rods cannot be victim-activated and function as antipersonnel mines.

Claymore and OZM-72 command-detonated mines

Certain types of mines are not prohibited by the Mine Ban Treaty in all instances because they are designed to be capable of being both command-detonated by electric means (which is permissible under the treaty) and victim-activated by using mechanical pull/tension release tripwire fuzes (which is prohibited by the treaty). In the past, options for both means of utilization have often been packaged with the mine.

In order to be compliant and fully transparent, States Parties should take steps, and report on them in Article 7 reports, to ensure that the means for victim-activation is permanently removed and that their armed forces are instructed as to their legal obligations.

The most common mines in this category are Claymore-type directional fragmentation munitions. The M18A1 (produced originally by the US but also widely copied or license-produced by other countries), MON series (produced in the former USSR and other Warsaw Pact countries), and the MRUD (produced in FR Yugoslavia) are the most well known and widely held examples of Claymore-type directional fragmentation mines.

Several States Parties have extended this command and target activation distinction to a type of bounding fragmentation mine, the OZM-72, which also possesses these inherent dual-use capabilities.

A total of 31 States Parties have declared that they retain stocks of Claymore-type and/or OZM-72 mines.⁵¹

Some States Parties have chosen to physically modify the mines to accept only electric detonation and some have physically removed and destroyed the tripwire assembly and appropriate blasting cap. **Belarus, Denmark, Lithuania, Moldova, New Zealand, and Sweden** have reported on the measures taken to modify these mines in their Article 7 reports. In 2006, Belarus destroyed the victim-activated components of its 5,536 MON mines and 200,826 OZM-72 mines.

Thirty States Parties have declared that they do not possess or have destroyed Claymore-type and/or OZM-72 mines.⁵²

The vast majority of States Parties have not declared whether their forces possess these types of mines. While the majority of these States Parties have declared that they do not possess any antipersonnel mine stockpiles, in some cases it cannot be presumed that this includes dual-use command-detonated mines.

Treaty-Related Meetings

Ninth Meeting of States Parties

States Parties, observer states, and other participants met for the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva, Switzerland from 24–28 November 2008 under the Presidency of Ambassador Jürg Streuli of Switzerland. The focus of the meeting was on the first formal decision-making regarding requests for extensions of mine clearance deadlines. Requests were granted to 15 States Parties, with the UK's the most contentious. The ICBL expressed its appreciation for the fact that the extension request process was taken seriously by all States Parties, but felt that the final decisions did not always apply the same rigorous standards to all, citing the **UK** and **Venezuela**, neither of which had even begun demining operations.

⁵¹ The 31 States Parties that acknowledge possessing Claymore-type or OZM-72 mines include: Australia, Austria, Belarus, BiH, Brunei, Canada, Colombia, Croatia, Denmark, Ecuador, Estonia, Honduras, Hungary, Latvia, Lithuania, Malaysia, Montenegro, Netherlands, New Zealand, Nicaragua, Norway, Papua New Guinea, Serbia, Slovenia, South Africa, Sweden, Switzerland, Thailand, Turkey, UK, and Zimbabwe.

⁵² The 30 States Parties that declare not possessing or having destroyed Claymore-type or OZM-72 mines are: Albania, Bangladesh, Belgium, Bolivia, Bulgaria, Cambodia, Chad, Cyprus, Czech Republic, El Salvador, France, Germany, Italy, Jordan, Kenya, Luxembourg, FYR Macedonia, Moldova, Mozambique, Peru, Philippines, Portugal, Qatar, Romania, Slovakia, Tajikistan, Tanzania, Turkmenistan, Uruguay, and Yemen.

While stating its grave concern that **Belarus, Greece, and Turkey** remained in serious violation of the treaty after missing their March 2008 stockpile destruction deadlines, the ICBL also expressed appreciation for the serious concerns stated by numerous States Parties about the need for those nations to urgently comply with their obligations. With the aim of preventing future instances of non-compliance, States Parties warmly welcomed a proposal submitted by **Lithuania and Serbia** on ensuring the full implementation of Article 4 on stockpile destruction.⁵³

Fifteen mine survivors from the ICBL delegation deplored that victim assistance remains seen as a lower priority, and urged concrete actions, citing the need for socio-economic inclusion of survivors in addition to medical assistance.

The ICBL regretted that for the first time since the Mine Ban Treaty entered into force in 1999, no new state had joined the treaty over a 12-month period, and called on all States Parties to increase their universalization efforts. On the positive side, 22 countries not yet party to the treaty participated as observers, demonstrating the continuing spread of the international norm against antipersonnel mines.⁵⁴

The meeting produced a strong Geneva Progress Report 2007–2008, which, in addition to reviewing progress in the past year, highlighted priority areas of work for the coming year. This built on Progress Reports from the previous three years, and the Nairobi Action Plan 2005–2009 adopted at the First Review Conference (Nairobi Summit on a Mine-Free World) in November–December 2004.

New co-chairs and co-rapporteurs of the Standing Committees were selected for the period until the Second Review Conference in Cartagena, Colombia from 30 November to 4 December 2009, with Ambassador Susan Eckey of Norway as President-Designate.

Standing Committee co-chairs and co-rapporteurs in 2008–2009

Standing Committee	Co-chairs	Co-rapporteurs
General Status and Operation of the Convention	Chile and Japan	Ecuador and Slovenia
Mine Clearance, Mine Risk Education and Mine Action Technologies	Argentina and Australia	Greece and Nigeria
Stockpile Destruction	Italy and Zambia	Bulgaria and Indonesia
Victim Assistance and Socio-Economic Reintegration	Belgium and Thailand	Peru and Turkey

Participation in the Ninth Meeting of States Parties was high—nearly 800 people—with a total of 125 country delegations attending, including delegations from 103 States Parties. The range of participants—diplomats, campaigners, UN personnel, and, most notably, significant numbers of mine action practitioners and landmine survivors—again demonstrated that the Mine Ban Treaty has become the framework for addressing all aspects of the antipersonnel mine problem. More than 150 members of the ICBL attended.

Implementation and intersessional work program

A notable feature of the Mine Ban Treaty is the attention which States Parties have paid to ensuring implementation of the treaty’s provisions. Structures created to monitor progress toward implementation and to allow discussion among States Parties include the annual

⁵³ The proposal calls for States Parties to take actions if a state does not have a plan for destruction within one year of entry into force, or has not started destruction within two years. It calls for pro-active consultations by Standing Committee co-chairs, and for stockpiling states to report on progress at every annual Meeting of States Parties and intersessional meeting, as well as in Article 7 reports. Non-compliant states are urged to provide a formal communication about reasons for failure to comply, and a plan to complete destruction with an expected completion date.

⁵⁴ Some of the more notable “holdouts” attended, including China, Egypt, India, Lao PDR, Lebanon, Pakistan, and Vietnam. Others included Armenia, Azerbaijan, Finland, Georgia, Libya, Marshall Islands, Micronesia, Mongolia, Morocco, Oman, Poland, Saudi Arabia, Singapore, Sri Lanka, and UAE.

Meetings of States Parties, the intersessional work program with its four Standing Committees, a coordinating committee, and contact groups on universalization of the treaty, Article 7, resource utilization, and linking mine action and development.

The intersessional Standing Committees met for one week in May 2009. Details on Standing Committee discussions and interventions can be found below in various thematic sections. A separate formal session was held devoted to preparations for the Second Review Conference.

The Oslo Process and the Convention on Cluster Munitions⁵⁵

With the failure of the CCW Third Review Conference in November 2006 to adequately address cluster munitions (see below), Norway announced it would start an independent process outside the CCW to negotiate a treaty banning cluster munitions that cause unacceptable humanitarian harm. It subsequently held the first meeting of the “Oslo Process” in February 2007, where 46 states committed themselves to conclude a new international treaty banning cluster munitions “that cause unacceptable harm to civilians” by 2008. A “Core Group” of nations took responsibility for the initiative, including Austria, Holy See, Ireland, Mexico, New Zealand, Norway, and Peru.

At the first follow-up meeting in Lima, Peru, in May 2007, a draft treaty text was distributed and discussed. Additional sessions to develop the treaty took place in Vienna, Austria, in December 2007 and Wellington, New Zealand, in February 2008. A total of about 140 countries participated in at least one of these Oslo Process preparatory meetings. Regional meetings to build support for the treaty were also held in Costa Rica in September 2007, Serbia in October 2007 (for affected states), Zambia in April 2008, and Thailand in April 2008 (sponsored by the ICRC).

Formal negotiations were held in Dublin, Ireland from 19–30 May 2008. At the conclusion, all 107 of the participating states adopted the new Convention on Cluster Munitions which comprehensively bans the use, production, stockpiling, and transfer of cluster munitions. An additional 20 states attended the negotiations as observers.

The Cluster Munition Coalition (CMC) and the ICBL praised the new treaty as one that will save thousands of lives for decades to come. Like the Mine Ban Treaty, it takes an integrated approach to the cluster munition problem, and requires clearance of contaminated areas as well as assistance to survivors and affected communities. The victim assistance provisions are especially laudable and much stronger than those included in the Mine Ban Treaty. Efforts to weaken the treaty with exceptions for certain cluster munitions, and to have a transition period allowing use of banned weapons for a number of years, were defeated. The most highly criticized aspect of the new convention is a provision that could be seen by some as a loophole allowing States Parties to assist in some way with the use of cluster munitions by non-States Parties in joint military operations.

In August 2008, Georgia and Russia both used cluster munitions in their conflict over South Ossetia, resulting in 70 civilian casualties and creating socio-economic harm. Around the world, CMC protests and media editorials condemned this new use of cluster munition so soon after the convention’s adoption.

However, this period also saw intensive activities to ensure that as many states signed the convention in Oslo as possible. Regional conferences held in Sofia, Bulgaria (18–19 September), Kampala, Uganda (29–30 September), Xieng Khouang, Lao PDR (20–22 October), Quito, Ecuador (6–7 November), and Beirut, Lebanon (11–12 November) helped secure commitments to sign and also provided useful venues to start considering implementation.

From 3–4 December 2008—two years after the Oslo Process began—Norway welcomed states back to Oslo for the Convention on Cluster Munitions Signing Conference. Ministers and senior officials from 94 governments signed the convention at Oslo City Hall, applauded

⁵⁵ For a detailed study, including entries on 150 countries, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009.

by a CMC delegation comprised of 250 campaigners from 75 countries. Another 28 countries attended but did not sign.

The number of signatories had grown to 98 as of early September 2009, and 17 states had ratified. The convention will enter into force six months after the 30th ratification.

The first significant gathering of signatories was held in Berlin from 25–26 June 2009, with a focus on stockpile destruction. Regional meetings to promote the convention were scheduled in Chile from 14–15 September and in Indonesia from 16–17 November 2009. The First Meeting of States Parties is being planned for Lao PDR in late 2010.

Convention on Conventional Weapons

Amended Protocol II

CCW Amended Protocol II regulates the production, transfer and use of landmines, booby-traps and other explosive devices. The inadequacy of the 1996 protocol gave impetus to the Ottawa Process that resulted in the Mine Ban Treaty. A total of 93 states were party to Amended Protocol II as of September 2009. Two states, **Georgia** (8 June 2009) and **Jamaica** (25 September 2008), joined since the publication of *Landmine Monitor Report 2008*. Just 11 of the 93 have not joined the Mine Ban Treaty: **China, Finland, Georgia, India, Israel, Morocco, Pakistan, Russia, South Korea, Sri Lanka**, and the US.⁵⁶ Thus, for antipersonnel mines, the protocol is only relevant for those 11 countries as the remainder are held to the higher standards of the Mine Ban Treaty.

The annual meeting of States Parties to Amended Protocol II took place in November 2008, with an informal meeting of experts in April 2009.

The nine-year deadline for states that chose to defer compliance with the requirements on detectability of antipersonnel mines and the requirements for self-destruction and self-deactivation for remotely-delivered antipersonnel mines, as provided in the Technical Annex, was 3 December 2007. **China, Latvia, Pakistan, and Russia** deferred on detectability, while **Belarus, China, Pakistan, Russia, and Ukraine** deferred on self-destruction and self-deactivation.⁵⁷

In its September 2007 Amended Protocol II Article 13 report, China stated that it had met its December deadline to comply with the protocol's technical specifications. In November 2007, China stated that it had made technical modification to or destroyed stockpiled antipersonnel mines which failed to meet the requirements of the protocol. It has provided few additional details.

Pakistan stated in November 2007 that it had made all the necessary technical changes to be compliant with the protocol, but it provided no details.

A Russian official said in November 2007, "By the end of this year a set of measures to implement requirements of the Protocol...will be nearing its completion. In particular, a national system of technical requirements to land mines, including anti-personnel ones, will be finalized and adopted for practical application, a planned disposal of obsolete types of mines is being carried out..."⁵⁸ Russia has not subsequently announced completion of the work, and over the years has provided few details about how it is complying with the technical requirements of the protocol.

⁵⁶ Mine Ban Treaty signatory Poland is party to CCW Amended Protocol II. Though it has not yet ratified the Mine Ban Treaty, as a signatory, it cannot do anything contrary to the object and purpose of the Mine Ban Treaty, so is already bound by a higher standard than Amended Protocol II.

⁵⁷ Remotely-delivered antipersonnel mine systems are stockpiled by Amended Protocol II States Parties Belarus, China, Greece, Israel, Pakistan, Russia, South Korea, Turkey, Ukraine, and US. The Mine Ban Treaty required Belarus, Greece and Turkey to destroy their remotely-delivered antipersonnel mines by 1 March 2008. Mine Ban Treaty States Parties Bulgaria, Italy, Japan, the Netherlands, Turkmenistan, and UK have already destroyed their stockpiles of remotely-delivered antipersonnel mines.

⁵⁸ Statement by the Delegation of the Russian Federation, Ninth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2007.

Latvia's deferral is presumably irrelevant since it already destroyed its stockpile as a State Party to the Mine Ban Treaty, although it has retained some mines for training purposes. Belarus was obligated by the Mine Ban Treaty to complete the destruction of its stocks of PFM remotely-delivered antipersonnel mines by 1 March 2008, but has not yet complied (See Antipersonnel Mine Stockpiles and Their Destruction section above). Ukraine is obligated by the Mine Ban Treaty to complete the destruction of its stocks of PFM remotely-delivered antipersonnel mines by 1 June 2010.

Protocol V on Explosive Remnants of War

Protocol V on Explosive Remnants of War is intended to address the post-conflict dangers posed by unexploded ordnance and abandoned ordnance. It was adopted in November 2003 and entered into force on 12 November 2006. As of August 2009, 60 states had ratified the protocol. Fourteen states ratified Protocol V since the publication of *Landmine Monitor Report 2008: Belarus, Canada, Chile, Costa Rica, Ecuador, Georgia, Jamaica, Mali, Pakistan, Paraguay, Peru, Senegal*, the UAE, and the US. The first annual meeting of States Parties was held in Geneva in November 2007 and the second in November 2008, with informal meetings of experts in July 2008 and April 2009.

Cluster Munitions

At the Third CCW Review Conference held in Geneva from 7–17 November 2006, States Parties rejected a proposal to begin negotiations within the CCW on a “legally-binding instrument that addresses the humanitarian concerns posed by cluster munitions” and instead agreed to a weak mandate to continue discussions on ERW, with a focus on cluster munitions, in 2007.

CCW's Group of Governmental Experts met for one week in June 2007 with the sole substantive topic being cluster munitions. However, the outcome was again weak, with a statement that the Group “without prejudice to the outcome, recommends to the [November 2007 Meeting of States Parties] to decide how best to address the humanitarian impact of cluster munitions as a matter of urgency, including the possibility of a new instrument. Striking the right balance between military and humanitarian considerations should be part of the decision.”

During the week-long November 2007 meeting, a proposal from the European Union to negotiate in 2008 a legally-binding instrument that prohibits cluster munitions that cause unacceptable harm to civilians was rejected. States considered several ever-weaker proposals to begin negotiations on cluster munitions in 2008, and settled for an agreement to “negotiate a proposal to address urgently the humanitarian impact of cluster munitions, while striking a balance between military and humanitarian considerations.” The mandate did not specify that negotiations should lead to a new legally binding protocol, or include any kind of prohibition, and had no timeline.

Meetings were held in accordance with the mandate from 14–18 January, 7–11 April, 7–25 July, and 1–5 September 2008. By the end of the September session, the chairperson had developed a draft protocol text, but there were still wildly divergent views on the need for a protocol and what it should contain. States Parties were unable to reach an agreement at the annual meeting of States Parties in November 2008, but decided to extend the mandate and hold a negotiating session from 16–20 February, and 14–17 April 2009.

However, States Parties remained far apart on key issues, even after an additional informal session held on 17–21 August 2009. Following that session, the chairperson produced a new draft protocol, presented in his personal capacity, for possible consideration at the annual meeting of States Parties. Most observers felt there would be little chance to conclude a new protocol at the annual meeting from 12–13 November 2009, and the main issue would be whether to extend the work again into 2010.

MINE ACTION

1999–2009 Overview

Since the entry into force of the Mine Ban Treaty in 1999, at least 1,100km² of mined areas and a further 2,100km² of battle areas have been cleared in more than 90 countries and other areas.¹ Operations have resulted in the destruction of more than 2.2 million emplaced antipersonnel mines, 250,000 antivehicle mines, and 17 million explosive remnants of war (ERW).

In 2008 alone, mine action programs cleared almost 160km² of mined areas, the highest total ever recorded by Landmine Monitor. In May 2009, **Tunisia** formally declared that it had completed its clearance obligations under the treaty, the eleventh State Party to do so. The 10 others are Bulgaria, Costa Rica, El Salvador, France, Guatemala, Honduras, FYR Macedonia, Malawi, Suriname, and Swaziland.²

Key Mine Action Terminology

A **mined area** contains antipersonnel or antivehicle mines or a mix of the two; such areas often also include items of unexploded ordnance (UXO).

A **battle area** is an area of combat affected by ERW but which does not contain mines. ERW includes both UXO and abandoned explosive ordnance.

Battle area clearance may involve only a visual inspection of a suspected hazardous area by professional clearance personnel, but is more often an instrument-assisted search of ground, i.e. using UXO detectors.

Clearance of mined areas refers to physical coverage of an area to a specified depth using manual deminers, mine detection dogs, and/or machines to detect and destroy (or remove for later destruction) all explosive devices found.

Land release means release of contaminated land through survey or clearance.

Survey in mine action means a formal process to identify areas containing mines or ERW.

Suspected hazardous area means an area suspected—but not confirmed—to contain mines and/or ERW.

Yet significant challenges remain in the ongoing struggle against landmines. Mine-affected states are required to clear all antipersonnel mines from mined areas under their jurisdiction or control within 10 years of becoming party to the Mine Ban Treaty.³ The first deadlines expired on 1 March 2009, but 15 States Parties with 2009 deadlines failed to meet them and were

¹ “Other areas” are distinct areas or regions with a specific mine or ERW threat but which are not—or only partially—internationally recognized as states: Abkhazia, Kosovo, Nagorno-Karabakh, Palestine, Somaliland, Taiwan, and Western Sahara.

² Fulfilling the requirements of Article 5 does not mean that a country is “mine-free,” a status that very few countries actually achieve. It is a statement that all known mined areas have been cleared of antipersonnel mines to humanitarian standards, and that all reasonable efforts have been made to identify all mined areas within a state’s jurisdiction or control. Thus, a small residual mine threat may be believed to exist even after a declaration of compliance with Article 5 has been made thus requiring the affected state to maintain the capacity to deal quickly with any residual contamination that may be discovered.

³ Jurisdiction means sovereign territory while control of territory means areas occupied by a state outside its sovereign territory.

granted extensions.⁴ In 2009, four more States Parties (three with 2010 deadlines and one, **Uganda**, whose deadline expired on 1 August 2009) formally requested extensions for periods ranging from three to 10 years.⁵ By contrast, at the First Review Conference of the Mine Ban Treaty in 2004, States Parties pledged that by the Second Review Conference in 2009 “few, if any, States Parties” would require an extension to their treaty deadlines.⁶

Scope of the Problem

With the Mine Ban Treaty already in force for 10 years, a reliable determination of the size of the global landmine problem still does not exist. Early estimates of the numbers of mines laid were merely speculative and often proved to be wildly inaccurate. Similarly, surveys, particularly some Landmine Impact Surveys (LIS), have overestimated the size of contaminated areas. Nonetheless, a more accurate understanding of the extent of contamination in both mined areas and battle areas does now exist, with many earlier estimates reduced significantly, largely as a result of more widespread land release procedures.⁷

Mine contamination

As of August 2009, more than 70 states were believed to be mine-affected, as well as seven areas not internationally recognized (see table below). In the past year Landmine Monitor has removed two states from the list: the **Gambia** and **Tunisia**.⁸ Although any estimate should be treated with caution, Landmine Monitor believes that less than 3,000km² of land worldwide⁹ was mine contaminated as of August 2009. Increasingly, data gathering efforts are—rightly—seeking to define more accurately the perimeters of suspected hazardous areas (SHAs)¹⁰ and to ensure there is sufficient evidence of contamination for these SHAs to be entered into national mine action databases.

⁴ In accordance with the treaty, BiH, Chad, Croatia, Denmark, Ecuador, Jordan, Mozambique, Nicaragua, Peru, Senegal, Thailand, the UK, Venezuela, Yemen, and Zimbabwe all made requests for an extension to their Article 5 deadlines ranging from one to 10 years, the maximum period permitted for any extension period (though more than one extension period can be requested). All of these requests were granted by the Ninth Meeting of States Parties in Geneva in November 2008.

⁵ These four states are: Argentina, Cambodia, Tajikistan, and Uganda.

⁶ Nairobi Action Plan, Action #27, “Final Report of the First Review Conference,” 29 November–3 December 2004, APLC/CONF/2004/5, 9 February 2005, p. 99.

⁷ Land release encompasses the range of techniques that ensure the efficient release of formerly suspect mined or battle areas other than purely by clearance, particularly technical survey. In addition, non-technical survey and database clean-up can lead to the cancellation of SHAs that are not in fact contaminated.

⁸ The Gambia has been removed from the list as there is no evidence of residual contamination following an accident in December 2007. Tunisia has a residual threat from mines laid by NSAGs, but has reported completing clearance of all confirmed mined areas. Zambia has not yet been removed from the list although a nationwide survey of contamination had not found any mined areas as of August 2009 as it has still formally to declare completion of its Article 5 obligations.

⁹ An area roughly the size of Luxembourg.

¹⁰ According to the IMAS on land release, a SHA refers to “an area suspected of having a mine/ERW hazard. A SHA can be identified by an impact survey, other form of national survey, or a claim of presence of explosive hazard.” UN Mine Action Service (UNMAS), “IMAS 08.20: Land release, Draft First Edition,” New York, 10 June 2009, p. 1. Often, these are very rough estimates represented by a large circle in the national database that overestimates the size of a SHA. In Afghanistan, for example, the results of polygon surveys—more accurate delineation of the perimeter of a SHA—by HALO in its area of operations in 2007 prompted the Mine Action Coordination Center of Afghanistan (MACCA) to plan such surveys in most of the rest of the country in 2008–2009. MACCA reported in April 2009 that polygon surveys had resulted in a 9% reduction in the total estimated SHA. Email from MACCA, 31 March 2009; and see *Landmine Monitor Report 2008*, p. 86.

Mine-affected states and other areas as of August 2009¹¹

Africa	Americas	Asia-Pacific	Europe	Commonwealth of Independent States	Middle East and North Africa

21 states, 1 area	8 states	14 states, 1 area	10 states, 1 area	8 states, 2 areas	12 states, 2 areas

¹¹ This table includes states and other areas with confirmed mined areas. States with a residual mine problem are not included, such as Belarus, Honduras, Kuwait, Poland, Ukraine, and, since its declaration of compliance with Article 5, Tunisia. The precise extent to which the Republic of the Congo, Mali, Moldova, Namibia, Niger, Oman, and the Philippines are mine-contaminated remained unclear as of August 2009. Both Argentina and the UK claim sovereignty over the Falkland Islands/Malvinas, which are mine-affected, and so both are included in the list. It is believed that both Djibouti and Montenegro have completed mine clearance, but this has not been formally confirmed so they remain on the list. Affected areas not internationally recognized as states are in italics.

Mine Clearance

Advances are being made in demining efficiency¹² with standard mine clearance tools that are rudimentary but practical. The primary clearance technique remains the manual deminer equipped with a metal detector proceeding slowly along one-meter-wide lanes. When a signal is heard, the deminer must stop and either the deminer or a colleague must carefully excavate the object to determine if it is an item of explosive ordnance or a harmless piece of metal. The overwhelming majority of signals lead to innocuous metal fragments being discovered (e.g. nails, barbed wire, and tin cans).¹³ This painstaking process—repeated thousands of times a day around the world—is why mine clearance is expensive and time consuming.¹⁴ The key to cost efficiency is minimizing the overall area to be cleared through good initial survey and ongoing refinement of the clearance plan for a minefield.¹⁵

Other demining tools—especially mine detection dogs (MDDs)¹⁶ and machines—are widely used in mine action programs, particularly to contribute to more efficient land release rather than as a sole clearance tool.¹⁷ In **Rwanda**, for example, Norwegian People's Aid (NPA) redeployed a MineWolf machine from its Sudan program in August 2008 to prepare approximately half a square kilometer of mine-suspected land for manual clearance by National Demining Office demining teams. At the end of the project in December 2008, the use of the machine meant that only 15,303m² (3% of the SHA, equivalent to about three football fields in size) needed to be physically cleared.¹⁸

Clearance in 2008

Despite continuing problems in distinguishing true mine clearance from release by survey, Landmine Monitor believes at least 158km² of suspected mined areas were cleared in 2008,¹⁹ resulting in the destruction of 476,875 antipersonnel mines and 99,466 antivehicle mines.²⁰ Greater precision is not possible due to the poor quality of reporting in a number of cases.²¹ The

¹² The term demining encompasses survey, mapping, marking, community liaison, and post-clearance handover as well as physical clearance itself.

¹³ HALO in Afghanistan and HALO and MAG in Cambodia are using the Handheld Standoff Mine Detection System metal detector, which has ground penetrating radar incorporated to reduce the number of false signals. The detectors are considered effective and raise productivity, but they are also expensive and complex to use. See reports on Afghanistan and Cambodia in this edition of *Landmine Monitor*; and see also *Landmine Monitor Report 2007*, p. 35.

¹⁴ The use of a metal detector in mineralized soil (soil with high metal content) or along railway lines is generally not feasible and other approaches must be used, sometimes requiring prodding. Prodding, by which a metal rod is carefully inserted into the ground at a 30 degree angle to check for mines, is more dangerous than the use of a metal detector as the risk of accidental detonation of a mine or item of explosive ordnance is significantly higher. Raking is a technique used in sandy soil, which has proved effective in a number of mine action programs, notably Jordan, Somaliland, and Sri Lanka.

¹⁵ It would appear that some organizations have done this well but that many others have been exceedingly wasteful.

¹⁶ MDDs locate mines through sense of smell, believed to be the vapor from explosives. Concerns persist, however, in certain quarters about their ability to consistently detect all explosive devices in a given area.

¹⁷ Their use as a sole clearance tool remains controversial because of concerns that mines are missed. In addition, machines cannot be used on steep inclines or rocky ground, and dogs do not function effectively in extreme temperatures.

¹⁸ Uganda has calculated that use of a machine on several of its remaining SHAs will save about one year of manual clearance time.

¹⁹ Equivalent to an area roughly twice the size of Paris. This figure excludes the area said to have been cleared in Iran, which has reported conducting more than 2,000km² of mine clearance in 2008.

²⁰ The high total of items destroyed in 2008 is largely explained by reporting by Iran of clearance of more than 77,000 antivehicle mines. It is likely, therefore, that previous years significantly under-reported the number of items cleared.

²¹ Thus, for example, the 412km² of clearance reported by Morocco are not included in this estimate because, although there are said to be 10,000 deminers engaged in a massive clearance effort, they only have 400 detectors and sets of personal protective equipment and clearance appears to include a very significant amount of release by survey.

largest areas of land were cleared by mine action programs in eight countries—**Afghanistan, Angola, Cambodia, Croatia, Ethiopia, Iraq, Sudan, and Yemen**—which accounted for more than three-quarters of the total recorded clearance (see table below).²² Mine clearance in 2008 increased compared to 2007, when programs cleared at least 122km² of mined areas.

Compliance with Article 5 obligations

Article 5 of the Mine Ban Treaty requires that each State Party destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 10 years after becoming party to the treaty. Ensuring full compliance with these mine clearance obligations is arguably the greatest challenge facing States Parties.

Since the last edition of Landmine Monitor and as of August 2009, one State Party declared fulfillment of its Article 5 obligations: Tunisia. This makes a total of only 11 States Parties that have declared fulfillment of their Article 5 obligations (see table below). At least three other States Parties could also be in a position to report formally they had fully complied with those obligations at the Second Review Conference in November 2009: **Albania** and **Rwanda** (both with 2010 deadlines) and **Zambia** (2011 deadline). Furthermore, **Montenegro** (deadline of 1 April 2017) is believed to have completed mine clearance operations, but no formal declaration has so far been made as suspected area still needs to be surveyed. The situation in **Djibouti**, whose deadline expired on 1 March 2009, remains unclear, ostensibly due to an unresolved border conflict with Eritrea.²³

There has also been significant progress in demining over the past 10 years in areas and states not party to the Mine Ban Treaty, notably in **China, Iran, Lebanon, Morocco, Nepal, and Sri Lanka**, as well as in **Taiwan, Georgia** and **Libya** have recently expressed a willingness to engage in further mine clearance operations on their territory.

Against this, 19 mine-affected States Parties have either missed their deadlines or have formally declared that they are not in a position to complete clearance operations before the Treaty's 10-year deadline. One State Party, **Uganda**, declared at the Standing Committee meetings in May 2009 that it would meet its 1 August 2009 deadline, only to submit a three-

Mined area clearance in selected states in 2008

* Date of completion of demining program (prior to entry into force of the Mine Ban Treaty)

²² This excludes the 27.5km² of land reportedly cleared by the Royal Cambodian Armed Forces as the quality of clearance and the extent of area cleared have not been independently verified.

²³ Djibouti completed its clearance of known mined areas in 2003 and France declared it had cleared a military ammunition storage area (ASA) in Djibouti in November 2008.

year extension request on 19 August.²⁴ Until States Parties decide on its request, Uganda will be in violation of the provisions of Article 5. Of particular concern, two of the four States Parties that formally requested an extension to their Article 5 deadlines in 2009 were unable to provide reliable figures for the extent of contamination (see table below).

In the case of Cambodia, a state that has had a mine action program since 1992, its initial extension request stated that available data did not permit a reliable estimate to be made and noted that a new survey would begin to determine the remaining contamination.²⁵ The ICBL suggested that Cambodia follow the approach taken by Chad, Denmark, and Zimbabwe: to request a shorter period to conduct the relevant survey and data analysis, and then make a second request properly informed by a reliable assessment of mined areas. For Tajikistan, survey of SHAs is ongoing and the mine action center has noted that its final estimate of contaminated area may increase.

Several States Parties granted extensions in 2008 have since made disappointing progress.²⁶ **BiH** failed to meet the first target set by its extension request, namely that by 2009 it was to have reduced the estimated area of contamination to 1,573km². To achieve this, BiH should have released 165km² of SHAs in 2008, but it achieved only a little over half of this amount (85km²) of which only just over 3km² was through clearance.²⁷ Moreover, the extent of the remaining task remains unclear and the assumptions on which completion within 10 years are based appear unrealistic when compared with past performance.²⁸

By mid-2009, **Thailand** was already having difficulty meeting the goals it had set out in its extension request. The rate of demining by the national mine action center in the first half of 2009 (1.3km²) was well behind what was needed to achieve the projected annual rate (43km²), while the estimated area of contamination had actually increased as a result of survey (from 528km² to 562km²).

The request by **Croatia** estimated that at the beginning of its extension period in March 2009 it would have 944km² of suspect land, meaning that it would reduce its total SHA through clearance and technical survey by 53km² in 2008.²⁹ Yet Croatia missed the target by 10.5km², releasing a total of 42.5km² in 2008 and bringing the total SHA down to 954.5km², still far in excess of probable contaminated area.³⁰

Ecuador and **Peru** have continued to make slow progress in clearing SHAs along their common border (both were granted eight-year extensions by the Ninth Meeting of States Parties).³¹ Both the **United Kingdom** and **Venezuela**, which were granted a 10-year and a five-year extension, respectively, have still to initiate formal clearance operations.

States Parties requesting an extension to their Article 5 deadline in 2009

State	Estimated area of mine contamination (km ²)	Length of extension request sought (in years)
Argentina	13	10
Cambodia	672 (estimated)	10
Tajikistan	14.4 (estimated, partial)	10
Uganda	0.26	3

²⁴ Uganda Article 5 deadline Extension Request, July 2009.

²⁵ Cambodia Article 5 deadline Extension Request, 30 April 2009.

²⁶ Moreover, certain extension requests were poorly prepared, suggesting an under-performing mine action program.

²⁷ BiH Article 5 deadline Extension Request (Revision), 27 June 2008, p. 26.

²⁸ See *Landmine Monitor Report 2008*, pp. 180–181.

²⁹ *Ibid.*, p. 306.

³⁰ Interview with Natasa Matesa-Matekovic, Head of Department for Planning and Analysis, Croatian Mine Action Center, Sisak, 9 February 2009.

³¹ Ecuador cleared 6,215m² of mined areas, leaving 517,312m² of mined areas to be cleared, while Peru cleared 1,155m² of mined areas on the border with Ecuador, leaving 192,000m² of mined areas as well as some mined areas surrounding national infrastructure inside the country.

Future compliance with Article 5 deadlines is likely to be similarly disappointing. Based on progress to date, Landmine Monitor believes that the following States Parties are not on track to comply with the treaty by their respective deadlines: **Mauritania** (2011); **Algeria** (2012); **Chile** (2012); **DRC** (2012); and **Eritrea** (2012). In some cases, the problem is inadequate funding; more often, delays in initiating a program, poor management, and insufficient political will are the root causes. **Colombia** (with a 2011 deadline) will almost certainly remain contaminated with mines laid by non-state armed groups (NSAGs) as security concerns have prevented the safe clearance of some areas. Among States Parties with later deadlines, **Iraq** is a particular concern. Less than a year after it became party to the treaty as one of the world's worst affected countries, Iraq not only had done nothing to mobilize resources needed to address its contamination but had even suspended all clearance outside Kurdish areas, raising serious concerns about the extent to which political leaders understood the severity of the problem or their treaty obligations.

In certain cases, there has been a lack of progress in demining contested borders (particularly in the case of **Thailand/Cambodia**, and **Tajikistan** and its neighbors): this is partly a result of a lack of clear delineation or demarcation of borders. **Jordan**, on the other hand, informed the Standing Committee meetings in May 2009 that, although a dispute over the border with Syria had not been fully resolved, the two countries had agreed demining could proceed unhindered.³²

Some States Parties have not yet acknowledged that they are legally obliged by the treaty to clear areas they control outside their sovereign territory.³³ As of August 2009, neither **Turkey** nor **Cyprus** had formally accepted responsibility for clearance in northern Cyprus, which is occupied by Turkish forces. A statement in June 2008 from **Moldova**, which had raised hopes that it had acknowledged its responsibility for clearance of any mined areas in the breakaway republic of Transnistria, where it continues to assert its jurisdiction, was later disavowed by the Ministry of Foreign Affairs.³⁴

Finally, the extent of any mined areas containing antipersonnel mines in four states with Article 5 deadlines in 2009 and 2010 remained unclear (see table below); none has so far formally reported mined areas containing antipersonnel mines or requested an extension.

States Parties with Article 5 deadlines in 2009 and 2010 whose compliance is uncertain³⁵

State	Compliance issue
Djibouti	Clearance of known mined areas complete but no formal declaration of compliance; possible new contamination from combat with neighboring Eritrea
Niger	Antipersonnel mine contamination not confirmed
Namibia	Antipersonnel mine contamination not confirmed
Philippines	Antipersonnel mine contamination not confirmed

Explosive remnants of war contamination

With firm action having been taken to address the global threat from mines, today ERW still represents a huge challenge, with tens of millions of items of UXO and abandoned explosive ordnance (AXO) contaminating countries affected by armed conflict.³⁶ For example, **Lao**

³² Statement of Jordan, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009.

³³ See Article 5 of the Mine Ban Treaty, which lays down the obligation to clear areas under the jurisdiction or control of a State Party; and Statement of ICBL, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 28 May 2009.

³⁴ See report on Moldova in this edition of Landmine Monitor.

³⁵ See the relevant reports in this edition of Landmine Monitor for details.

³⁶ There are also a small number of states (for example, Albania, Republic of the Congo, and Kenya,) in which UXO contamination has occurred as a result of military training or the undesired explosion of ammunition in an ASA. AXO can result from a lack of proper ASA management and control.

PDR and Vietnam are still massively contaminated as a result of US bombing campaigns four decades ago, although no credible estimates of the full extent of contamination currently exist.

The adoption of the Convention on Cluster Munitions in May 2008 highlighted a specific threat that Landmine Monitor has reported on for many years—that of cluster munition remnants, especially unexploded submunitions.³⁷ Although the full extent of contamination is still to be determined, survey and clearance operations in 2008 and 2009 revealed at least 27 states and three areas with some degree of unexploded submunition contamination on their territory, as set out in the table below. It is hoped that reporting under the new convention once it enters into force will clarify the global extent of contamination from cluster munition remnants.³⁸

States and other areas affected by cluster munition remnants as of August 2009³⁹

Africa	Americas	Asia-Pacific	Europe	Commonwealth of Independent States	Middle East and North Africa
Angola	Argentina	Afghanistan	Albania	Azerbaijan	Iraq
Chad		Cambodia	BiH	Georgia	Kuwait
Congo, Republic of the		Lao PDR	Croatia	Russia	Lebanon
DRC		Vietnam	Montenegro	Tajikistan	Syria
Mauritania			Serbia	Nagorno-Karabakh	Western Sahara
Sudan			UK		
Uganda			Kosovo		
Zambia					
8 states	1 state	4 states	6 states, 1 area	4 states, 1 area	4 states, 1 area

³⁷ The convention defines cluster munition remnants as including the following: unexploded submunitions, unexploded bomblets (submunition dropped from a fixed-wing dispenser), failed cluster munitions (i.e. the canister failed to disperse the submunitions as intended during deployment), and abandoned cluster munitions.

³⁸ Certain states have already clarified the extent of the area affected by cluster munition remnants. In Serbia, for example, NPA's general survey of submunition contamination, conducted between 9 November 2007 and 30 November 2008, identified 105 "deployment zones" where cluster munitions were used and 390 polygons or suspect areas covering a total of 30.7km². These affected 28 communities in 16 municipalities. Mauritania has reported plans to conduct survey over 6km² of SHA reported to contain cluster munition remnants. See, further, the respective reports on these two states in this edition of Landmine Monitor.

³⁹ Zambia has been added to the list of affected states since last year based on a nationwide survey by NPA, which found two areas containing unexploded submunitions. Guinea-Bissau has been removed from the list as it is reported that the last known cluster munition remnants were destroyed by a UK commercial demining operator, Cleared Ground Demining, in August 2008. Israel has also reported clearing all unexploded submunitions fired by Hezbollah into Israel during the August 2006 conflict in Lebanon. Whether Eritrea, Ethiopia, Grenada, and Saudi Arabia remained contaminated was unclear as of August 2009, so they have not been included in the list. As noted above, both Argentina and the UK claim sovereignty over the Falkland Islands/Malvinas, which are affected by cluster munition remnants, and so both are included in the list. Affected areas not internationally recognized as states are in italics. There may be contamination from cluster munition remnants resulting from training or testing in a number of other states, including Chile, Jordan, and the US.

Battle Area Clearance

Battle area clearance (BAC) seeks to clean former combat areas of ERW.⁴⁰ BAC tends to be far quicker than mine clearance for two main reasons. First, in certain circumstances visual inspection of an area may be sufficient, sometimes without the need to conduct instrument-assisted search of the surface. Second, even when sub-surface clearance is deemed necessary, it does not need such sensitive detectors as are used for mine clearance: BAC seeks to detect far greater quantities of metal than occur in common antipersonnel mines and it does not normally have to leave an area metal free. Accordingly, operations endure far fewer false positive signals from harmless metal fragments and coverage of SHAs tends to be far quicker than mine clearance as a result.

Battle area clearance in 2008

Despite problems in ensuring that BAC is not double reported (i.e. sub-surface clearance is repeated in surface clearance figures), Landmine Monitor believes at least 270km² of battle areas were cleared in 2008, resulting in the destruction of more than 48,000 unexploded submunitions⁴¹ and some 2.3 million other items of ERW. The largest areas cleared by mine action programs in **Afghanistan, Georgia, Iraq, and Lao PDR**, which together accounted for 80% of the total recorded BAC (see table below).⁴² BAC in 2008 decreased compared to 2007, when programs reported clearance of at least 412km² of battle areas.

Battle area clearance in selected states in 2008

State	BAC (km ²)
Afghanistan	121.1
Lao PDR	55.2
Iraq	14.5
Lebanon	10.0
Georgia	7.9

Clearance obligations under the Convention on Cluster Munitions

Under Article 4 of the Convention on Cluster Munitions, each State Party “undertakes to clear and destroy, or ensure the clearance and destruction of, cluster munition remnants located in cluster munition contaminated areas under its jurisdiction or control” as soon as possible but not later than 10 years after becoming party. Should cluster munitions be used after the treaty enters into force for a particular state, that state is required to fulfill the same clearance obligations “as soon as possible but not later than ten years after the end of the active hostilities during which such cluster munitions became cluster munition remnants.” Upon fulfilling either of these obligations, the relevant State Party is required to make a declaration of compliance to the next Meeting of States Parties.⁴³

Negotiations for the convention benefited from the experiences in implementation of Article 5 of the Mine Ban Treaty. The text is far more detailed as to reporting obligations in its Article 7 reporting on transparency measures, which will assist the future oversight of cluster munition clearance efforts. In particular, States Parties will be required to report on the size of areas both estimated to be contaminated and subsequently cleared, not just on the location of areas and the number of items cleared, as with the Mine Ban Treaty.

Clearance obligations under Convention on Conventional Weapons Protocol V

Under Article 3 of Protocol V on Explosive Remnants of War of the Convention on Conventional Weapons (CCW), after the “cessation of active hostilities and as soon as feasible,” each State Party and party to an armed conflict⁴⁴ is required to “mark and clear, remove or

⁴⁰ Thus, as mentioned above, BAC is conducted on areas that do not contain a mine threat. Care must be taken in making this determination: casualties occurred in Lebanon, for example, as a result of BAC being conducted on land that was, in fact, contaminated with mines.

⁴¹ The actual total is probably much higher as Vietnam did not report comprehensive figures for the destruction of cluster munition remnants, and Afghanistan, Azerbaijan, BiH, Cambodia, Iraq, Israel, Lebanon, Sudan, and Uganda did not disaggregate cluster munition clearance figures from other ERW. Full or partial cluster munition clearance figures were reported for the following states: Albania, Croatia, DRC, Georgia, Kuwait, Lao PDR, Serbia, Tajikistan, Vietnam, and Zambia, as well as the areas of Kosovo and Western Sahara.

⁴² Reported figures for the Sri Lanka Army of 121km² (which resulted in the destruction of only 121 items of UXO) are not included in this total as it has not been possible to verify the clearance.

⁴³ Article 4.1, Convention on Cluster Munitions.

⁴⁴ Including NSAGs.

destroy explosive remnants of war in affected territories under its control.”⁴⁵ In addition, the users of explosive ordnance are placed under a special responsibility to record their use of these weapons, and to provide data and assistance for the clearance of any resulting UXO in territory that they do not control.

Land Release

If the mine and ERW problem⁴⁶ is to be addressed efficiently, national authorities will have to develop transparent systems to reduce SHAs to confirmed mined areas. As the International Mine Action Standards (IMAS) on land release state: “on some occasions, land has been subjected to full clearance unnecessarily.”⁴⁷ Any land that is not contaminated but is physically cleared represents inefficiency and a potentially huge waste of resources for a national demining program.⁴⁸

In part, land release is a recognition that some surveys have led to excessive estimates of the size and number of SHAs.⁴⁹ Due to the efforts of many, particularly the Geneva International Centre for Humanitarian Demining (GICHD), which has spearheaded the development of land release processes along with the government of Norway and others, there is now a better understanding that an array of techniques in addition to full clearance can enable SHAs to be addressed efficiently and with a high degree of safety for both program personnel and the intended beneficiaries.⁵⁰ These techniques include better information gathering and verification, and greater use of high-quality non-technical⁵¹ and technical survey.⁵²

Care must be taken, however, when applying land release to ensure that certain basic principles are followed.⁵³ In particular, any land confirmed to be contaminated must be fully cleared to humanitarian standards to meet the requirements of the Mine Ban Treaty, and the process of land release by both technical and non-technical means must be accountable and follow applicable mine action standards.⁵⁴

⁴⁵ Article 3.2, CCW Protocol V on Explosive Remnants of War.

⁴⁶ Land release principles are also applicable to battle areas, including areas affected by cluster munition remnants, but procedures tailored to battle areas are to be elaborated in a separate IMAS. Telephone interview with Havard Bach, Head, Operational Methods Section, GICHD, 11 September 2009.

⁴⁷ UNMAS, “IMAS 08.20: Land release, Draft First Edition,” New York, 10 June 2009, p. v.

⁴⁸ That is not to suggest that this applies to all countries or demining organizations. A number of these have consistently insisted on the importance of careful survey and mapping of SHAs prior to clearance.

⁴⁹ See, for example, Coordinator of the Resource Utilization Contact Group (Norway), “Applying all available methods to achieve the full, efficient and expedient implementation of Article 5,” Discussion paper (Revision), July 2008.

⁵⁰ HALO stresses the efficiency of a four-stage approach to addressing SHAs: 1. Good non-technical survey. 2. Find the mines, using technical survey/clearance. 3. Clear from the inside out to the limit of the threat. 4. Hand over to local people. Email from Christian Richmond, Desk Officer, HALO, 3 September 2009.

⁵¹ Non-technical survey is defined by the relevant IMAS as survey which involves “collecting and analysing new and/or existing information about a hazardous area. Its purpose is to confirm whether there is evidence of a hazard or not, to identify the type and extent of hazards within any hazardous area and to define, as far as is possible, the perimeter of the actual hazardous areas without physical intervention. A non-technical survey does not normally involve the use of clearance or verification assets. Exceptions occur when assets are used for the sole purpose of providing access for non-technical survey teams. The results from a non-technical survey can replace any previous data relating to the survey of an area.” UNMAS, “IMAS 08.21: Non-Technical Survey, Draft First Edition,” New York, 10 June 2009, pp. 1–2.

⁵² IMAS defines technical survey as “a detailed intervention with clearance or verification assets into a CHA, or part of a CHA. It should confirm the presence of mines/ERW leading to the definition of one or more DHA and may indicate the absence of mines/ERW which could allow land to be released when combined with other evidence.” UNMAS, “IMAS 08.20: Land release, Draft First Edition,” New York, 10 June 2009, p. 2.

⁵³ See *Landmine Monitor Report 2007*, p. 32.

⁵⁴ Three IMAS address land release: UNMAS, “IMAS 08.20: Land release, Draft First Edition,” New York, 10 June 2009; UNMAS, “IMAS 08.21: Non-Technical Survey, Draft First Edition,” New York, 10 June 2009; and UNMAS, “IMAS 08.22: Technical Survey, Draft First Edition,” New York, 10 June 2009. All are available for download at: www.mineactionstandards.org.

Techniques

The IMAS on land release describes the approach as “an evidence-based information assessment process that can help determine with confidence which land needs to be cleared and which does not.”⁵⁵ It adds new terms—and potentially new interventions—to the mine action lexicon (and therefore also to the mine action database). The term “Confirmed Hazardous Area” (CHA) refers to “an area identified by a non-technical survey in which the necessity for further intervention through either technical survey or clearance has been confirmed.” The term “Defined Hazardous Area” (DHA) refers to “an area, generally within a CHA, that requires full clearance. A DHA is normally identified through thorough survey.”⁵⁶ Thus, a SHA should be subjected to non-technical survey to either confirm or discredit suspicions of the presence of mines. If no—or possibly scant⁵⁷—evidence is found, the land is cancelled. If, on the other hand, evidence of contamination is found, the area is normally defined as a CHA⁵⁸ and is then subjected to technical survey. Technical survey then reduces the CHA to a DHA, which is then subjected to full clearance.⁵⁹ All stages of the land release process must be carefully documented.

Achievements

A paper by Norway in July 2008 concluded that: “States Parties [to the Mine Ban Treaty] should acknowledge that land reassessment and release through non-technical means, when undertaken in accordance with high quality national policies and standards that incorporate key principles highlighted in this paper, is not a short-cut to implementing Article 5.1 but rather is a means to more expediently release, with confidence, areas at one time deemed to be ‘mined areas’.”⁶⁰ The concept of land release was formally endorsed by the Ninth Meeting of States Parties,⁶¹ and an increasing number of States Parties have been employing land release principles to improve program performance.

Information Management

Reliable land release (and efficient demining overall) benefits from effective information management.⁶² This begins with systematic, high-quality data gathering, a fundamental prerequisite that has too often been lacking in mine action, despite the huge sums of money donors have contributed to the sector. It also befits a sector receiving more than half a billion dollars

⁵⁵ UNMAS, “IMAS 08.20: Land release, Draft First Edition,” New York, 10 June 2009, p. 3.

⁵⁶ *Ibid.*, p. 1.

⁵⁷ According to the IMAS, “Before land can be released from suspicion, it should be established, with a sufficiently high level of confidence, that there is no longer any evidence that the area contains any explosive hazards. This confidence can only be gained after all reasonable efforts to investigate whether mines/ERW are present have been made... ‘All reasonable effort’ may, at one extreme, only be the conduct of a non-technical survey which finds absolutely no evidence of mines/ERW... However, if the non-technical survey confirms some evidence of mines/ERW, it would be reasonable to expend more effort to gain more confidence about which areas are free of mines/ERW and which are not. In this case, ‘all reasonable effort’ may mean that a technical survey or clearance should be conducted.” UNMAS, “IMAS 08.20: Land release, Draft First Edition,” New York, 10 June 2009, p. 5.

⁵⁸ In certain circumstances, the evidence may be sufficient to define the area of contamination and this DHA is then subjected to full clearance.

⁵⁹ For a flowchart of the process, see UNMAS, “IMAS 08.20: Land release, Draft First Edition,” New York, 10 June 2009, p. 3.

⁶⁰ Coordinator of the Resource Utilization Contact Group (Norway), “Applying all available methods to achieve the full, efficient and expedient implementation of Article 5,” Discussion paper (Revision), July 2008.

⁶¹ See Coordinator of the Resource Utilization Contact Group (Norway), “Applying all available methods to achieve the full, efficient and expedient implementation of Article 5,” APLC/MSP/9/2008/WP.2, 2 October 2008; and “Final Report of the Ninth Meeting of States Parties,” 28 November 2009, Paragraph 31.

⁶² As IMAS state, “Proper management procedures, including adequate decision-making mechanisms, recording, training, monitoring and adjustment, are essential requirements of the process.” UNMAS, “IMAS 08.20: Land release, Draft First Edition,” New York, 10 June 2009, p. 6.

annually to report accurately and promptly on its achievements.⁶³ In **Angola**, for instance, the National Demining Institute, despite having 2,000 operational staff across the country, was unable to provide detailed reporting on its demining activities in 2008, as in 2007, because its data management system was said to be not functioning properly.

The primary mine action information management software remains the Information Management System for Mine Action (IMSMA), managed by GICHD. This is the standard database software for mine action, used by some 50 demining programs around the world, but it remains the subject of criticism. Some blame the software while others suggest the operators are at fault. Certainly, the old adage of “poor data in, poor data out” will always apply.⁶⁴ In a number of instances, however, notably in **Cambodia** and **Lao PDR**, accessing data from the latest version of IMSMA has proved challenging.⁶⁵

Mine Action by Non-State Armed Groups

During the last 10 years NSAGs have sometimes carried out limited mine clearance or explosive ordnance disposal (EOD) operations. NSAG mine clearance or EOD has taken place in **Colombia**, **Iraq**, **Lebanon**, **Sudan**, and **Sri Lanka**, as well as in **Western Sahara**.

In Kurdish areas of northern **Iraq**, the Kurdistan Democratic Party and the Patriotic Union of Kurdistan undertook mine clearance through the Northern Iraq Mine Action Program, supported by UNOPS, from 1997 until the 2004 integration of the Kurdish groups into the Iraqi Interim Government. Also in northern Iraq, the Hawpar organization, linked to the Turkish Kurdistan Workers Party has carried out limited clearance in 2007 and 2008 with support from NPA. In **Lebanon**, Hezbollah volunteers cleared a possibly large number of submunitions after the armed conflict in 2006. In Southern **Sudan**, the Sudan People’s Liberation Movement/Army undertook mine clearance through the Operation Save Innocent Lives initiative supported by UNICEF from 1997 until the 2005 Comprehensive Peace Agreement and the formation of the Government of National Unity. In northern **Sri Lanka**, the Tamil Rehabilitation Organization Humanitarian Demining Unit, which was linked to the Liberation Tigers of Tamil Eelam (LTTE), undertook clearance activities in cooperation with international clearance organizations between 2002 and 2006.

In 2008 in **Myanmar/Burma**, the Karen National Union, which controls small amounts of territory in the east of the country, was provided with metal detectors for mine clearance and trained in their use. Also in Myanmar, the Chin National Front/Army stated to the NGO Geneva Call that it had cleared mines from three sites along Myanmar’s border with India during 2008.⁶⁶

Deminer Security

In recent years, armed violence has inflicted losses on demining operators, who have also lost staff as well as vehicles and equipment worth hundreds of thousands of dollars in attacks or raids by insurgent or criminal groups.

⁶³ The quality of reporting is uneven but is generally poor. Strictly, the Mine Ban Treaty only requires reporting on locations of areas cleared and the number of antipersonnel mines destroyed; good practice demands far more detailed reporting, as a minimum: the size as well as the location of areas released; the form(s) of clearance or other means used to release the land, disaggregated by area, and all devices encountered and destroyed.

⁶⁴ As Landmine Monitor noted last year, it is surprising that data recording and entry has been so difficult in several programs that have received extensive international support and assistance. In Somaliland, for example, the problems are so significant that as of late 2008 the IMSMA database had not been effectively updated since 2003. See *Landmine Monitor Report 2008*, p. 22.

⁶⁵ In March 2009, GICHD reported that it would be making changes to IMSMA “to enhance the support that information management can provide to national mine action centres and other mine action partners.” See GICHD, “GICHD Information Management Programme – Changes,” March 2009, www.gichd.org.

⁶⁶ The Chin National Front/Army signed Geneva Call’s Deed of Commitment in August 2006. The Turkish PKK and its People’s Defense Forces militia signed Geneva Call’s Deed of Commitment in July 2006. Signatories agree to prohibit use, production, stockpiling, and transfer of antipersonnel mines, and to undertake and cooperate in mine action. The clearance activities of both groups were reported as compliance with their pledges under the Deed of Commitment.

In **Afghanistan**, deminers and support staff have been kidnapped and killed since 2007. In May 2008, three security guards and a logistics clerk were killed and a driver wounded in an attack by insurgents. In July, gunmen kidnapped 16 deminers working for the Mine Detection and Dog Centre in eastern Paktia province but released them after the intervention of local community leaders. The same month, separate attacks took place on the Danish Demining Group compound in Balkh province and on deminers returning from clearance, fatally wounding one supervisor. In May 2009, a HALO Trust vehicle was damaged in a vehicle-activated improvised explosive device explosion, slightly injuring several staff.

In **Iraq**, political instability and insecurity have periodically halted clearance. In June 2007 the National Mine Action Authority was shut down after the kidnap and subsequent murder of its director general. Work resumed from April until December 2008, when the Ministry of Defense suspended clearance in all parts of Iraq, except the north, on grounds of security and the need to vet personnel engaged by demining operators (due to their access to mines and/or explosive ordnance).

In **Sri Lanka**, demining launched in 2002 became more difficult after 2007 and largely came to a halt due to increased armed conflict, including mine use, until May 2009. In 2008, operators experienced abductions of deminers in areas controlled by security forces or pro-government militias, while some deminers working in LTTE-controlled territory were forcibly recruited into local militias.

In **Senegal**, the Movement of Democratic Forces of Casamance (MFDC) attacked an army mine clearance unit killing three and injuring seven in 2005. In 2006, an army demining unit accompanied by Moroccan soldiers was attacked by the MFDC resulting in the death of two soldiers and leaving 14 injured. In 2008, Senegal requested an extension of its Article 5 deadline citing, among other things, deminer security as a reason for its inability to clear the mines in time.

In **Sudan**, several operators and UN agencies reported increased insecurity since 2006 when the Ugandan Lord's Resistance Army ambushed a team from the Swiss Foundation for Mine Action near Juba, killing two deminers. Several other demining organizations halted operations due to movements of NSAGs or armed conflict in their areas. In January 2007, an Indian peacekeeper in Southern Sudan was killed and two others wounded while escorting a mine clearance team. In 2008, insecurity prevented survey activities taking place in Western Darfur.

The Future of Mine Action

The next few years may come to be seen as the high water mark of demining. In most countries, the mine threat is being reduced significantly and better demining approaches and procedures have widely—though not always—increased both productivity and effectiveness. Redoubled efforts to complete mine clearance in all affected states, whether party to the treaty or not, remains a priority. Significant resources—from both national and international sources—will continue to be needed for many years. And the implementation of the Convention on Cluster Munitions will surely see major inroads into global contamination from unexploded submunitions.

CASUALTIES AND DATA COLLECTION

1999–2009 Overview

Landmine Monitor has identified at least **73,576 casualties** in **119 countries/areas** in the past 10 years. The total number of survivors worldwide is not known but is estimated to be in the hundreds of thousands. This figure includes at least **5,197 casualties** caused by mines, explosive remnants of war (ERW), and victim-activated improvised explosive devices (IEDs) **in 2008**, slightly fewer than the 5,473 casualties recorded in 2007. This decrease was markedly less than in most previous years of the past decade. As before, these figures were incomplete due to inadequate or non-existent data collection.

Casualties from 1999–2008

Despite data collection challenges, Between 1999 and the end of 2008, Landmine Monitor collected information on 73,576 recorded mine/ERW/IED casualties in 119 countries and areas, of which 17,867 were killed, 51,711 injured, and 3,998 of unknown status.¹

While tragically high, the number of casualties in the past decade is incomplete because it includes only recorded casualties. There was certainly under-reporting throughout the decade due to the lack of adequate data collection mechanisms worldwide, a lack of retrospective data collection, and under-reporting of certain groups of casualties, such as foreign nationals, refugees or internally displaced persons, non-state armed groups (NSAG), or ethnic minorities. Mine/ERW casualties during conflicts are also under-reported.

Also, many countries with mine/ERW contamination transitioned out of conflict prior to 1999, meaning that most of their casualties would also have occurred before 1999, for example in **Bosnia and Herzegovina (BiH), Burundi, Cambodia, Croatia, Egypt, El Salvador, Lao PDR, Mozambique, Nicaragua, Syria, or Vietnam.**

A regional breakdown of the total global casualties recorded by Landmine Monitor from 1999–2008 is set out in the table below.

Casualties by Region, 1999–2008

Region and no. of states	No. of states with casualties	No. of casualties
Asia-Pacific (40)	21	33,627
Africa (48)	32	16,390
Middle East and North Africa (18)	17	8,558
Americas (35)	14	7,202
Commonwealth of Independent States (12)	12	4,628
Europe (42)	23	3,171
Total	119	73,576

¹ These figures only include casualties occurring on a country's territory, and only include some of the many casualties among soldiers, peacekeepers, deminers or humanitarian workers from many other countries, for example **Australia, France, Netherlands, the United Kingdom, or the United States.**

Most casualties (49,617 or 67%) occurred in 82 States Parties. Among States Parties, nine in every 10 casualties happened in the so-called VA26 countries (44,694).² Some 26% of total casualties during the decade happened in just two countries: **Afghanistan** (16%) and **Cambodia** (10%). In states not party and areas not internationally recognized there were 23,755 casualties.³

Recorded casualties reduced gradually throughout the decade from more than 8,000 per year between 1999 and 2003, to just over 7,000 in 2005, and fewer than 5,500 per year since 2007.

Among the **VA26 countries**, 71% of casualties where the civil/military status was known were civilians and 2% were humanitarian deminers. Additionally, 24% were security forces (the majority in **Colombia**), and 3% were paramilitary or NSAGs.

When the age was known, 68% of casualties were adults and 32% were children. The vast majority of casualties were male (90%) and men made up the largest casualty group (63%), followed by boys (27%), then women and girls (5% each).

Some 44% of casualties were caused by ERW (excluding cluster munitions), 30% by antipersonnel mines, 13% by unspecified mines, 10% by antivehicle mines, 2% by cluster submunitions, and the remainder by victim-activated IEDs (less than 1%).⁴

At least 34% of casualties where the activity at the time of the incident was recorded occurred during livelihood activities. Some 20% of casualties happened by directly interacting with an explosive device and 18% occurred while traveling.

States with 1,000 casualties or more from 1999-2008

State	Total 1999–2008
Afghanistan	12,069
Cambodia	7,300
Colombia	6,696
Iraq	5,184
India	2,931
Russia	2,795
Angola	2,664
Somalia	2,354
Myanmar	2,325
Lao PDR	2,295
Pakistan	1,969
Ethiopia	1,947
Sudan	1,748
Congo, Democratic Republic of (DRC)	1,696
Vietnam	1,545
Sri Lanka	1,272

Casualties in 2008⁵

In 2008, Landmine Monitor identified 5,197 recorded casualties caused by mines, ERW and victim-activated IEDs.⁶ Some 1,266 people were killed, 3,891 injured, and the status of 40 people was unknown. Casualties in 2008 were recorded in fewer countries and areas than in 2007:

² This is the informal name given to the 26 States Parties with significant numbers of survivors, and, therefore, with the greatest responsibility to act but also the greatest needs and expectations for assistance: Afghanistan, Albania, Angola, BiH, Burundi, Cambodia, Chad, Colombia, Croatia, DRC, El Salvador, Eritrea, Ethiopia, Guinea-Bissau, Iraq, Jordan, Mozambique, Nicaragua, Peru, Senegal, Serbia, Sudan, Tajikistan, Thailand, Uganda, and Yemen. For further details, see the Victim Assistance chapter.

³ In Poland, the only Mine Ban Treaty signatory with casualties, 204 casualties were reported between 1999 and 2008.

⁴ These figures do not include casualties from explosive devices, such as cluster munitions, at the time of attacks. They do include casualties from ERW and from mines during conflict.

⁵ Figures include individuals killed or injured in incidents involving devices detonated by the presence, proximity, or contact of a person or a vehicle, such as all antipersonnel mines (whether factory or home-made), antivehicle mines, unexploded ordnance, abandoned explosive ordnance, victim-activated IEDs and vehicle-activated IEDs. Not included in the totals are: estimates of casualties where exact numbers are not given; incidents clearly caused by remote-detonated mines or IEDs; and devices that were clearly not victim-activated. Also not included are people killed or injured while manufacturing devices. For some countries, such as Iraq or India, where verification of reported incidents was particularly difficult, even stricter criteria were applied as IED incidents were only included if the device was set off by direct (hand or foot) contact.

⁶ This figure is the number of casualties recorded in formal data collection mechanisms and/or identified by hospitals, NGOs, or through the media. The actual number of casualties is certainly higher, as many countries do not have data collection mechanisms, data collection is not nationwide, does not include all groups of the population, or is hampered by security or geographic difficulties.

75 compared to 78. Ten countries with recorded casualties in 2007 did not record any casualties in 2008, most notably **Mauritania**, which had recorded casualties every year since 2000.⁷ Seven countries that did not record casualties in 2007 suffered casualties in 2008,⁸ including **Libya**, where Landmine Monitor identified casualties for the first time since 1999 (despite regular but unconfirmed reports of high casualty rates). Casualties again occurred in **Mali**, which recorded its first-ever casualties in 2007, and in **Niger**, which had not recorded casualties for several years before 2007.

States and other areas with mine/IED/ERW casualties in 2008⁹

Africa	Americas	Asia-Pacific	Europe	Commonwealth of Independent States	Middle East and North Africa
Angola	Colombia	Afghanistan	BiH	Azerbaijan	Algeria
Burundi	El Salvador	Bangladesh	Croatia	Belarus	Egypt
Chad	Nicaragua	Cambodia	Cyprus	Georgia	Iran
Côte d'Ivoire	Peru	China	Greece	Kyrgyzstan	Iraq
DRC	US	India	Montenegro	Moldova	Israel
Eritrea		Indonesia	Poland	Russia	Jordan
Ethiopia		Korea, South	Serbia	Tajikistan	Kuwait
Guinea-Bissau		Lao PDR	Turkey	Ukraine	Lebanon
Kenya		Malaysia	Kosovo	Abkhazia	Libya
Mali		Mongolia		Nagorno-Karabakh	Morocco
Mozambique		Myanmar/Burma			Syria
Niger		Nepal			Yemen
Rwanda		Pakistan			Palestine
Senegal		Philippines			Western Sahara
Somalia		Sri Lanka			
Sudan		Thailand			
Uganda		Vietnam			
Zambia					
Zimbabwe					
Somaliland					
19 states, 1 area	5 states	17 states	8 states, 1 area	8 states, 2 areas	12 states, 2 areas

⁷ The 10 countries without new casualties were Albania, Armenia, Chile, France, Gambia, Honduras, Latvia, Mauritania, Namibia, and South Africa.

⁸ The seven countries with new casualties were Bangladesh, Cyprus, Greece, Libya, Malaysia, Moldova, and Montenegro.

⁹ IED refers to victim-activated improvised explosive device.

In earlier years there was an average annual decrease of at least 9%, but casualty rates in 2008 were 5% lower than 2007.¹⁰ It is even possible that 2008 will be the first year since 2005 in which there is no decrease in the casualty rate compared to the previous year. This is because 2008 casualty figures only include casualties recorded in formal data collection mechanisms and identified by Landmine Monitor through other means, which are incomplete in nearly all countries (see Data collection section below). Additionally, data collection is slow in many countries/areas, meaning that casualties are “discovered” long after the incident date.¹¹

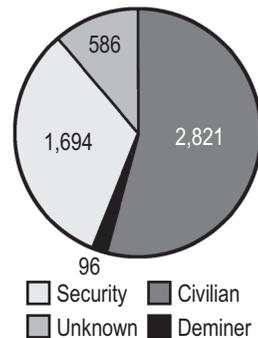

Casualty demographics

In 2008, some 61% of casualties (where civilian/military status was known) were civilians (2,821 of 4,611).¹² While civilians still make up most casualties, as a percentage of total casualties they continued to decrease from 71% in 2007 and 81% in 2005.¹³ This is mainly due to the high number of military casualties in **Colombia** (507) and **Myanmar** (508). Other reasons were possible over-reporting of military casualties in the media and major incidents causing multiple military casualties. In total, there were 1,694 casualties among security forces, with Colombia and Myanmar accounting for 60% of these casualties.

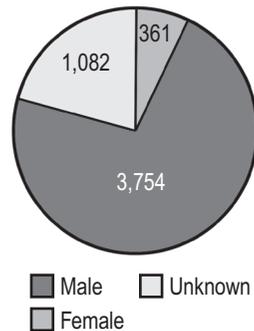

There were 96 demining casualties in 14 countries in 2008, a 20% decrease compared to 2007, when there were 120 casualties.¹⁴ By far the most clearance casualties occurred in **Afghanistan** (51 casualties, 53% of all demining casualties in 2008), followed by **BiH** (eight, but 30% of total mine/ERW casualties in that country), **Iran** (eight), and **Cambodia** and **Iraq** (seven each). The drop is largely due to a sharp decrease in demining casualties in **Cambodia** (seven, down from 17 in 2007) and **Lebanon** (one, down from 16). Just one female demining casualty was recorded in **Mozambique**. In addition, among the total military casualties, 12 were conducting clearance when the incident occurred.

The vast majority of casualties where the gender was known were male (3,754, or 91% of 4,115), 361 were female (9%). The gender of 1,082 recorded casualties was unknown (21%, compared to 19% in 2007). For civilian casualties only, females made up 12% of casualties (309 of 2,478 where the gender is known). Females were the majority casualty group in three countries (**Bangladesh**, **Mozambique**, and **Rwanda**), but this was related to specific incidents causing multiple casualties and not to a pattern of activities putting women at particular risk.

Casualties in 2008 by Civilian/Military Status

Casualties in 2008 by Gender

¹⁰ *Landmine Monitor Report 2008* identified 5,426 casualties in 78 countries and areas in 2007. Due to slow data collection and data verification the total of 5,426 was revised to 5,473, with changes in Afghanistan, Azerbaijan, Chad, Colombia, Georgia, Jordan, Nagorno-Karabakh, Niger, Russia, Sri Lanka, and Tajikistan.

¹¹ For example in 2008, *Landmine Monitor* identified 256 additional casualties for 2006 in Afghanistan alone compared to data available in 2007. This data was made available to *Landmine Monitor* only in mid-2008. Casualty updates for 2008 have already been received from several countries, including Afghanistan, Cambodia, Chad and Colombia in early September 2009, which could not be included due to the incomplete nature of the data provided.

¹² The civilian/military status of 586 casualties was unknown.

¹³ See *Landmine Monitor Report 2008*, p. 53.

¹⁴ The 14 countries with demining casualties included Afghanistan, BiH, Cambodia, Croatia, Cyprus, Iran, Iraq, Lebanon, Mozambique, Nicaragua, Sri Lanka, Sudan, Tajikistan, and Yemen.

In **Lao PDR, Nepal, Somaliland, and Yemen**, the percentage of female casualties was significantly higher than the 2008 average, because certain livelihood activities that women typically engage in put them at higher risk. For example, in **Yemen** women traditionally tend the animals or collect water, food or wood. In both **Lao PDR** and **Nepal**, women are more extensively involved in scrap-metal collection or related activities.

Children accounted for 28% of casualties where the age was known (1,184 of 4,214). For some 19% of people, no age information was known (983). For civilian casualties only, children constituted 41% of casualties where the age was known.¹⁵ Nearly three-quarters of child casualties were boys (869) and 193 were girls; the gender of 122 child casualties was not known. In an increasing number of countries and areas, boys were the single largest casualty group: **Chad, El Salvador, Eritrea, Jordan, Lao PDR, Nepal, Somalia, Somaliland, Sudan, and Yemen**

(compared to just three countries in 2007: **Chad, Kosovo, and Lao PDR**). In **Afghanistan**, nearly half of all civilian casualties were boys, a significant increase compared to 2007.

For all adult casualties, 93% were men (2,828 of 3,030), but less than half of these men were civilians (1,358 or 48% of adult male casualties). Some 5% of casualties were women (164), including 137 civilians (84% of adult female casualties).¹⁶

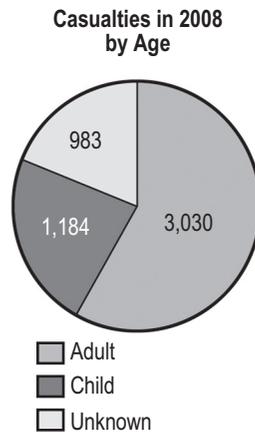

Devices causing casualties

In more than one-quarter of cases, the device that caused the casualty was unknown (1,342). For the 3,078 cases where the device type was known:¹⁷

- antipersonnel mines caused 715 casualties (23%), a decrease compared to 25% in 2007;
- antivehicle mines caused 440 casualties (14% up from 13% in 2007);
- unspecified mines caused 486 casualties (16% up from 11% in 2007);
- cluster munitions caused 125 casualties (4% down from 5% in 2007);¹⁸
- other ERW caused 1,227 casualties (40% up from 36% in 2007); and
- victim-activated IEDs caused 80 casualties (below 3%, down from some 10% in 2007).¹⁹

ERW casualties (excluding those caused by cluster munitions) occurred in 49 states/areas, antipersonnel mines casualties in 31 countries, antivehicle mines casualties in 19, victim-activated IEDs in 10, and cluster munitions casualties in nine.

Where age was known, most antipersonnel mine casualties were adults (80%).²⁰ Nearly all adult antipersonnel mine casualties were men (94%), including 54 deminers. Civilians were most affected by antipersonnel mines in **Cambodia, Myanmar, and Pakistan**. Similarly, most casualties caused by antivehicle mines were adults (88%), and 95% of these were men. Civilians traveling were at particular risk from antivehicle mines in **Afghanistan and Pakistan**.

¹⁵ This equals 1,040 civilian child casualties of 2,566 civilian casualties where the age was known. In addition to this there were a few child soldier casualties and several children for whom the civilian/military status could not be determined.

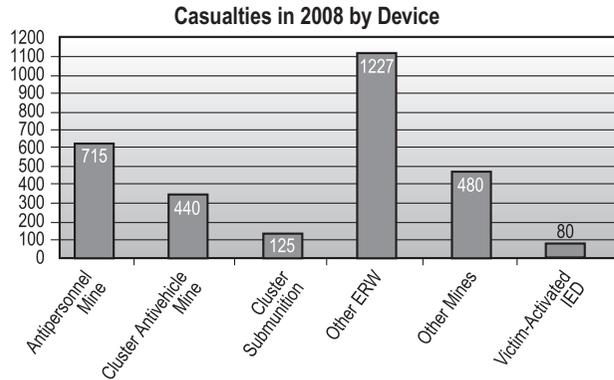

¹⁶ For 38 adults no gender details were known.

¹⁷ As in all previous years, casualties from Colombia (777) were also excluded, because casualties are incorrectly labeled as caused by antipersonnel mines.

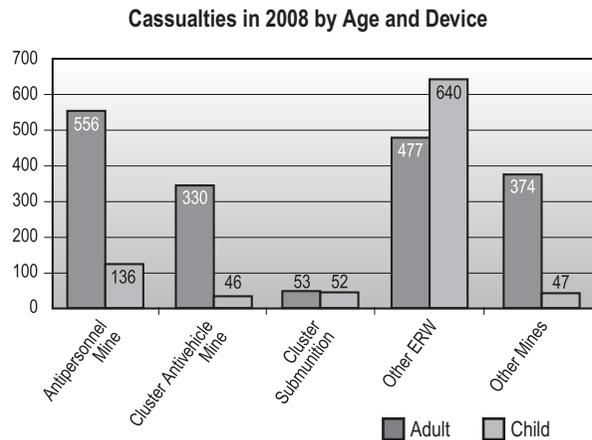

¹⁸ As in all previous years, this does not include direct casualties from cluster munition strikes.

¹⁹ An additional five casualties were caused by an IED that was vehicle-activated, thus functioning as an antivehicle mine.

²⁰ 556 of the 692 antipersonnel mine casualties whose age was known.

As in previous years, cluster munitions were the only device type where the child-adult ratio was 50-50. **Lao PDR** was the only severely affected country where children constituted the largest group of cluster munition casualties. In **Cambodia**, which is less-affected by unexploded submunitions than Lao PDR, children also made up the largest group of cluster munitions casualties.

When looking at ERW other than cluster munitions, the majority of casualties were children (57%).²¹ When the gender was known, some 45% of ERW casualties were boys, 42% men, 9% girls and 4% women. Boys were particularly affected by ERW in **Afghanistan, Cambodia, Chad, Eritrea, Lao PDR, Nepal, Sudan, and Yemen**.

Activity at time of incident

While in many cases crucial information about the activities being carried out by casualties at the time of the mine/ERW incident is lacking, Landmine Monitor was able to collect this type of information for 3,617 (or 70%) of the casualties it identified. Due to the large percentage of military casualties, “security” was the most common type of activity (1,305), although security

²¹ 640 of 1,117 ERW casualties where the age was known, excluding cluster munitions.

forces were also involved in incidents, for example while traveling, carrying out clearance, tampering with devices, and handling devices.

The second most common activity at the time of incidents was traveling (516), most often caused by antivehicle mines (44%) or antipersonnel mines (23%).

This was followed by tending animals (247), standing near/passing by during an incident (207), playing/recreation (197) and collecting food/wood/water (182). All livelihood activities combined resulted in 651 or 18% of casualties for whom activity information is known;²² 92% of those carrying out livelihood activities were civilians (602). Some 56% of casualties occurring during livelihood activities were adults and 44% were children. Most livelihood casualties were caused by mines (311), usually antipersonnel mines (210). But children were much more at risk from ERW during livelihood activities. These figures exclude those deliberately dealing with explosive devices for economic gain.

Activities involving people who, intentionally or unintentionally, interact directly with explosive devices caused 452 casualties. These include 188 people tampering, 145 people handling explosive devices (excluding demining accidents), 88 people collecting scrap metal, 29 playing and two burning explosive devices. It needs to be noted that many casualties among those fishing or tending animals probably also involved deliberate handling of explosive devices. This could explain why children were at more risk from ERW than from mines while conducting livelihood activities. Three-quarters of casualties in which the device was handled were caused by ERW, and casualties were usually male (85%). The largest casualty group was boys (45%), followed by men (40%), girls (10%), and women (5%). Boys are particularly at risk in **Cambodia** and **Nepal** (where girls were also at high risk). Scrap metal collection became an increasing problem among men in **Egypt**.

Other activities causing casualties were coca eradication (68 in **Colombia**) and portering/forced labor (eight in **Myanmar**).

Regional distribution

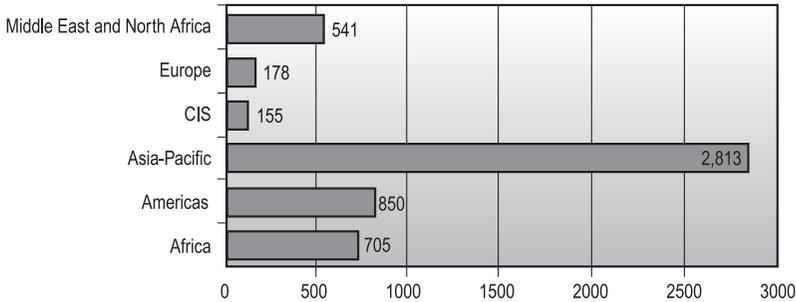

Casualties were recorded in every region of the world in 2008 (see table below). There were significant increases in the Asia-Pacific region and in the Commonwealth of Independent States (CIS).

Region	2008		2007	
	No. of casualties	No. of countries/ areas with casualties	No. of casualties	No. of countries/ areas with casualties
Africa	705	20	954	24
Asia-Pacific	2,813	17	2,495	15
Americas	805	5	982	7
Commonwealth of Independent States	155	10	118	10
Europe	178	9	238	9
Middle East and North Africa	541	14	686	13

The 26 States Parties responsible for significant numbers of survivors accounted for 55% of total casualties in 2008 (2,867) and just two of these countries (**Afghanistan** and **Colombia**) accounted for 34% of total casualties (1,769).

²² This increases to 28% when excluding the casualties resulting from "security" activities from the total number of casualties where the activity at the time of the incident is known.

Casualties in 2008 by Region

In 2008, 35 countries recorded increased casualties compared to 2007, in some cases significantly, for example in **Egypt** (40 up from 25), **Iraq** (263 up from 216), and **Pakistan** (341 up from 271).

- **Afghanistan** also saw the first increase in casualties since 2005 making it the country with the highest number of casualties in 2008 (992 up from 842).
- In **Georgia** casualties increased due to the 2008 conflict (to 26 up from three the previous year).
- In **Myanmar** the increase was due to access to information about military casualties (721 up from 438).
- In 37 countries there were fewer casualties in 2008 than in 2007, for example in **Chad**, **Nepal**, and **Vietnam**.
- **Cambodia** continued the downward trend started in 2006 (269 down from 352 in 2007); the 2008 rate is only 31% of the 2005 rate when 875 casualties were recorded.
- In **Colombia** the decline in casualties started in 2007 continued (777 down from 904), the first time since 2005 that it is not the country with the most casualties.
- In **Lebanon**, for the first time since the 2006 conflict, casualties returned to levels similar to 2005 (28 down from 130 in 2007 and 207 in 2006).
- In many other countries, however, decreased casualty rates were at least partly attributable to worse data collection, for example in **Burundi**, **Ethiopia**, and **Namibia**.²³

Trends in States with 100 or More Casualties in 2008

State	Casualties in 2008	Casualties in 2007
Afghanistan	992	842
Colombia	777	904
Myanmar	721	438
Pakistan	341	271
Cambodia	269	352
Iraq	263	216
Chad	131	188
Somalia	116	74
Lao PDR	100	100
Turkey	100	101

²³ In three countries (Israel, Lao PDR, and Syria) there were just as many casualties in 2008 as in 2007.

New casualties in 2009

Casualties continued to be recorded in 2009, in at least 59 countries and areas as of September 2009, including three countries where no casualties had been recorded in 2008 (**Albania**, **Japan**, and **Uzbekistan**).²⁴ In **Chechnya**, **Guinea-Bissau**, and **Western Sahara** the recorded totals were almost as high or higher than the annual total for 2008.

Data Collection

In 1999, Landmine Monitor noted that, “Concrete information on mine victims remains difficult to obtain” and “seriously lacking.”²⁵ In 1999, most available information was patient information from ICRC rehabilitation programs, thus not actual casualty data. Landmine Monitor also noted that data collection methods “can do more harm than good if they proliferate and are not closely linked to action that is tangible to the survivor community.”²⁶

In 2009, it is accepted that comprehensive casualty data is crucial to understanding the scope of the challenges and the needs of survivors. The main purpose of casualty (and service) data collection is its use for planning purposes, not only for victim assistance but also other mine action tasks (such as clearance and mine/ERW risk education).

While data collection has improved since 1999, Landmine Monitor has reported consistently throughout the decade that mine/ERW casualties are certainly under-reported because of inadequate data collection mechanisms, inaccessible terrain, conflict, under-reporting of fatal casualties, fear, or political sensitivities.

Still, 28 of 75 countries/areas with casualties in 2008 did not have formal data collection mechanisms, including some with persistently high casualty figures, for example **Iran**, **Myanmar**, and **Pakistan**, or to a lesser extent **Algeria**, and **Uganda**. These 28 countries accounted for 1,408 casualties in 2008 (or 27% of the total—up from 25% in 2007 and 19% in 2006), which Landmine Monitor mainly identified through media reports. The remaining 47 countries/areas had data collection systems, and 29 of these used the Information Management System for Mine Action (IMSMA) to store data collected.²⁷

However, even when data collection mechanisms existed, these were incomplete in the vast majority of countries (43). Only in **Cambodia**, **Jordan**, **Kosovo**, and **Tajikistan** could casualty data for calendar year 2008 be considered “complete.” These accounted for 306 casualties (6%) in 2008, meaning that 94% of casualties in 2008 were recorded in countries with incomplete or no data collection (up from 93% in 2007 and from 92% in 2006). Another country with complete data collection, **Albania**, recorded casualties in 2009. Through media, hospital or NGO information, Landmine Monitor identified additional casualties that were not recorded in 28 of the 47 countries with data collection mechanisms in 2008 (955 or 18% of total casualties).

When data collection mechanisms exist, the most common problems were: limited geographic and demographic coverage; a lack of standard methodology, terminology or types of information collected; a lack of useful detail on devices, demographics, socio-economic indicators, or activities; a lack of capacity impeding proactive data collection; poor quality control and verification; and multiple actors collecting overlapping and contradictory data in separate databases. Further problems are that casualty data is insufficiently linked to contamination or

²⁴ In 2009, Landmine Monitor identified five new ERW casualties, one killed and four injured in two incidents in Okinawa, Japan. Three of these casualties occurred on 24 March 2009, in the worst incident since 1974. A US marine was killed and another marine and sailor were injured while disposing of ordnance at an US military facility. Eric Talmadge, “60 years after Second World War, Okinawa still rife with bombs,” *The Canadian Press*, 3 May 2009.

²⁵ See *Landmine Monitor Report 1999*, p. 19.

²⁶ *Ibid.*, p. 20.

²⁷ In comparison *Landmine Monitor Report 2003*, p. 40, reported that, “Of the 65 countries, and seven areas, reporting new mine casualties in 2002–2003, only 25 countries and four areas report using IMSMA, or other databases, to record casualty data. Of those, only 18 countries and two areas provided Landmine Monitor with full year data.”

victim assistance data, data is not shared for planning purposes or linked to referral mechanisms, resulting in data collection for compilation purposes rather than the provision of assistance.

Conclusion

Although recorded casualties have decreased significantly over the past five years, the number remains unacceptably high—there were still more than 5,000 recorded casualties in 2008. This is a far cry from the common estimate of 26,000 per year in the 1990s—even if it is not possible to gauge the accuracy of that estimate. For we will never know exactly how many people were killed or injured by mines or ERW returning to Afghanistan, gathering food in Angola, or growing rice in Cambodia. What is certain is that casualty data collection still remains inadequate in many countries. It is a fundamental responsibility of states to assist those most directly affected by mines and ERW, and a pre-requisite to such assistance is an accurate determination of the number of survivors as well as the dependants of those who did not survive.

RISK EDUCATION

1999–2009 Overview

Mine and explosive remnants of war risk education (RE) has evolved significantly since the Mine Ban Treaty entered into force in 1999 as many programs have shifted from a purely message-based approach towards efforts to bring about broader behavior change and risk reduction. Overall, there has been a marked—though not universal—shift from “mine awareness” in 1999 to “mine/ERW risk education” in 2008.¹ Influencing risk-taking behavior is very challenging, however, as it is often related to complex economic, cultural, and social factors.

RE seeks to reduce incidents caused by mines, victim-activated improvised explosive devices, and explosive remnants of war (ERW).² When done well, RE involves a combination of actions: raising awareness of the threat, working with communities to identify ways to reduce risk and promote behavior change, providing information to clearance operators (and sometimes even contributing to demining prioritization), identifying development interventions to reduce risk, and contributing to victim assistance by supporting casualty data collection and providing information to survivors about services.

Broader risk reduction approaches were identified within RE programs in at least six states in 2008 (**Angola, Cambodia, Colombia, Lao PDR, Sri Lanka, and Vietnam**). In these states, programs worked with communities to explore alternative behaviors, improve input into clearance decision-making, and link with other development sectors to decrease the impact of mines and ERW. Similarly, the support of RE to mine action through community liaison has increased. In **Vietnam**, it has made clearance more efficient, and in **Angola** it has contributed to land release.

Effective programs are based on a solid understanding of the target groups for RE, and why they are at risk.³ According to Landmine Monitor’s review, thorough analysis has unfortunately been lacking in almost all RE programs. Indeed, in 2008 in at least 26 states and areas, RE programs were still being implemented without comprehensive needs assessments.⁴ In **Afghanistan**, for instance, which has the world’s oldest mine action program, a European Union evaluation in 2008 found that RE was not based on a good understanding of the target audience.⁵

Risk Education in 2008

In 2008, RE was provided in 57 states and areas, compared to 61 states and areas in 2007. RE activities increased significantly in **Yemen and Somaliland**, and also increased to some degree in 10 other states.⁶ In **Palestine**, RE decreased in 2008 but rose sharply in response to conflict in Gaza in December 2008–January 2009.

¹ The term “education” reflects a change from simple awareness-raising of the threat—people in affected areas are often already aware there is a problem—to engaging with communities in a dialogue about the problem and possible solutions.

² The reference to ERW as well as mines recognizes the fact that UXO or abandoned explosive ordnance causes as many, if not more, casualties than mines in most affected states/areas.

³ For instance, a 2006 study by MAG and UNICEF in Lao PDR challenged the common assumption that people engage in dangerous livelihood activities through lack of choice, and found that: “[W]hile contributing factors of voluntary exposure were often rooted in poverty, it was rarely perceived by communities or individuals as the only option. More commonly, intentional UXO risk-taking was found to be based on a rational decision-making process involving weighing the potential costs and benefits of a range of available options.” Jo Durham, “Needs Assessment in Lao PDR,” *Journal of Mine Action*, Issue 11.1, Summer 2007.

⁴ No needs assessments have been conducted in the last three years in the following states and areas: Abkhazia, Afghanistan, Azerbaijan, DRC, Croatia, Egypt, Iran, South Korea, Mauritania, Nagorno-Karabakh, Pakistan, Peru, Russia, Senegal, Somaliland, Syria, Thailand, Uganda, Western Sahara, Yemen, Zambia, and Zimbabwe. Needs assessments were conducted in only limited geographical areas in Chad, Iraq, Mozambique, and Somalia.

⁵ Paul Davies and Bruce Todd, “Mid Term Evaluation of the Mine Action Programme in Afghanistan – Final Report,” EU Programme for Afghanistan, April 2009, p. 62.

⁶ Ten states with increased RE included: BiH (though it still represented a decrease from 2006), DRC, Cyprus, Eritrea, Guinea-Bissau, Jordan, Mali (in response to an incident), Peru, Tajikistan, and Somalia.

States and other areas with RE in 2008

Africa	Americas	Asia-Pacific	Europe	Commonwealth of Independent States	Middle East and North Africa
Angola	Colombia	Afghanistan	Albania	Armenia	Algeria
Burundi	Ecuador	Cambodia	Bosnia and Herzegovina (BiH)	Azerbaijan	Egypt
Chad	El Salvador	Lao PDR	Croatia	Georgia	Iran
Congo, Democratic Republic of (DRC)	Nicaragua	Myanmar/Burma	Cyprus	Russia	Iraq
Eritrea	Peru	Nepal	Poland	Tajikistan	Jordan
Ethiopia		Sri Lanka	Kosovo	Abkhazia	Lebanon
The Gambia		Thailand		Nagorno-Karabakh	Syria
Guinea-Bissau		Vietnam			Yemen
Kenya		Taiwan			Palestine
Mali					Western Sahara
Mauritania					
Mozambique					
Rwanda					
Senegal					
Somalia					
Sudan					
Uganda					
Zambia					
Zimbabwe					
Somaliland					
19 states, one area	Five states	Eight states, one area	Five states, one area	Five states, two areas	Eight states, two areas

A decrease in RE due to reduced funding or capacity was reported in 10 states.⁷ Activities decreased in several states and areas in line with a reduced need for RE: **Abkhazia, Burundi, Kenya, Nagorno-Karabakh, and Nicaragua**. In **Mozambique** the number of RE beneficiaries reportedly decreased, but there was greater integration of RE activities with clearance activities.

⁷ Ten states with decreased RE due to funding or capacity included: Angola, Chad, Chile, El Salvador, India, Mauritania, Sri Lanka, Thailand, Zambia, and Zimbabwe.

There were no RE programs in several states, although contamination and casualty data indicated that there was probably a need: **China, Republic of the Congo, India, North Korea, Kuwait, Libya, Philippines, Rwanda, and Turkey.** In **Myanmar**, several needs assessments have been conducted in the past few years, but only limited RE activities have been undertaken due to the ongoing conflict.

In most other states and areas, the level of RE remained the same as in 2007, or data for 2008 were not available for comparison.

Risk education targeting

Information about who is at risk, and why, should be analyzed from contamination data, casualty data, landmine impact surveys, and knowledge, attitude, and practice (KAP) surveys. Casualty data has shown that the overwhelming number of incidents result from engagement in livelihood activities, particularly farming, herding, and collecting food, fuel, water, building materials, and scrap metal for sale. Scrap metal collection was reported as a risk activity in at least 14 states and areas.⁸ In **Lao PDR** it caused 32% of casualties in 2008.

Traveling (including crossing borders, sometimes illegally, as in **Greece and Thailand**) results in casualties, as does tampering either to defuze ordnance or because of curiosity, particularly among children and young adults. The majority of casualties were men, although in some states women and children made up a significant proportion of casualties (see Casualty data section above).

Refugees and internally displaced persons (IDPs) are particularly vulnerable, whether in the place they are displaced to, while traveling, or on their return home. In 2008, RE programs targeting refugees and IDPs were reported in at least 19 states.⁹ In 2008, in **Cyprus and Greece**, illegal immigrants became mine casualties.

People are also at risk when hazardous areas are unmarked, or where marking is inadequate or not maintained, as is the case in a large proportion of states, for example in **Angola and Turkey.** Areas contaminated by cluster munition remnants, such as in south **Lebanon**, are very difficult to mark.

In many states, needs assessments, including KAP surveys, are conducted as part of ongoing information-gathering during RE activities. In 2008, assessments and surveys for nine states were made available to Landmine Monitor: in Cambodia, Eritrea, Ethiopia, northern Iraq, Nepal, Pakistan, Serbia, Somalia, and Vietnam. Only three—**Ethiopia, Nepal, and Somalia**—suggested that people lacked awareness or knowledge.¹⁰ Most research found that people were generally aware of the risks posed by mines/ERW but still engaged in dangerous behavior.

In **Serbia**, for instance, high-risk behavior was reported in more than 90% of surveyed contaminated areas. According to a 2009 report by Norwegian People's Aid (NPA), inhabitants of affected communities "seem to underestimate the threat" from unexploded submunitions.¹¹ The "frequency of incidents is such that the probability of activating unexploded submunitions will rise with the growing needs of the population to use the blocked land."¹²

In northern **Iraq**, a UNICEF/Handicap International (HI) survey said that general knowledge about mines and UXO was good and most affected people had participated in at least one RE session. Even so, some of their knowledge was still rather superficial (for example about marking signs and evacuation procedures from a minefield) and some impacted villages had not yet received RE. In some districts women were usually "less knowledgeable" than males

⁸ Scrap metal collection was reported in: Albania, Algeria, BiH, Egypt, Georgia, Iraq, Jordan, Kosovo, Lao PDR, Palestine, Sri Lanka, Uganda, Vietnam, and Yemen.

⁹ There were RE programs for IDPs and refugees in: Afghanistan, Croatia, DRC, Eritrea, Ethiopia, the Gambia, Georgia, Greece, Iraq, Kenya, Kuwait, Philippines, Rwanda, Senegal, Somalia, Sri Lanka, Sudan, Uganda, and Zambia.

¹² Ibid, p. 48.

(but also less exposed to the risk). Children, thanks to the schools program, were usually “more knowledgeable” than adults.¹³

Methods of implementing risk education

Although there has been an increase in integrated efforts, RE in 2008 often focused on the dissemination of simple messages about the threat, rather than an integrated effort to reduce risk-taking behavior. These messages continued to be delivered in a number of ways: by teams hired for the purpose; community-based methods, through the training of community leaders, religious leaders, or churches; integration into the school curriculum; mass media; and the distribution of materials.

While most programs acknowledged the importance of ‘communication-for-behavior-change’ within a broader risk reduction strategy, only a minority was able to turn theory into practice during 2008. **Angola** used a solution-based methodology in which NGOs worked with community focus groups to discuss the mine/ERW problem and identify solutions. Participatory rural appraisal techniques such as community mapping and seasonal calendars were applied. **Cambodia** used livelihood/integrated mine action approaches, law enforcement, and monitoring of the scrap metal trade to reduce risk.

In **Colombia**, the ICRC and Colombian Red Cross conducted risk reduction activities to ensure communities had safe access to important resources such as water, schools and agricultural land. **Lao PDR** adopted a behavior-change-communication approach in 2008 based on discussions of options and minimizing risk for intentional adult risk takers. A foundry project implemented by the Mines Advisory Group (MAG) in Lao PDR conducted safety training for scrap metal collectors. In **Sri Lanka**, RE teams acted as a link to emergency relief agencies. In **Vietnam**, the Golden West Humanitarian Foundation launched a project to reduce the risk of scrap metal collection by setting up 28 “safe holding areas.”

In at least 24 states and areas, community liaison, particularly links between affected communities and demining, was reported to take place.¹⁴ The level and type of links varied from country to country. In **Angola**, for example, RE organizations liaised closely with provincial mine action centers and provided information to communities on how to report contamination and casualties. MAG’s community liaison teams were mainly engaged in survey in support of land release and impact assessments. In **BiH**, Community Integrated Mine Action Plans involved communities in decision-making. In **Vietnam**, MAG reported that its community liaison capacity, established in late 2007, had led to an improvement in clearance productivity by approximately one-quarter, as a result of improved quality of information and trusted reporting structures developed with stakeholders.¹⁵ At least four states operated hotline numbers for civilians to report contamination.¹⁶

About half of all RE programs in 2008 could be described as community-based.¹⁷ Community members, often volunteers, were trained (usually by NGOs, but also by national authorities) to disseminate RE messages, and often to act as mine action focal points, providing information about contamination and casualties, and sometimes feeding into local priority-setting. Some programs included child-to-child methods.¹⁸ In at least 15 states and areas, the national Red

¹³ UNICEF/HI, “MRE Knowledge, Attitudes and Practices Survey in Northern Iraq 2008: Impact Monitoring Report,” 2008, p. 76.

¹⁴ The 24 states/areas with some form of community liaison were: Abkhazia, Albania, Angola, Azerbaijan, BiH, Burundi, Cambodia, Chad, DRC, Eritrea, Ethiopia, Iraq, Jordan, Kosovo, Lao PDR, Lebanon, Mozambique, Senegal, Sri Lanka, Somaliland, Sudan, Uganda, Vietnam, and Yemen.

¹⁶ Examples of states with hotlines for civilians: Ecuador, Georgia, Guinea-Bissau, and Vietnam.

¹⁷ States/areas with community-based RE programs: Afghanistan, Albania, Angola, Azerbaijan, BiH, Burundi, Cambodia, Chad, Colombia, DRC, Ecuador, Guinea-Bissau, Iraq, Jordan, Lebanon, Lao PDR, Mozambique, Nepal, Senegal, Somalia, Sri Lanka, Somaliland, Sudan, Tajikistan, Thailand, Uganda, Yemen, and Zimbabwe.

¹⁸ Child-to-child methodology uses children and youth as a resource in RE.

Cross and Red Crescent societies delivered RE and engaged in mine action through their volunteer networks.¹⁹

RE was implemented directly by the mine action centers in only a few cases, and then often by military personnel.²⁰ In several states the army and police were involved in the dissemination of RE messages. In a small number of cases, RE was also reported to be conducted alongside clearance by the clearance teams themselves:²¹ in **Moldova** and **Poland** this was the only type of RE provided.

In **Vietnam**, district mobile communication teams operating in 2008 were funded by UNICEF, and while a UNICEF evaluation commended the project as an innovative experiment, it concluded that the project was “not a cost effective, efficient or appropriate vehicle for disseminating messages to the public.”²²

School-based RE is an effective way of reaching many children, and integrating RE into existing structures can make it more cost effective and sustainable. By 2008, RE had been integrated into the curriculum in 13 states and areas²³ and was conducted in schools in at least 15 other states and areas.²⁴ However, school-based RE has its limitations and, therefore, cannot be used as the sole tool for RE. School-based RE is essentially a one-way provision of information and in some states children are not even the primary target group, based on analysis of risk. In **BiH** school-based RE did not appear to be fully functional, and in **Vietnam** UNICEF found that results in schools without RE in the curriculum were indistinguishable from those where it was included. In some states efforts to integrate RE fully into the curriculum were unsuccessful, due to a lack of resources or commitment from education ministries (though some school-based RE was still conducted).²⁵

RE messages were sometimes integrated with other non-mine action messages and other sectors: in **Sri Lanka** with child protection messages; in **Nepal** as part of a social mobilization program; in **Angola** with HIV/AIDs messages; in **Senegal** with child protection and stress management/conflict prevention; in **Afghanistan** with disability advocacy; and in a number of states with small arms and light weapons (SALW) messages.

Emergency risk education

Emergency RE was conducted during and after conflict in 2008 in **Chad**, **Georgia**, **Somalia**, and **Sri Lanka**, and in early 2009 in Gaza. Other states that reported emergency RE were **Nepal** and the **DRC**.

Legal obligations to provide risk education

Article 6(3) of the Mine Ban Treaty calls on each State Party “in a position to do so” to provide assistance for mine awareness programs. There is no specific requirement on affected states to provide RE to those at risk.²⁶ The Convention on Cluster Munitions provides stronger support

¹⁹ Red Cross and Red Crescent RE activities in: Afghanistan, Albania, Angola, Azerbaijan, BiH, Cambodia, Colombia, Croatia, Iran, Iraq, Jordan, Kyrgyzstan, Nepal, Tajikistan, and Western Sahara (Moroccan Red Crescent Society).

²⁰ Mine action center RE in: Chad, Eritrea, northern Iraq, Thailand, Yemen, and Zimbabwe.

²¹ RE alongside clearance in, for example, Albania, Azerbaijan, Burundi, Ethiopia, and Mozambique.

²³ RE integrated into curriculum in: Afghanistan, Azerbaijan, BiH, Cambodia, Chad (in 2009), Eritrea, Lao PDR, Mozambique, Nagorno-Karabakh, Nepal (in 2009), Sudan, Vietnam, and Zambia.

²⁴ RE conducted in schools in: El Salvador, Georgia, Guinea-Bissau, Iran, Iraq, Kosovo, Mauritania, Nicaragua, Palestine, Peru, Poland, Senegal, Syria, Thailand, and Uganda.

²⁵ Efforts to integrate RE into curriculums were not successful in: Albania, Angola, Belarus, Sri Lanka, and Tajikistan.

²⁶ The July 2009 draft of the Cartagena Action Plan to be adopted by the Second Review Conference of the Mine Ban Treaty called on States Parties to: “Provide mine risk reduction and education programmes to communities at risk that are in coherence with national standards and the International Mine Action Standards, age-appropriate and gender-sensitive, tailored to their needs, and integrated into education systems, mine action, relief and development activities.” “A Shared Commitment, Draft Cartagena Action Plan 2010 – 2014, Ending The Suffering Caused By Anti-Personnel Mines,” Geneva, 17 July 2009, p. 4, Action 18.

for programs in areas affected by unexploded submunitions; it specifically obliges affected States Parties to conduct “risk reduction education to ensure awareness among civilians living in or around cluster munition contaminated areas of the risks posed by such remnants,” taking into consideration the provisions of Article 6 on international cooperation and assistance.²⁷ In conducting RE, States Parties are also required to take into account international standards, including the International Mine Action Standards (IMAS).²⁸

Measuring the impact of risk education

Evaluations of RE programs were conducted in at least six states in 2008,²⁹ and several needs assessments also provided information on the effectiveness of RE programs. All evaluations recommended a greater focus on behavior change interventions and less emphasis on conventional information dissemination, with a better understanding of the target audience as none of the programs in question were assessed as doing this effectively or sufficiently. Other recommendations included better planning, implementation of standards, making RE sustainable, and using lessons learned from elsewhere.

According to a joint article by UNICEF and the Geneva International Centre for Humanitarian Demining (GICHD), “as with all mine-action activities, [for RE] distinguishing between outputs and outcomes has proven elusive.”³⁰ In other words it is easier to measure the number of people attending RE sessions, or the number of posters distributed, than it is to measure behavior change or whether RE is the determining factor in a reduction of casualties. Several evaluations reported that although it is difficult to measure the impact in a short period of time, the projects had resulted in behavior change. However, a review by Landmine Monitor of RE programs over the last 10 years provides next to no examples of where baseline data on knowledge, attitudes, and practice has been collected and then used as an indicator of change.³¹

In many states, statements were issued in 2008 to the effect that RE has contributed to the reduction of incidents.³² Yet a correlation between casualty figures and RE activities, while an important indicator, is not sufficient alone to show the effectiveness of an RE program, as other factors may result in a reduction in casualties such as clearance, community awareness through the occurrence of incidents, or population movements. The Centre for Community Empowerment’s (CECEM) RE evaluation in **Vietnam** in 2008 admitted that “it is difficult to determine causality of association between UNICEF’s MRE program and its project aim of reducing the incidence and severity of injuries caused by UXO/landmines,” but believed that “UNICEF can claim due credit for contributing towards a decline in mortality and morbidity rates linked to UXO/mines in recent years.”³³ In **BiH**, however, neither of two major evaluations in 2007 identified a causal relationship between RE implementation and casualty rates.³⁴

While beneficiary numbers are useful to show the extent of RE activity, alone they do not provide an indicator of its effectiveness. They say nothing about the quality of RE and whether it is targeted to at-risk groups, and are usually not compared with the number of people at risk. Moreover, it is very difficult to gather accurate beneficiary numbers, particularly when,

²⁷ Article 4(2)(e), Convention on Cluster Munitions. Article 6 provides that “each State Party in a position to do so shall provide assistance... to identify, assess and prioritise needs and practical measures in terms of...risk reduction education...as provided in Article 4 of this Convention.”

²⁸ Article 4(3), Convention on Cluster Munitions.

²⁹ There were evaluations in: Afghanistan, Cambodia, Colombia, DRC, Lao PDR, and Vietnam.

³⁰ Sharif Baaser, Eric M. Filippino, and Hugues Laurence, “Mine-risk Education in Mine Action: How is it Effective?” *The Journal of ERW and Mine Action*, Issue 13.1, Summer 2009, p. 45.

³¹ This is partly because evaluations often recommend better data collection, as there often was no baseline information to work with. Additionally, even if information is contained in assessments or surveys, it is often not updated systematically to reflect changes in information so that it remains useful for planning.

³² In the following states the national authorities and/or RE operators made statements in 2008 to the effect that RE had resulted in a reduction in casualties, or this statement was made in evaluations: Afghanistan, Albania, Chad, Ecuador, the Gambia, Georgia, Jordan (though overall there was an increase in ERW casualties in 2008), Mozambique, Nicaragua, Russia, Rwanda, Senegal, and Sri Lanka.

³³ CECEM, “UNICEF Vietnam Support to Mine Risk Education,” Evaluation report (draft), 20 August 2008, p. iv.

³⁴ See *Landmine Monitor Report 2008*, p. 170.

as is usually the case, RE is conducted through community volunteers or integrated in other institutions, such as schools or the health sector. A much better indicator of the effectiveness of RE is the extent of reporting of contamination by the public. In several states this was noted as a positive indicator for the RE programs.³⁵

Risk education coordination, management, and capacity-building

In the overwhelming majority of concerned states and areas, RE in 2008 was managed and coordinated by national authorities. In a small handful, UNICEF was the *de facto* coordinator, or played a significant role in coordination and management.³⁶ In Somalia, UNDP and the Swedish Rescue Services Agency managed RE.

In some states technical advisors were placed with the national authorities by the UN or an NGO.³⁷ The ICRC provided support to the many national Red Cross and Red Crescent societies conducting RE. In at least nine other states, UNICEF, the ICRC and international NGOs provided some capacity-building support through coordination meetings and funding.³⁸

Other methods of capacity-building included study visits (for instance, UNICEF supported Iraqi managers to visit Cambodia, and Eritrean managers to visit Kenya). International organizations provided short courses or training workshops to mine action centers and NGO personnel.³⁹ In a number of states, international NGOs partnered with national NGOs to build capacity, as in Angola, the DRC, and Vietnam.

The provision of international expertise, however, does not guarantee that best practices based on lessons learned over 10 years of RE are being put in place. Thus, an International Mine Risk Education Advisory Group was set up in 2008 to help disseminate best practices, and it had met twice by August 2009. New resources developed for use at an international level include the “Mine and ERW Risk Education: a project management guide” by GICHD in November 2008 and an “Emergency Mine Risk Education Resource Kit” developed by UNICEF in 2008.⁴⁰

The IMAS for RE were under revision as of September 2009. In 2008, the IMAS or national standards were reported as being used in at least 12 states.⁴¹

Risk Education from 1999 to 2008

In 1999, RE programs were identified in just 14 states: Afghanistan, Angola, BiH, Cambodia, Colombia, Croatia, Iraq, Lao PDR, Lebanon, Mozambique, Nicaragua, Rwanda, Sudan, and Yemen. Other limited mine awareness activities, mainly material distribution and the delivery of messages through the mass media, were identified in a further 21 states and areas.⁴² Over the last ten years, the number of states where RE has been conducted has increased significantly, to 57 in 2008, as has the level of activity within these states.

The understanding of the most effective way of delivering RE has changed since 1999. Back then, the prevailing assumption was that incidents took place because people were unaware of the risk from mines and ERW. In 1999, Landmine Monitor stated that, “The local population must learn how to live their daily lives in mine and UXO infested areas until the threat is

³⁵ Reporting by the public was noted in, for example, Azerbaijan, Jordan, Nicaragua, and Sri Lanka.

³⁶ UNICEF had a key role in, for example, DRC, Iraq, Nepal, Palestine, Sri Lanka, Sudan, and Vietnam.

³⁷ For instance, in Lao PDR by MAG, Uganda by DDG, and in Eritrea and Jordan by UNICEF.

³⁸ There was UNICEF, ICRC, and NGO capacity-building in, for example, Angola, Chad, Columbia, Eritrea, Ethiopia, the Gambia, Guinea-Bissau, Lebanon, and Senegal.

³⁹ There were international organization courses in: BiH, Somalia and Sri Lanka.

⁴⁰ According to UNICEF, since its production the Emergency MRE Toolkit has been used to develop an MRE intervention in Gaza (2008–2009), Pakistan (2009), and by UNICEF in the Philippines (September 2009). Email from Judy Grayson, Senior Adviser, Landmines and Small Arms Cluster, Child Protection Section, UNICEF, 14 September 2009.

⁴¹ IMAS or national standards were used in: Afghanistan, Albania, Angola, BiH, Cambodia, DRC, Iraq, Jordan, Lao PDR, Sri Lanka, Uganda, and Zambia.

⁴² RE activities were also identified in: Albania, Belarus, Burundi, Costa Rica, Egypt, El Salvador, Ethiopia, Guatemala, Jordan, Namibia, Nagorno-Karabakh, Palestine, Senegal, Tajikistan, Thailand, Uganda, Vietnam, Western Sahara, the former Yugoslavia, and Zimbabwe.

removed.⁴³ In Cambodia, a significant number of people had received RE by 1999, but Landmine Monitor reported that, “it is evident given the number of accidents that result from tampering with mines that many people lack or have incorrect knowledge about the dangers of mines/UXO, especially children.”⁴⁴ The use of mass media and posters were highlighted as an important component of RE.⁴⁵

By 2000, Landmine Monitor stated that RE, “is a community-level education program that seeks to provide (or generate) viable alternatives to high-risk behavior to populations living or working in, or traveling through, mine-affected areas. It works best on the basis of two-way information exchange, learning from communities how they survive the daily threat of landmines and unexploded ordnance (UXO), and working cooperatively to identify how the risk of death and injury can be minimized. Mine awareness is frequently confused with public information about the effects of mines and UXO. Such information campaigns are extremely valuable but do not in a strict sense constitute mine/UXO awareness programs.”⁴⁶ Landmine Monitor emphasized the importance of needs assessments and the gathering of baseline data to understand the target audience,⁴⁷ and questioned the effectiveness of the use of mass media and posters.⁴⁸ This understanding of RE is the one that has prevailed over the last 10 years, and is the one reflected in the IMAS for Mine Risk Education (MRE) which were first released in December 2003. The number of programs that have adopted this approach has grown, though, as Landmine Monitor 2009 research has shown, many have failed to do so sufficiently.

The Future of Risk Education

In order for RE to effectively contribute to casualty reduction through behavior change, and to support clearance activities and victim assistance, a number of areas need to be strengthened. First and foremost, all RE programs that seek to be effective should be based on a thorough understanding of the needs of the target audience, and greater effort should be invested in needs assessments, not just to know activity at the time of incident, but to understand the reasons for risk-taking (economic, social, cultural), and how behavior change or risk reduction strategies can address this.

Greater efforts will need to be exerted to ensure best practices are put in place and to share lessons learned from RE programs across the world. International advisors should have the appropriate skills, experience, and expertise, and more effort should be made to transfer knowledge and experience across mine/ERW-affected states. New projects are frequently established that fail to take on the lessons learned in other programs. Good resources have been produced, and their use should be promoted.

For RE to become more effective in changing behavior, reducing risk, and reducing the number of casualties, programs need to be more systematically evaluated, using appropriate evaluation methodologies and indicators and, where recommendations are made, they should be implemented. Thus, evaluations in 2008 in **Cambodia, Eritrea, and Vietnam** recommended the implementation of behavior-change strategies. Other states and areas, which have not had adequate evaluations, would likely benefit from similar approaches.

While it is true that evaluating behavior change is very difficult, it must be acknowledged that the majority of programs have not made efforts to do this. Programs in at least 28 states and areas have not been evaluated for at least three years, including some dealing with significant mine and UXO problems such as **Angola, Iraq, Sudan, and Yemen**.⁴⁹

⁴³ See *Landmine Monitor Report 1999*, p. 22.

⁴⁴ *Ibid*, p. 403.

⁴⁵ *Ibid*, p. 23.

⁴⁶ See *Landmine Monitor Report 2000*, p. 33.

⁴⁷ *Ibid*, pp. 35–36.

⁴⁸ *Ibid*, pp. 34–35.

⁴⁹ Programs without evaluations for at least three years include: Angola, Azerbaijan, Croatia, Georgia, Iran, Iraq, Kosovo, Kyrgyzstan, Mauritania, Nagorno-Karabakh, Nepal, Palestine, Peru, Russia, Senegal, Somalia, Somaliland, Sudan, Thailand, Uganda, Western Sahara, Yemen, Zambia, and Zimbabwe. States with smaller RE programs that have not been evaluated in the last three years are: Ecuador, El Salvador, Nicaragua, and Syria.

In the next few years, the need for RE will probably decrease in most cases as a result of clearance, and stand-alone RE programs will no longer be required in many. Programs should increasingly look at integration into national structures to ensure sustainable and more cost-effective ways of implementing RE. This includes linkages with other messages, for example on SALW.

Finally, effective rapid-response emergency capacities need to remain in place. While conducting RE during conflict is challenging, a number of programs have been able to carry out emergency RE interventions with some success, such as in **Afghanistan** (2001–2003), **Sudan** (2005), **Nepal** (2006–2007), and **Gaza** (2008–2009).

VICTIM ASSISTANCE

During the Mine Ban Treaty's first decade, victim assistance (VA) has made the least progress of all the major sectors of mine action, with both funding and the provision of assistance falling far short of what was needed. This is despite the treaty's promise in Article 6.3 that, "each State Party in a position to do so shall provide assistance for the care and rehabilitation, and social and economic reintegration, of mine victims..."

At the First Review Conference in Nairobi in November–December 2004, States Parties reaffirmed their promise to do "their utmost" to assist survivors by agreeing to undertake a set of actions to improve services, strengthen coordination, and ensure participation of survivors in decisions that affect them from 2005–2009.¹ Yet, by May 2009, the co-chairs of the Standing Committee on Victim Assistance and Socio-Economic Reintegration indicated that this promise had not been fulfilled. According to the co-chairs, "The challenges faced in 2009 are to a large extent identical to those faced in 2004 and likely will be the same as those to be faced in 2014."²

Certainly, VA coordination has improved and there is greater awareness of survivors' needs, but service provision has not improved significantly, particularly in the last five years. While many survivors have received some form of assistance through the years, services have had too many gaps, and been too unsystematic and unsustainable to improve the living conditions of most in any lasting way. Most efforts remained focused on medical care and physical rehabilitation, often supported by international organizations and funding, rather than on promoting economic self-reliance for survivors, their families, and communities.

At the First Review Conference, States Parties agreed that 23 States Parties with significant numbers of survivors should make special efforts to meet their needs. Throughout 2005–2009, progress among these now 26 States Parties has been variable, with some countries actively engaging and others hardly at all. Progress was mostly visible in coordination aspects, rather than in implementation of actual services, even by those who made significant advances, as many of the so-called VA26's objectives related to data collection, strategies, awareness-raising, and coordination. Progress on activities was often unrelated to the plans the 26 countries set for themselves.

At the Second Review Conference in November 2009, States Parties are expected to renew, if not reinforce, their political commitment to "ensure the full and effective participation and inclusion" of the "victims."³ Yet these individuals—hundreds of thousands of men, women, and children across more than 120 countries—need more and better assistance, not more unfulfilled promises, and they need it now.

¹ "Ending the Suffering Caused by Anti-Personnel Mines: Revised Draft Nairobi Action Plan 2005–2009," APLC/CONF/2004/L.4/Rev.1, 5 November 2004, Actions 29–39. The 11 concrete actions include pledges to increase and improve medical, rehabilitation, psychosocial and economic reintegration services, as well as casualty data collection capacities and legal frameworks. Additionally, States Parties were called upon to allocate sufficient resources, include survivors and experts in relevant discussions, and report regularly on progress.

² Co-Chairs of the Standing Committee on Victim Assistance and Socio-Economic Reintegration, "Victim Assistance in the Context of the AP Mine Ban Convention—Priorities and challenges during the period 2010–2014," Geneva, 29 May 2009, p. 8.

³ "A Shared Commitment, Draft Cartagena Action Plan 2010–2014: Ending the Suffering Caused by Anti-Personnel Mines," Geneva, 17 July 2009, p. 4. Victim in this context means the directly-affected individuals, their families, and their communities.

Survivor Inclusion

According to the Nairobi Action Plan, States Parties need to “ensure effective integration of mine victims in the work of the Convention.”⁴ The draft Cartagena Progress Review notes that, “States Parties have come to recognise the importance of the inclusion and active participation of mine victims and other persons with disabilities” in VA.⁵

Drawing on lessons from the Mine Ban Treaty, the negotiation of the Convention on Cluster Munitions involved survivors more extensively, contributing to stronger VA obligations. Many States Parties to the Mine Ban Treaty have joined the UN Convention on the Rights of Persons with Disabilities, in which participation of persons with disabilities was underscored by the call “nothing about us without us.” In practice, however, only a few Mine Ban Treaty States Parties (for example, **Afghanistan, Albania, Tajikistan, and Uganda**) have fulfilled their commitment to involve survivors in planning, implementation, and monitoring of VA activities at local, national, regional, or international levels.

From 2000–2001, “raising the voices of landmine survivors” was one of the key themes at intersessional Standing Committee Meetings. In 2003–2004, Croatia, as co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration, encouraged the participation of survivors in State Party delegations to improve coordination with civil society and was one of very few delegations to Meetings of States Parties to regularly include a survivor from 2005–2009.

Most survivors participating in international meetings were sponsored by civil society, such as the Raising the Voices program run by Landmine Survivors Network and its successors, or the ICBL VA focal point network.⁶ Civil society-organized survivor participation culminated in the Survivor Summit in November 2004 bringing together survivors from 30 countries and government representatives to discuss survivors’ needs. They submitted a declaration to the First Review Conference reiterating that governments should do more to ensure the rights and needs of survivors are met, and that survivors should be included in decision-making.⁷

At the national level, assessing survivors’ needs by consulting them directly is key to increasing both effectiveness and efficiency of services. Yet a survey of more than 1,500 survivors published by Handicap International (HI) in September 2009 found that just one in five respondents thought that survivors were included in VA/disability coordination and only one in four thought that VA plans were based on the needs of survivors. The study noted that 38% of respondents believed that survivors were involved in implementation of activities, but added that, “this percentage is likely too high as many respondents were NGO, DPO [disabled people’s organizations] or survivor organization members.”⁸

At international meetings, States Parties reported regularly on VA, although this was often not accompanied by the provision of regular information domestically, resulting in a lack of information on services and on VA achievements among survivors. The HI study noted that just 17% of survivors thought that they received regular information on VA/disability achievements:⁹ “When asked if they had a final comment, survivors most often said that this survey was an opportunity to get people to finally ‘Listen to Us.’”¹⁰

⁴ “Final Report, First Review Conference of the States Parties to the Convention on the Prohibition of the Use, Stockpiling, Production and Transfer of Anti-Personnel Mines and on Their Destruction,” Nairobi, 29 November–3 December 2004, APLC/CONF/2004/5, 9 February 2005, p. 101.

⁵ “Draft Review of the Operation and Status of the Convention on the Prohibition of the Use, Production and Transfer of Antipersonnel Mines and on their Destruction: 2005–2009,” Geneva, 17 July 2009, p. 24.

⁶ Between 2000 and 2004, 62 survivors from 37 countries/areas participated in the Raising the Voices program, which later became Widening the Voices, and Expanding the Voices.

⁹ *Ibid.*, p. 232.

¹⁰ *Ibid.*, p. 2.

Landmine Monitor has found that while some countries made efforts to include survivors in activities, this was not systematic and was hampered by the limited means and capacities of survivor organizations or DPOs.

Afghanistan made concerted efforts to include survivors in workshops, though DPOs and survivors noted that coordination with the government remained difficult and that more activist organizations were often excluded. In **Colombia**, most survivors were not aware of their rights or services available to them, and occasional “survivor meetings” of the mine action program reached only a few of them. After initially excluding survivor organizations, **El Salvador** included them in VA work as of mid-2007, though most survivors still felt excluded as improved planning had done little to improve their daily lives. In **Uganda**, stakeholders said the main achievement since 1999 had been the increased autonomy of survivor associations. However, the government was unable to assist the national umbrella organization; blocked international funding hindered associations’ activities; and logistical challenges made it difficult for associations, particularly from the west, to participate in meetings.

Victim Assistance Implementation

2008–2009: A status quo?

From 2008–2009, there was a continued lack of psychosocial support and economic reintegration even where there were improvements to national healthcare, physical rehabilitation, or disability laws/policies. The global economic crisis was cited for setbacks in placing survivors in jobs, for example by government representatives in **Serbia** and by survivors themselves in **Thailand**. Some countries, such as **Pakistan** and **Sri Lanka**, saw deterioration of services nationwide or in certain areas because of conflict and natural disasters.

Other trends included: the continuing handover of physical rehabilitation programs to national management and a continued increase of survivor associations and/or their capacities. On the downside, this period also saw the closure of several national NGOs/DPOs, continued capacity problems for others, and persistent funding challenges.

Understanding the needs

Accurate data about the number of survivors and their needs is critical to VA. Mostly, even countries with relatively complete casualty data continued to lack usable information about survivors’ needs or services received. As in previous years, certain states aimed to improve this type of information through surveys or data consolidation, such as **Chile** or **Lao PDR**. A number of states (e.g. **India**) conducted disability surveys which could indirectly improve services relevant to mine/ERW survivors. **Azerbaijan** initiated a needs assessment of persons with disabilities and started offering skills development services as a result. **Thailand** completed a comprehensive casualty survey and needs assessment establishing the baseline for future planning and implementation of services.

Elsewhere, delays in setting up disability or injury surveillance mechanisms were cited as a reason for not collecting information on survivors’ needs. At the same time, a few states made progress in VA entirely dependent on better data, notably in **Angola**, **Croatia**, and **Serbia**. As of 2009, Bosnia and Herzegovina (**BiH**) had not completed the casualty data revision project planned since 2006, and data on VA services, which had previously been available, had not been collected. In **Cambodia**, a survivor survey was shelved because it was deemed discriminatory towards other persons with disabilities by external technical advisors. This survey was one of Cambodia’s main 2005–2009 objectives to mitigate the negative impact of the continued lack of disability information on VA.

Emergency and continuing medical care

Improvements in medical care received by survivors were nearly always the result of efforts to improve healthcare for all, thus also benefiting survivors. As in earlier years, these gains were unrelated to VA planning, and were part of large-scale international development assistance or post-conflict reconstruction programs (**Ethiopia**, **Iraq**, and **Lao PDR**), improved economic situations (**Armenia**, **Azerbaijan**, and **Chechnya**), or more socially-oriented government programs (**Nicaragua**).

Notable exceptions in 2008–2009 were in **Albania**, where improvements to emergency medical care were based on the needs of survivors in its mine-affected northeast region and resulted from strategic VA planning; and **Thailand**, where general emergency medical services were expanded to reach adequate coverage, which was at the same time coherent with VA needs and plans.

Sometimes, infrastructure improvements happened but states lacked the capacity to utilize these improvements to enhance service provision, as in **Angola**. Conflict damaged or prevented the maintenance of medical systems in several countries (**Pakistan, Somalia, and Sri Lanka**). Conflict also prevented survivors from accessing existing facilities, such as in the Casamance region (**Senegal**) and the Kivu region (**Democratic Republic of the Congo, DRC**).

Physical rehabilitation

From 2008–2009, as in all previous years of the last decade, steady advances were made to physical rehabilitation. Services improved because of increased availability (new facilities or increased production), as in **BiH, Jordan, and Western Sahara**. In other cases, more efficient management and planning, sustained training and on-the-job capacity-building, or the establishment of minimum standards and curricula led to advances (**Afghanistan and El Salvador**). In **Nicaragua**, the government restructured the management of physical rehabilitation, began developing a national plan specifically for physical rehabilitation, and increased national funding.

Transition to national structures continued (**Azerbaijan, Ethiopia, and Tajikistan**), and a number of handovers prior to 2008–2009 were evaluated positively (for instance, the Juba Teaching Hospital in **Sudan**). Elsewhere, a deterioration of services in 2008–2009 was directly linked to the reduction of international support and the failure of national players to increase their role accordingly, such as **Algeria**. Despite a handover process started in 2001, none of the **Angolan** rehabilitation centers were fully functional—and services had deteriorated to levels worse than 2005—after the last international operator departed in August 2008. Some said the handover to national ownership was insufficiently prepared; many experts thought the main reason was a lack of Ministry of Health interest.

Some countries were able to operate solely on national capacity (**Armenia, Chile, Croatia, and Thailand**). In many more countries improvements to services remained heavily dependent on international support. While a three-year handover of rehabilitation services in **Cambodia** was initiated in mid-2008, the government achieved less than 50% of its targets for 2008 and international operators guaranteed all services. International operators expected that the government would not be capable of managing the sector by the end of 2010 as foreseen, although international funding for NGOs was decreasing. In **Guinea-Bissau**, the only operating physical rehabilitation center, which was NGO-run, lacked personnel for most of 2008 and its production decreased by 50% compared to 2007, despite increased international support.

Most services remained centralized although a few countries sought to increase the number of mobile workshops and outreach services, such as **El Salvador** and northern **Sudan** (albeit planned since 2005). The HI survivor study revealed that, in **Albania**, few survivors thought they could access services closer to home, even though a new center opened by early 2008 and a repair unit had been upgraded.¹¹ In **Iraq**, although rehabilitation centers were made operational nationwide so that patients would not have to travel great distances, fewer people came to the centers due to transport costs, insecurity, and a lack of information about the availability of services.

Psychological support and social reintegration

Despite a chronic lack of psychosocial support services for survivors, government institutions often failed to address the issue, leaving this type of assistance to family or friends, local NGOs, and DPOs or survivor organizations. The latter gradually gained more attention and some managed to expand activities, but for the vast majority of organizations, sustainability remained precarious due to a lack of financial support or capacity-building. Moreover, 2008–2009 saw the closure of several well-established survivor organizations citing financial and sustainability issues (**Serbia**), and reduced capacity due to management changes (**Peru**).

¹¹ Ibid, p. 25.

In **BiH, El Salvador, and Ethiopia**, existing survivor networks previously depending on the NGO Survivor Corps were transitioning to national organizations and in doing so expanded the scope of their work. In **Cambodia**, self-help groups continued to multiply, although coordination or exchanges of lessons learned between groups or the NGOs supporting them did not happen. Also, the groups' primary function was financial rather than psychosocial, and some were contribution-based, thereby excluding many survivors.¹² The only remaining survivor NGO in **Croatia** closed in 2008, following the closure of the largest one, the Croatian Mine Victim Association, in 2007.

In countries such as **Burundi** and **Senegal**, international NGOs provided psychosocial services but usually targeted all war-traumatized people, or increasingly focused on other groups of war victims rather than mine/ERW survivors, for example rape victims in the **DRC**.

Economic reintegration

The HI survey noted that 85% of survivors thought that they were the last to get jobs.¹³ Indeed, few advances were made to increase survivors' access to education and vocational training, to help secure employment, or to receive sufficient pensions. Many countries recognized economic reintegration as an absolute priority, but also acknowledged making the least progress in this area (**Afghanistan, El Salvador, and Serbia**). Others reported that economic reintegration projects were postponed or ended due to lack of funds (**Guinea-Bissau**).

Elsewhere, VA programs remained more focused on medical interventions and failed to recognize the importance of economic reintegration, for example in **Yemen**. Two long-term international funding commitments (to 2011) enabled national NGOs to boost economic reintegration activities in **Sudan**. However, most were small-scale pilot projects, not all were reselected for second-phase contributions, and insufficient attention was given to following training programs with work opportunities.

Some countries reported advances in economic reintegration opportunities through the disability sector or, at least, adhered to the theory of integrating survivors in broader disability and development projects, for example in **India** and **Nicaragua**. Even when measures to this effect were taken, they did not necessarily lead to increased opportunities for mine/ERW survivors, since they were only one among many vulnerable groups seeking to receive assistance. The general economic slowdown in 2008–2009 further reduced economic prospects.

In some countries pensions increased, such as **El Salvador** and **UK**. **Croatia** established a department for persons with disabilities within the national employment agency and gave financial incentives to those employing persons with disabilities. In 2009, however, a government representative reported that employment rates remained low and that persons with disabilities were often fired as soon as companies' financial benefits ended.

Laws and public policy

New disability laws, policies, and/or coordination structures were developed in many countries, such as **Afghanistan, Montenegro, BiH, China, Namibia, and South Korea**.¹⁴ Elsewhere, legislation had been pending for so long that it was in need of adjustment by the time of approval (for example, in **Cambodia**). In other countries, legislative changes intended to benefit survivors remained pending for most of the last decade, for example in **Eritrea** and **Guinea-Bissau**. In other cases, the development of new legislation had an adverse effect, making the legal framework too complex, laws mutually exclusive, or reducing the number of sources for assistance. **Colombia**, for example, aimed to mainstream complex compensation mechanisms because survivors could not navigate the bureaucracy. While bureaucracy remained complex, a new decree actually limited access to services because the time to apply was reduced, documentation requirements were made stricter, and funding channels reduced.

¹² This means that a survivor needs to be able to make monthly (or other) payments into the group's fund in order to be able to make use of the group's support.

¹³ HI, "Voices from the Ground," Brussels, 2 September 2009, p. 235.

¹⁴ Of the 75 countries with casualties in 2008, 62 had specific or general legislation prohibiting discrimination against persons with disabilities. Legislative efforts were pending in two more (Eritrea and Guinea-Bissau).

Much of this legislative activity was the result of countries starting to align their disability legislation with the UN Convention on the Rights of Persons with Disabilities (UNCRPD); this effort should benefit survivors as well as other persons with disabilities.¹⁵ Sometimes survivors have been mentioned as a specific target group, for example in **Sudan**. It is still too early to determine if these laws will be enforced and positively impact survivors.

1999–2009: Decade of known and unresolved challenges

Information and understanding about survivors have improved significantly since 1999. Since then, however, Landmine Monitor reported the same unmet challenges to VA service provision, i.e. that in the vast majority of countries “one or more aspects of [VA] were inadequate to meet the needs of mine survivors.”¹⁶

The conclusion in 2009 can only be that, although there is better knowledge and more services, this has failed to impact survivors in a systematic way. In the 2009 HI survey, survivors reached similar conclusions: just over 25% found they received more services in 2009 than in 2005 and 28% thought that services were better in 2009 compared to 2005.¹⁷

Survivor challenges

Survivors did not receive the assistance they needed when they needed it due to access, cost, availability, bureaucratic, and discrimination challenges.

Already in 2001, it was noted that most resources were dedicated to medical and physical rehabilitation,¹⁸ in 2009 economic reintegration and psychosocial support remained neglected. HI’s survey found that from 2005–2009, survivors saw most progress in medical care (36%). Apart from being virtually non-existent, psychosocial services remained under-valued and stigmatized.¹⁹

Since 1999, better national legislation and an increasingly strong international framework (with the UNCRPD), has resulted in increased disability awareness among the general public and legislators. In practice, disability legislation remained poorly implemented, budgets not allocated to disability strategies, and activities virtually not monitored. Recourse to action if rights were not respected was often unavailable, bureaucratic procedures complicated, and compensation payments not worth their while. The lack of legislative enforcement was most felt in the areas of economic opportunities and physical accessibility.

Economic reintegration was the area where nearly a quarter of survivors in the HI study saw deterioration.²⁰ Programs remained limited in number of beneficiaries, geographic coverage, and timeframe, and were mainly operated by NGOs with fluctuating funding. Programs did not meet market demands or survivors’ needs and training was not followed by job placement or business opportunities. Vocational training required educational levels many survivors did not have, did not cater to the aging survivor population, and was not inclusive of family members. Survivors were often not granted loans because they were considered high-risk groups and employment quotas were not enforced.

Almost everywhere, basic (mostly medical) services in 2009 were available at the community level. In contrast, specialized services remained, as noted in 2002,²¹ centralized in urban areas far away from the mine-affected rural areas where most survivors live. Community-based

¹⁵ As of 15 September 2009, there were 142 signatories to the UNCRPD, and 66 ratifications. In addition, 85 states signed the Optional Protocol and 44 ratified it. Of the so-called VA26, 17 signed the UNCRPD (16 on 1 September 2008) and 10 ratified it (six on 1 September 2008); 13 signed the Optional Protocol (10 on 1 September 2008) and seven ratified it (three on 1 September 2008). See *Landmine Monitor Report 2008*, p. 43.

¹⁶ See for example *Landmine Monitor Report 2003*, p. 1, 43. *Landmine Monitor 2003* states there was inadequate services in 48 of 61 countries in 2002; *Landmine Monitor Report 2004*, p. 47. *Landmine Monitor 2004* states there was inadequate services in 53 of 66 countries with casualties in 2003–2004; *Landmine Monitor Report 2005*, p. 52. *Landmine Monitor 2005* states there was inadequate services in 51 of 58 countries with casualties in 2004–2005; and *Landmine Monitor Report 2007*, p. 59. *Landmine Monitor 2007* states that only around one-quarter of services in countries with casualties were adequate.

¹⁸ See *Landmine Monitor Report 2001*, p. 41.

¹⁹ HI, “Voices from the Ground,” Brussels, 2 September 2009, pp. 230–231.

²⁰ *Ibid.*, p. 231.

²¹ See *Landmine Monitor Report 2002*, p. 45.

rehabilitation increased though it remained limited. Rural facilities had difficulties coping with emergency and trauma situations and emergency transport or fast response times were inadequate, despite road and infrastructure improvements in many countries. This led the ICRC in 2009 to call for more investment in emergency services in affected areas because too many casualties “never become survivors.”²²

Whereas basic services are often free, specialized or follow-up care usually are not, especially for the uninsured, nor are costs of transportation, accommodation, or accompaniment by a caregiver. NGOs have increased their efforts in providing transport and accommodation, sometimes with local authorities, although these efforts only cover the identified beneficiaries and are often by reimbursement, which does not solve survivors’ initial financial problems. Many survivors’ economic situation does not allow them to be away from home or work for a long time, causing them to postpone or forego essential treatment. Long waiting lists further complicate the situation.

Despite calls for a holistic approach to VA, many actors focus on one aspect, do not refer systematically to other types of services, and teams in centers are not multi-disciplinary. Referral systems were often non-existent or deficient. A lack of awareness about available services, as well as bureaucratic obstacles to survivors receiving them, further exacerbated already significant difficulties for survivors. Overall, services for military survivors remained better than those for civilians.

Operator challenges

Most operators have had to face significant challenges in delivering assistance to mine/ERW survivors. First, while steady progress has been made in training physical rehabilitation staff, nurses, and first-aid responders since 1999, professionals trained in trauma care or formal psychological support, and teachers educated in disability issues, remained uncommon. Increased technical and management training was still needed for many staff, DPOs, and government stakeholders. Qualified staff, particularly specialized professionals, are usually concentrated in urban centers. Retaining well-trained staff has also proved to be a problem, particularly when programs were handed over to national management, or when competing with neighboring countries, the private sector, or NGO salaries.

Infrastructure, equipment, and supply shortages remained more common in rural areas, even though they were also a challenge in urban facilities. Cost issues were a particular problem for continuing medical care and physical rehabilitation (often requiring purchase of equipment and goods from abroad).

Increasingly, minimum standards and guidelines have been developed for the physical treatment and care of survivors, and also for mental health, though their systematic implementation as well as the sharing of lessons learned remains a challenge. VA continued to be carried out without sufficient casualty and service data. When data exists, it is not always used for planning, shared, or stored centrally, as evidenced by the difficulties of the VA26 countries in compiling statistical information for the Cartagena Progress Review.

International cooperation

The draft Cartagena Progress Review noted that, “a lack of financial resources and/or technical support continues to limit the potential for progress in some States Parties to develop and/or implement plans...States Parties in a position to do so are obliged to provide assistance...”²³

Throughout 1999–2009, VA remained the smallest component of mine action funding, despite calls for increased and sustainable funding to match the long-term nature of VA/disability assistance. Increasingly, handovers and NGO pullouts were hurried by donor fatigue, even

²² “Proposals for the Cartagena Action Plan: compilation of key issues highlighted by the ICRC during the Standing Committee Meetings and the First Preparatory Meeting,” provided by email from Camilla Waszink, Policy Adviser, Arms Unit, Legal Division, ICRC, 9 June 2009.

when national entities were only slowly increasing their contributions and lacked the financial resources to continue programs after international organizations had withdrawn.

Of the 20 countries with significant numbers of survivors which responded to an open question on their expectations for VA from 2005–2009, 18 had expected to receive increased financial and technical assistance, and 14 felt they had not received such support. Just one in seven donors deemed international contributions to VA sufficient, most often citing the continuing high levels of need and competing public health priorities in many recipient countries. Nevertheless, they added that unless affected countries could cover their own VA needs in 10 years or less, they would never be fully able to.²⁴

Victim Assistance Strategic Framework

2008–2009: cementing slow-paced progress

In 2008, Landmine Monitor stated that, with one year left, the VA26 States Parties²⁵ would have to increase their efforts if they truly wanted to make a difference in the lives of survivors in 2005–2009.²⁶ In 2008–2009, most progress was made in the following countries:

- **Albania**, the most consistent performer on VA from 2005 to 2009, completed or made significant progress towards all its objectives.
- **Afghanistan** and **Sudan** both started implementing their action plans and could demonstrate significant advances even though a good number of objectives remained unachieved.
- **Tajikistan** for the first time received funding sufficient to further its needs-based plan, although it had been able to maintain some small-scale activities and consistent coordination throughout 2005–2009.
- **Thailand's** improvements were based on finding a more appropriate VA coordination body and increased prioritization.
- **Jordan** made a promising start by identifying a focal point with a significant mandate, starting stakeholder consultations on how to effectively integrate VA into the disability sector while still ensuring that the special needs of survivors are met.
- **Cambodia** finalized its VA/disability action plan in February 2009, though operators have indicated the plan is too broad and may be unrealistic given current government capacity.
- In **Nicaragua**, the more socially-oriented government made progress in the health and disability sectors. This benefited survivors but was unrelated to VA planning.
- The **Peruvian** mine action center focused more on VA in 2009 by expanding the VA committee and holding regular meetings, though the benefits had yet to be felt by survivors.

Deterioration was seen in **Yemen** during the reporting period because the mine action program's VA department was forced to scale back its operations due to reduced national funding. The funds given were earmarked for clearance. As the program did not link with the disability sector, it was unable to identify funding and assistance alternatives, creating a dire situation for survivors solely dependent on the VA department. **Iraq** expected to have a VA focal point by the Second Review Conference but remained largely unengaged despite indicating in July 2008 that it was responsible for a significant number of survivors.

For the remainder of the VA26 countries, activities continued, though the status quo appears largely to have prevailed.

- **Burundi, Chad, and Guinea-Bissau** were unable to make progress due to incessant capacity and funding gaps.

²⁶ See *Landmine Monitor Report 2008*, p. 39.

- In **Senegal**, the mine action center was unable to raise funding for VA and did not know which ministry it had to turn to for disability issues.
- Despite elaborate plans and well-established disability structures, progress in **Uganda** remained hindered by funding blockages and the lack of a technical advisor in 2008.
- In **Angola, BiH, El Salvador, and Mozambique** the main obstacle was a lack of authority by the coordinating body (often combined with funding/capacity constraints).
- Progress in the **DRC and Ethiopia** was hampered by continued ambiguity about who was in charge of coordination and a lack of government backing, among other reasons.
- In **Colombia** the VA coordinating body focused on planning rather than implementation, while in **Serbia** the focus was purely on physical rehabilitation.
- In several cases a lack of political will or involvement was noted, as in **Croatia or Eritrea**.

1999–2009: coordination successful while implementation failed?

The co-chairs noted in May 2009 that “Of course the most identifiable gains have been process-related...”²⁷ This is confirmed in the draft Cartagena Progress Review which lists developing objectives/plans, establishing coordination mechanisms, and VA/disability expert participation at international meetings among the main successes for 2005–2009. In 2004, Landmine Monitor similarly concluded that the main progress since 1999 had been awareness-raising.²⁸

Increased state participation

Whereas in 1999 international NGOs and the ICBL dominated the VA discourse, in more recent years the co-chairs gradually succeeded in engaging affected and donor states on VA, although interventions were usually “one-off” or just listed international NGO activities. More importantly since 2005, States Parties started to send appropriate people from health or social affairs ministries or from the disability sector to discuss VA at Mine Ban Treaty-related meetings. Whereas in 2004 just two of 19 statements were given by VA/disability experts, by 2009 this increased to 15 of 22.²⁹ Some government experts have continuously participated from 2005–2009, although for most states the expert changed frequently and/or was present irregularly.

Already in 1999, the establishment of national coordination bodies was seen as necessary to bring together stakeholders and improve services.³⁰ A 2002 UN Mine Action Service consultation concluded that national coordination and planning was a key priority to ensure adequate assistance.³¹ Affected countries were encouraged to report more often and to use the so-called 4P’s format (plans, priorities, progress, and problems). By 2004, at least 22 States Parties had started developing VA action plans, including at least 13 of the future VA26, some of whom still did not have complete plans as of 2009.³²

Narrowing the focus to 26 states

Although all States Parties have a commitment towards survivors, the primary responsibility for the period 2005–2009 was placed on affected states. Because of significantly different development, contamination, and political contexts, affected countries should be directly in charge of determining the goals they wanted to achieve by the next milestone Review Conference

of the Mine Ban Treaty in 2009. Since 2004, “this responsibility is most pertinent”³³ for 23 (now 26) States Parties declaring responsibility for significant numbers of survivors, but also with the “greatest needs and expectations for assistance.”³⁴

During 2005–2009, these 26 countries participated in an informal process to ensure more measurable action³⁵ by committing to:

- assess their VA situation;
- develop SMART (specific, measurable, achievable, relevant, and time-bound) objectives to be achieved by 2009;
- create plans to achieve the objectives; and
- identify resources to realize the plans.³⁶

These states were also encouraged to set up inter-ministerial coordination mechanisms. Their main tool was a questionnaire provided by the co-chairs in 2005. No other States Parties and just one state not party to the Mine Ban Treaty (Lebanon) have used the questionnaire to guide their activities.

Throughout 2005–2009, progress among the VA26 has been variable, with some countries actively engaging and others hardly at all. Progress was mostly visible in coordination aspects, rather than in implementation of services, even by those who made significant advances, as many of the VA26’s objectives related to data collection, strategies, awareness raising and coordination. Progress on activities was often unrelated to the plans the 26 countries set for themselves. In many cases, achievements owed much to sustained UN support or to continuity in the VA focal point position. Gaps in capacity and financial means have been reported throughout the period.

Between 2005 and July 2009:

- **22 of the 26** States Parties presented the scope of their problem and objectives, although the latter were often not SMART and incomplete;³⁷
- **13** countries convened workshops on VA and/or action plans, which did not always lead to the development of plans or better coordination;³⁸
- **12** states refined their objectives to make them SMART-er, which sometimes meant making objectives less ambitious, extending timeframes, or removing specific beneficiary targets;³⁹
- **12** countries developed inter-ministerial coordination mechanisms to implement action plans; in at least 50% of these countries, these mechanisms are not functioning;⁴⁰
- **10** developed VA/disability plans. Because of the slow pace in developing them, most plans did not cover the first part of the 2005–2009 timeframe and extend past 2009;⁴¹

³³ “First Review Conference of the States Parties to the Convention on the Prohibition of the Use, Stockpiling, Production and Transfer of Anti-Personnel Mines and on Their Destruction – Final Report,” APLC. CONF/2004/5, Nairobi, 29 November–3 December 2004, p. 33.

³⁴ Ethiopia became the 24th State Party shortly after the First Review Conference, Jordan the 25th in 2007, and Iraq the 26th in 2008.

³⁵ They received “process support” for this from the Geneva International Centre for Humanitarian Demining (GICHD) Implementation Support Unit Victim Assistance Specialist Support through in-country visits, requested by all of the 26 States Parties except Eritrea, distance support (for example via email), outreach to other relevant organizations, and assistance with workshop organization.

³⁶ Kerry Brinkert, “Making Sense out of the Anti-Personnel Mine Ban Convention’s Obligations to Landmine Victims,” GICHD, Geneva, 31 March 2006.

³⁷ Burundi, Chad, Iraq and Jordan did not present this, although the latter two joined the informal process more than half-way through.

³⁸ Afghanistan, Albania, Angola, BiH, Cambodia, El Salvador, Ethiopia, Nicaragua, Senegal, Sudan, Tajikistan, Thailand, and Uganda.

³⁹ Afghanistan, Albania, Angola, Cambodia, Croatia, DRC, El Salvador, Nicaragua, Serbia, Sudan, Tajikistan, and Uganda.

⁴⁰ Afghanistan, Albania, Angola, BiH, Cambodia, Chad, DRC, El Salvador, Sudan, Tajikistan, Thailand, and Uganda. The coordination body is not functioning in Angola, BiH, Cambodia, Chad, DRC, and El Salvador.

⁴¹ Afghanistan, Albania, Angola, Cambodia, El Salvador, Sudan, Tajikistan, Thailand, Uganda, and Yemen.

- **seven** countries implemented plans, though several only started in 2008–2009 because of the time taken to develop and/or approve plans and a lack of financial means;⁴²
- **six** “have reported progress in the achievement of specific objectives;”⁴³ and
- **three** states adequately monitored progress made against the plan (**Albania, Sudan, and Tajikistan**); and
- just **two** report on progress systematically (**Albania and Tajikistan**).

Reporting

It was recognized in the first years of Mine Ban Treaty implementation that better VA reporting was needed to assess progress. The development of Form J of the Article 7 reports started in 1999–2000 and the (ultimately blank) Form J was adopted in 2001. Since then, the need to further develop progress indicators has been a recurrent theme. As of 2009, the challenge of measuring progress, particularly in states’ own reporting, has not been remedied even though the questionnaire of the co-chairs was to serve as a baseline for “an unambiguous assessment of success or failure” by the Second Review Conference.⁴⁴

Very few states have adequate monitoring mechanisms. A review of VA statements and Article 7 reports in 2008–2009 by Landmine Monitor showed clearly that states’ reports were usually unrelated to objectives or plans, did not clarify progress compared to previous years, or explain the impact of activities on survivors.

The focus on the VA26 also made statements from other affected states increasingly infrequent throughout 2005–2009, even though some, such as **Algeria** or **Turkey**, struggled with a significant VA challenge. In May 2009, the ICRC stated, “We urge States [P]arties at the Review Conference to call for the development of more standardized and rigorous reporting and monitoring of the implementation of victim assistance commitments,” adding that this was “essential to maintaining a focus on victim assistance beyond the Review Conference and demonstrating that it is an area of implementation that merits increased investment.”⁴⁵

National Commitment and Capacity

In June 2008, the co-chairs noted that national ownership was “not a specific aim of the *Nairobi Action Plan*, perhaps because it should go without saying...”⁴⁶ More national ownership means improved VA coordination, ideally by the relevant ministries assessing needs and developing strategies adapted to local realities; placing organizations under national management; and increasing national budgets and abilities to mobilize external resources.

Since 2004, the co-chairs aimed to “work intensively, on a national basis with relevant States Parties in order to reinforce national ownership and ensure [...] long-term sustainability.”⁴⁷ VA became more effective when there was an ongoing, active involvement of national coordination bodies. Better coordination also helped to ensure participation of key stakeholders, more balanced priority-setting, better defined responsibilities, and increased accountability. Dialogue remained flawed when strategies were developed by one key player, often an expatriate, without consulting others, meaning that plans were not realistic nor had a broad base of support.

⁴² Afghanistan, Albania, Sudan, Thailand, Tajikistan, Uganda, and Yemen.

⁴³ Afghanistan, Albania, Serbia, Sudan, Tajikistan and Yemen; see “Draft Review of the Operation and Status of the Convention on the Prohibition of the Use, Production and Transfer of Antipersonnel Mines and on their Destruction: 2005–2009,” Geneva, 17 July 2009, p. 24.

⁴⁷ “Draft Review of the Operation and Status of the Convention on the Prohibition of the Use, Production and Transfer of Antipersonnel Mines and on their Destruction: 2005–2009,” Geneva, 17 July 2009, p. 23.

Even when coordinating bodies existed this did not mean that they could coordinate without assistance, or could do so systematically. Their merit was often limited to awareness raising or liaison, without much effect on activity implementation. Giving the VA focal point or coordinating body more authority, as happened in **Afghanistan, Azerbaijan, and Thailand**, is a sign of increased ownership. The most common problems related to the lack of a mandate to direct other relevant government partners; competing claims of who is in charge; a lack of continuity in the coordination position; a lack of ministerial budgets; and a lack of political will. Responsibility for VA was often scattered among several bodies, just one of many competing priorities, or not integrated with the broader disability sector.

In 2001, Landmine Monitor noted that “it is essential that the international community focuses on local capacity-building...”⁴⁸ Increased government involvement has resulted in VA no longer being ‘a mere NGO program’ with national NGOs and DPOs increasingly participating and some sustainable handovers of programs to national authorities. Yet sustained international support remained indispensable in many more countries. In **Eritrea**, UNDP noted in 2004 that the “most comprehensive [VA] program in the world”⁴⁹ could be established, though activities seem to have halted as soon as Eritrea requested its UN technical advisors leave in mid-2005 and very little has been done since to assist mine/ERW survivors there.⁵⁰

In 2008–2009, international operators noted in several countries that no handover could be foreseen in the near future because of a lack of government capacity and/or will. In other places, transitions were hastened by decreasing funding or long-planned handover processes were not successful due to a lack of government interest, funding or capacity, directly impacting availability and quality of services (see Physical rehabilitation section above).

Sometimes, international operators have been substituting for the government for so long that there is an overdependence on them and decreased ownership, interest, and room for action by those who are primarily responsible—the national authorities. Additionally, there is increasing awareness that international operators have not invested sufficiently in training local counterparts.

As a result, nearly all the VA challenges listed in the draft Cartagena Progress Review relate to a lack of national commitment and capacities, mainly:

- non-prioritization of, and weak capacity to address disability issues and a lack of national ownership or interest to tackle VA/disability issues when faced with other competing priorities;
- weak state structures lacking bureaucratic, human resource, technical, and financial capacity to develop, implement, and monitor objectives, national plans, and legislation;
- inadequate resources to build government capacity; and
- inadequate long-term international assistance to remedy the national challenges.⁵¹

Conclusion: Victim Assistance to 2014

It is hard to explain why assistance to mine and ERW survivors has been poorly supported in the past, particularly when donors have been generous to other mine action sectors. One factor is that VA has been the “least developed of the Convention’s core aims.”⁵² Additionally, throughout the past decade VA has been seen as a complicated field dependent on broader development, poverty reduction, public health, social services, and legislative efforts, requiring a long-term commitment for which concrete results might not be directly or visibly measurable. Improving

⁵² Co-Chairs of the Standing Committee on Victim Assistance and Socio-Economic Reintegration, “Priorities and challenges during the period 2010–2014,” Geneva, 29 May 2009.

VA is of course a difficult task when public health systems are beset with problems, especially in war-torn or developing societies. In providing VA, however, states are also reinforcing broader human rights, public health, and promoting social inclusion of vulnerable groups.

While the Mine Ban Treaty was the first conventional weapons treaty to include victim assistance provisions, more advanced VA frameworks are now provided in the Convention on Cluster Munitions and the UNCRPD. Combined with the clear lack of implementation progress, the Mine Ban Treaty will need a strong and implementation-oriented action plan to ensure more success in 2010–2014.

Synergies should be sought with both the Convention on Cluster Munitions and UN the UNCRPD which aim to provide a more systematic, sustainable approach to VA, bringing it into the broader disability and development context. The stricter obligations of both new treaties pave the path for more measurable action. The States Parties to the Mine Ban Treaty can again lead the way by implementing a concrete 2010–2014 Cartagena Action Plan in which survivors can access comprehensive services, fully exercise their rights, and participate in decisions when and where needed.

SUPPORT FOR MINE ACTION

For 2008 Landmine Monitor identified a total of US\$626.5 million in funding for mine action worldwide, combining international and national funding. International funding increased significantly, while national funding decreased slightly compared to 2007. Total international support for mine action for 1992–2008 was \$4.27 billion.

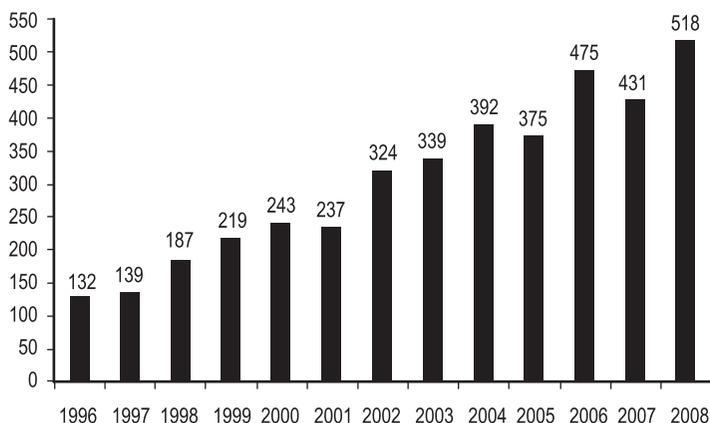

Landmine Monitor identified roughly \$517.8 million (some €351.7 million) of international funding allocated for mine action in 2008 from 23 countries and the European Commission (EC). This is an increase of approximately \$87.9 million (20%) compared to 2007 and the highest reported total to date, surpassing the previously highest total—\$475 million in 2006—by some \$43 million (9%). In national currency terms, 16 donors increased funding in 2008 compared to 2007, while six decreased funding. (The Czech Republic reported funds in Euros in 2008, but in Koruna in 2007.) Funding in 2008 was channeled to at least 53 recipient states and other areas. The top five recipients of mine action funding in 2008 were, in descending order, **Afghanistan, Sudan, Iraq, Lebanon, and Cambodia.**

Landmine Monitor also identified at least \$108.7 million (€73.8 million) in national funding (monetary or in-kind assistance contributed to their own mine action programs) in 2008 by 22 states affected by mine/explosive remnants of war (ERW). This is a decrease of roughly \$8.7 million (7%) compared to 2007.

Introduction

Article 6 of the Mine Ban Treaty (international cooperation and assistance) recognizes the right of each State Party to seek and receive assistance from other States Parties in fulfilling its treaty obligations. Landmine Monitor reports annually on support for mine action based on monetary and in-kind assistance reported by mine/ERW-affected states and on international mine action assistance reported by donor states. Landmine Monitor also reports on the estimated costs and resource mobilization strategies for fulfilling treaty obligations on the part of mine/ERW-affected states, and the priorities and strategies for mine action assistance on the part of donor states.

International Mine Action Funding 1996–2008 (US\$ million)

Landmine Monitor relies in most cases on responses to requests for information from, or public reporting by, donor and mine/ERW-affected states. While Landmine Monitor seeks to provide the most complete and accurate possible account of global mine action support, its

reporting is limited by the ability and willingness of states to track and report their own funding and other forms of support, and by the availability of cost estimates, budgets, strategic plans, and other financial reporting.

Although several mine-affected countries have reported annual national funding for at least two consecutive years, reporting and comparison of annual national funding levels remains imprecise. A continued absence of standard methods of tracking and reporting by mine/ERW-affected states and, in some cases, a lack of information available on actual expenditures, makes overall annual comparisons difficult.

The biggest contributors to mine action in 2008 were the EC (\$89.5 million), the United States (\$85 million), Japan (\$51.6 million), Canada (\$43.1 million), Norway (\$36.7 million), the Netherlands (\$28.2 million), Germany (\$26.7 million), the United Kingdom (\$24.9 million), Spain (\$20.4 million), Sweden (\$18.9 million), and Australia (\$18.2 million). The largest contribution came from the EC combined with national funding by European Union (EU) member states, a total of \$264.2 million (€179.4 million), as reported below.

As in 2007, changes in the average exchange rates between national currencies and the US dollar in some cases had a significant effect on the US dollar value of international contributions to mine action. The average exchange value of the Euro, for example, increased by roughly 7% in US dollar terms in 2008 compared to 2007, affecting the US dollar value of contributions by 10 of the 20 largest international donors; and as a result of the decline of the British pound in relation to the US dollar, UK contributions fell in US dollar terms during 2008 despite rising in UK pound terms.

National Contributions to Mine Action

At least 22 mine/ERW-affected states contributed \$108.7 million in funding (including in-kind contributions) to their own mine action programs during 2008, compared to roughly \$117.4 million in 2007. Of the 15 mine-affected states submitting Article 5 deadline extension requests in 2008, 11 reported national funding during 2008, totaling \$77,430,891. Of the four states submitting Article 5 deadline extension requests in 2009, two reported national funding in 2008, totaling \$2.37 million (see Funding Article 5 deadline extensions section below).

Eight countries (**Afghanistan, Ecuador, Egypt, Iraq, Mauritania, Rwanda, South Korea, and Uganda**) reported national funding in 2007 but did not report funds in 2008. Together, these countries represented \$20.9 million in national funding in 2007, though of this total, \$18.2 million was contributed by Iraq alone. Two countries (**Cyprus and Somalia**) newly reported national funding in 2008. Together, these countries represent \$158,219 in reported national funds.

Among the 20 states reporting national mine action support in both 2007 and 2008, 10 reported increases in levels of support in US dollar terms: **Chile** (\$9.4 million increase), **Azerbaijan** (\$4.1 million), **Bosnia and Herzegovina** (BiH) (\$2.5 million), **Cambodia** (\$650,000), **Thailand** (\$550,470), **Mozambique** (\$263,270), **Yemen** (\$100,000), **Albania** (\$65,000), **Peru** (\$45,414), and **Tajikistan** (\$9,000). Three states—**Lebanon, Jordan, and Zimbabwe**—reported no change in funding levels. Seven states reported decreases in funding: **Croatia** (\$325,335 decrease), **Colombia** (\$390,500), **Nicaragua** (\$400,000), **Chad** (\$479,418), **Senegal** (\$623,000), **Zambia** (\$824,844), and **Sudan** (\$2,565,120).

Eleven mine/ERW-affected states contributed, according to their own estimates, more than 0.01% of their gross national income (GNI) to mine action in 2008: **Azerbaijan, BiH, Cambodia, Chad, Croatia, Jordan, Lebanon, Mozambique, Sudan, Tajikistan, and Yemen.**¹

¹ GNI data for Somalia and Zimbabwe is not available.

National Mine Action Funding for 2008: \$108.7 million²

Donor	(US\$ million)	(€ million)
Croatia	45.3	€30.8
BiH	16.2	€11.0
Chile	10.6	€7.2
Azerbaijan	6.3	€4.3
Lebanon	5.5	€3.7
Sudan	4.9	€3.3
Yemen	3.6	€2.4
Jordan	3.5	2.4
Thailand	3.3	2.2
Chad	2.0	1.4
Cambodia	1.8	1.2
Mozambique	1.6	1.1
Peru	1.0	0.7
Colombia	0.9	0.6
Nicaragua	0.6	0.4
Tajikistan	0.6	0.4
Senegal	0.3	0.2
Albania	0.3	0.2
Zambia	0.2	0.1
Cyprus	0.1	0.1
Somalia	0.01	0.01
Zimbabwe	0.01	0.01

It is assumed that, globally, national funding is under-reported. Assessment of national contributions remains limited by a lack of consistent and complete reporting on national assistance, and by the absence of a standard method of reporting and applying monetary value to in-kind contributions.

International Contributions to Mine Action

Landmine Monitor identified approximately \$517.8 million (€351.7 million) of international funding for mine action in 2008, donated by 23 countries and the EC.³ Of this, at least \$1.4 million was contributed in support of the negotiation and adoption of the Convention on Cluster Munitions, including funding for advocacy and regional conferences and workshops.⁴

² Includes monetary and in-kind contributions. Table does not add to \$108.7 as figures are rounded to the nearest \$100,000. Average exchange rates for 2008 vary; see list of exchange rates in this edition of Landmine Monitor for further details.

³ Reporting does not enable a disaggregation of funding by mine action activity. There was almost no identified funding specifically for cluster munitions in 2008.

⁴ The total does not include funding to mine action in countries and other areas affected by cluster munitions, as donor reporting to these recipients was variously identified for cluster munitions, landmines, and ERW.

International Mine Action Funding by Year⁵

Period	Amount (US\$ million)
2008	518
2007	431
2006	475
2005	375
2004	392
2003	339
2002	324
2001	237
2000	243
1999	219
1998	187
1992–1997	529
Total for 1992–2008	4,268

EC funding together with national funding by EU member states totaled \$264.2 million (€179.4 million) in 2008.⁶ Combined EC/EU member funding remained the largest source of mine action funding in 2008, as it was in 2007. Reported EC/EU funding in 2008 was approximately 25% more in Euro terms than in 2007, and 34% more in US dollar terms.

In national currency terms, three donor states—**Sweden, Spain, and Italy**—provided more mine action funding in 2008 than they had in any previous year.⁷ **New Zealand's** contribution of NZ\$3.7 million in 2008–2009 almost matched its previously highest contribution, in 2004–2005). Of the 20 largest donors in 2008, 16 provided more funding in US dollars terms in 2008 than 2007, and four provided less. Those increasing their contribution were: **Italy** (138% increase), **Austria** (132%), the **EC** (96%), **Spain** (74%), **Finland** (47%), **Germany** (45%), **Japan** (45%), **New Zealand** (31%), **Switzerland** (26%), the **US** (22%), **Denmark** (21%), the **Netherlands** (21%), **Australia** (9%), **Sweden** (8%) and **Ireland** (3%). **Saudi Arabia**, which did not report funding in 2007, provided \$1.5 million in 2008. Donors with decreased contributions were: **Norway** (27%), **Canada** (6%), **Belgium** (3%), and the **UK** (1%). **Slovakia**, which was among the 20 largest donors in 2007, did not report funding in 2008.

⁵ The 1992–2007 total and 1998 annual figure include contributions by some states for which the exact amounts are not known, and contributions by some states for which amounts for specific years are not known, including \$50 million from the UAE to Lebanon in 2002–2004.

⁶ The total of EC and EU member states' funding in 2008 has been calculated by adding Landmine Monitor's estimate of EC funding in 2008 (€60,758,061) to EU member states' mine action funding provided bilaterally or otherwise (not including that provided through the EC). EU member states as of August 2009 are Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and the UK.

⁷ Three donor states—Czech Republic, Japan and the Netherlands—reported some funding items in US\$, which have been converted to national currencies using the relevant average annual rates; see list of exchange rates in this edition of Landmine Monitor for further details.

The 15 states which provided funding in 2008 equivalent to more than 0.001% of GNI, in descending order, were: **Norway, Denmark, Sweden, the Netherlands, Switzerland, Ireland, Canada, Finland, Luxembourg, New Zealand, Australia, Belgium, Spain, Slovenia, and Japan.** Among Permanent Members of the UN Security Council, the **UK** was 16th according to this ranking; the **US** 20th; and **France** 23rd.⁸ No monetary funding for mine action was reported by **China** or **Russia** in 2008. No donors contributed more than 0.01% of GNI in 2008.

International Mine Action Funding for 2008: \$517.8 million

Donor	(US\$ million)	(€ million)
EC	89.5	60.8
US	85	57.7
Japan	51.6	35.0
Canada	43.1	29.3
Norway	36.7	24.9
Netherlands	28.2	19.2

⁸ World Bank, "World Development Indicators Database; Total GNI 2008, Atlas method," 1 July 2009, www.worldbank.org. For EU member states, the calculation of mine action funding as a percentage of GNI is based solely on their reported contributions bilaterally or otherwise (not including that provided through the EC); individual EU member states' contributions to mine action through the EC has not been reported.

Funding by Donor States

EUROPEAN COMMISSION⁹

Period	(\$ million)	(€ million)	Additional R&D Funding	
2008	89.5	60.8	2005	1.4
2007	45.6	33.3	Prior to 2005	35.7
2006	87.3	69.5	Total	51.1
2005	47.7	38.3		
Prior to 2005	363.8	369.5		
Total	633.9	571.4		

In 2008, EC and EU member states together committed \$264.2 million (€179.4 million) in mine action funding, compared to \$196.8 million (€143.6 million) in 2007.¹⁰ This represents an overall increase of approximately \$67.4 million (€35.8 million) compared to 2007.¹¹ Among the 27 member states of the EU, 16 reported mine action funding in 2008 independent of EC funding mechanisms.¹² Of these, 12 reported funding increases in terms of original currency, while four reported declines in funding.¹³ The remaining 11 member states either did not report funding or did not provide valuations of in-kind contributions.

The EC contributed €60,758,061 (\$89,472,321) in 2008. This consisted of €21,758,061 (\$32,040,921) in funds disbursed in 2008, and €39 million (\$57,431,400) in commitments made in 2008 to future mine action projects in countries which could include: Afghanistan, Albania, Angola, Belarus, BiH, Colombia, Ethiopia, Georgia, Lao People's Democratic Republic (Lao PDR), Lebanon, Nepal, Sudan, Sri Lanka, and Serbia.¹⁴ The amount of funds disbursed decreased by 25% compared to €33,280,659 (\$45,631,112) in 2007, but total 2008 funding, including both disbursements and funds committed to future projects, increased by 45% compared to the previous year.

No country-specific allocations have been made from the overall commitment; in May 2009 the Directorate-General for External Relations stated that the funding commitment would be applied to "planned activities to be defined at a later stage."¹⁵ Although Landmine Monitor reports EC funding on the basis of annual commitments, actual EC disbursements for 2008 remain undetermined and subject to change until the finalization and release of funds by the EC, and may be subject to revision.¹⁶

Eleven countries actually received funds from the EC in 2008, totaling €21,758,061 (\$32,040,921). All of these countries are also among the 14 for which the EC reported commitments in 2008 to future mine action projects. The EC contributed to mine action in 11 countries and other areas in 2007.

⁹ Email from Mari Cruz Cristóbal, Desk Officer, Directorate-General for External Relations, 28 May 2009; and statement of the EC, Standing Committee on the General Status and Operation of the Convention, Geneva, 29 May 2009.

¹⁰ As noted in previous years, neither the EC nor EU member states were able to provide a breakdown of how much of EC funding should be ascribed to individual member states in 2008. Therefore, it is not possible for Landmine Monitor to provide a complete picture of EU members' mine action funding.

¹¹ 2007 funding figures are based on the average 2007 exchange rate: €1.3711.

¹² EU member states as of August 2009: Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and the UK. EU, "Gateway to the European Union," europa.eu.

¹³ The Czech Republic retains the Koruna as its national currency, but reported 2008 funding in Euros. For comparison of 2007 and 2008 funding, values have been converted according to the average exchange rate for 2008: €1=CZK24.9898.

¹⁴ Statement of the EC, Standing Committee on the General Status and Operation of the Convention, Geneva, 29 May 2009.

¹⁵ Email from Mari Cruz Cristóbal, Directorate-General for External Relations, 28 May 2009.

UNITED STATES OF AMERICA¹⁷

Period	(\$ million)	Additional R&D Funding	
2008	85	2008	13.6
2007	69.8	2007	14.4
2006	94.5	2006	13.8
2005	81.9	2005	13.2
Prior to 2005	626.4	Prior to 2005	132.8
Total	957.6	Total	187.8

The US provided \$85 million to mine action in 32 countries and other areas in 2008, a 22% increase compared to \$69.8 million to 30 recipients in 2007. Starting in fiscal year 2009, the US has integrated three separate accounts—Humanitarian Demining, International Trust Fund, and Small Arms/Light Weapons—into a single account for Conventional Weapons Destruction (Nonproliferation, Anti-terrorism, Demining, and Related Programs-Conventional Weapons Destruction, NADR-CWD). The transition to a combined account did not evidently affect US funding levels for mine action; however, long-term funding projections have not been reported.

JAPAN¹⁸

Period	(\$ million)	(¥ million)	Additional R&D Funding	
2008	51.6	5,318	2007	4.2 489
2007	35.5	4,176	2006	9.1 1,058
2006	25.3	2,944	2005	7.4 811
2005	39.3	4,323	Prior to 2005	13.6 1,555
Prior to 2005	178.0	20,612	Total	34.3 3,913
Total	329.7	37,373		

In 2008, Japan contributed ¥5,318,480,480 (\$51,589,261) compared to ¥4,175,698,717 (\$35,493,439) in 2007, an increase of approximately 27% in Yen terms. Japan gave funds to 13 countries in 2008, compared to 17 in 2007.

CANADA¹⁹

Period	(\$ million)	(C\$ million)	Additional R&D Funding

¹⁷ US Department of State, "To Walk the Earth in Safety," Washington, DC, July 2009, www.state.gov.

¹⁸ Email from Hayashi Akihito, Japan Campaign to Ban Landmines (JCBL), 4 June 2009, with translated information received by JCBL from the Humanitarian Assistance Division, Multilateral Cooperation Department, and Conventional Arms Division, Non-proliferation and Science Department.

¹⁹ Emails from Kim Henrie-Lafontaine, Second Secretary, Foreign Affairs and International Trade Canada, 6 June 2009 and 19 June 2009.

Canada contributed C\$45,969,874 (\$43,124,339) to mine action in fiscal year 2008–2009, a decrease of 7% in Canadian dollar terms compared to 2007–2008 (C\$49,195,671/\$45,830,687). Canada provided funding to 13 countries, including contributions to Afghanistan totaling approximately C\$28.7 million (\$27 million).

Canadian funding remained roughly stable between 2007 and 2008, as the dedicated Canadian Landmine Fund, in place from 1999 to March 2008, was replaced by funding structures integrated within Foreign Affairs and International Trade Canada and the Canadian International Development Agency (CIDA). In May 2009, Canada reported that the “vast majority” of new funds are provided by CIDA, in order to align mine action funding with development priorities and to support the Millennium Development Goals. As a result of the new funding structures, Canada reported that mine action funds have been difficult to access for countries outside CIDA’s geographic areas of priority, and for mine action projects unrelated to field activities, such as advocacy.²⁰

From November 2008 to August 2009, Canada chaired the Contact Group on Linking Mine Action and Development.

NORWAY²¹

Period	(\$ million)	(NOK million)	Additional R&D Funding		
2008	36.7	206.6	2007	\$649,040	3.8
2007	50.2	293.7	2006	\$618,421	4
2006	34.9	223.9	2005	\$333,833	2.3
2005	36.5	235	Total	1,601,294	10.1
Prior to 2005	219.1	1,649.9			
Total	377.4	2,609.1			

Norway contributed NOK206,631,608 (\$36,656,447) to mine action in 2008, an approximately 30% decrease in Norwegian kroner terms from 2007 (NOK293,650,490/\$50,155,504). Funds were allocated to 17 countries and other areas. The decline in funds is in line with statements by the Ministry of Foreign Affairs in August 2008, that the pattern of increased funding in previous years may end in the near future, as some programs were reduced (such as clearance in Jordan) and as Norwegian embassies give priority to other humanitarian aid sectors.²²

In a statement to the intersessional Standing Committee meetings in May 2009, Norway reported that it will continue to provide “a high level” of mine action assistance in the future, and will consider multi-year funding arrangements with selected partners to ensure stable funding to mine action programs. It called on both donor states and mine-affected states to develop mine action methods that “can be sustained over time... when cooperation and assistance parameters change.”²³

From November 2008 to August 2009, Norway chaired the Contact Group on Resource Mobilization.

²⁰ Statement of Canada, Standing Committee on the General Status and Operation of the Convention, Geneva, 29 May 2009.

²¹ Email from Ingunn Vatne, Senior Advisor, Ministry of Foreign Affairs, 4 June 2009.

THE NETHERLANDS²⁴

Period	(\$ million)	(€ million)
2008	28.2	19.2
2007	23.4	17.1
2006	26.9	21.4
2005	19.3	15.5
Prior to 2005	114.6	102.9
Total	212.4	176.1

The Netherlands contributed €19,172,459 (\$28,233,363) in funds in 2008, a 12% increase in Euro terms compared to 2007 (€17,056,776/\$23,386,546). The Netherlands contributed funds to 11 states and other areas in 2008, compared to 10 in 2007.

At the Ninth Meeting of States Parties in November 2008, the Netherlands outlined five principles guiding its mine action funding policy: geographic spread, with emphasis on the Horn of Africa, the Great Lakes region, the Western Balkans, and Afghanistan; effectiveness and socio-economic impact of programs; capacity-building; application of the International Mine Action Standards principles and procedures; and additional support to other mine action sectors. The Netherlands reported that at least €10 million of its contributions in 2008 were channeled through NGOs.²⁵

GERMANY²⁶

Period	(\$ million)	(€ million)	Additional R&D Funding	
2008	26.7	18.1	2007	5.2
2007	18.4	13.4		4.2
2006	18.6	14.8		
2005	21.1	17		
Prior to 2005	122.9	115.6		
Total	207.7	178.9		

Germany's funding of €18,148,899 (\$26,725,921) in 2008 was an increase of 35% in Euro terms compared to 2007 (€13,400,957/\$18,374,052). Germany contributed to 21 states in 2008, compared to 17 states and other areas in 2007. Germany's funding for 2008 exceeded its earlier projection of €17.6 million.

In May 2009, Germany reported contributing a total of \$100 million to the EC budget for mine action, in addition to its direct assistance to mine action. Germany projected donations in 2008 and 2009 totaling \$46 million. In allocating funds, Germany reportedly has no geographic areas of priority, but focuses support on States Parties to the Mine Ban Treaty.²⁷

In a statement on mine clearance in May 2009, Germany stressed the importance for mine-affected states to take national ownership of their mine action programs, and to build up "efficient and sustainable local capacities" in mine action.²⁸

2005–2006	8.9	11.7
Prior to 2005	66.2	104.4
Total	126.5	179.2

Australia's funding of A\$21,263,137 (\$18,152,340) in fiscal year July 2008–June 2009 represented a 7% increase in Australian dollar terms from fiscal year 2007–2008 (A\$19,906,343 or \$16,703,412). In 2005, Australia made a five-year, A\$75 million commitment to mine action. Having spent A\$60.3 million over four years, Australia remains on track to meet its five-year commitment. Australia's support was provided to seven countries in 2008, the same number as in 2007.

As of November 2008, Australia projected contributions in 2008–2009 totaling roughly A\$8.8 million, which was surpassed by actual contributions.³³

SWITZERLAND³⁴

Period	(\$ million)	(CHF million)
2008	15.2	16.3
2007	12	14.4
2006	14.1	17.6
2005	12.1	15.1
Prior to 2005	67.8	91.3
Total	121.2	154.7

Switzerland's 2008 mine action funding of CHF16,341,060 (\$15,108,944) was a 13% increase in Swiss franc terms compared to 2007 (CHF14,407,760 or \$12,007,427). Switzerland funded 14 countries and areas in 2008, the same number as in 2007. The 2008 total includes CHF8.4 million (\$7,766,640) in support to the Geneva International Centre for Humanitarian Demining (GICHD). Swiss funding for GICHD totaled \$6.8 million in 2007, \$6.4 million in 2006, \$6 million in 2005, \$6.1 million in 2004, \$5.23 million in 2003, \$4.35 million in 2002, \$3.3 million in 2001, and \$2.3 million in 2000, totaling some \$48.3 million from 2000–2008.

Switzerland's mine action strategy for the period 2008 to 2011 calls for maintenance of funding levels around CHF16 million per year. Switzerland prioritizes integration of mine action funding within peace and development programs.³⁵

In a statement to the Ninth Meeting of States Parties in November 2008, Switzerland called for additional efforts by States Parties to improve mechanisms for technical assistance and exchange of information, and called on States Parties fulfilling obligations under Article 5 to strengthen cooperation at the regional level to develop joint mine action strategies.³⁶

2005	2.2	1.7
Prior to 2005	14.1	13.9
Total	35.3	29.4

Ireland's mine action funding of €4,900,000 (\$7,215,740) is a 4% decrease in Euro terms compared to 2007 (€5,115,103 or \$7,013,318). Ireland contributed to six countries and one area in 2008, compared to nine countries in 2007.⁴²

AUSTRIA⁴³

Period	(\$ million)	(€ million)
2008	7.2	4.9
2007	7.0	5.1
2006	4.8	3.8
2005	2.2	1.7
Prior to 2005	14.1	13.9
Total	35.3	29.4

Austria provided €1,823,320 (\$2,685,021) in mine action funding in 2008, a 116% increase in Euro terms compared to 2007 (€845,723 or \$1,159,571). Austria contributed to six countries in 2008, compared to three countries in 2007.

⁴⁰ Email from Sirpa Loikkanen, Secretary, Ministry of Foreign Affairs, 27 February 2009.

⁴¹ Email from David Keating, Disarmament and Non-Proliferation, Department of Foreign Affairs, 12 March 2009.

⁴² *Landmine Monitor Report 2008* reported eight recipient countries of funding from Ireland, adjusted here to nine. Countries receiving funds were Afghanistan, Angola, Cambodia, Iraq, Jordan, Lao PDR, Mozambique, Somalia, and Uganda.

⁴³ Email from Daniela Krejdl, Humanitarian Aid, Ministry for Foreign Affairs, 3 March 2009.

NEW ZEALAND⁴⁴

Period	(\$ million)	(NZ\$ million)
2008–2009	2.6	3.7
2007–2008	2	2.7
2006–2007	0.9	1.3
2005–2006	0.9	1.3
Prior to 2005	11.5	20.1
Total	17.9	29.1

New Zealand reported contributions totaling NZ\$3,705,000 (\$2,649,446) during fiscal year July 2008–June 2009, an increase of 35% in New Zealand dollar terms compared to 2007–2008 (NZ\$2,740,981 or \$2,018,733). As well as its global funding, New Zealand reported the value of its funding to Egypt, and its support to four other countries, but without providing valuations.

FRANCE⁴⁵

Period	(\$ million)	(€ million)
2008	0.4	0.3
2007	2.4	1.7
2006	3.3	2.6
2005	3.8	3.1
Prior to 2005	24.8	25.8
Total	34.7	33.5

France reported contributing €300,994 (\$443,244) for mine action in 2008, an 83% decrease in Euro terms compared to 2007 (€1,744,055 or \$2,391,274). This included in-kind contributions and training for mine-affected states. As of August 2009, the Ministry of Foreign Affairs reported to Landmine Monitor that complete funding data for 2008 was unavailable. In 2007 France reported a similar absence of data from its embassies, and stated actual 2007 funding may have been greater than reported.

Other mine action donors

Saudi Arabia contributed \$1.5 million to mine action in Lebanon in 2008.⁴⁶

Luxembourg contributed €800,488 (\$1,178,799) to five countries in 2008.⁴⁷ Luxembourg provided €637,943 (\$874,684) in 2007. Total mine action funding to date was \$9.3 million.

The **Czech Republic** contributed €703,986 (\$1,036,689) to mine action in 2008.⁴⁸ The Czech Republic provided CZK23,867,286 (\$1.2 million) for mine action in 2007. Estimated total mine action funding to August 2009 was \$5.5 million.

⁴⁴ New Zealand Article 7 Report, Form J, 30 April 2009.

⁴⁷ Email from Daniel Gengler, Ministry of Foreign Affairs, 5 March 2009.

⁴⁸ Czech Republic Article 7 Report (for calendar year 2008), Form J. The Czech Republic reported funding in both US\$ and € for 2008. Values have been converted using the average annual US\$–€ exchange rate for 2008.

Slovenia reported contributing €379,736 (\$559,199) in 2008.⁴⁹ It provided €506,093 (\$693,904) in 2007. Total mine action funding as of August 2009 was \$5.9 million.

Poland reported in-kind contributions to mine action in 2008–2009 in the form of mine clearance personnel in support of international peacekeeping operations, but did not report a value for these contributions.⁵⁰ Poland reported in-kind contributions without valuations in 2007. Total mine action funding for the period 2005–2008 (excluding contributions without valuation) was \$3.3 million.

China reported in-kind contributions to mine action during 2008 but did not report valuations. China contributed a total of RMB6 million (\$789,000) in support of mine action in 2007. Estimated total mine action funding to August 2009 (excluding in-kind assistance without valuation) was \$7 million.

The **United Arab Emirates** (UAE) did not report new international funding in 2008. The UN Mine Action Service (UNMAS) reported receiving \$600,000 (€437,605) from the UAE during 2007 for mine and cluster munitions clearance in southern Lebanon. Total mine action funding to August 2009 was \$69.9 million.

Slovakia did not report international funding in 2008. Slovakia's in-kind assistance to mine action in Iraq, via contributions of the Slovak Armed Forces, ended in 2007. Slovakia continued to provide in-kind assistance to the International Security Assistance Force in Afghanistan, but did not report a value for its contributions in 2008. In-kind assistance to Iraq and Afghanistan totaled SKK236,348,798 (\$9,619,396) in 2007. Total reported funding to date is roughly \$34.5 million.

Landmine Monitor is not aware of funding by **Greece** in 2008. Greece last reported contributing €1.9 million (\$2.4 million) in February 2006 for mine action in Iraq. Mine action funding by Greece has totaled \$12 million for 2001–2008.

Landmine Monitor is not aware of funding by **South Korea** in 2008. South Korea contributed \$1 million to the UN Development Group Iraq Trust Fund in 2007. Total mine action funding as of August 2009 was \$6.2 million.

Landmine Monitor is not aware of funding by **Iceland** in 2008. Iceland last reported providing \$1.5 million for victim assistance in 2005. Total mine action funding was \$2.8 million from 1997–2008.

Major Recipients

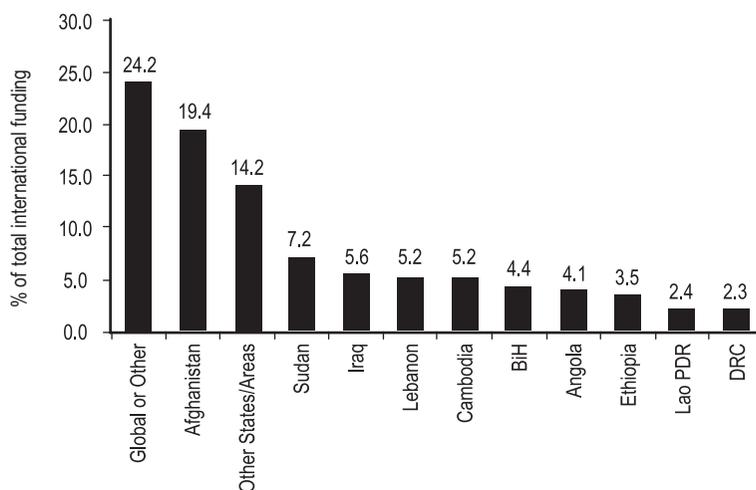

Landmine Monitor has identified international funding totaling \$386.8 million (€262.6 million) to 53 recipient states and other areas in 2008, down from 70 recipients in 2007. This is in addition to \$130.4 million (€88.5 million) in funds for mine action for which no recipient state is specified (or with multiple and undifferentiated recipients), and \$14.1 million (€9.6 million) contributed to research and development.⁵¹

The top recipients of mine action funding in 2008 were **Afghanistan** (\$105.2 million), **Sudan** (\$39.1 million), **Iraq** (\$35.9 million), **Lebanon** (\$28.2 million), **Cambodia** (\$28.1 million), **BiH** (\$23.6 million), **Angola** (\$22.1 million), **Ethiopia** (\$18.9 million), **Lao PDR** (\$12.7 million) and the **Democratic Republic of the Congo**, DRC (\$12.4 million).

⁴⁹ Email from Gregor Kaplan, Security Policy Division, Ministry of Foreign Affairs, 19 June 2009.

⁵⁰ Poland Article 7 Report (for calendar year 2008), Form J.

⁵¹ "Global and Other" funding includes €39 million in EC commitments during 2008 for which specific amounts to recipient countries have not yet been determined.

Mine Action Recipients in 2008⁵²Mine Action Recipients Receiving \$1 Million or More in 2008⁵³

Country/Area	\$ million	€ million	Country/Area	\$ million	€ million
Afghanistan	105.2	71.5	Albania	5.8	3.9

⁵² Figures are rounded to the nearest 0.1% and do not add to 100%.

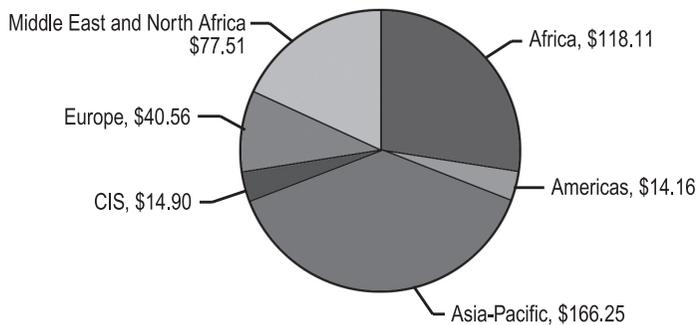

⁵³ Mine-affected countries and other areas receiving at least \$1 million. Figures are rounded to the nearest \$100,000.

Increases of at least \$5 million were seen in 2008 in **Afghanistan** (up \$19 million), **Ethiopia** (\$13.1 million), **Sudan** (\$9.9 million), **Georgia** (\$8.7 million), **BiH** (\$6.5 million), and the **DRC** (\$6.5 million).

Significant reductions in mine action funding—of at least \$2 million—occurred in **Azerbaijan** (down \$2 million), **Cambodia** (\$2.7 million), **Nicaragua** (\$3 million), **Guinea-Bissau** (\$4 million), **Jordan** (\$5 million), **Somalia** (\$5.5 million), **Belarus** (\$5.5 million), **Cyprus** (\$5.5 million), and **Senegal** (\$7.3 million).⁵⁴

In regional terms, where recipient states or regional implementing organizations were identified, annual funding increased, most notably in Africa (\$118.1 million in 2008 compared to \$81.2 million in 2007), followed by Asia-Pacific (\$166.3 million in 2008 compared to \$144.4 million in 2007) and Europe and the Commonwealth of Independent States (\$54.5 million in 2008 compared to \$44.3 million in 2007).⁵⁵ Funding declined in the Middle East and North Africa (\$77.5 million in 2008 compared to \$94.7 million in 2007) and the Americas (\$14.2 million in 2008 compared to \$15.8 million in 2007).

2008 International Mine Action Funding by Region (\$ million)⁵⁶

In 2008, 31 countries and other areas received at least \$1 million in funding, compared to 34 countries and other areas in 2007. States and other areas directly receiving funds in 2007 but not in 2008 were: **Algeria, Belarus, Burkina Faso, Cameroon, Central African Republic, Chechnya, Republic of the Congo, Cyprus, Djibouti, Ecuador, Gabon, Guinea, Indonesia, Kyrgyzstan, Madagascar, Malawi, Niger, Nigeria, Thailand, Togo, Tunisia, and Zambia.**⁵⁷ States and other areas directly receiving funds in 2008 but not in 2007 were: **Armenia, Eritrea, Georgia, Palestine, the Philippines, and Rwanda.**

⁵⁴ In some cases international funds committed in prior years may have been to applied programming in 2008.

⁵⁵ In its regional comparison of funding in 2007, Landmine Monitor reported funds to Europe and Central Asia, here reported as Europe and the Commonwealth of Independent States.

⁵⁶ By US\$ value of contributions, where a recipient country is specified (not including global or regional funding), except in the case of Americas, which includes general funding to the Organization of American States, and Europe/Central Asia, which includes funding to the ITF.

⁵⁷ Donors reported funding to joint mine action programming on the Ecuador-Peru border in 2008, but no funding was reported exclusively to Ecuador.

Trust Funds

Landmine Monitor has identified at least \$140.7 million contributed to mine action via international trust funds in 2008, compared to \$136.6 million in 2007.

The UN Voluntary Trust Fund for Assistance in Mine Action, operated by the UN Mine Action Service (UNMAS), received \$92.5 million in 2008, compared to about \$93 million in 2007, including core and multiyear funding.⁵⁸

The International Trust Fund for Demining and Mine Victims Assistance (ITF), based in Slovenia, received \$34 million in donations from 13 countries in 2008, as well as from the UN and its agencies, local authorities, government agencies, and private donors.⁵⁹ The ITF received \$25.7 million in donations in 2007.

The UNDP Thematic Trust Fund for Crisis Prevention and Recovery received contributions totaling \$14.2 million in 2008, compared to \$16.1 million in 2007. Funds were directed to mine action in 13 countries, and to regional workshops in support of the Convention on Cluster Munitions.⁶⁰

Implementing agencies, organizations and institutions

International funds were directed to mine action in 2008 through nearly 100 agencies, organizations, and institutions identified by donor states as responsible for allocation of funds to operating partners or for direct implementation of programs.⁶¹ As in 2007, some donors reported the operators responsible at the local level for project implementation, others identified an international mine action organization, which may or may not have undertaken projects with local partners, and others identified the UN or another agency through which funds were dedicated to projects at the national level.⁶²

Implementing and coordinating NGOs, trust funds, and other agencies were identified for approximately \$387 million of the \$518 million in total mine action funding. Landmine Monitor identified at least 39 agencies receiving more than \$1 million in international funds in 2008. These included contributions identified only generally by donors, where allocations through specific agencies can be assumed but were not reported. Overall, the UN, its agencies, peacekeeping operations and trust funds acted as implementers for at least \$142.7 million in funds, or some 28% of total reported funding worldwide.

Research and Development

Landmine Monitor identified \$14,110,068 (€9,581,738) in international funding by two donor states for research and development (R&D) in 2008, a decrease of approximately 29% compared to 2007 (\$19,980,298 or €14,572,459).

The US Department of Defense spent \$13.63 million on humanitarian demining R&D projects in fiscal year 2008, compared to \$14.4 million in fiscal year 2007.⁶³

Belgium contributed \$480,068 (€326,000), consisting of contributions to the Belgium Royal Military Academy for demining research, as well as to the International Test and Evaluation Program for Humanitarian Demining to support testing of demining equipment.

⁵⁸ UNMAS, "Voluntary Trust Fund: Status as at 1 May 2009," 1 May 2009, www.mineaction.org.

⁵⁹ ITF, "Annual Report 2008," Ljubljana, p. 22.

⁶⁰ Email from Maria Vardis, Advisor and Inter-Agency Liaison, Bureau for Crisis Prevention and Recovery, UNDP, 22 September 2009.

⁶¹ This excludes direct bilateral funding to governments and government agencies in mine-affected states, and funding via UN peacekeeping missions.

⁶² In its initial submission of data to Landmine Monitor, the US reported allocation of funds without identifying the implementing agency, with the exception of funds contributed to the ITF, which were earmarked by the US Department of State. In some cases the US Department of State later identified implementing agencies for specific funding items.

⁶³ Office of the Secretary of Defense, "Research and Development Descriptive Summary, Humanitarian Demining, PE: 0603920D8Z," February 2008, www.defenselink.mil.

Switzerland continued to provide general support to GICHD, including R&D, but R&D amounts are not consistently differentiated from non-R&D funding.

Japan did not report funding for R&D in 2008. Assistance by Japan to R&D in recent years, carried out under a five-year project (2002–2006) of the Japan Science and Technology Agency and a six-year project (2002–2007) of the New Energy and Industrial Technology Development Organization, concluded in 2007.⁶⁴ Japanese funding for R&D totaled roughly \$4.2 million (¥488,907,424) in 2007.

Funding Article 5 Deadline Extensions

Fifteen countries submitted requests to extend their Article 5 deadlines in 2008: BiH, Chad, Croatia, Denmark, Ecuador, Jordan, Mozambique, Nicaragua, Peru, Senegal, Thailand, the UK, Venezuela, Yemen, and Zimbabwe. Of these, four states (Denmark, Jordan, the UK, and Venezuela) reported the capacity to fund their own clearance initiatives or to raise all required funds, while 11 expressed the need for international assistance. As of July 2008, the total projected cost for the 11 extension requests requiring international funding was approximately \$2.26 billion through 2019.

Between August and November 2008, five states—Ecuador, Mozambique, Peru, Thailand, and Zimbabwe—submitted revised extension requests including budget projections. (Yemen submitted a revised extension request in November 2008, but with no changes to its budget projections.) Of these, two reported reduced cost estimates: Mozambique (\$28.4 million, down from \$32 million); and Thailand (\$528.9 million from \$575 million). Two states reported increased cost estimates: Ecuador (\$16.7 million, up from \$10.6 million), and Peru (\$25.9 million from \$17.9 million). Zimbabwe withdrew its original budget of \$45.5 million and submitted a three-year cost estimate of \$6.9 million, to complete the first phase of its extension plan, after which it will provide a plan and budget for the remaining tasks. As a result of all budget revisions, the total projected cost for states submitting Article 5 extension requests in 2008 declined by some \$66 million, from \$2.26 billion to roughly \$2.19 billion through 2019.

Four additional states submitted Article 5 extension requests between January and August 2009: Argentina, Cambodia, Tajikistan, and Uganda. All have expressed the need for international assistance in completing their clearance obligations, and all included cost projections in their extension requests. The projected costs for these requests total roughly \$595 million, with Cambodia's request accounting for \$307.4 million, Argentina's for \$250 million, Tajikistan's for \$32.6 million, and Uganda's for \$5.2 million.⁶⁵

Taking together the revised 2008 extension requests and extension requests newly submitted between January and August 2009, the projected costs for all Article 5 extension requests total roughly \$2.78 billion for the period 2009–2019. Given that the timelines and annual budgets of each extension request are different, the annual projected costs for all extension requests are as follows:

⁶⁴ Email from Yasuhiro Kitagawa, JCBL, 2 September 2009.

⁶⁵ Argentina's Article 5 deadline Extension Request covers clearance of the Falkland Islands/Malvinas, which is also covered in the UK's extension request. The UK request, however, does not include cost estimates for completion.

Total annual cost estimates for Article 5 deadline extension requests (as of August 2009)⁶⁶

Year	Total cost (US\$ million)
2009	253.3
2010	297.7
2011	302.4
2012	295.7
2013	292.5
2014	302.3
2015	278.1
2016	256.9
2017	237.1
2018	222.5
2019	68.4

Cost projections for 2009 represent 40% of all international and national funding reported for 2008, for all mine action sectors, and 49% of all international funds reported for the year. The projected costs, as shown above, average approximately \$300 million for 2011–2014 before decreasing each after that until 2019 when \$68.4 million of international assistance will be sought for Article 5 extension requests. It is assumed the annual needs for 2015–2019 will increase until 2014 as future extension requests are approved, before declining for the remainder of the period.

Given that other states will in all likelihood submit Article 5 extension requests, and that victim assistance obligations are not included in the majority of plans contained in Article 5 extension requests, it is likely that mine action funding will need to increase over the next five to 10 years. This will challenge not only fulfillment of the extension plans themselves, but also assistance to other mine action sectors, such as risk education, stockpile destruction, training, and victim assistance, and to mine/ERW-affected states that do not require an Article 5 deadline extension.

⁶⁶ Figures are rounded to the nearest \$100,000.

STATES PARTIES

AFGHANISTAN

2008 Key Data

State Party since	1 March 2003
Contamination	Antipersonnel and antivehicle mines, IEDs, submunitions, other UXO, AXO
Estimated area of contamination	668km ² (31 July 2009)
Casualties in 2008	992 (2007: 811)
Estimated mine/ERW survivors	Unknown but estimated 52,000–60,000
Article 5 (clearance of mined areas)	Deadline: 1 March 2013
Demining in 2008	Mined area clearance: 51.5km ² Battle area clearance: 121.1km ² Total clearance: 172.6km ² Other land release: 85.1km ²
Risk education recipients in 2008	1.4 million
Progress towards victim assistance aims	Moderate
Support for mine action in 2008	International: \$105.1 million (\$86.3 million)

Ten-Year Summary

The Islamic Republic of Afghanistan became a State Party to the Mine Ban Treaty on 1 March 2003. It has not adopted national implementation legislation. Afghanistan completed destruction of its known stockpiles of more than 486,000 antipersonnel mines in October 2007, eight months after its treaty deadline. It has discovered or recovered and destroyed tens of thousands of additional mines since then. Taliban forces have used antipersonnel mines sporadically since 2001.

Afghanistan's demining program is the world's largest and oldest, but in 2006–2007 it underwent extensive operational reform, restructuring, and refocusing to increase the efficiency and competitiveness of the UN's implementing partners as well as to reflect the threat to mine clearance from growing insurgency. In 2008, demining organizations released more than 250km², a record for the program.

The Mine Action Center for Afghanistan¹ recorded at least 12,069 casualties from mines and explosive remnants of war (ERW) between 1999 and 2008, including 1,612 killed and 10,457 injured. Casualties are likely under-reported due to the difficult terrain, ongoing insecurity which impedes access for data collectors, and because fatal casualties were often not reported from 1999–2002. The overwhelming majority of recorded casualties were civilians. The casualty toll in 2008 was less than half the level in 2001, but rose for the first time since that year. It is estimated there are up to 60,000 survivors.

Extensive mine/ERW risk education (RE) conducted over the last 10 years by approximately 15 organizations reached up to 3.5 million people a year. RE has focused on communities, internally displaced persons, and returning refugees. From 2002–2006, UNICEF supported RE technically and financially. In 2003, RE began to focus more on community-based activities and behavioral change strategies. School-based RE programs have also been developed. However,

¹ The UN coordinated the Mine Action Programme for Afghanistan (MAPA) through the UN Mine Action Center for Afghanistan, (UNMACA), until 2007 when it became referred to as the Mine Action Center for Afghanistan (MACA) and in January 2009 it was renamed the Mine Action Coordination Centre of Afghanistan (MACCA).

two evaluations in 2008 found that RE programs needed more understanding of the problem and to work more through established institutions.

Despite increased national ownership and interest in victim assistance (VA) and disability issues, increased survivor inclusion and better policy frameworks, there was little real improvement in the situation of survivors. This is in part due to the very low development level in Afghanistan and continued conflict, but also because of a lack of capacity and prioritization. Afghanistan has developed a VA plan as part of its 2005–2009 commitment to the Nairobi Action Plan, but implementation is facing significant challenges.

Mine Ban Policy

Afghanistan acceded to the Mine Ban Treaty on 11 September 2002, becoming a State Party on 1 March 2003. It has not adopted national implementation legislation.² Afghanistan submitted its seventh Article 7 transparency report covering calendar year 2008.³

Afghanistan participated in the Ninth Meeting of States Parties in Geneva in November 2008, making statements on VA and mine clearance. Afghanistan also attended the May 2009 interessional Standing Committee meetings, making statements on VA, RE, and mine clearance. Afghanistan has not made known its views on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Afghanistan signed the Convention on Cluster Munitions in December 2008, but had not yet ratified it as of 1 July 2009.⁴

Afghanistan signed the Convention on Conventional Weapons in April 1981, but has never ratified it, and thus is not party to the convention or its protocols on mines and ERW.

Production, transfer, use, stockpiling, and destruction

Afghanistan is not known to have ever produced or exported antipersonnel mines. Throughout many years of armed conflict large numbers of mines from numerous sources were sent to various fighting forces in Afghanistan. There have been no confirmed reports of outside supply of antipersonnel mines to non-state armed groups (NSAGs) in recent years.

Afghanistan reported that it completed its stockpile destruction obligation in October 2007.⁵ This was eight months after its treaty-mandated deadline of 1 March 2007.⁶ It is unclear how many stockpiled mines Afghanistan had destroyed at the time it declared completion of the program. It reported that as of April 2007, it had destroyed 486,226 stockpiled antipersonnel

² In May 2009, Afghanistan repeated from previous Article 7 reports that “its constitution adopted in January 2005 requires the country to respect all international treaties it has signed. The Ministry of Defense instructed all military forces to respect the comprehensive ban on antipersonnel mines and the prohibition on use in any situation by militaries or individuals.” Article 7 Report (for calendar year 2008), Form A. In addition, no action had been taken as of 1 July 2009 on a 2004 draft law on mine action. Response to Landmine Monitor questionnaire by MACCA, 17 March 2009.

³ Previous Article 7 reports were submitted on: 13 May 2008, 30 April 2007, 1 May 2006, 30 April 2005, 30 April 2004, and 1 September 2003.

⁴ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 27–28.

⁵ On 11 October 2007, Afghanistan formally notified the Implementation Support Unit of the Mine Ban Treaty that “Afghanistan has now fully completed the destruction of all its known stockpiles of Anti-Personnel Mines.” Letter from Dr. Rangin Dadfar Spania, Minister of Foreign Affairs, to Kerry Brinkert, Manager, Implementation Support Unit, GICHD, 11 October 2007.

⁶ In April 2007, Afghanistan informed States Parties that while it had destroyed 486,226 stockpiled antipersonnel mines, two depots of antipersonnel mines still remained in Panjsher province, about 150km north of Kabul. Provincial authorities did not make the mines available for destruction in a timely fashion. For details on the destruction program and reasons for not meeting the deadline, *Landmine Monitor Report 2007*, pp. 89–90, and *Landmine Monitor Report 2008*, pp. 79–80.

mines,⁷ and later reported that in calendar year 2007, it destroyed 81,595 antipersonnel mines.⁸ How many of those were found and destroyed after the October 2007 declaration of completion is not known.

In its latest Article 7 report, Afghanistan indicated that an additional 62,498 stockpiled antipersonnel mines were discovered and destroyed during calendar year 2008. The bulk—58,588—were PFM-1 mines destroyed in Balkh, Kapisa, and Parwan provinces.⁹ The mines were destroyed at 160 events in 20 provinces, all by open detonation.¹⁰ The type and number of mines destroyed in each location, and the dates of destruction, have been recorded in detail in Afghanistan's Article 7 report.¹¹

Mines retained for training and development

Afghanistan reported that during 2008 the maximum number of antipersonnel mines retained for training purposes was 2,618.¹² This total is 62 mines fewer than the number retained at the end of 2007. Afghanistan has previously informed Landmine Monitor that it retains a fluctuating number of mines (depending on the needs of its training programs), and that the number is approved by the Ministry of Defense. The mines it retains come from discoveries and seizures that continue to occur within the country.¹³

In June 2008, the Program Director of the Mine Action Coordination Center of Afghanistan (MACCA) told Landmine Monitor that all of the mines Afghanistan listed as retained are fuzeless, and that the fuzes are destroyed separately prior to use in training.¹⁴

In its latest Article 7 report, in expanded Form D on retained mines, Afghanistan stated, "MACCA uses retained antipersonnel mines in its test centers in Kabul, Logar, Herat, Kunduz, Jalalabad and Kandahar to accredit the mine detection dogs of implementing partners... The implementing partners, under the oversight of MACCA, use antipersonnel mines for training of their mine detection dogs and deminers." It also noted that MACCA, "stores mines that may be needed for testing and accreditation in the future in a secured bunker."¹⁵ Afghanistan did not report how many mines were transferred to the training program, their origin, or the number that were consumed during training.

Use

According to the UN, 2008 was the most violent year in Afghanistan since 2001. International Security Assistance Force (ISAF) force levels increased, insurgent attacks increased, and violence rose sharply in the south, southeast, and southwest of the country. The insurgency attacked in previously stable areas, including high-profile coordinated attacks against multiple government ministries in Kabul in February 2009.¹⁶

⁷ Khaled Zekriya, Head of Mine Action, Ministry of Foreign Affairs, "Update on Stockpile Destruction," Statement to the Standing Committee on Stockpile Destruction, Geneva, 23 April 2007.

⁸ Article 7 Report, Form G, 13 May 2008.

⁹ Article 7 Report (for calendar year 2008), Form G. PFM-1 mines have been identified by other States Parties as especially problematic to destroy. Other mines destroyed included (as listed by Afghanistan): 52 Claymore, four LO-6, three M18, 11 M-4, 23 MON-100, five MON-50, four MS-3, six No. 4, three OZM, 247 OZM-72, one P-2, 60 P-4, two PMD-6, 774 PMN, 102 PMN-2, 267 POMZ-2, seven PPMISR, three TS-50, 10 Type 69, 65 Type 72, 2,231 YM-1, and 40 unknown mines.

¹⁰ Article 7 Report (for calendar year 2008), Form F. Mines were destroyed in Baghlan, Balkh, Bamayan, Faryab, Herat, Jawzjan, Kabul, Kapisa, Kunar, Kunduz, Laghman, Logar, Nangarhar, Paktya, Parwan, Samangan, Sari Pul, Shiberghan, Takhar, and Wardak provinces.

¹¹ Afghanistan provides very detailed reporting, however, it should make unambiguously clear that the mines in Form G are acquired through recoveries, and that the mines in Form F indicate the destruction of same. Landmine Monitor clarified this only through communications in June 2008.

¹² Article 7 Report (for calendar year 2008), Form D.

¹⁴ See *Landmine Monitor Report 2008*, pp. 80–81.

¹⁵ Article 7 Report (for calendar year 2008), Form D.

¹⁶ Report of the Secretary-General, "The situation in Afghanistan and its implications for international peace and security," A/63/751–S/2009/135, 10 March 2009; and NATO, Public Diplomacy Division, "Afghanistan Report 2009," 31 March 2009, www.nato.int.

Yet neither Afghan nor coalition forces are reported to have used antipersonnel mines. United States forces have reportedly deployed and used Claymore directional fragmentation mines in command-detonated mode, which is not prohibited by the Mine Ban Treaty.¹⁷

Non-state armed groups

While the level of insurgent activity increased sharply, the vast majority of reports of explosive attacks did not involve victim-activated antipersonnel mines, even though media reports frequently attributed attacks to “landmines.” Instead, attacks were mostly carried out with remotely-detonated improvised explosive devices (IEDs), often targeting vehicles.¹⁸ On its website, the Islamic Emirate of Afghanistan (Taliban) claimed responsibility for an extensive number of attacks against military personnel and vehicles using command-detonated IEDs.¹⁹ The Hizb-e-Islami militia of Gulbudin Hekmatyar has also claimed responsibility for IED attacks on ISAF troops.²⁰

In June 2008, there were several reports of new use of antipersonnel mines by the Taliban in Arghandab district of Kandahar province.²¹ A spokesperson for the Ministry of Defense was quoted as saying, “The Taliban had laid landmines—anti-vehicle and anti-personnel—on roads and footpaths in Arghandab District.”²² The ICBL expressed concern at the reports of ongoing Taliban use of antipersonnel mines.²³ In January 2009, a US Army captain asserted that the insurgency was using antipersonnel and antivehicle mines, as well as IEDs with pressure plates to trigger explosives, but did not provide specific incidents.²⁴

There were some media reports of ISAF forces recovering antipersonnel mines. In August 2008, three persons were arrested with 30 antipersonnel mines and one antivehicle mine in Pul-i-Khumri in Baghlan province.²⁵ In October 2008, coalition forces recovered several antipersonnel mines among other weapons in Kandahar province.²⁶ In December 2008, ISAF forces recovered one antipersonnel mine and some antivehicle mines in Ghorak district, Kandahar.²⁷ In January 2009, coalition forces recovered antipersonnel mines and pressure plates for mines among other weapons in Kandahar province.²⁸ Other media reports also mention seizures of landmines, but do not identify the type.²⁹

¹⁷ See, for example, “U.S. troops strike hard at Taliban, 13 insurgents killed in surprise attack in Afghanistan valley,” *New York Times* (Korangal Outpost, Afghanistan), 18 April 2009.

¹⁸ These explosive devices have killed and injured international and national troops, government officials, and national and international aid workers, including mine action personnel, and other civilians. Antivehicle devices are often made from shells, rockets, mines, and other munitions, and are transported to the site by bicycle or donkey, placed, and detonated from a distance once a target comes into sight.

¹⁹ In May 2009, the website listed the details of 247 different attacks with dozens of vehicles allegedly destroyed and many alleged military casualties. See www.alemarah1.org.

²⁹ “Large Weapons Cache Discovered in Zabol Province (Afghanistan),” *US Fed News* (Kandahar Airfield), 8 August 2008.

The government's Disbandment of Illegal Armed Groups (DIAG) program collects mines. In November 2008, a local security department discovered 10 antipersonnel mines among other weapons in the Koran area, Gusfandi district of Sari Pul province and turned them over to DIAG. The mines were left over from the Soviet occupation, and commanders were planning to sell them instead of handing them over to DIAG.³⁰ Antipersonnel mines collected under the DIAG program are turned over to the government's Anti-Personnel Mine & Ammunition Stockpile Destruction program run by UNDP.

Scope of the Problem

Contamination

Afghanistan remains one of the states with the highest level of contamination from landmines and ERW, mainly the result of the 1992–1996 internal armed conflict, the decade-long war of resistance that followed the Soviet invasion of 1979, and the US-led coalition's intervention in late 2001, which added considerable quantities of UXO.³¹

Increased insurgency in the past two years has resulted in additional ERW contamination and more use by NSAGs of antipersonnel and antivehicle mines and victim-activated IEDs.³² Security forces, the government, and the UN have continued to uncover large caches of weapons and munitions, including landmines; more than 2,900 tons (2.9 million kg) of munitions were discovered in northern Afghanistan by the joint Afghan-UNDP Afghanistan New Beginnings Project.³³

Estimates of contamination have fluctuated in the last two years as MACCA conducted an audit of data. The Afghanistan Landmine Impact Survey (ALIS), completed in 2005, had found 2,368 communities and more than four million people affected by mines, and identified some 715km² of suspected hazardous areas (SHAs).³⁴ Consolidation of different data sets and discovery of new minefields not identified in the ALIS saw the estimate of contamination rise to 852km² as of 31 December 2007. After further clearance and data consolidation, MACCA estimated the number of hazards as of the end of July 2009 at 6,502, covering 668km², and thought this figure could rise with the results of further survey.³⁵

Soviet forces used air-dropped and rocket-delivered submunitions in the 1979–1989 conflict, and US aircraft dropped 1,228 cluster munitions containing some 248,056 submunitions between October 2001 and early 2002.³⁶ However, clearance operations followed in 2002–2003 guided by US cluster strike data, and the ALIS found that 89% of affected communities reported only antipersonnel and/or antivehicle mines.³⁷ Demining operators say they now encounter few cluster munition remnants.³⁸

³⁷ SAC, "Afghan Landmine Impact Survey," 2005, p. 52.

³⁸ HALO, the biggest demining operator in Afghanistan, reports that it continues to find abandoned Soviet cluster munitions but has not cleared a Soviet cluster strike in more than five years and finds only occasional Soviet submunitions in the course of demining or BAC operations. HALO reports it cleared 9,000 unexploded US submunitions from 2002–2003 and a further 1,780 unexploded submunitions between 2004 and 2008. In the first half of 2009 it cleared 76 unexploded submunitions. Email from Ollie Pile, Weapons and Ammunition Disposal Officer, HALO, 30 June 2009.

Casualties³⁹

In 2008, Landmine Monitor identified at least 992 new casualties in 553 incidents due to mines, ERW, and victim-activated IEDs in Afghanistan, including 266 people killed and 726 injured. Of these, MACCA recorded 831 casualties in 515 incidents (187 killed and 644 injured). MACCA data did not include information on foreign nationals or on people injured by victim-activated IEDs, as this is a security issue outside the scope of its operations.⁴⁰ Landmine Monitor media analysis identified 161 additional casualties from 38 incidents (79 killed and 82 injured), including foreign soldiers from the United Kingdom, US,⁴¹ Romania, Poland, Latvia, Denmark, and Canada (including four military deminers).

The 2008 casualty rate is the first marked increase since 2005 and is due to intensified conflict. This can be seen from the increasing number of civilian casualties in conflict areas such as Kandahar, Helmand, and Ghazni and from the increasing number of military casualties among foreign troops as well as Afghan forces.⁴² In 2007, Landmine Monitor identified 842 casualties: 781 through MACCA and 61 through other sources.⁴³ The average monthly casualty rate of 83 in 2008 is still significantly lower than 172 per month in 2001 or 94 in 2005. Due to ongoing conflict and inaccessibility of the conflict areas, casualties were likely to be under-reported, especially in southern Afghanistan.⁴⁴

Analysis of MACCA casualty data for 2008 shows that most mine/ERW casualties were civilian (704, including three government officials), 51 were deminers, 35 were from the Afghan National Security Forces, and 41 were unknown or “other.” Children constituted 56% of civilian casualties (393); a significant increase from 48% in 2007. Nearly half of the civilian casualties were boys (342, up from 41% in 2007). This can be explained by an increase in ERW incidents among children, particularly boys (up to 33% from 20% in 2007). The number of child casualties deliberately handling the device did not increase. The second largest group was men (280), followed by girls (51), and women (25); the age of six males was unknown.

MACCA reported antipersonnel mines caused 153 casualties, antivehicle mines 125, ERW 474, and unknown devices 25.⁴⁵ Due to changes in the data collection mechanism MACCA was unable to provide a more detailed breakdown of types of ERW causing casualties in 2008.⁴⁶

The most common activity at the time of the incident was traveling (139), followed by tending animals (132), playing/recreation (130), unknown (104), and collecting wood/food/water (91). While traveling casualties remained relatively stable compared to 2007 (down to 17% from 20%), more casualties were recorded while carrying out livelihood activities (up to 34% from 27%), possibly due to harsher living circumstances caused by conflict. Only 38 casualties were caused by tampering (40 in 2007). No casualties were reported in three provinces (Daykondi, Farah, and Samangan). Three provinces without casualties in 2007 recorded casualties in 2008 (Nimruz, Nuristan, and Panjshier). Most incidents occurred in the conflict-ridden provinces in the south (227), mostly in Kandahar (130), Helmand (75), and Ghazni (91) in the restive southeastern part of Afghanistan, followed by Kabul (60) and Baghlan (51). Only 21 casualties (3%, similar to 2007) reported receiving mine/ERW RE and 364 stated they had not received

³⁹ Unless noted otherwise, Landmine Monitor analysis of casualty data for the period 1999–2009 provided by MACCA, Kabul, 26 May 2009; and Landmine Monitor media monitoring between 1 January 2008 and 31 May 2009.

⁴⁰ See *Landmine Monitor Report 2008*, p. 90.

⁴¹ Several more US casualties were reported in IED incidents, but insufficient information was available to determine whether these were victim-activated or remote-detonated devices; statistics from www.defenselink.mil.

⁴² HALO noted that the increase in casualties might also be due to increased recording of people involved in ISAF attacks as ERW casualties and reporting of IED casualties as mine casualties. Email from Tom Dibb, Senior Operations Manager, HALO, 18 August 2009.

⁴³ This total is higher than reported in *Landmine Monitor Report 2008*, p. 90, due to the continuous updating of the casualty database. In August 2009, MACCA subsequently revised its total to 777, but this information could not be included in Landmine Monitor since detailed casualty data was not provided for analysis.

⁴⁴ See *Landmine Monitor Report 2008*, p. 90.

⁴⁵ Email from Deputy Programme Director, MACCA, 20 August 2009.

⁴⁶ Email from MACCA, 27 May 2009.

RE; for the remaining casualties (446) this information was not known. Some 60% of incidents occurred in areas that were not marked.

ISAF maintained records on IED casualties and noted that the number of victim-activated IED incidents increased sharply compared to 2007. From 1 January to 22 May 2008, ISAF recorded 10 ISAF soldiers and 10 Afghan civilians killed, and 75 ISAF soldiers and 20 civilians injured by victim-activated IEDs.⁴⁷ These casualties could not be included in the 2008 casualty total as insufficient information was available for cross-checking.

Casualties continued to be reported in 2009 with at least 177 casualties in 84 incidents as of 31 May (45 killed and 132 injured). MACCA recorded 150 casualties in 78 incidents (29 killed and 121 injured), including 141 civilians, six deminers, and three of unknown status. More than 60% of casualties were children (93), including 83 boys. ERW caused 99 casualties, antipersonnel mines 29, and antivehicle mines 22. Most casualties occurred in Kandahar and Nangarhar (18 each), Kabul (17), and Helmand (14) provinces. Landmine Monitor identified 27 additional casualties in six incidents (16 killed and 11 injured) including 18 Afghan civilians.

Between 1999 and the end of 2008, MACA recorded 12,069 mine/ERW casualties, including 1,612 killed and 10,457 injured. Most casualties occurred in 2001 (2,062), due to conflict and population movements.⁴⁸ Fatal casualties appear to be underreported, particularly between 1999 and 2002. At least 5,607 casualties were civilians, 441 deminers and 504 military; the status of 4,793 was unknown and 724 had 'other' as status. Most casualties were men (5,555), followed by boys (4,994), girls (642), and women (350).

Of the total, 3,282 casualties were due to antipersonnel mines, 831 due to antivehicle mines, 4,646 due to ERW,⁴⁹ and 3,310 due to unknown devices. Only in 1999 did antipersonnel mines cause more casualties than ERW. The percentage of casualties due to unknown devices decreased every year from 32% in 1999 to 13% in 2008. Most antivehicle mine casualties happened in 2007 (155 or 20% of casualties) due to alleged increased use.

MACCA recorded 19,706 casualties between 1979 and 26 May 2009.⁵⁰ According to estimates drawn from the 2005 Afghanistan National Disability Survey, Afghanistan has some 52,000 to 60,000 mine/ERW survivors.⁵¹

Risk profile

People are at risk from both mines and ERW, particularly in Helmand and Kandahar provinces, and new contamination in 2008 increased the risk. Risk activities include traveling, recreation, tending animals, and collecting wood/water/food. Children make up almost half of all casualties.

Socio-economic impact

Although some three-quarters of impacted communities are located in 12 of the country's 34 provinces, mines and ERW still pose a formidable challenge to the country's social and economic reconstruction, which is critical for political stabilization. Mine and ERW contamination is particularly concentrated in central and key food-producing eastern provinces, affecting towns and urban commercial areas as well as villages, farm and grazing land, and roads.⁵² The ALIS found that the main economic blockages caused by mine/ERW contamination were on pastureland, cropland, and roads.⁵³ However, the extent of contamination makes battle area clearance and/or demining a prerequisite for most infrastructure and major construction projects.

⁴⁷ Emails from Maj. Martin L. O'Donnell, US Army, 23 and 24 May 2008.

⁴⁸ 1999: 1,684; 2000: 1,412; 2001: 2,062; 2002: 1,419. 2003: 941; 2004: 911; 2005: 1,122; 2006: 906; 2007: 781; and 2008: 831.

⁴⁹ Cluster submunitions casualties were not specified in MACA data due to a change in the recording mechanism. For more information on cluster submunitions casualties in Afghanistan see, Handicap International, *Circle of Impact: The Fatal Footprint of Cluster Munitions on People and Communities* (Brussels: HI, May 2007), pp. 93–103.

Program Management and Coordination

Mine action

The Mine Action Programme of Afghanistan (MAPA), set up by the UN in 1989, has been coordinated by what started as the UN Mine Action Center for Afghanistan (UNMACA), in 2007 became the Mine Action Center for Afghanistan (MACA), and since January 2009 has been called the Mine Action Coordination Center of Afghanistan (MACCA).

Until 2008, the Ministry of Foreign Affairs provided the government focal point on mine action.⁵⁴ A symposium on mine action organized by the Ministry of Foreign Affairs and MACA on 10 December 2007 decided that an interministerial board should be set up to provide guidance to MACA and that existing institutions should continue to provide support to the government on mine action until 2013,⁵⁵ when responsibility for mine action is to be handed over to national ownership.⁵⁶ The Interministerial Board (IMB) had reportedly met three times as of May 2009 and appointed the Department of Mine Clearance (DMC) to act as its secretariat.⁵⁷

An interministerial meeting convened by the Ministry of Foreign Affairs on 16 January 2008 assigned the lead role in mine action to the DMC, a department set up in the Afghanistan National Disaster Management Authority in 1989, which reports to the Office of the President.⁵⁸ In May 2008, the DMC set up its offices in MACA's Kabul headquarters but has continued to be funded through the national budget.⁵⁹

Until 2009, MACA was responsible for managing, planning, and coordinating all aspects of mine action undertaken by MAPA.⁶⁰ It updated strategic and operational mine action plans and policies, drew up an annual operational workplan, and coordinated the monitoring of RE. It also accredited and quality assured mine action operators, and was responsible for maintaining the mine action database, resource mobilization, support to and coordination of implementing partners, and oversight of national mine action standards.⁶¹ In 2008, MACA established a body to manage contracts with implementing partners on behalf of the UN Mine Action Service Voluntary Trust Fund.⁶² The DMC has increasingly become the interface between MACCA and other government departments.

In the Afghan year 1388 (1 April 2009–30 March 2010), MACCA and the DMC have joint responsibility for coordinating all mine action activities. The DMC, with 15 staff, was due to take over responsibility for accrediting mine action organizations, coordinating external quality assurance, acting as lead coordinator for RE with the Ministry of Education, and preparation of Afghanistan's Article 7 reports, working with existing staff at MACCA.⁶³ The MAPA 1388 workplan also provided for the possibility of setting up a contracting entity within the DMC, the development of transition plans for mine action and the Interministerial Board, and the preparation of a capacity development plan for the DMC.⁶⁴

⁵⁴ See *Landmine Monitor Report 2007*, pp. 92–93.

⁵⁵ Email from MACA, 30 April 2008.

⁵⁶ MAPA, "1388 Integrated Operational Plan" (Version 1.0), Kabul, 20 October 2008, p. 61. Hereinafter, this document is referred to as the "1388 Integrated Operational Plan."

⁵⁷ Interview with MACCA and Abdul Haq Rahim, Director, DMC, Kabul, 18 May 2009. A GICHD assessment of MACA based on a staff mission in June 2008 reported that up to that date the IMB had met only once.

⁵⁸ Interviews with MACA, Kabul, 25 May 2008; and interview with Abdul Haq Rahim, DMC, Kabul, 26 May 2008.

⁵⁹ Interview with MACCA and Abdul Haq Rahim, DMC, Kabul, 18 May 2009; and *Landmine Monitor Report 2008*, p. 83.

⁶⁰ Thus, commercial clearance, which MACCA does not contract directly, and demining by ISAF are outside of its purview.

⁶¹ See *Landmine Monitor Report 2007*, p. 93.

⁶² Email from MACCA, 23 June 2009.

⁶³ Interview with MACCA and Abdul Haq Rahim, DMC, Kabul, 18 May 2009; and emails from MACCA, 31 March 2009 and 20 August 2009.

⁶⁴ MAPA, "1388 Integrated Operational Plan," Kabul, 20 October 2008, p. 11.

However, a European Union (UN) evaluation, which issued its report in April 2009 (see Program evaluations section below) noted a “lack of clarity” about MACCA’s role as the agency coordinating the MAPA. It also found “several reasons to be concerned with this process and to question the capacity and commitment of the DMC to assume the current role of the MACCA.” It noted that the relationship between the MACCA and DMC had not been clarified in a Memorandum of Understanding, or formally detailed in any other way.⁶⁵

MACCA has seven Area Mine Action Centers (AMACs) in Gardez (Southeast), Herat (West), Jalalabad (East), Kabul (Central), Kandahar (South), Kunduz (Northeast), and Mazar-e-Sharif (North). Staffed entirely by Afghans, the AMACs coordinate, oversee, and monitor demining activities at the regional and provincial levels. The regional offices also work directly with communities, UN offices, government representatives, and development organizations to ensure that operations are coordinated and meet local needs.⁶⁶ Regional coordination meetings are held once a month and national coordination meetings are held every one or two months.⁶⁷

Risk education

MACCA is the coordinating body for mine/ERW RE, and coordinates at a regional level through the seven AMACs.⁶⁸ They provide implementing agencies with data, with which they then develop their own plans based on MACCA’s priorities. MACCA also monitors the activities⁶⁹ and holds quarterly technical working group meetings, attended by all RE implementing organizations.⁷⁰ Monthly coordination meetings are also held at the AMACs. ⁷¹ MACCA’s international staff provides technical support to their national counterparts at MACCA and the AMACs.⁷² Handicap International (HI) reported that coordination between ministries and MACCA has increased, and that the capacity of government staff has grown.⁷³ RE is also part of the technical working group for mine action, which includes implementing partners and MACCA personnel.⁷⁴

Victim Assistance

The Ministry of Labour, Social Affairs, Martyrs and Disabled (MoLSAMD), through its Department of Disabled Affairs and dedicated deputy minister, is responsible for coordination, monitoring, and reporting on disability/VA activities within all relevant ministries and stakeholders.⁷⁵ In October 2008, the first inter-ministerial meeting on disability issues, led by MoLSAMD, was held to improve government coordination.⁷⁶ The group meets quarterly and its main mandate is raising awareness and advocating for inclusion of survivors/persons with disabilities in government programs.⁷⁷ The public health and education ministries are also involved.⁷⁸

⁷⁸ See *Landmine Monitor Report 2008*, p. 101.

Coordination with the disability/VA sector is carried out through various coordinating bodies at the relevant ministries.⁷⁹ The most important is the Disability Stakeholder Coordination Group under MoLSAMD. International and national organizations participate regularly in these meetings.⁸⁰ The Ministry of Public Health (MoPH) strengthened its coordination mechanisms in 2008 by upgrading the Disability Unit to a department and the informal community-based rehabilitation network to a formal mechanism under the ministry.⁸¹ MACCA provides technical and financial support to the concerned ministries.⁸²

Overall, coordination was considered to function relatively well,⁸³ but the MoPH noted some challenges due to low awareness, frequent changes in the disability structure and weak coordination on how services are distributed geographically.⁸⁴ Representatives from disabled people's organizations (DPO) and survivor organizations noted that coordination with the ministries remained challenging.⁸⁵

Data collection and management

MACCA manages a database that has used the Information Management System for Mine Action (IMSMA) Version 3. In June 2009, MACCA started a two-month pilot program importing all existing data into IMSMA Version 5 to test the system, while at the same time continuing to maintain its existing database.⁸⁶

Until March 2009, MACCA used a decentralized data entry system in which staff at the AMACs entered clearance data and completion reports provided by operators into the database, and MACCA was responsible for quality control, updating of information, and sending updates to the AMACs. From April 2009, the AMACs continued collecting and verifying clearance data but data entry was undertaken by MACCA staff in Kabul.⁸⁷ RE activity reports are also provided to MACCA and entered into IMSMA.⁸⁸

Casualty data collection in Afghanistan remains incomplete due to the security situation, communication constraints, unequal coverage, and the time needed to centralize information. Data collectors estimate under-reporting of 10–15%.⁸⁹ MACCA is responsible for maintaining and verifying the IMSMA casualty database. Casualty data is collected mainly by the Afghan Red Crescent Society (ARCS). At the end of 2006, the ICRC handed its casualty database over to UNMACA and handed responsibility for maintaining the data collection network over to the ARCS. The ICRC continued to monitor data collection throughout 2007. In Kandahar, HI is an important source of casualty data. An EU evaluation of the mine action program noted that ARCS data collection deteriorated in 2008 because of the ICRC withdrawal.⁹⁰

The MACCA database contains standardized and detailed information on personal details, device type, activity, incident location, RE provision, and marked areas. Unlike the ICRC database, no detail on sustained injuries is recorded, nor does the database contain information on services received. The data is not complete as it does not contain information on casualties among foreign troops or victim-activated IED casualties (with the exception of 2007) and, since 2008, reduced device type detail. The EU evaluation noted that MACCA needs to analyze its data better for RE and other purposes.⁹¹

Plans

Strategic Mine Action Plan

The core objectives of MACCA plans are to achieve the goals set out in the Afghan Compact which the government agreed with international donors in 2006 and Afghanistan's obligations under the Mine Ban Treaty.⁹² The workplan for Afghan year 1388 (1 April 2009–31 March 2010) targets, in order of priority:

- the “killing zones” (communities that have recorded casualties every year since 2003);
- high-impact districts and communities;
- suspected hazardous areas with victims recorded in the ALIS;
- small hazards (less than 5,000m²);
- all hazards within 500m of the center of a community;
- medium-impacted communities;
- mountain-top and flat land that did not fit the categories above;
- donor priorities, including areas with cultural or other benefits;
- demining organization priorities (funded bilaterally);
- non-classified hazards that need further investigation; and
- highly contaminated districts, focusing on those most heavily impacted.⁹³

The 1388 workplan calls for clearance of 946 mine/ERW hazards covering 128.7km² and affecting 484 communities, and “release by technical survey” of a further 75.2km². Nearly three-quarters of the hazards (73%) and of the estimated area for clearance (71%) are located in the central area (around Kabul) and the northeast of the country. The plan aims to free a total of 320 communities and nearly 80,000 affected families from mine/ERW hazards. It also includes 51 hazards whose clearance will allow MACCA to declare 29 districts free of hazards.⁹⁴

MACCA has also drawn up plans, and was seeking funding, for two additional projects: a US\$5 million project to clear 107 hazardous areas within Kabul city limits, covering just under 7km² of land which are unavailable for housing and pasture but are badly needed by the city's fast expanding population; and a \$40 million, two-year community-based demining project to completely clear four eastern provinces (Kunar, Laghman, Nangahar, and Nurestan). MACCA was also preparing a third project to propose to donors for the complete clearance of Ghazni city, southwest of Kabul, which is to be the Islamic City of Culture in 2013.⁹⁵

MACCA's three year (2007–2009) internal RE plan is updated annually. A new plan for 1 April 2009 to 31 March 2010 has been developed.⁹⁶ Areas are prioritized for RE on the basis of: incidents, proximity to minefields, previous RE coverage, and presence of recent returnees and internally displaced peoples (IDPs).⁹⁷ LIS data, which has been refined over the years, supports prioritization.⁹⁸

Victim assistance

The long-term strategy, “The Way Ahead,” set the following goal for VA: “The End Goal for Mine/ERW survivor assistance will be achieved when mine/ERW survivors are reintegrated into Afghan society, with support provided through a national system that incorporates the rights and needs of people with disabilities.”⁹⁹

In the second half of 2008, the Afghanistan National Disability Action Plan 2008–2011 (ANDAP)—prepared by MoLSAMD with extensive stakeholder consultation¹⁰⁰—was approved by the government.¹⁰¹ Development of this plan started as part of Afghanistan’s commitment to the 2004 Nairobi Action Plan but it has become the *de facto* workplan for the disability sector (*see below*).

While a sophisticated mechanism was developed to monitor every objective in ANDAP, monitoring of this scope was found to be beyond MoLSAMD’s capacity. ANDAP will be monitored in accordance with the relevant indicators of the development strategy.¹⁰² MACCA supports MoLSAMD in building monitoring capacity.¹⁰³ The MoPH started collecting rehabilitation statistics in 2008 to improve referral.¹⁰⁴

National ownership

Commitment to mine action and victim assistance

Afghanistan has the oldest and largest mine action program in the world. It reports that between 1988 and 2006 the MAPA cleared 12,000 minefields, 300,000 landmines, and more than seven million ERW.¹⁰⁵ It also increased its financial support for mine action. In 2008, the government committed \$2.6 million to clearance of an area targeted for Chinese investment in copper mining.¹⁰⁶

A Geneva International Centre for Humanitarian Demining (GICHD) report summarized the government’s view of mine action as “a moderately high priority but...it’s not broken so there’s no need to fix it.” The report observed “the government has never had to make a collective decision concerning mine action, and its political will has not been tested.”¹⁰⁷

Between 2005 and 2009, Afghanistan has gradually increased national ownership of VA/disability issues, with the Deputy Minister for Disability Affairs stating that “some of the most significant achievements have been in the transition of responsibility for victim assistance from the UN to the Government of Afghanistan.”¹⁰⁸ Increased involvement started in 2006 and continued with subsequent organizational reinforcements in 2007.¹⁰⁹ MACCA believed that activities of VA/disability operators have “become more prominent” and “the services they provide are considered important if not priorities among the public sector.”¹¹⁰

The situation of survivors has not changed significantly despite increased attention to VA/disability. One major achievement was the increased participation of persons with disabilities and their organizations in planning. But DPOs added that survivors were not included more

frequently in social, political, cultural issues or employment and that negative attitudes persisted.¹¹¹

An EU evaluation noted that VA was among the “less effective” of MACCA’s program areas.¹¹² The evaluation noted that VA under MACCA coordination “seemed overly focused” on policy and awareness-raising and that “for mine survivors it is unlikely that such initiatives will generate much in the way of tangible benefits in the short term.” It added that in MACCA planning there was insufficient focus on “practical skills training and income generation measures.”¹¹³ MACCA disagreed with this recommendation.¹¹⁴

National management

Current planning provides for transition to full national responsibility for mine action by 2013 and MACCA’s workplan for 1388 provided for MACCA to draw up a draft transition plan and to work with the Inter Ministerial Board on a plan to develop the role of the DMC. MACCA appointed an Afghan as the program director for the MAPA for the first time in June 2007 and has progressively nationalized senior staff posts.¹¹⁵ By 2009, MACCA employed 14 international staff, down from 23 the previous year.¹¹⁶

The EU evaluation, however, said the “key stumbling block” to the transition was that the government “has little or no interest in owning either the problem of, or solution to, ERW contamination in Afghanistan.” It added MACCA’s Afghan implementing partners also expressed no interest in changing the status quo. It concluded: “Until these issues are resolved talk of transition is largely meaningless.”¹¹⁷

A GICHD assessment in 2008 reported “some progress” in bringing Afghans into decision-making positions and promoting national ownership but also observed that “the DMC presently has little capability and unknown commitment.” The DMC’s endorsement as the focal point for mine action was the result of an *ad hoc* process which may not represent the final position of the government, and that a broader institutional framework had not been agreed. The report said MACCA should assess whether DMC personnel had the basic skills and commitment and if the DMC’s senior management included a “champion for change.” If not, GICHD recommended “the UN should not waste time and money on capacity development support until changes are agreed.”¹¹⁸

VA has been integrated in the disability work of MoLSAMD, MoPH, the Ministry of Education (MoE), and in relevant development plans. Coordination structures and disability departments and mechanisms have been set up in the three ministries and reinforced in 2008.¹¹⁹ A Deputy Minister for Disability Affairs was appointed at MoLSAMD in August 2008 which, according to MACCA, was “critical to address issues related to social and economic reintegration, and to keep disability on the radar of other ministries and, hopefully, begin better resource mobilization and monitoring of activities.”¹²⁰

¹²⁰ Response to Landmine Monitor questionnaire by MACCA, 29 March 2009.

Despite this, MoLSAMD still lacked capacity to coordinate VA and monitor implementation; it was also heavily dependent on external funding. MoLSAMD traditionally focused on payment of pensions and had little budget for other services, such as education and employment.¹²¹ Funding challenges were common among all relevant ministries.¹²² The unstable political context also hampered the functioning of the ministries. ANDAP will assist in achieving the Afghanistan National Development Strategy.¹²³

Implementation of ANDAP is largely left to non-governmental operators (see below). National NGOs were taking on more substantial roles in implementation but also in training and support to DPOs.¹²⁴ Two of the largest disability operators in Afghanistan, the ICRC and the Swedish Committee for Afghanistan (SCA), noted that no end dates were envisioned for their support. The ICRC reported that Afghanistan was the only country in which it “had completely assumed the task of ensuring access to rehabilitation services.”¹²⁵ SCA added there was no end date because “there are a few actors working in the field of disability and, for the time being, the government is also not in a position to take over services nor are DPOs in a position to support all advocacy activities.”¹²⁶

National mine action legislation

The DMC, created in 1998 as a department of the Afghanistan National Disaster Management Authority, was seeking a presidential decree confirming the status and lead role assigned to it by the interministerial symposium in January 2008. The DMC also resumed discussions in 2009 with the Ministry of Justice on a draft mine action law it first submitted in 2006.¹²⁷

National mine action standards/Standing operating procedures

MACA conducted a review of national mine action standards (AMAS) from 2006–2007 to ensure consistency with a new concept of operations and restructuring of demining teams.¹²⁸ In 2007, MACA also developed a specific chapter of the AMAS to deal with systematic handover of cancelled or otherwise released land to end users.¹²⁹ In 2008, amendments to eight chapters of the AMAS, including a rewritten chapter on quality management, were reviewed by a Review Board, made up of representatives of MACCA, international and national NGOs, and international and national commercial companies.¹³⁰ There are national standards for RE based on the International Mine Action Standards.¹³¹

Program evaluations

An EU evaluation said that overall, mine action “represents an extremely successful sector of international development aid programming in Afghanistan” with a track record of delivering results and highly regarded by a wide range of stakeholders. It noted that innovations such as community-based demining “may make mine action even more strategically important” as one of the few international aid interventions capable of working in areas where insecurity is high. As a result it recommended the EU “substantially increase funding” for mine action, “perhaps by 100%.”¹³²

¹³⁰ Emails from MACCA, 18 May and 17 June 2009.

¹³¹ Email from MACCA, 30 March 2009.

¹³² Paul Davies and Bruce Todd, “Mid Term Evaluation of the Mine Action Programme in Afghanistan – Final Report,” EU, April 2009, p. 2.

The evaluation said MACCA was “adding more value to the MAPA by better analysis of the mines problem as recorded in the national database, and is co-ordinating a more intelligently crafted solution that is driven far more by qualitative factors than ever before.” It described the 1388 annual workplan as “the most systematically intelligent planning process at national programme level observed anywhere in the global mine action industry, possibly to date.”¹³³

Part of its success was that national operators were developing their own workplans, breaking a past “culture of dependency” on the UN. “MACCA now sees its role as ensuring that the IPs [implementing partners] are working towards a common strategic vision, represented in progress towards the mine action benchmarks, with responsibility on the staff of the IPs to come up with detailed operational plans in support of the national programme vision.”

The evaluation found mine action “much improved” by operational reforms since 2006, but it also flagged a number of significant concerns. It observed that many national operators lacked the ability and confidence to fulfil the role of full service providers under the new concept of operations¹³⁴ and suggested that this could affect safety. The evaluation found “unacceptable” that at least 48 demining accidents were reported by MACCA among Afghan implementing partners in 2008. It also drew attention to problems of missed mines and incidents on previously cleared land. It said MACCA had not responded to requests for information, seemed “defensive” about holding an open review of operational quality standards, and seemed “torn between defending the operational standards of the (implementing partners)...and admitting there is a quality problem.” The evaluation recommended quality assurance should be outsourced to a technically competent agency not operating in Afghanistan.¹³⁵

A GICHD assessment in 2008 said MACA and MAPA organizations “have, collectively great capacity to address contamination problems but also to make more substantial contributions to peace building, reconstruction and poverty reduction.” The report noted that “years of paternalism and micro-management by MACA has stunted some of the capabilities of the Afghan NGOs,” but it concluded MACA had a strong management team which had initiated “excellent” reforms, although it still did not have, and should formulate, a formal, written strategy and medium-term plan.¹³⁶

An evaluation by an independent consultant of MACCA’s post-demining impact assessments (PDIA) found that the Landmine Impact Assessment Teams (LIATs) which conduct PDIA were “conscientious” but also “mechanical.” The report found “information collection analysis and use are still very much top-down processes. They are focused on satisfying donors and headquarters that targets have been reached and money has been well spent, rather than checking that operations are on the right track.”¹³⁷ LIATs stuck closely to questionnaires and were more comfortable with figures than community interaction and social impact assessment.¹³⁸ AMAC staff, to whom LIATs reported, did not appear to receive information about what percentage of cleared land was not being used and why, and no shift was apparent to community involvement in operational planning and priority-setting.¹³⁹

Demining and Battle Area Clearance

In 2008, some 8,000 Afghans worked for organizations coordinated by MACCA. These included five Afghan NGOs: Afghan Technical Consultants (ATC), Demining Agency for Afghanistan (DAFA), Mine Clearance Planning Agency (MCPA), Mine Detection and Dog

¹³⁹ Ibid, pp. 16–18.

Centre (MDC), and Organization for Mine Clearance and Afghan Rehabilitation (OMAR); and two international NGOs, Danish Demining Group (DDG) and HALO Trust. There were also 11 commercial companies operating in 2008, including four Afghan companies (Afghan Campaign for Landmines, Hemayatbrothers Demining International, Kardan Demining Group, and National Demining Support Services); and seven international companies (ArmorGroup, DynCorp International, EOD Technology, MineTech International, RONCO, The Development Initiative—TDI, and UXB International).

Since UNMACA introduced a new concept of operations in November 2006, demining has undergone substantial reform. Operators restructured demining teams into smaller units gaining greater operational flexibility and switched from two to one-person, one-lane drills; all operators were trained for survey, which previously had been conducted exclusively by one NGO, MCPA, and under a policy of regionalization, NGOs concentrated assets in particular geographic areas.¹⁴⁰

In 2008, MACA introduced a Request for Proposals system for competitive bidding by NGOs and commercial operators for clearance contracts awarded by UNOPS, in an effort both to increase annual clearance and raise efficiency. ArmorGroup won one contract for clearance of a 7km² airfield at Shindand in western Herat province and completed it.¹⁴¹ MineTech won a contract for clearance in two locations in Badghis province, but was unable to complete work for what, according to MineTech and MACA, were security reasons. MineTech was assigned a smaller contract close to Herat which was completed in July 2009.¹⁴² As of June 2009, MACCA had not issued any further Requests for Proposals.

MACA also promoted community-based demining (CBD) in 2008 in order to mobilize clearance capacity in areas deemed too insecure to deploy NGO or commercial operators. MACCA planned to employ CBD in 43 communities in southern and eastern Afghanistan, including parts of Ghor, Helmand, Kandahar, Kunar, Nimruz, Paktia, and Zabul provinces.¹⁴³ By May 2009, three NGOs had set up a total of 13 CBD teams: three supported by OMAR in Kunar province; two supported by MDC in Uruzgan; and eight teams backed by DAFA in Lashkargah in Helmand province.¹⁴⁴ Quality management of the Kunar CBD was conducted by AMAC Eastern area and for Helmand and Uruzgan by AMAC Southern area. In June 2009, OMAR started operations by four CBD teams in Ghor, and MCPA started six teams operating in Kandahar.¹⁴⁵

Identification of hazardous areas

The ALIS, completed in January 2005 and certified by the UN on 30 September 2005, provided a basis for significantly refocusing mine action. The survey identified 2,368 mine and UXO-impacted communities and 4,514 SHAs, of which 718 (16%) were high-impact, 1,055 (23%) medium-impact, and 2,741 (61%) low-impact.¹⁴⁶ As a result of the survey, the total SHA in the MACA database fell by 15%, from 850km² to 715km².¹⁴⁷

The ALIS also found that all but two of Afghanistan's 32 provinces (Daykondi and Uruzgan) were mine-affected, but three-quarters of SHAs—and of recent casualties—were located in only 12 provinces, and half the SHAs were located in just six provinces, led by Kabul.¹⁴⁸ Moreover, 45% of recent casualties recorded by the survey were in the three provinces of Kabul, Parwan, and Takhar.

¹⁴⁰ See *Landmine Monitor Report 2008*, p. 85.

¹⁴³ See *Landmine Monitor Report 2008*, p. 86.

¹⁴⁴ Email from MACCA, 18 May 2009. In three months (16 December 2008 to 12 March 2009) the CBD teams cleared a total of 242,754m² of mined areas and 173,799m² of battle areas, with the destruction of 42 antipersonnel mines and 4,369 items of UXO.

¹⁴⁵ Email from MACCA, 18 May 2009.

¹⁴⁶ SAC, "Afghan Landmine Impact Survey," 2005, p. 19.

¹⁴⁷ *Ibid.*, pp. 8–9.

¹⁴⁸ *Ibid.*, pp. 19–26; and email from unnamed program officer, UNMAS, 20 July 2006. Kabul accounted for 313 affected communities (13% of affected communities), 155 SHAs (18%), and 420 recent victims (19%).

A polygon survey—more accurate delineation of the perimeter of a SHA—by HALO in its area of operations in 2007 identified 32km² of affected land not included in the ALIS, but enabled HALO to reduce previously identified suspected hazardous areas by an average of 40%. Those outcomes led MACA to proceed with polygon surveys in most of the rest of the country in 2008–2009, employing HALO and MCPA survey teams.¹⁴⁹ Of Afghanistan's 245 districts, MACCA rated 79 districts inaccessible for security reasons and planned polygon surveys in a total of 150 districts. HALO and MCPA deployed eight survey teams each and by mid-2009 had completed 123 districts. Surveys in a further 16 districts were suspended for security reasons leaving 27 to be completed, expected by the end of 2009.¹⁵⁰

MACCA reported in April 2009 that polygon surveys had resulted in a 9% reduction in the total estimated SHA.¹⁵¹ However, 624 minefield reports submitted by HALO in July and early August 2009 revealed 337 previously unrecorded minefields, adding 20km² to the total hazardous area in the IMSMA database. As of August 2009, MACCA had a further 200 mined area and 144 battle area reports to process. These included some resurveyed areas but MACCA expected would result in a further increase in the estimated hazardous area.¹⁵²

Mine and battle area clearance in 2008

Despite operational constraints resulting from deteriorating security, total clearance rose by 10% in 2008, partly a result of improved planning and management resulting in more focused operations and improved efficiency on the part of Afghan implementing partners. The amount of mined area cleared was 87% higher than the previous year, pushed up by big increases in clearance by all the demining NGOs, particularly HALO and MDC, but battle area clearance was down by 18% over the previous year. An additional 85km² was released through area reduction or cancellation (see table below).

Armed opposition and criminal groups have inflicted losses on demining operators in the past two years. After three MDC deminers were shot dead in southern Kandahar province in September 2007, seven more deminers were killed in March 2008: five from Afghan Technical Consultants (ATC) were shot in northern Jawzjan province, and two MDC deminers were killed in Kunduz province. Demining operators also lost vehicles and equipment worth hundreds of thousands of dollars in attacks or raids by insurgent or criminal groups.¹⁵³ Security threats have prompted commercial companies to stop moving personnel and assets by road and to use air transport, substantially raising operating costs.¹⁵⁴

Direct attacks on deminers appeared to diminish in 2009, but three security guards and a MineTech logistics clerk were killed and a driver injured in an attack by insurgents or criminals as they left a MineTech demining site near Herat on 28 May. MineTech concluded the attack was well planned and had targeted international staff working at the site.¹⁵⁵ In July, gunmen kidnapped 16 deminers working for MDC in eastern Paktia province but released them reportedly without any ransom payment after the intervention of local community leaders.¹⁵⁶ DDG experienced two attacks in 2009, the first on 15 July when gunmen fired two rocket-propelled grenade rounds and small arms at a DDG compound in Balkh province and the second on 20 July when two gunmen opened fire at deminers returning from a clearance site, fatally wounding a group supervisor. Initial assessments concluded the attacks were random and had not targeted DDG.¹⁵⁷ A HALO truck suffered damage in a vehicle-activated IED explosion on 20 May 2009 as it delivered ammunition for destruction to a site outside Kabul. Staff in the

Clearance capacity is concentrated among NGOs, with about 8,000 deminers in total. HALO, the biggest operator in Afghanistan, had increased capacity to 3,200 personnel as of April 2009 (from 2,800 in 2007). It deployed 98 demining teams, 29 mechanical teams, 12 battle area clearance (BAC) teams, nine explosive ordnance disposal (EOD) teams, and eight survey teams, working in western Herat province, in the north and in the vicinity of Bagram. HALO accounted for two-thirds of the mines and more than half (54%) of UXO cleared through demining operations in 2008 (see table above). It also had 16 weapons and ammunition disposal (WAD) teams and seven WAD survey teams, which destroyed a further 62,925 antipersonnel mines, 435 antivehicle mines, and 1.1 million items of UXO.¹⁶⁰ The other international NGO, DDG with a total staff of 540 in 60 sections, shifted operations from western to northern Afghanistan as part of MACA's regionalization strategy. It also completed cross-training of its field staff for manual demining, BAC, and EOD.¹⁶¹

¹⁵⁸ "IED Incident Report – Deh Sabz, CDS, Bagram," HALO, 20 May 2009.

¹⁵⁹ Email from MACCA, 31 March 2009.

¹⁶⁰ Email from Tom Dibb, HALO, 5 May 2009.

¹⁶¹ Email from Clinton Smith, Country Program Manager, DDG, 19 May 2009.

Among Afghan NGOs, ATC remained the biggest operator with 48 demining teams in 2008, together with eight EOD teams and nine mechanical demining units concentrated in central and southeastern Afghanistan. Its demining teams cleared 45% more land in 2008 than in 2007, but conducted less BAC.¹⁶² MDC operated with 1,260 staff in 32 mine detection dog (MDD) groups (128 MDD), five demining teams, two EOD teams, and six mechanical units, working in the south and south east.¹⁶³ OMAR, with 29 manual demining teams, two EOD teams, six mechanical demining units, and three mine detection dog (MDD) sets, focused on operations in western and eastern Afghanistan, also increased the area demined manually by 45%.¹⁶⁴ MCPA, with 490 staff making up 18 demining teams (including six community-based), two EOD teams, three mechanical units, and five MDD sets, focused on clearance in the south and southeast,¹⁶⁵ while DAFA, with 32 demining teams, three mechanical units, and three MDD sets, also operated in the south.¹⁶⁶

DynCorp International, with 16 international and 172 national staff, managed seven Conventional Weapons Destruction teams set up in 2008 on behalf of the US Department of State's Weapons Removal and Abatement Program. Three teams operated in Herat on tasks assigned by the Afghan Ministry of Defense. The others operated in the northern provinces of Baghlan, Kunduz, and Samangan, undertaking village clearance tasked by the regional AMAC, but threats against its security prompted the team in Baghlan to move to Kunduz.¹⁶⁷

Other commercial companies mainly undertake clearance to support infrastructure development such as roads, airfields, power lines, and military and police installations. RONCO has some 700 staff working at Bagram airbase under a contract to the US Air Force renewed in 2008 for four years and some 365 staff, including 10 expatriates, who in 2008 undertook contracts for the US Army Corps of Engineers and NATO Maintenance and Supply Agency.¹⁶⁸ ArmorGroup cleared 4.5km² in Shindand airfield under MACA's Request for Proposals program.¹⁶⁹ Among Afghan commercial companies, Hemayatbrothers Demining International (HDI), employing some 200 staff, undertook clearance and BAC in support of construction projects in Farah, Kunduz, and Uruzgan provinces and in April 2008 started a contract for clearance around Bagram airfield.¹⁷⁰

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Afghanistan is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2013 (which falls within Afghan Year 1391). This obligation is a key influence in Afghanistan's strategic planning. The Afghan Compact of 2006 set the target of clearing 70% of hazards and contaminated areas by 2010, and The Way Ahead draft strategy for mine action released in 2006 set the target of completing clearance of all known mined areas by 2013.¹⁷¹

At the Ninth Meeting of States Parties, Afghanistan said it had made "strenuous efforts to improve all aspects of our organization and operation so that we might achieve our vision of a mine-free Afghanistan by 2013."¹⁷² At the intersessional Standing Committee meeting six months later Afghanistan estimated the cost of completion at just over \$500 million. stated, “We have the technical ability to achieve this goal. Our only barrier is sufficient funds to get the job done.”¹⁷³

Progress towards mine action benchmarks¹⁷⁴

	Adjusted baseline at 31 July 2009	Remaining contamination at 31 July 2009	Clearance processed 2006–July 31 2009	Compact target–70% by 1389 (2010–2011)	Progress toward Compact target	Treaty target–100% by 1391 (2012–2013)	Progress towards treaty target
Number of hazards	10,175	6,502	3,944	7,123	55%	10,175	39%
Hazard area (km ²)	1,028	668	363	720	50%	1,028	35%

In the past nine years, demining organizations have cleared more than 250km² of mined area and 837km² of battle area (see table below), but continuing new discoveries of contamination have hampered progress towards achieving targets. The area of estimated contamination rose from 656km² at the end of March 2009 to 668km² at the end of July as a result of adding in hazards discovered in the course of the polygon survey (see Identification of hazardous areas section above). At the end of May 2009, MAPA estimated it had achieved 89% of the Compact target, 62% of the Mine Ban Treaty target in relation to hazards, and 60% of the Compact target and 42% of the treaty target in relation to area.¹⁷⁵ By the end of July, after processing polygon survey results, MACCA estimated it was about halfway to achieving the Compact targets and had completed 39% of hazards and 35% of the hazardous area due to be cleared to meet Afghanistan’s treaty obligations, lower than the levels reported in April 2008.¹⁷⁶

Clearance Activities from 2001–2008¹⁷⁷

Year	Mine clearance (km ²)	BAC (km ²)	Other land release (km ²)
2008	51.53	121.10	85.1
2007	27.51	148.83	78.7

Risk Education

In 2008, MACA reported that more than 1.4 million Afghans received RE, of which over 40% were women and 70% were children.¹⁷⁸ RE interventions are focused on antivehicle mines and ERW.¹⁷⁹ By the end of 2008, more than 68% of the 428 high-impact communities targeted for RE had been reached. In addition, 202,239 returnees were provided with RE. RE teams also visited areas with medium- and low-impact communities during 2008 based on requirements.¹⁸⁰ A successful radio campaign was also implemented.¹⁸¹

The Afghan Red Crescent Society (ARCS) is the biggest implementer, and has activities in almost every province. The ICRC handed over its RE capacity to the ARCS in 2008.¹⁸²

RE has been integrated into the school curriculum for grades seven to 14 and has been produced in local languages with the support of MACA. The MoE has taken an increased role, providing funding, training staff, and monitoring activities. Disability advocacy is incorporated into RE messages in school and is regarded as a particular success of the program.¹⁸³ The Ministry of Interior puts three child protection officers in every province, trained in RE and disability awareness, among other things. Each provincial team trains teachers in affected communities on RE and disability issues.¹⁸⁴

There is sufficient RE capacity to cover all affected areas, but security problems frequently prevent implementation, with RE personnel sometimes unable to leave their homes, and NGOs taking precautionary measures which slow down implementation.¹⁸⁵ In the south, work was suspended by HI for several months in some districts in 2008.¹⁸⁶ The ARCS has female staff in the south who work in clinics and deliver RE.¹⁸⁷

New RE training aids were developed, with assistance from AAR Japan, for use by all implementing organizations. The materials are illustrated with photographs, and are suitable for use with people with no or low literacy.¹⁸⁸ The materials also included information on the rights of people with disabilities.¹⁸⁹

Many agencies submitted clearance requests to MACA. However, MAPA implementing agencies have finite resources and assets and therefore are not able to respond to all requests.¹⁹⁰

Monitoring was conducted both internally by the implementing organizations and externally by the operations departments of MACA and AMACs, through regular field visits by MACA's national RE project manager.¹⁹¹ Feedback from monitoring fed into developing effective training, supplies of materials, and ensuring that the relevant authorities were informed about RE activities.¹⁹² RE in schools was monitored by the MoE.¹⁹³

Overall, MACCA believes that RE is meeting the needs of its target audience and plays a role in reducing incidents, even if it cannot eliminate them completely, although there is a need to continually review the target audience. A gender survey revealed that women valued RE for their children and wished to see it continue.¹⁹⁵

An evaluation of mine action by GICHD in 2008 found that, “The Afghan NGOs have been the principal providers of MRE since the start of mine action in Afghanistan. However, the ‘traditional MRE’ they provide (e.g. direct delivery of MRE in refugee transit points or to communities) is of limited benefit once conflict and population movements have stopped, and is unsustainable as a standalone activity. MRE needs to be more tightly targeted to at-risk groups and delivered through established institutions. Accordingly, MACCA has been working effectively with the Ministry of Education and the Afghan Red Crescent Society to provide ‘residual’ MRE services.”¹⁹⁶ An evaluation of the EU’s program for mine action in Afghanistan concluded that, “Mine risk education (MRE) is conceptually weak” and it recommended a further independent review as it was seen as under-performing. It stated that, “MACCA’s MRE department needs to improve its understanding of the problem, and its solution, by investing time in analyzing victim data within the IMSMA database, and trends that this contains.” It recommended that the European Commission (EC) earmark funding for the ARCS and that it may need a technical consultant.¹⁹⁷

Extensive RE over the last 10 years has been implemented by up to 15 organizations reaching between almost one million and up to 3.5 million people a year. RE has targeted communities in Afghanistan, including internally displaced persons and returning refugees in Pakistan and Iran.¹⁹⁸

In 2002, UNICEF joined the program to provide coordination, technical assistance, and capacity-building to MAPA partners, and the Monitoring, Evaluation and Training Agency (META) became responsible for training and monitoring RE organizations and teachers, integrating RE into the school curriculum, and developing materials.¹⁹⁹ In 2006, UNICEF ceased funding RE, and coordination was integrated into UNMACA. RE was coordinated and quality assured by the AMACs.²⁰⁰

Several evaluations and surveys have been conducted related to RE. In March 2006, MAPA published a complete RE impact monitoring study based on Knowledge, Attitudes, and Practice surveys conducted in 2004 and 2005. The two surveys showed an overwhelming majority of people were fully aware of the dangers of mines/ERW, but were not sure of safe behavior if they found themselves in a minefield. The MAPA also found that knowledge was higher among boys and young men than women and girls, although incidents were increasing among boys. It concluded that, “economic necessity leads to this *subconscious* ignoring of danger.”²⁰¹ Community interviews conducted as part of the ALIS from November 2003 to November 2004 found only 27% of impacted communities in 32 provinces reported receiving RE in the previous 24 months. Six provinces with recent casualties reported no RE activities.²⁰²

Afghanistan used Form I in its annual Article 7 report to provide information on RE activities from 2005–2009.²⁰³

Victim Assistance

The total number of survivors is unknown but is estimated to be between 52,000 and 60,000. In May 2009, Afghanistan stated that despite steady progress and increased commitment, key challenges remained, such as reconstructing health and social services after years of conflict, “increasing employment and education among persons with disability and ensuring the rights of persons with disability are respected.”²⁰⁴ Representatives of DPOs noted that, since 1999, there had been “very little improvement” in services,²⁰⁵ because of the limited number of skilled professionals, but also due to a lack of funding as a result of low donor interest in disability.²⁰⁶

As in previous years, the ICRC noted that access to services was hampered by a lack of awareness, professionalism, poverty, distances and transportation difficulties, violence, ethnic and political divisions, and prejudice against disability.²⁰⁷ Access to services for women was even more problematic due to cultural barriers, the lack of qualified female staff, and reluctance to let women work outside the house.²⁰⁸

The MoPH coordinates healthcare through two strategies: the Basic Package of Health Services and the Essential Package of Hospital Services, implementation of which is mostly contracted to NGOs and international organizations.²⁰⁹ Despite increased coverage of these packages,²¹⁰ healthcare in Afghanistan remains among the worst in the world. Increased conflict and attacks on health facilities and staff resulted in more than 600,000 Afghans lacking access to services according to April 2009 estimates by the MoPH.²¹¹ This number is twice as high as estimated in the same period of 2008.²¹²

Physiotherapy services are available in 19 provinces and through 14 rehabilitation centers. The lack of services in the remaining 15 provinces is problematic.²¹³ Although the MoPH coordinates the sector, it only runs one center.²¹⁴ In 2008, physical rehabilitation services were included in the MoPH health packages, awareness of the importance of rehabilitation services was raised, and training increased.²¹⁵

Conflict-related mental health problems are common in Afghanistan, including among mine/ERW survivors, and are exacerbated by stigma related to disability. Psychosocial support activities remained limited, despite increased attention by the MoPH through training and the establishment of a Mental Health Unit at the ministry.²¹⁶ As of 2008, there were five mental health clinics in Kabul.²¹⁷

²¹⁶ Response to Landmine Monitor questionnaire by Razi Khan Hamdard, MoPH, 2 April 2009.

²¹⁷ Statement by Suraya Paikan, MoLSAMD, Ninth Meeting of States Parties, Geneva, 27 November 2008.

Stigma and high general unemployment limit the employment prospects of persons with disabilities. SCA noted that, in 2008, employment of persons with disabilities in the government and private sectors had decreased slightly compared to 2007.²¹⁸ Unemployment among persons with disabilities was already estimated at 75%, and some 73% did not have access to education. Results of vocational training programs have been disappointing due to a lack of cooperation, funding and infrastructure, poor quality of education, and a lack of employment opportunities afterwards.²¹⁹

Persons with disabilities registered at MoLSAMD receive a pension of AFN300–500 (\$6–10) per month depending on the degree of disability. This amount is not considered to be sufficient,²²⁰ and many persons with disabilities are not registered for payments.²²¹

The National Law for the Rights and Privileges of Persons with Disabilities, developed in 2006, was approved by the parliament at the end of 2008 but still awaited presidential approval at the end of May 2009.²²² As of 1 July 2009, Afghanistan had not signed the UN Convention on the Rights of Persons with Disabilities (UNCRPD), but the convention and supporting documents had been translated into local languages by the Afghanistan Independent Human Rights Commission.²²³ A disability terminology guide was also under development.²²⁴ Several operators noted that the existence of the UNCRPD provided an opportunity to put pressure on the government to support the disability sector. However, the rights of persons with disabilities were generally not ensured due to the lack of a legislative framework.²²⁵

Progress in meeting VA26 victim assistance objectives

Afghanistan is one of 26 States Parties with significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate assistance for the care, rehabilitation and reintegration of survivors.²²⁶ In May 2009, Afghanistan stated that its priorities for VA were: continued implementation of ANDAP (the national disability plan), disability awareness-raising, training and capacity development for implementing agencies, and better mechanisms for coordination, identification of gaps and fundraising.²²⁷

As part of its commitment to the Nairobi Action Plan, Afghanistan first presented its 2005–2009 victim assistance objectives in 2005 and its plan of action in 2006; the latter was revised to become ANDAP in 2007.²²⁸ ANDAP is SMART-er (specific, measurable, achievable, relevant, and time-bound) than its predecessors and assigns clear responsibilities. In places, it is also “less ambitious to take into account the particular challenges faced by the disability sector.”²²⁹ Two components, inclusive education and community-based rehabilitation (CBR), were added.²³⁰ In

²³⁰ See *Landmine Monitor Report 2008*, pp. 99–100.

March 2009, a third national workshop was held to discuss ANDAP and its implementation.²³¹ Previous workshops were held in 2006 and 2007.²³²

MACA noted that the process leading to the development of the plan had been “very productive,” resulting in the actual plan and increased awareness on the needs, gaps, and challenges faced by both persons with disabilities and government. It further stated that the VA26 process, the informal commitment made by 26 States Parties to work in a more focused manner for achieving actions laid out in the 2005–2009 Nairobi Action Plan, is “not an activity engaged in by the government and is not really understood as a process for evaluation.”²³³

ANDAP was only formally approved in late 2008, and there were delays in translating the plan.²³⁴ Therefore, most stakeholders reported in 2009, as they did in 2008, that they conducted their activities irrespective of the plan.²³⁵ But, as many stakeholders had been involved in the plan’s development, their activities in 2008 contributed to the achievement of a plan.

Overview of progress to June 2009:

- **Data collection:** Casualty data collection continued as in the past and was only hampered by the security situation. The implementation of a monitoring system for ANDAP was not achieved by the end of 2008, although the system was developed and some data is gathered through other mechanisms.
- **Emergency and continuing medical care:** Progress has been made on objectives scheduled for 2009 relating to staff training for emergencies and awareness. This might be due to greater MoPH involvement, but measures were being taken recently to assess their impact. Emergency evacuation abilities and access are likely adversely affected by increased conflict. Most significant objectives have deadlines for 2010.
- **Physical rehabilitation:** Progress was made on capacity-building, awareness-raising, and the regulation of the sector through the integration of physiotherapy in health packages, inclusion of physical rehabilitation in human resource strategies, staff training, collection of service provision statistics, and development of guidelines and curricula.²³⁶ In 2007 objectives were made less ambitious and progress was made mainly by external operators, but more rapid progress in strengthening the sector seems to have been made in 2008 (possibly due to more active MoPH involvement). However, this progress did not yet produce any visible improvement in assistance for survivors.²³⁷
- **Psychological support and social reintegration:** Except for staff training and disability awareness-raising (particularly women with disabilities), no progress was reported for this part of the plan, although many deadlines were set for the end of 2009. Progress does not appear to have impacted lives of survivors or persons with disabilities (see above).
- **Economic reintegration:** As in previous years, this remained the weakest component and it was acknowledged as such by the government. None of the plan’s objectives appear to be on track.

²³⁷ Email from Krisztina Huszti Orban, Legal Attaché, Arms Unit, Legal Division, ICRC, 21 August 2009.

- **Laws and public policy:** Progress has been made in achieving objectives with 2009 completion dates through the development of terminology, increased awareness-raising, implementation of disability benchmarks in the development strategy, and the establishment of resource centers. Making disability a priority issue was having mixed success due to the many competing challenges: similar mixed results are reported for increased DPO capacity and involvement. The two main objectives for 2008—approval of disability legislation and ratification of UNCRPD—have not been achieved, resulting in little *de facto* change for persons with disabilities (see above).
- **CBR:** In 2008, the CBR network was formalized and strengthened, strategies developed, and a conference bringing together government, NGOs and specialists was held to discuss further expansion and cooperation.²³⁸ It would appear that these objectives (originally elaborated from the physical rehabilitation objectives and with some of the earliest deadlines²³⁹) are on track for achievement. Except for ongoing NGO activities, no notable progress in inclusive education was reported to Landmine Monitor.

Throughout the reporting period, Afghanistan was actively involved in VA at the international level, assuming the role of co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration at the Sixth Meeting of States Parties. In this capacity, it stated its aim “to lead by example and develop a plan of action to meet the needs of landmine victims and other people with disabilities.”²⁴⁰ The Mine Ban Treaty’s Implementation Support Unit undertook six process support visits to Afghanistan. Afghanistan included VA/disability experts on its delegation at the intersessional Standing Committee meetings held from 2005–2008, and for the meetings of States Parties in 2005, 2006, and 2008, including four deputy ministers and two survivors. Afghanistan provided status updates at all meetings between 2005 and 2009 and reported in detail on its activities in Form J of its Article 7 report throughout the period.²⁴¹

Victim assistance activities

There are many stakeholders in the VA/disability sector and MACA said that to its knowledge none ceased their activities in 2008 and it was not aware of new organizations starting.²⁴² Therefore, only those providing updated information to Landmine Monitor are included below. Information on the others can be found in previous editions of Landmine Monitor.

Government services

MoLSAMD, with support from MACA, organized several regional workshops to raise awareness on ANDAP and the rights of persons with disabilities. Some 383 people participated in seven cities.²⁴³

The newly established Disability and Rehabilitation Department at the MoPH trained 312 medical staff in 10 provinces, 400 graduate medical staff, 20 staff of implementing partners for the Basic Package of Health Services, and eight mobile medical teams assisting Kochi nomads, on disability and physical rehabilitation issues to facilitate access to services. In addition, 44 rehabilitation staff and 20 DPO staff were trained in psychosocial support and 20 surgeons in emergency care. The MoPH further integrated physiotherapy in services of 56 district hospitals, upgraded rehabilitation staff, and held a CBR workshop. The MoPH had a budget of \$200,000 for disability in 2008, financed through the EC, MACA, and its own resources, but lacked funding to activate the physical rehabilitation center in Khost.²⁴⁴

²⁴³ Article 7 Report (for calendar year 2008), Form J.

²⁴⁴ Response to Landmine Monitor questionnaire by Razi Khan Hamdard, MoPH, 2 April 2009.

The MoE included disability awareness in the national school curriculum and 16,293 teachers received disability awareness (and RE) training.²⁴⁵ The curriculum was reviewed by the Afghanistan Independent Human Rights Commission, which was also actively involved in awareness raising and production and distribution of materials on the UNCRPD.²⁴⁶

NGO services

The Afghan Landmine Survivors' Organization (ALSO), which started activities in 2008, provided peer support and referral services, especially to new survivors or newly disabled persons and their families through regular counseling sessions in several hospitals in Kabul and self-help groups. ALSO was also engaged in advocacy and VA related to the Convention on Cluster Munitions. ALSO invested in improving its organizational structure and planning but is dependent on *ad hoc* funding.²⁴⁷

In 2008, Development and Ability Organization (DAO) provided rights and disability training in 10 provinces for community leaders and officials involved in service provision and for persons with disabilities involved in ANDAP implementation. It produced radio and television programs documenting the abilities and challenges of persons with disabilities. DAO reported providing social reintegration services to survivors and took a lead on developing standard disability terminology for MoLSAMD. As in previous years, the security and funding situation hampered DAO activities.²⁴⁸

The Community Center for the Disabled (CCD) provides socio-economic reintegration to persons with disabilities, as well as disability awareness sessions which include RE. With its awareness-raising program it reached 4,800 people in 2008; 779 persons with disabilities received socio-economic services.²⁴⁹

In 2008, Afghan Amputee Bicyclists for Rehabilitation and Recreation provided vocational training, basic education, bicycle rehabilitation, physiotherapy, wheelchair and bicycle repair services, sports, as well as training in proposal writing and problem identification in eight provinces. The main challenges to its work were long-term donor commitments and security.²⁵⁰

Kabul Orthopedic Organization (KOO) is the only national NGO providing physical rehabilitation and run by a female director. KOO also provides awareness training and a new income-generating project repairing demining equipment for Afghan Technical Consultants. It provided physical rehabilitation to more than its target of 6,000 people in 2008 (7,359 receiving 15,033 services).²⁵¹ It treated mostly military casualties and saw this number increase due to intensified conflict. KOO signed an agreement with the Ministry of Defense to provide services to the national army. Its biggest challenge was lack of funding.²⁵²

The Physical Therapy Institute (PTI) supported by the International Assistance Mission provides professional physiotherapy training and rehabilitation services (to 869 persons with disabilities in 2008). PTI started the new physiotherapy curriculum at the end of May 2008 (18 students) and teachers and clinical staff received upgrade training in December 2008 (17

²⁵² Jamil Danish, "UNAMA helps to promote leading orthopedic centre in Kabul," *UNAMA* (Kabul), 23 February 2009, p. 3.

students). A psychology manual was developed for inclusion in PTI's training courses. PTI was also involved in the MoPH-coordinated disability rights training for services providers.²⁵³

In 2008, the Swedish Committee for Afghanistan (SCA) continued to expand its comprehensive community-based Rehabilitation of Afghans with Disabilities (RAD) program in 42 districts in 13 provinces. It also started providing technical and financial support to four DPOs. As in 2007, it was challenged in certain provinces, particularly Ghazni, Logar, and Wardak, by the security situation and its limited number of female professionals. SCA-RAD assisted 175,477 persons with disabilities, slightly higher than its target of 166,100.²⁵⁴ More services were provided to survivors than in 2007 (27,097 vs. 21,549). The physical rehabilitation component was evaluated by Sandy Gall's Afghanistan Appeal in 2008 and impact surveys were carried out for the employment and awareness-raising activities. SCA did not face funding challenges in 2008 but had to make some cuts in 2009 due to currency exchange rate fluctuations and increased fixed costs (fuel and supply prices).²⁵⁵

Due to increased conflict in 2008, many areas outside the capitals in southern and eastern provinces were "off-limits" for the ICRC, which relied on local ARCS volunteers. The ICRC supported 12 health facilities and, in cooperation with the ARCS, enhanced referral, first-aid and surgical capacity, as well as hospital security to deal with the increased number of war-injured. It treated 2,388 weapon-injured (1,621 in 2007) and nearly double the number of mine/ERW casualties in 2008 (434 versus 286).²⁵⁶ The ICRC also continued to support six rehabilitation centers and the component factory, four non-ICRC rehabilitation centers (with material and training), as well as a socio-economic reintegration project.²⁵⁷ Some 66,595 people received physical rehabilitation services and more than 2,300 received socio-economic assistance; 600 persons with disabilities worked in the ICRC centers. The ICRC started a three-year prosthetics and orthotics course in coordination with the MoPH; 16 trainees enrolled (seven women).²⁵⁸ One of the main achievements of 2008 for the ICRC rehabilitation program was the increased transfer of managerial responsibilities to national staff, and quality improvements. Due to the increasing number of patients, however, it was challenged to balance quantity and quality of services. While no funding challenges have been encountered in 20 years of operations, the ICRC estimated that difficulties "could appear in the second part of 2009."²⁵⁹

In 2008 HI continued to expand the following programs in Kabul, Herat, Kandahar, and Helmand: physical rehabilitation and physiotherapy in the Afghan health systems at the national and community levels; developing and replicating models for socio-economic inclusion for people with disabilities; advocating for people with disabilities through lobbying Afghan authorities and supporting local civil society; and implementing community-based RE in the South. Challenges in this work included the volatile security situation, difficulties in monitoring activities, and long recruitment periods for expatriate staff, which cause continuity problems and increased pressure on the teams.²⁶⁰

²⁵³ Response to Landmine Monitor questionnaire by PTI, 3 May 2009; and IAM, "Afghanistan Compact, Matrix for Capturing Progress of Progress Indicators," undated but 2009.

²⁵⁴ In 2007, 181,852 people received services but the decrease is solely due to fewer awareness raising activities.

²⁵⁵ Response to Landmine Monitor questionnaire by Fiona Gall and Amin Qanet, SCA, 4 May 2009; SCA, "SCA Annual Report 2008 – Rehabilitation of Afghans with Disability (RAD)," Kabul, undated but 2009, pp. 1–8; and SCA, "Afghanistan Compact, Matrix for Capturing Progress of Progress Indicators," undated but 2009.

2008 Victim Assistance Activities²⁶¹

Name of organization	Type of organization	National/international	Type of activity	Number of mine survivors assisted
ALSO	DPO	National	Peer support, advocacy	At least 214 survivors
CCD	NGO	National	Socio-economic reintegration, advocacy	At least 30 survivors
DAO	DPO	National	Social reintegration, advocacy	At least 1,240 survivors
HI	International organization	International	Physical rehabilitation, socio-economic reintegration, advocacy, RE	8,019 multiple services provided to survivors
ICRC	International organization	International	Medical care, physical rehabilitation, socio-economic reintegration, training, materials	Medical care for 434 mine/ERW casualties, 2,653 prostheses and orthoses for survivors
KOO	NGO	National	Physical rehabilitation, socio-economic reintegration	2,932 survivors
MoLSAMD	Government	National	Coordination/training	N/A
MoPH	Government	National	Coordination/training	N/A
PTI-IAM	NGO	National/international	Physical rehabilitation/training	35 people trained
SCA-RAD	NGO	International	Data collection, CBR, physical rehabilitation, psychosocial support, economic reintegration, inclusive education, advocacy, and capacity-building	27,097 multiple services to survivors

Support for Mine Action

Afghanistan has not reported a comprehensive long-term cost estimate for meeting all its mine action needs. In May 2009, Afghanistan reported that fulfillment of clearance obligations will cost roughly \$500 million over a period of five years.²⁶² The MAPA Integrated Operational Plan for the period from April 2009 to March 2010 includes a budget estimate of \$104,028,000, including \$11,319,000 for mine action coordination, transition of coordination to government and capacity-building; \$90,015,000 for survey and clearance of mines and ERW; and \$2,694,000

²⁶¹ See paragraphs on relevant organizations above.

²⁶² Statement of Afghanistan, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, May 2009.

for RE field operations.²⁶³ The plan assumes that funds would be raised from sources including the UN Voluntary Trust Fund (VTF), bilateral donor contributions directly to implementing partners, and contributions from the government of Afghanistan. Afghanistan's latest Article 7 report states that among its management responsibilities, MACCA is expected to manage mine action implementation using VTF funding on behalf of the UN Mine Action Service (UNMAS).²⁶⁴

National support for mine action

Afghanistan did not report national funding for mine action in 2008. It reported contributing AFN14,364,447 (\$288,725) for mine clearance in 2007. The Integrated Operational Plan for the period from April 2009 to March 2010 states that, "more substantive efforts will be made to further explore and strengthen options for funding humanitarian mine action activities through the Government of Afghanistan."²⁶⁵ No reference is made in the plan to commitments from the government of Afghanistan during 2008. In May 2009, Afghanistan reported a commitment by the government of \$2,600,000 during 2009 to carry out clearance in support of development of a copper mine.²⁶⁶

International cooperation and assistance

In 2008, 18 countries reported providing \$105,070,944 (€71,350,633) to mine action in Afghanistan, approximately 22% more than mine action funding reported in 2007. Annual funding at 2008 levels appears sufficient to meet the requirements stated by Afghanistan for fulfilling its mine action targets. In January 2009, however, MACCA reported that funding to Afghanistan's mine action program was threatened by the global economic situation.²⁶⁷ In March 2009, the UN Secretary General's report on Afghanistan to the Security Council cited a funding shortfall of roughly \$53 million in 2009 against requirements to meet the Afghanistan Compact benchmarks.²⁶⁸

2008 International Mine Action Support to Afghanistan: In-Kind²⁶⁹

Donor	Form of In-Kind Support	Monetary Value (where available)
Belgium	ERW/IED clearance personnel	\$1,278,217 (€868,000)
Spain	Mine clearance EOD personnel via ISAF peacekeeping	\$773,115 (€525,000)
Total		\$2,051,332 (€1,393,000)

In addition to the above, New Zealand reported contributing a military liaison officer for mine action from ISAF to MACCA in 2008, but did not report a valuation.²⁷¹

The EC reported in the May 2009 intersessional Standing Committee meetings that in 2008 it had made a €39 million (\$57.4 million) general commitment “to support future action” in a number of states, including Afghanistan. It did not specify the amounts available to individual countries.²⁷² The EC told Landmine Monitor in June 2009 that the commitment “can be subject to changes” before its final adoption by the EC.²⁷³

HALO reported receiving funds from Japan, the Netherlands, Finland and the Czech Republic in 2008.²⁷⁴ None of these donors reported funding directly to HALO in 2008; however, Japan and the Netherlands reported funding to HALO in 2007.

²⁷¹ New Zealand Article 7 Report, Form J, 30 April 2009.

²⁷² Statement of the European Commission, Standing Committee on the General Status and Operation of the Convention, Geneva, 29 May 2009.

²⁷³ Email from Mari Cruz Cristóbal, EC, 12 June 2009.

²⁷⁴ Email from Tom Dibb, HALO, 18 August 2009. HALO reported \$202,000 from the Czech Republic for mine clearance, and unspecified amounts from the other donors. HALO also reported receiving \$50,000 from AAR Japan for battle area clearance in 2008.

ALBANIA

2008 Key Data

State Party since	1 August 2000
Contamination	Antipersonnel and antivehicle mines, submunitions, other ERW, abandoned explosive ordnance
Estimated area of contamination	747,114m ² (as of May 2009)
Casualties in 2008	0 (2007: 18)
Estimated mine/ERW survivors	Unknown but at least 510
Article 5 (clearance of mined areas)	Deadline: 1 August 2010
Demining in 2008	Mine clearance: 122,433m ² Battle area clearance: 94,640m ² Area reduction: 471,698m ²
Risk education recipients in 2008	25,500
Progress towards victim assistance aims	Good
Support for mine action in 2008	International: \$5.7 million (2007: \$1.2 million) National: \$300,000 (2007: \$235,000)

Ten-Year Summary

The Republic of Albania ratified the Mine Ban Treaty on 29 February 2000. It completed destruction of its stockpile of 1,683,860 antipersonnel mines in April 2002, and has opted not to retain any antipersonnel mines for training purposes. Albania enacted national implementation legislation in 2006.

Albania has made slow but steady progress in demining, and set itself the target of completing clearance of all mined areas and areas with cluster munition remnants by the end of 2009, well within its respective treaty deadlines.

As of May 2009, the Albanian Mine Action Executive (AMAE) recorded 272 mine/explosive remnants of war (ERW) casualties (34 killed and 238 injured) since 1999, all in the mine-affected Kukës region. AMAE also recorded a further 510 abandoned explosive ordnance casualties (72 killed and 438 injured) throughout the country. There have been no mine casualties since 2005 and casualties from abandoned ordnance have decreased.

Risk education activities were conducted by the local NGO Victims of Mines and Arms Association—Kukësi in the northeast of the country—the most affected region—and by the Albanian Red Cross in 10 other prefectures. Victim assistance in mine-affected areas improved significantly since 1999, with increased healthcare, rehabilitation, and psychological support. However, laws and public policy on disability were lacking.

Mine Ban Policy

Albania signed the Mine Ban Treaty on 8 September 1998 and ratified it on 29 February 2000, becoming a State Party on 1 August 2000. It enacted national implementation legislation in 2006, which includes penal sanctions.¹

¹ Law No. 9515, “The Implementation of the Convention on the Ban of Use, Storage, Production and Transfer of the Anti Personnel Mines and their Destruction.” See *Landmine Monitor Report 2006*, p. 126, for more details on the law and on previous laws giving legal force to the treaty in Albania.

Albania submitted its annual Article 7 report in April 2009, covering calendar year 2008.² It included voluntary Form J, which provides details on Albania's victim assistance programs.

Albania attended the Ninth Meeting of States Parties in Geneva in November 2008, and made statements on its mine clearance and victim assistance programs. It also announced that Albania would host a regional workshop in October 2009 in preparation of the Second Review Conference. Albania participated in the intersessional Standing Committee meetings in May 2009, and again made statements on victim assistance and mine clearance.

In August 2009, a Ministry of Defense official told Landmine Monitor that there had not yet been an explicit order to destroy antivehicle mines with breakwires.³

Albania is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. As in previous years, it did not submit an annual Article 13 report. Albania is also party to CCW Protocol V on Explosive Remnants of War, but, as of June 2009, had not submitted an Article 10 transparency report covering 2008. Albania signed the Convention on Cluster Munitions on 3 December 2008 and ratified it on 16 June 2009, becoming the ninth country to ratify the treaty.⁴

Albania completed destruction of its stockpile of 1,683,860 antipersonnel mines on 4 April 2002, more than two years before its treaty deadline, in an internationally funded project carried out under NATO auspices. Albania has opted not to retain any antipersonnel mines for research or training purposes. It stated that "there were no justifiable reasons for the retention of APM [antipersonnel mines] for training or any other purpose."⁵

Production of antipersonnel mines in Albania was suspended in 1990 and officially ceased in 1991. Albania may have been a minor exporter of antipersonnel mines in the past. The most recent use of antipersonnel mines in Albania was in 1998 and 1999 in the northeast of the country during the Kosovo crisis.⁶

Scope of the Problem

Contamination

The northeast of Albania is contaminated by mines and ERW arising largely from the Kosovo crisis of 1998–1999, when forces of the former Federal Republic of Yugoslavia laid extensive minefields in the border districts of Kukës, Has, and Tropojë. In addition to antipersonnel and antivehicle mines, the area contains unexploded submunitions from at least six NATO cluster munition strikes, which fell within Albanian territory, as well as other UXO resulting from Yugoslav army artillery.⁷

A general survey by the Albanian Armed Forces (AAF) in 1999–2000 identified 102 affected border areas totaling some 15km². Following a decade of demining by the AAF and, since 2002, by DanChurchAid (DCA), Albania reported in May 2009 that the hazardous area had decreased

² Previous Article 7 reports were submitted in April 2008, 16 April 2007, 27 March 2006, 29 April 2005, 30 April 2004, 30 April 2003, and 3 April 2002.

³ Email from Anila Alibali, Researcher, Landmine Monitor, 12 August 2009. Albania said it used the antivehicle mines for the disposal of old ammunition. The ICBL and many States Parties believe that antivehicle mines with sensitive fuzes such as breakwires meet the definition of an antipersonnel mine in the Mine Ban Treaty and are therefore prohibited. Email from Lt.-Col. Sami Nezir, Head of Arms Control Section, Ministry of Defense, 20 April 2006; and see *Landmine Monitor Report 2006*, p. 127, for more details on Albania's position on Articles 1, 2, and 3.

⁴ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 28–29.

⁵ Article 7 Report, Form D, April 2008.

⁶ Two production plants were converted to facilities for ammunition demilitarization by 2002. According to the UN, Russian antipersonnel mines found in Kosovo after the 1999 conflict may have been transferred from Albania. For more details on past production, trade, stockpiling and use, see *Landmine Monitor Report 2004*, pp. 99–101.

⁷ "Mine Action History," www.amae.org.al; see also *Landmine Monitor Report 2007*, p. 116; and *Landmine Monitor Report 2008*, p. 109.

to 743,100m², comprising 11 mined areas (totaling 269,600m²) and nine battle areas (totaling 473,500m²).⁸

Albania also has a threat from abandoned explosive ordnance (AXO). During a period of internal turmoil in 1997, at least 15 army ammunition storage areas were destroyed and looted, leaving tons of dangerous munitions scattered around. The AAF cleared 15 so-called “hot spots,” but incidents caused by AXO persist.⁹ Albania’s remaining substantial stocks of obsolete munitions, held in 52 poorly maintained military depots near populated areas, also pose a serious threat. Although Albania reports it has destroyed a large number of munitions in recent years, as of July 2008 it still had about 90,000 tons (90 million kg) of surplus dangerous munitions.¹⁰

On 15 March 2008, a depot used for demolition of munitions exploded in Gerdec village, in the suburbs of Vora, about 13km from the capital, Tirana, killing 26 people and injuring 300 others, scattering shells to four other villages and contaminating an area of approximately 3.5km² with ERW.¹¹ The explosion reportedly destroyed some 4,200 houses, 32 businesses, and 34 farms, inflicting damage estimated at US\$18.75 million (€11.8 million).¹²

Casualties

The Albanian Mine Action Executive (AMAE) recorded no new mine/ERW casualties in 2008.¹³ The local NGO Victims of Mines and Arms Association-Kukesi (VMA) reported 44 ERW/explosives casualties in 2008 based on media monitoring; no further details were provided.¹⁴ However, AMAE insists on standardization, verification, and quality management of data before entering casualties into the Information Management System for Mine Action (IMSMA) database. No IMSMA forms for casualties occurring in 2008 were submitted to AMAE as of 28 May 2009.¹⁵ This represents a decrease from the 18 AXO casualties recorded by AMAE in 2007 (two killed and 16 injured).¹⁶ The last mine casualties reported were in 2005.¹⁷

In January 2009, there were two military casualties in one incident involving tampering with AXO. One woman died and one man was injured. Both were on duty at the time.¹⁸

AMAE maintains two databases on casualty information: one recording mine/ERW casualties in the mine-affected Kukës region (including the districts of Kukës, Has, and Tropojë), and the other recording AXO casualties in the whole of Albania. As of May 2009, the AMAE IMSMA database for the Kukës region contained information on 272 mine/ERW casualties (34 killed and 238 injured) since 1999.¹⁹ This included at least 53 casualties from submunitions (10 killed and 43 injured) between 1999 and 2006. The number of living survivors is corrected in the

Kukës database each time a survivor dies. Another two casualties reported in the media occurred during weapons use and are not included among submunition ERW casualties.²⁰

The Albania-wide AXO casualty data for 1997–2009 included 510 casualties (72 killed and 438 injured).²¹ Most casualties were students, children, or unemployed adults. The most affected districts were Berat, Gramsh, Kukës, Puke, Shkodër, Tirana, and Vlore.²² AMAE has estimated there are at least 500 AXO survivors in Albania allowing for the possibility of unrecorded casualties.²³

Risk profile

There have been no mine/ERW casualties since 2005. Prior to this, incidents took place in the northeast. Those most at risk are males intentionally handling AXO and cached explosive weapons. Most AXO casualties between 2005 and 2009 occurred during handling or playing with explosive devices and scrap metal collection.²⁴ Approximately one third of these victims were aged between 15 and 45, and half of the victims were farming, grazing cattle, or on their way to school at the time of their incidents. Police officers have been wounded or killed by mines/UXO while patrolling the border.²⁵

The risk of mines and UXO is also present in other parts of Albania, particularly from munitions stored in poorly maintained military depots. The concerns caused by the explosion in March 2008 also resulted in private arms caches being abandoned, increasing the AXO threat.²⁶

Socio-economic impact

Although there have been no mine victims in the northeast for several years, mine contamination is said to have hampered development of infrastructure in this isolated, mountainous, and impoverished area. The contamination has blocked access to land and water resources needed by a population mostly dependent on subsistence farming and animal husbandry.²⁷

Program Management and Coordination

Mine action

The Albanian Mine Action Committee (AMAC), an interministerial body formed in October 1999, serves as the “executive and policy making body for mine action” in Albania.²⁸ In 2008, AMAC held a series of meetings with stakeholders in 2008 to coordinate responses to the Gerdec explosion, as well as separate meetings with ministries and donors.²⁹

The Albanian Mine Action Executive (AMAE), set up at the same time as AMAC, is responsible for coordinating and monitoring mine action activities, including risk education, in Albania.³⁰ AMAE works through its headquarters in Tirana and a field office in Kukës.³¹

AMAE coordinated victim assistance (VA) activities in cooperation with local and international partners: the Ministry of Health, Kukës Regional Hospital, the Directorate of Primary Health Care, National Orthotic-Prosthetic Center (NOPC), ICRC, Victims of Mines

and Arms Association–Kukësi (VMA), Handicap International (HI), the International Trust Fund for Demining and Mine Victims Assistance (ITF), and the Institute for Rehabilitation, Republic of Slovenia (IRRS).³² Coordination by AMAE resulted in mine/ERW survivors receiving improved services. Survivors were involved in VA planning and coordination through regular meetings.³³

Data collection and management

AMAE maintains a mine action database using IMSMA at its Kukës office.³⁴ The Geneva International Centre for Humanitarian Demining (GICHD) updated the system in 2008, but AMAE decided not to transfer its data to the latest version of IMSMA to avoid errors in data transfer and because Albania expected to complete clearance in 2009.³⁵

Albania has two mine/ERW casualty surveillance systems. In northeast Albania, AMAE coordinates a well-established data collection mechanism using the IMSMA database installed in Kukës. Information is shared with all stakeholders and updated if a registered survivor dies. Due to lack of resources, no nationwide casualty surveillance system has been established, despite recommendations by GICHD and the ICRC that the Ministry of Health should do so.³⁶

In 2008 and 2009, the Albanian Red Cross Society (ARCS) collected and updated information on AXO casualties throughout the country. The ARCS casualty reporting uses IMSMA and is stored by AMAE in Tirana. AMAE is legally required to provide annual casualty updates to the Institute of Statistics of Albania.³⁷ Data in mine-affected areas was collected with the support of the ARCS and VMA through a network of “anti-mine committees” and risk education (RE) programs in 22 villages.³⁸

Plans

Strategic mine action plans

In December 2008, AMAC, in cooperation with UNDP, presented a revised National Mine Action Plan for Completion 2009–2010.³⁹ The plan set out four main goals.⁴⁰

- *Coordination and monitoring* of all mine action activities will continue under AMAE until March 2010. After that date, responsibility will transfer to the Explosive Ordnance Disposal (EOD) Response Section in the Ministry of Defense.
- *Survey and clearance*: Albania plans to complete clearance of the remaining 0.86 km² of contaminated land (as of December 2008) and release it to the community by December 2009, well within its Article 5 deadline for clearance of mined areas (1 August 2010). With the completion of clearance, demining operations in northeast Albania will close and technical skills may be used for EOD and destruction of UXO in other areas of the country.
- *Risk education* should be integrated into the school curriculum and implemented in all school districts by December 2009.
- *Victim assistance* aims to improve delivery and quality of emergency and ongoing healthcare for mine/ERW survivors in northeast Albania and provide vocational training for 90 mine/ERW survivors. The plan called for training of 30 physiotherapists and six prosthetics and orthotics technicians by June 2009 and the preparation of a Level II prosthetics curriculum. During 2009 and 2010, the NOPC should become fully functional with new premises and equipment.

The National Mine Action Plan for Completion was updated in November 2008 and again at the end of May 2009 to take account of the Convention on Cluster Munitions.⁴¹ The revised plan provided for completing clearance of all known mine and UXO contamination by the end of 2009.⁴²

National ownership

Albania exercises full national ownership of mine action, with advisory support provided by UNDP.⁴³ Since the end of 2007, the DanChurchAid (DCA) mine action program has been operated by national staff in all aspects, including planning, operations, training, finance, and administration. The staff is supervised by an international program manager and receives frequent quality assurance visits by technical staff from DCA headquarters.⁴⁴

UNDP has provided capacity-building to Albania's mine action program since 2002.⁴⁵ This support was due to end in December 2006, when a victim assistance advisor's position closed, but it continued to support a quality management advisor until November 2007.⁴⁶ UNDP has progressively reduced technical support to the program, but, under a Memorandum of Understanding signed with Albania's Ministry of Defense in July 2007, it will continue to provide administrative and financial support to AMAE until the end of 2010.⁴⁷

³⁹ In December 2006, AMAE presented a National Mine Action Plan for Completion Fulfilling the Obligations Under Article 5 of the Anti-personnel Mine Ban Treaty 2007–2010.

National mine action legislation

Law No. 9515 on implementation of the Mine Ban Treaty passed by parliament in April 2006 confirmed the Minister of Defense as the national authority in charge of mine action and implementation of the Mine Ban Treaty by AMAC and AMAE.⁴⁸

National mine action standards/Standing operating procedures

In 2004, AMAE issued technical safety standards for mine action operations, based on the International Mine Action Standards (IMAS). In 2007, AMAE drew up national mine action standards (NMAS) adapted from IMAS with support from GICHD, which will become part of the existing law on the implementation of the Mine Ban Treaty.⁴⁹ The incident in Gerdec in 2008 and elections scheduled for June 2009 held up progress, but AMAE expected that the NMAS would come into effect by the end of 2009.⁵⁰ DCA uses standing operating procedures (SOPs) approved by AMAE as part of its accreditation process.⁵¹

Demining and Battle Area Clearance

DCA remained the only mine and battle area clearance (BAC) operator under AMAC in Albania during 2008.⁵² From 2004–2008, DCA conducted community assessments and technical surveys that provided the basis for clearance operations and area reduction.⁵³ Under the Completion Plan for Albania, DCA was due to finish clearing the last known area of contamination by the end of 2009.⁵⁴

In 2008, DCA deployed seven demining teams (six manual demining teams and one BAC team) and one technical survey team. Each demining team consists of one team leader, one deputy team leader, one medic, and six deminers. The technical survey team consists of one team leader, one medic, and four deminers.⁵⁵ DCA maintained the same capacity for 2009.⁵⁶

The Albanian Mine Action Program's target for 2008 was to release 500,000 to 600,000m² of mined areas through clearance, technical survey, and land release activities.⁵⁷ The program substantially exceeded the target and released 952,771m², almost double the 2007 figure (492,517m²).⁵⁸

DCA released a total of 783,771m². This included clearance of 122,433m² of mined areas and 94,640m² of battle areas, resulting in the destruction of 264 antipersonnel mines, one antivehicle mine, 192 items of UXO, and 84 unexploded submunitions.⁵⁹ It also released a total of 566,698m² through survey (technical survey of 262,439m² and general survey of 304,259m²).⁶⁰ AMAE also canceled 169,000m² through a process of community liaison conducted in accordance with AMAE's Risk Management SOP.⁶¹ There were also 30 requests from local communities to deal with EOD tasks.⁶²

After the Gerdec explosion on 15 March 2008, emergency BAC of surrounding areas involved AAF EOD teams with 392 personnel; DCA provided two BAC teams with 16 deminers for two weeks and one team for the month of April,⁶³ the Kosovo Protection Corps deployed two EOD teams until 12 April; and Swedish Rescue Services Agency provided two advisers and

two large-loop detectors for a month. These operations were coordinated by AMAE.⁶⁴ In May, ArmorGroup North America started a program to clear UXO around the blast area expected to continue until 2011 with more than \$6 million from the US Department of State.⁶⁵

Albanian media reported that in the emergency clean-up phase between 17 March and 3 April, teams cleared 5,712 items of UXO as well as the remnants of 660 exploded shells.⁶⁶ DCA teams cleared a total of 823,308m² and recovered 618 items of UXO and 1,000 pieces of small arms ammunition; 675 houses were released after searching.⁶⁷

As of July 2008, five Albanian AAF EOD teams were still clearing the area around Gerdec.⁶⁸ The teams were joined by personnel from ArmorGroup in September 2008.⁶⁹

AMAE conducts quality management (QM) of demining, RE, and VA to ensure they conform to the IMAS and Albania's adopted Technical and Safety Standards. An AMAE regional office in Kukës that opened in 2002 has a QM section consisting of three operators in northeast Albania to monitor clearance and survey. After completion of clearance operations, the QM team conducts a final quality control check with methods adopted from IMAS.⁷⁰

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Albania is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 August 2010. Albania's National Mine Action Plan for Completion aims to complete clearance of all its known mined areas by the end of 2009, well ahead of its Article 5 deadline.⁷¹ In May 2009, AMAE's director confirmed to Landmine Monitor Albania's intention to complete clearance of all mined areas and thereby fulfill its Article 5 obligations by the end of 2009.⁷² It was hoped that completion of clearance could be announced at a regional meeting on mine action planned to take place in Albania in October 2009.⁷³

Mined and battle area clearance in 2000–2008⁷⁴

Year	Mine clearance (m ²)	BAC (m ²)	Area released by other means (m ²)
2008	122,433	94,640	735,698
2007	61,040	48,714	362,763
2006	240,532	234,584	905,812

Risk Education

Mine and ERW RE activities were conducted in 2008 by the local NGO VMA in the northeast of the country, and by the ARCS in 10 other prefectures. A 2007 GICHD mine action program evaluation found that “it is reasonable to conclude that in Albania the extensive nature of the [RE] program has reduced accidents and casualties.”⁷⁵

AMAE organized regular coordination meetings between VMA, the ARCS, and UNICEF.⁷⁶ There are national RE and community liaison standards, which were developed with GICHD support in 2007.⁷⁷ The accreditations of VMA and the ARCS were renewed by AMAE in early 2008.⁷⁸ An AMAE field monitor participates in VMA’s activities and conducts quality assurance.⁷⁹ All RE activities are recorded in IMSMA.⁸⁰ VMA RE activities received \$79,800 in funding from the US Department of State through the ITF in 2008.⁸¹

In 2008, the RE program aimed to keep the 25,500 members of the remaining 22 contaminated villages informed about the mine and UXO threat. By the end of 2008, clearance had reduced the number of mine contaminated villages to 16.⁸² Community-based RE was implemented through monthly gatherings with village anti-mine committees in all communities.⁸³ RE mobile theater comedy performances were conducted. VMA reached 13,700 people in Kukës. In Gerdec, 11,630 people received RE; direct emergency RE was previously conducted in the area in response to an explosion at a munitions depot.⁸⁴

School-based activities such as competitions, leaflet distribution, songs, and role plays took place in 2008 to inform about minefields, mine risk signs, and environmental issues.⁸⁵ The ARCS distributed around 1,300 books with mine awareness messages for pupils in schools near the Kosovo border.⁸⁶ However, UNICEF was unable to mobilize resources as planned for the integration of RE into the school curriculum by the end of 2009. RE manuals had still not been revised as of June 2009, as had been recommended by GICHD, and no progress was reported on teacher training.⁸⁷

A leaflet with messages promoting safe behavior toward mines and AXO was published by the ARCS, in consultation with AMAE and funded by the ICRC. The leaflet was distributed by ARCS volunteers in ammunition hotspot areas of 10 prefectures in Albania.⁸⁸ TV spots were produced and aired for UXO awareness throughout the country in 2007 to 2009 under the ARCS project.⁸⁹

RE continued to be conducted with clearance activities in 2008.⁹⁰ A 2007 GICHD evaluation recommendation that RE messages be adjusted to include assurances to communities about cleared land was implemented. Handover ceremonies took place, with RE organizations present,

and community meetings were held to inform the population about the clearance results, and to promote usage of the land.⁹¹

Progress since becoming a State Party

Albania's RE program started in 1999 with UNICEF as the UN lead agency, and with coordination by AMAE.⁹² CARE International trained teachers and community committees from 2000–2002.⁹³ The ICRC worked with ARCS volunteers to implement community-based RE, combined with food distribution.⁹⁴ In 2001, UNICEF started to support VMA.⁹⁵ UNICEF erected 7,000 warning signs from 1999 to 2004.⁹⁶

In 2001–2002, AMAE and CARE conducted a needs assessment for a national strategy. It found that although there was good RE coverage, 70% of people surveyed were forced to enter contaminated areas for economic reasons. The target group was economically active 15- to 30-year-olds, and people in remote villages. The strategy made AMAE responsible for RE, and called for greater integration of RE with mine action.⁹⁷ Activities consisted of school-based RE, and community RE through committees, theater, and media.⁹⁸ UNICEF stopped funding RE in April 2006.⁹⁹

In 2004, the Albanian Institute of Pedagogical Studies produced manuals for students and teachers for use in ERW hotspots in central Albania.¹⁰⁰ A 2005 study by the National Demilitarization Center recommended that RE be conducted in the central part of Albania, and in June 2007, the ARCS started this.¹⁰¹

In 2005, community liaison (CL) was strengthened with the appointment of a CL officer at the AMAE regional office.¹⁰² RE standards based on IMAS were introduced in 2003.¹⁰³

Victim Assistance

The total number of survivors in Albania is unknown but at least 748, including at least 238 mine/ERW survivors in the Kukës region and at least 510 AXO survivors around the country.¹⁰⁴

Health infrastructure in the mine-affected areas has improved significantly over the last five years, under AMAE coordination of VA, with new equipment, and staff training. VMA reported that overall the situation for mine survivors was good.¹⁰⁵ However, outside the mine-affected areas there were no specific VA programs, and AXO survivors faced similar challenges to many other persons with disabilities in Albania, including “widespread poverty, unregulated working conditions, and poor medical care.”¹⁰⁶ There remained a need for continuing VA in mine-affected areas and support services to survivors in AXO-affected areas.¹⁰⁷

¹⁰⁷ Interview with Dr. Veri Dogjani, AMAE, in Geneva, 25 May 2009.

State-run emergency and medical services are available throughout the country and the national referral system functioned adequately. Evacuation for trauma patients by helicopter ambulances was available. In 2008, emergency medical facilities were improved at Kukës regional hospital with the introduction of new equipment, including an electro-surgical unit and an x-ray machine.¹⁰⁸ A community-based rehabilitation (CBR) nursing system, established in 2005 for mine-affected communities, provides basic medical care, rehabilitation, and referrals at the local level.¹⁰⁹

Access to quality continuing medical care remained problematic.¹¹⁰ The government provided incentives to prevent the loss of skilled medical staff, and resulting shortages of services in mine-affected areas.¹¹¹ Corrective surgery was only available at the Mother Theresa Hospital in Tirana, but was sufficient.

Physical medicine and rehabilitation capacity improved nationally in 2008, including in mine-affected areas, through the project “Access to Physical Medicine and Rehabilitation (PMR) in Albania-Phase II.” Six prosthetic/orthotic technicians, including two each from Kukës Hospital and the National Orthotic-Prosthetic Center (NOPC), continued to receive training as planned in Albania’s VA objectives. The course certification was recognized by the Ministry of Education in 2008. Continuing annual enrolment in the physiotherapy program at the Tirana Faculty of Nursing in 2008 brought the number of students to 90 over three years. In 2009, 20 medical doctors were receiving physical medicine upgrade training.¹¹²

The total number of prosthetic workshops providing devices for civilians in Albania increased to three by 2008, including the Kukës workshop. Previously only the NOPC in Tirana had produced prosthetics. In 2008, the prosthetic workshop and physiotherapy unit in Kukës was rehoused in refurbished and re-equipped premises within Kukës Hospital, marking an improvement in services.¹¹³ With the availability of devices in mine-affected areas, survivors were spared the six-hour journey to Tirana, which was previously reported as a major accessibility problem. In an effort to support sustainable national capacity, only survivors with difficult lower limb or upper limb amputations were treated at the Institute for Rehabilitation, Republic of Slovenia (IRRS).¹¹⁴

The quality of NOPC devices was reportedly “just about acceptable” in 2008 and had improved on past years due to the return of two trained staff since early 2008.¹¹⁵ Despite various commitments since 2004 by several organizations to provide adequate premises, the NOPC was moved three times since 2007. Each location was inadequate and inappropriate. The ICRC’s Special Fund for the Disabled (SFD) support, on which the NOPC had previously relied, was scaled back in 2008 because the government had assured it would increase its support.¹¹⁶ In 2008, prosthetic production at the NOPC decreased to almost a quarter of the level in 2007 as a result of the move to inappropriate premises and the lack of materials that were due to be supplied by the Ministry of Health.¹¹⁷ This continued a sharp decline from 2006 and represented the NOPC’s lowest output since 2004.¹¹⁸

Education, vocational, and income-generation opportunities continued to improve through VMA projects in 2008 and 2009.¹¹⁹ Psychological support was provided through social workers and VMA peer support. Professional psychosocial support capacity diminished with the departure of staff trained in 2005.¹²⁰

The Albanian constitution and law prohibits discrimination against persons with disabilities, and all new public buildings must be accessible.¹²¹ However, such legal provisions are not well enforced.¹²² Access to employment remained a major problem for persons with disabilities.¹²³ As of June 2009, Albania had not signed the Convention on the Rights of Persons with Disabilities.

Progress in meeting VA26 victim assistance objectives

Albania is one of 26 among the States Parties identified as having significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance.”¹²⁴ Albania presented its 2005–2009 victim assistance objectives at the Sixth Meeting of States Parties in 2005, revised objectives in 2006 and 2007, and presented plans to achieve the objectives.¹²⁵

Albania has made significant and steady progress in achieving its objectives. Most objectives were achieved and, where appropriate, activities continued past the stated deadline. Some activities were delayed but were generally accommodated within the revised plans for 2005–2008.

There has been progress on objectives under all victim assistance pillars, despite initial holdups in some programs. Progress has included: data collection both in and outside of the Kukës region; the creation and maintenance of a community-based rehabilitation nursing network in mine-affected areas; improved facilities and training for medical and rehabilitation staff; increased national prosthetics capacity; prosthetic and rehabilitation services in the mine-affected region; the introduction of physiotherapy training; continuing psychological support including peer support for mine survivors; and exceeding objective targets for vocational training and micro-credit loans. In the area of law and public policy, there was some progress, particularly in informing survivors of their rights. Least progress was made on relocating the NOPC facilities, originally planned for 2005, and securing a separate state health budget for the center.¹²⁶ However, due to ongoing efforts by AMAE, by early 2009 the Ministry of Health had committed to acting on the NOPC relocation.¹²⁷

Albania reported its progress on victim assistance objectives at all meetings of States Parties and intersessional Standing Committee meetings between 2005–2009. Albania’s victim assistance expert consistently attended meetings and parallel work programs.¹²⁸ Albania included detailed updates on VA in voluntary Form J of its Article 7 reports from 2005 to 2009.¹²⁹

Victim assistance strategic framework

Albania presented VA objectives for 2005–2009 in November 2005 at the Sixth Meeting of States Parties in Zagreb. The 2009–2010 completion plan included the final phase objectives of mainstreaming VA into government structures by 2010.¹³⁰

The Kukës Regional Development Initiative includes a mine action focus. This has increased government and other development actors' commitments to projects connected to mine-affected villages.¹³¹

The long-term viability of VA relies on implementation of the National Strategy on People with Disabilities (NSPWD), although it does not specifically mention VA.¹³² The NSPWD aims to ensure the rights of persons with disabilities, improved services, and legislation.¹³³ However, drawing on survey data from six regions, including the AXO-affected Tirana, Shkoder, and Vlore, the second NSPWD implementation report, released in October 2008, saw no progress in some 40% of measures. Only 2% of measures were accomplished according to timelines.¹³⁴

Victim assistance activities

No major changes in VA service providers were reported in 2008. VMA, the only local NGO providing VA in Kukës region, provided multiple services to its 238 members in 2008, including medical treatment, counseling, and peer support, sport activities, loans, vocational training, job placement, educational support, and essential logistical support services.¹³⁵

In 2008, materials for the Kukës prosthetics workshop were provided with international funding. Regional health authorities were involved in their procurement process, a step towards full integration into the national health budget in 2010.¹³⁶ The workshop provided 12 survivors with prostheses and provided prosthetic repairs to another 97 survivors in 2008.

No landmine survivors were assisted at the NOPC in 2008.¹³⁷

The IRRS made a triage of the needs of some 45 AXO survivors in 2008 and subsequently 19 amputees received prostheses and physical rehabilitation. A further nine amputees received assistance at the institute from January to May 2009.¹³⁸

Support for Mine Action

The Albania National Mine Action Plan for Completion 2009–2010, published in December 2008 as a revision of an original plan for the period 2007–2010, estimated it would cost \$3,771,309 to address treaty obligations for 2009 and 2010, of which \$1,417,600 had been pledged at the time of publication by Albania and international donors. Mine action in 2009 was projected to cost \$2,942,385, while costs in 2010 were projected to total \$828,924, with mine clearance costs diminishing steeply. The plan's costs include fulfillment of mine clearance obligations, and addressing RE and VA needs.¹³⁹ The plan, which includes projected annual budget needs, but does not specify resource mobilization strategies, is reviewed and updated by AMAE in cooperation with UNDP.¹⁴⁰

¹³⁸ Article 7 Report, Form J, 28 April 2009.

¹³⁹ AMAE, "National Mine Action Plan for Completion 2009–2010," Tirana, December 2008, p. 20.

¹⁴⁰ Response to Landmine Monitor questionnaire by Arben Braha, AMAE, 20 June 2008.

National support for mine action

AMAE reported \$300,000 in contributions by the government of Albania to the national mine action program in 2008.¹⁴¹ AMAE did not report on the use of national funding but Albania stated in May 2009 that its national support consisted of providing explosive and stand-by medical evacuation service for mine clearance operations.¹⁴² Albania reported \$235,000 in national support in 2007.

International cooperation and assistance

In 2008, six countries and the European Commission (EC) reported providing \$5,788,885 (€3,931,064) to mine action in Albania, 381% more than the amount reported in 2007. AMAE reported receiving an additional \$328,085 from three other sources.

In May 2009, the EC announced that it may allocate additional funds “to support future action” in a number of countries, including Albania. The amount and nature of the funding was not confirmed as of 1 July 2009.¹⁴³

As of June 2009, AMAE reported international funding totaling \$4,348,583 for 2008, including funds from Canada, the EC, Germany, Sweden, the United Kingdom, and the United States.¹⁴⁴ Funds reported for 2008 account for 75% of the total revised budget for 2008–2010 reported by AMAE in June 2008. Based on this, funding at 2008 levels appears to be sufficient to meet overall mine action needs in Albania.

In 2008, the ITF reported allocating \$4,364,248 (14%) of its funds to Albania,¹⁴⁵ compared to \$2,137,859 (9.3%) of its funds in 2007.¹⁴⁶

2008 International Mine Action Funding to Albania: Monetary¹⁴⁷

Donor	Implementing Agencies/ Organizations	Project Details	Amount
US	ITF	Mine clearance, RE, VA	\$4,045,834
EC	UNDP	Coordination and monitoring	\$736,300 (€500,000)
Germany	Unspecified	Mine clearance	\$564,976 (€383,659)
UK	UNDP	Coordination and monitoring	\$280,645 (€151,332)
Sweden	Swedish Rescue Services Agency	Unspecified	\$58,362 (SEK384,215)
Slovenia	ITF	Unspecified	\$10,308 (€7,000)
Total			\$5,696,425 (€3,868,277)

2007 International Mine Action Support to Albania: In-Kind¹⁴⁸

Donor	Form of In-Kind Support	Monetary Value (where available)
Switzerland	Provision of expert assistance to AMAE	\$92,460 (CHF100,000)
Total		\$92,460 (€62,787)

EC funding via UNDP covers the period August 2008 to August 2010. AMAE reported additional funding during 2008 from Canada (C\$104,013/\$97,573) via the ITF for mine clearance, from Sweden (\$200,000) via UNDP for VA, and from the ICRC (CHF33,000/\$30,512) for RE.¹⁴⁹ Neither Canada nor Sweden reported allocating these specific funds to Albania in 2008.

¹⁴⁸ Email from Rémy Friedmann, Political Division IV, Ministry of Foreign Affairs, 11 March 2009.

¹⁴⁹ Email from Arben Braha, AMAE, 10 August 2009.

ALGERIA

2008 Key Data

State Party since	1 April 2002
Contamination	Antipersonnel and antivehicle mines, IEDs, UXO
Estimated area of contamination	No reliable estimate
Casualties in 2008	At least 19
Estimated mine/ERW survivors	Unknown but at least 183
Article 5 (Clearance of mined areas)	Deadline: 1 April 2012
Demining in 2008	Not reported

Ten-Year Summary

The People's Democratic Republic of Algeria became a State Party to the Mine Ban Treaty on 1 April 2002. It established an interministerial committee on the implementation of the treaty in 2003. Algeria completed destruction of its stockpile of 150,050 antipersonnel mines in November 2005, while retaining 15,030 mines for training purposes—one of the highest numbers of any State Party. In December 2008 and March 2009 it reduced the number to 6,090 mines. Algeria considers its existing laws as sufficient to implement the treaty. There have been unverifiable media reports of use of mines by insurgents or “terrorist groups.” In 2007, Algeria seized a cache of about 2,800 antipersonnel mines, one of the largest known seizures anywhere in the world since the Mine Ban Treaty entered into force.

Algeria is contaminated with mines and explosive remnants of war (ERW) from conflicts dating back to World War II. A mine action program, which was established at the end of 2006 with UNDP assistance, has struggled to recover from the December 2007 bombing of the UN building in Algiers, which killed three UNDP mine action personnel, including the chief technical advisor.

From 1999 to 2008, Landmine Monitor identified at least 273 mine/ERW/victim-activated improvised explosive device (IED) casualties, including 90 killed and 183 injured, although in the absence of effective data collection casualties may have been under-reported. Algeria does not have a formal risk education program, but some basic awareness messages were provided by local organizations in 2008. Health, rehabilitation, and socio-economic reintegration services to assist persons with disabilities, including mine/ERW survivors, are in place but need to be strengthened. Discrimination against persons with disabilities was reported in 2008.

Mine Ban Policy

Algeria signed the Mine Ban Treaty on 3 December 1997, ratified it on 9 October 2001, and became a State Party on 1 April 2002. The Interministerial Committee on the Implementation of the Mine Ban Treaty was established in 2003.¹ Algeria considers existing laws, including its penal law, as sufficient legal measures to implement the Mine Ban Treaty.² In November 2008, an Algerian official reiterated this to Landmine Monitor.³

¹ In August 2006, responsibility for the committee was transferred from the Prime Minister's Office to the Ministry of Defense. Interview with Mohamed Masoud Adimi, former Executive Secretary, Interministerial Committee, Algiers, 18 January 2007.

² This includes Law Number 97-06 on war material, arms, and munitions (enacted on 21 January 1997) and Executive Order Number 98-96 (18 March 1998) implementing Law 97-06. Article 7 Report, Sections 1.1 and 1.2, 1 May 2003, and repeated in more recent reports.

³ Interview with Hamza Khelif, Deputy Director, Ministry of Foreign Affairs, in Geneva, 25 November 2008.

Algeria submitted its seventh Article 7 transparency report in April 2009.⁴

Algeria attended the Ninth Meeting of States Parties in November 2008, where it called on states not party, particularly from the Maghreb region of North Africa, to join the treaty.⁵ It also commented on several other states' Article 5 deadline extension requests and made statements on its own mine clearance obligations, and on mines retained for training.

Algeria also participated in the intersessional Standing Committee meetings in Geneva in May 2009, where it provided an update on its efforts to meet its 2012 mine clearance deadline.

Algeria has not engaged in the extensive discussions that States Parties have had on matters of interpretation and implementation related to Articles 1 and 2 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, and antivehicle mines with sensitive fuzes or antihandling devices). However, in November 2008, Algerian officials told Landmine Monitor that Algeria does not participate in joint military operations, but should it ever do so with a state not party, it will under no circumstances use antipersonnel mines.⁶

Algeria is not party to the Convention on Conventional Weapons (CCW). It has not signed the Convention on Cluster Munitions.⁷

Production, transfer, use, stockpiling, and retention

Algeria is not known to have ever produced or exported antipersonnel mines. It imported antipersonnel mines from China, the former Soviet Union, and the former Yugoslavia.⁸ The government has acknowledged that it used mines against "terrorists" during the 1990s.⁹ On 21 November 2005, Algeria completed the destruction of its stockpile of 150,050 antipersonnel mines, four months in advance of its treaty-mandated deadline.¹⁰

The armed opposition group Al-Qaida Organization in the Islamic Maghreb¹¹ has previously been reported to use landmines or IEDs.¹² In August 2008, in Skikda province, the government accused Al-Qaida of setting off several landmines, apparently command-detonated, resulting in the deaths of both security forces and civilians.¹³ In the first three months of 2009, Algerian newspapers reported a number of incidents with "terrorist groups" allegedly using mines or IEDs, though it is not clear if these were antipersonnel or antivehicle, and if they were command-detonated or victim-activated.¹⁴

⁴ Like all previous Article 7 reports, the April 2009 report does not state a specific reporting period and does not use the standard reporting format. Algeria previously submitted Article 7 reports in April 2008, April 2007, on 10 May 2006, 27 October 2005, 11 May 2004, and 1 May 2003.

⁵ Statement of Algeria, Ninth Meeting of States Parties, Geneva, 24 November 2009.

⁶ Interview with Hamza Khelif, Ministry of Foreign Affairs, and Col. Hacène Gherabi, Chairperson, Interministerial Committee, in Geneva, 25 November 2008.

⁷ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 185.

⁸ Article 7 Report, Section 2, 1 May 2003.

⁹ Statement of Algeria, Seventh Meeting of States Parties, Geneva, 18 September 2006, p. 2. The government first admitted this in May 2005. Previously, Algeria had only stated that landmines were used before 1962 by the "colonial army" along the country's borders.

¹⁰ Between 24 November 2004 and 21 November 2005, Algeria destroyed 150,050 antipersonnel mines of 10 different types in 12 destruction events. In addition, it destroyed 18,873 coils of tripwire and 187,510 wooden stakes. Presentation by Col. Hacène Gherabi, Interministerial Committee, Standing Committee on Stockpile Destruction, Geneva, 15 June 2005. See *Landmine Monitor Report 2006*, p. 144.

¹¹ Formerly known as the Groupe Salafiste pour la Predication et le Combat (Salafist Group for Call and Combat).

¹² Landmine Monitor has not received any specific reports of use of antipersonnel mines by insurgents since July 2003. See *Landmine Monitor Report 2003*, p. 74.

¹³ Alfred de Montesquiou, "At least 43 killed as suicide bomber attacks police academy in Algeria," *The Guardian*, 20 August 2008, www.guardian.co.uk.

¹⁴ See for example, "Landmine explosion injures woman in Bouira," *Al-Kahbar* (daily newspaper), 9 January 2009; "Two security members killed and four injured in military vehicle explosion," *Al-Nahar* (online newspaper), 15 February 2009; "Man amputated after stepping on landmine planted by terrorist group," *Al-Nahar*, 21 February 2009; "Shepherd injured, security forces surround Boukil mountains," *Al-Nahar*, 22 February 2009; "Three Algerians killed and injured in landmine explosion," *Al-Siasi* (online newspaper), 19 March 2009; and "Three terrorists killed and security group leader injured in landmine explosion in Belabas," *Sout Al-Ahrar* (daily newspaper), 31 January 2009.

Seizures of antipersonnel mines

Landmine Monitor has not seen any reports of seizures of mines during the reporting period (from May 2008 to May 2009).¹⁵ In June 2007, Algerian army intelligence agencies reportedly seized 2,815 antipersonnel mines from a house in the city of Maghnia, Tlemcen province, in western Algeria.¹⁶ The case went to the criminal court of Algiers in May 2008.¹⁷ The court ordered the Ministry of Justice to destroy the mines.¹⁸ This is one of the largest seizures of antipersonnel mines that Landmine Monitor has seen reported in the past decade. Algeria did not report on the seizure or destruction of the mines in its Article 7 reports submitted in April 2008 or April 2009.¹⁹

Mines retained for training

On completion of stockpile destruction in November 2005, Algeria reported that it was keeping 15,030 antipersonnel mines for training purposes. Up until April 2008, the number of retained mines had not changed and was at the time the second highest number of all States Parties.²⁰ In November 2008, however, Algeria announced it would destroy 9,000 of these mines.²¹ Subsequently, it destroyed 1,000 mines on 28 December 2008 and 7,940 mines on 23 March 2009. The destruction events were witnessed by members of the Interministerial Committee, diplomats from Belgium, Canada, and Sweden, and representatives of UNDP, ICRC, Handicap International, and the local media.²² This brought the number of retained mines down to 6,090, just 90 mines short of the goal of 6,000 mines as stated in its latest Article 7 report.²³

Algerian officials have said that the retained mines are being used by both military and police forces, and that they prefer to train deminers with live mines.²⁴ Algeria has not reported in any detail on the intended purposes and actual uses of its retained mines—a step agreed by States Parties in 2004.

Scope of the Problem

Contamination

Algeria is contaminated with mines and explosive remnants of war (ERW) from World War II, the conflict to end French colonial occupation, and the insurgency of the 1990s. The precise extent of residual contamination is not known. An impact survey planned with UNDP support to help prioritize clearance had not been initiated as of May 2009.

¹⁵ There were reports in 2007 of another seizure of mines and of the discovery of a manufacturing shop by the authorities, with the latter most likely being for IEDs. See *Landmine Monitor Report 2008*, p. 123.

¹⁶ The mines were alleged to have been brought in by networks of smugglers across the Moroccan border, and were destined for “the terrorist groups in the mountains of Tizi Ouzou” in central Algeria. Reportedly, the mines were collected from the Algerian-Moroccan border with the intention to extract the explosives to make other kinds of explosive devices. See *Landmine Monitor Report 2008*, p. 123. A. Brahim, “Algerian Army uncovers anti-personnel mines cache,” *El-Khabar*, 25 June 2007. Translation by BBC Monitoring Middle East.

¹⁷ “Justice opened the file of 2500 antipersonnel mines on the way to Al-Qaeda,” *El-Khabar*, 31 March 2008.

¹⁸ Interview with Col. Hacène Gherabi, Interministerial Committee, in Geneva, 25 November 2008.

¹⁹ In both reports, Section 2.2 covers antipersonnel mines discovered after the passage of the stockpile destruction deadline, and is marked “none.”

²⁰ Article 7 Report, Section 4, April 2008.

²¹ Statement of Algeria, Ninth Meeting of States Parties, Geneva, 28 November 2008.

²² Article 7 Report, April 2009, Section 4. The mines destroyed were 25 PMD-6, 190 PMD 6-M, 100 PMN, 100 PMA, 90 GLD-115, 100 OZM, 100 POMZ-2 and POMZ-2M, 40 PROM-1, 15 PMR-2A, and 240 GLD-125 on 28 December 2008, and 30 PMD-6, 2,310 PMD 6-M, 455 PMN, 310 PMA, 2,655 GLD-115, 200 OZM, 700 POMZ-2 and POMZ-2M, 80 PROM-1, 45 PMR-2A, and 1,155 GLD-125 on 23 March 2009.

²³ Article 7 Report, Section 4, April 2009. The mines retained for training now consist of 545 PMD-6, 500 PMD, 245 PMN, 200 PMA, 3,015 GLD-115, 200 OZM, 200 POMZ-2 and POMZ-2M, 100 PROM-1, 80 PMR-2A, and 1,005 GLD-125. The report indicates that an additional 45 PMD-6 and 45 PMN are to be destroyed.

²⁴ ICBL meeting with the Algerian delegation at the intersessional Standing Committee meetings, Geneva, 17 June 2005.

In 2003, the government estimated that 3,064,180 mines were laid by the French colonial army in the late 1950s along Algeria's eastern border with Tunisia and the western border with Morocco.²⁵ In April 2009, Algeria reported that demining operations through the end of 2008 had released an "estimated" total of almost 18.5km², mainly in Bechar in the southwest of the country.²⁶

The north of the country is contaminated by an unknown number of homemade mines and explosive items laid by insurgent groups and a reported 15,709 antipersonnel mines laid by the Algerian army around installations, particularly high-tension powerlines.²⁷ Algeria has also stated that some "locations that still need clearance in the center of the country continue to be targeted by the insurgent groups." As of April 2009, a total of 4,713 mines still remained to be cleared from the total laid by the army in the north: according to Algeria, the remaining areas in the north are still targeted by terrorist groups.²⁸

Mines continue to be found outside known mined areas. In April 2009, Algeria noted that in 2008, 132 "isolated" antipersonnel mines had been encountered and destroyed; this compares with 227 the previous year.²⁹

Casualties

In 2008, Landmine Monitor identified at least 19 new mine/ERW/victim-activated IED casualties including eight killed and 11 injured in 11 incidents.³⁰ Four casualties were reported by the Interministerial Committee and 15 by local media. Ten casualties were civilians and nine were military and security forces. Among civilians were six men, three boys, and one girl. Activities include conducting military activities (nine), herding (four), hunting (two), and traveling (one); the activity of three casualties remains unknown. Mines caused eight casualties (five unknown mines and three antipersonnel mines), victim-activated IEDs six, and ERW one; four casualties were caused by unknown devices. Casualties were reported in eight provinces: Tizi Ouzou (seven), Biskra (three), Sidi Bel Abbes (three), Naama (two), Medea (one), Tebessa (one), Bouira (one), and Skikda (one).

The 2008 casualty rate represents a decrease compared to 2007 (78), 2006 (58), and 2005 (51), but is still higher than in 2004 (nine). Casualties may go unreported, as information on mine/ERW incidents remains limited. The total number of mine/ERW/IED casualties in Algeria remains unknown, and different sources report conflicting data. From 1999 to 2008, Landmine Monitor identified at least 273 mine/ERW/victim-activated IED casualties, including 90 killed and 183 injured, although in the absence of effective data collection casualties may have been under-reported.³¹

Casualties continued to be reported by local media at an increased rate in 2009, with at least 34 mine casualties (14 killed, 16 injured, and four unknown) in 12 incidents, as of 31 May 2009.³² At least 10 were civilians and nine were military and security forces; the civil status of 15 remained unknown. Among civilians were four men, three women, one boy, one child of unknown gender, and one person of unknown gender and age. The activity at the time of the incident included traveling (11), herding (two), collecting olives (one), conducting security activities (one), and other types of activities (five); the activities of 14 casualties are unknown. All casualties were caused by mines (including 10 by antivehicle mines).

²⁵ See, for example, Article 7 Report, April 2008, Sections 2 and 3; and see also Article 7 Report, April 2009, Sections 2 and 3.

²⁶ Article 7 Report, April 2009, Section 3.

²⁷ See Article 7 Report, April 2009, Section 3; and *Landmine Monitor Report 2007*, p. 132.

²⁸ Article 7 Report, April 2009, Section 5.3. Algeria also reports that 4,813 mines remain to be cleared from the 1st Military Region. It is not known which figure is correct.

²⁹ Article 7 Report, April 2009, Section 5.4.

³⁰ Landmine Monitor media monitoring from 1 January to 31 December 2008; Landmine Monitor analysis of casualty data provided by Salima Rebbah, Project Coordinator, HI, 13 June 2008; and Landmine Monitor analysis of casualty data provided by Col. Hacène Gherabi, Interministerial Committee, 3 June 2008.

³¹ See previous editions of Landmine Monitor.

³² Landmine Monitor media monitoring from 1 January to 31 May 2009.

There have been at least two Algerian casualties outside of Algeria. On 7 May 2004, an Algerian working for a Polish television crew was killed together with another crew member when their vehicle hit a landmine in Iraq. In May 2002, an Algerian peacekeeper was killed in a landmine incident in the Democratic Republic of the Congo.³³

In 2008, some 1.9 million persons with disabilities were registered in Algeria, according to the Ministry of Labor and National Solidarity.³⁴ A national disability survey has yet to be launched.³⁵ Other sources estimated that there are three million persons with disabilities in Algeria.³⁶

Risk profile

Based on analysis of Landmine Monitor data, military and males conducting livelihood activities are the most at-risk group. The Ministry of Defense reported that “children and nomads are considered to be the most at risk groups.”³⁷ Local media reported also that young people engage in intentional risk-taking behaviors out of economic necessity, including clearing mines to remove the explosives and sell the scrap metal.

Program Management and Coordination

Mine action

The Interministerial Committee on the Implementation of the Mine Ban Treaty, set up in 2003 by presidential decree, was made responsible for implementing a joint mine action project with UNDP. In addition, a steering committee was established to oversee the project, chaired by the Ministry of Foreign Affairs.

Victim assistance

Since 2003, the Interministerial Committee has been responsible for oversight of victim assistance (VA). Algeria reported that coordination is in place between the Ministry of Health, the Ministry of Labor and Social Security and the Ministry of War Veterans in mine/ERW contaminated areas to ensure VA is provided.³⁸

In January 2007, the Ministry of Labor and Social Security, in cooperation with Handicap International (HI) hosted a VA workshop, which identified the following VA priorities: fully integrate economic reintegration; provide information and training on disability and labor issues; increase cooperation between stakeholders and share best practices; conduct training on project management and technical aspects of economic reintegration; and focus on the economic integration of young persons with disabilities.

Data collection and management

In October 2007, an Algerian newspaper reported that records relating to the minefields laid by French troops from 1956–1959 along the Challe and Morice lines in the east and west of the country had “finally” been handed over to Algeria. A statement from the French embassy in Algiers indicated that the move aims at “removing the obstacles inherited from the past and building relations of trust with Algeria.” In April 2008, however, Algeria stated that the maps had not resulted in any previously unknown mined areas being identified.³⁹

³⁸ Statement of Algeria, Standing Committee on Victim Assistance and Socio-Economic Reintegration, Geneva, 8 May 2006.

³⁹ See Article 7 Reports, April 2008 and April 2009, Sections 2 and 3.

The Geneva International Centre for Humanitarian Demining (GICHD) planned to install the Information Management System for Mine Action (IMSMA) in Algeria before the end of 2007. In July 2009, GICHD stated that IMSMA was not installed as the authorities no longer wished to use the system.⁴⁰

There is no unified and comprehensive casualty data collection mechanism in Algeria and it is difficult to obtain detailed information on mine/ERW incidents. The recommendations of the 2007 VA workshop remain unimplemented. A UNDP project with the Ministry of Labor and Social Security aimed to create a casualty data collection mechanism by the first half of 2008; no progress toward this goal was reported, as of May 2009.⁴¹

The Interministerial Committee reported that both the gendarmerie and police collect data, including device type, on “physical incidents” including those resulting in mine/ERW/IED casualties. The Ministry of Interior and Local Governments records and stores information on “casualties of terrorism” including mine/ERW/IED casualties.⁴² Data is shared with other ministries and local authorities for compensation, pensions, or other purposes.⁴³ Data is also shared with associations working with persons with disabilities, including mine/ERW/IED survivors.⁴⁴ The Ministry of Labor and Social Security records information related to persons with disabilities and the Ministry of War Veterans records information on “victims of colonialism,” including mine/ERW/IED casualties.⁴⁵

The media continues to be the main source of data, but the details of information collected remains insufficient.⁴⁶ HI maintained a casualty database monitoring major Algerian newspapers until mid-2008.⁴⁷

In 2009, the National Research Center in Social and Cultural Anthropology (Centre National de Recherche en Anthropologie Sociale et Culturelle, CRASC), on behalf of the government and UNDP, conducted a study on the socio-economic impact of mines/ERW in Algeria, which included information on mine/ERW casualty data.⁴⁸ In the framework of the HI risk education (RE) needs assessment (see Risk education section below), new mine/ERW casualty data was collected in the eastern and western provinces and shared with relevant partners, including the CRASC.⁴⁹

Plans

Strategic mine action plans

In November 2006, the Algerian government and UNDP signed a project document to support Algeria's mine action program within the framework of the Mine Ban Treaty. The project included the conduct of a survey, the development of a national strategy and annual plans, and the installation of an information system, as well as mine/ERW RE and VA activities. The project initially covered a two-year period through December 2008, but this was extended for an additional year as a result of the impact of the bombing in November 2007.⁵⁰ One of the outputs of the UNDP project was to be a strategic mine action plan, but this had not been drafted as of late July 2009.⁵¹ The strategy would seek to address the needs of survivors and develop strategies for their socio-economic reintegration.⁵²

National ownership

Commitment to mine action and victim assistance

Algeria has been slow to initiate a mine action program since becoming a State Party to the Mine Ban Treaty in 2002. Algeria's program is nationally managed but with UN technical support and funding. The program was significantly impacted by the December 2007 bombing of the UN building. As of July 2009, recruitment of a UNDP Chief Technical Advisor was underway.⁵³ Algeria stated its commitment to ensure assistance to survivors at international meetings in 2004, 2006, and 2007.⁵⁴ Since then it has not reported on VA achievements or challenges.

National mine action legislation and standards

With the exception of the May 2003 presidential decree, there has been no mine action legislation passed in Algeria. In 2006, the army was said to be conducting demining operations according to "common international standards," which have been adapted to Algeria's soil conditions.⁵⁵

Demining and Battle Area Clearance

All demining in Algeria is carried out by the military using manual clearance methods. A tender was launched in 2007 for an impact survey and an organization to conduct the survey was selected.⁵⁶ As of July 2009, the survey was said to be close to completion by the selected contractor, CRASC, under the auspices of UNDP.⁵⁷

Demining in 2008

In 2008, the army destroyed 91,865 antipersonnel mines in the west, southwest, and east of the country, almost double the number destroyed in the same areas in 2007.⁵⁸ Algeria has not formally reported the size of areas covered by demining operations in 2008 alone.

⁵⁸ See Article 7 Report, April 2009, Section 5.2.1.1.

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Algeria is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 April 2012. In May 2009, Algeria stated it would not spare any effort to meet its deadline, although it noted that the context was “complex.”⁵⁹

Between November 2004 and March 2009, Algeria reported the destruction of 379,243 antipersonnel mines.⁶⁰ Yet the current pace of demining continues to be insufficient if the deadline is to be met. Algeria has noted that productivity was subject to factors such as climatic conditions, the type of soil, thick vegetation, soil erosion, and movement of sand by the wind, shortage of funds, and a lack of personal protective equipment and demining tools.⁶¹

As noted in its Article 7 report submitted in April 2009, Algeria has maintained two mined areas in the Challe minefields, one in the east and one in the west of the country, as a “historical site.” The size of both areas in Tébessa and Bechar regions is small, totaling 3,000m² and 2,000m², respectively, and Algeria has declared that the areas are “duly protected and marked” as a legacy of the War of National Liberation.⁶² Such retention of mined areas is, however, not permitted by the Mine Ban Treaty and therefore these areas must be cleared before its 2012 Article 5 deadline.

Risk Education

In 2008, as in previous years, there has been no formal RE program in Algeria.⁶³ The government’s objective, however, is to reach “zero mines, zero victims” by 2012.⁶⁴

Some local organizations continued to provide basic awareness.⁶⁵ Algeria reported that mined areas are marked.⁶⁶ In addition, when mines are discovered, relevant authorities provide *ad hoc* awareness messages to affected communities.⁶⁷ The last RE reported by the army was in 2006, when it provided awareness training as part of the military training for its staff, as well as for military academy students and the national police.

On 28 September 2008, a needs assessment was conducted by HI in the eastern and western regions of Algeria to identify the level of awareness and behaviors of affected communities.⁶⁸ The results were presented in a meeting between the government, HI, and UNDP, but they were not made available to Landmine Monitor because the Interministerial Committee did not wish to make the study public at that stage.⁶⁹ In March 2009, HI launched an RE project in partnership with UNDP and the government. HI started to provide RE capacity-building to eight local associations in six provinces.⁷⁰

⁶⁹ Telephone interview with Faiza Bendriss, UNDP, 23 June 2009.

⁷⁰ Response to Landmine Monitor questionnaire by Salima Rebbah, HI, 22 June 2009.

The first reports of RE activities for civilians were in 2007, when HI and the Ministry of Labor and Social Security organized a presentation on basic RE for local NGOs. Three local organizations reportedly carried out RE in Biskra, El Tarf, and Skikda provinces.⁷¹

Victim Assistance

The total number of mine/ERW survivors in Algeria remains unknown, though from 1999 to 2008, Landmine Monitor identified at least 183 people injured by mines/ERW/IEDs. In 2009, the Interministerial Committee reported that there have been more than 3,500 mine casualties in Algeria since independence and that the majority of them were identified in El Tarf, Souk Ahras, and Tebessa in the east and Tlemcen, Naama, and Bechar in the west; the highest casualty rate was recorded in 1974.⁷² The Ministry of Interior and Local Governments stated that between 1995 and 2005, mines and IEDs killed approximately 4,000 and injured 13,000.⁷³ The Ministry of War Veterans provides support to 3,069 “victims of explosive devices.”⁷⁴

Algeria has facilities to assist persons with disabilities including mine/ERW survivors. According to HI, overall assistance remains adequate and accessible, but services need to be strengthened and survivors need to be better informed and oriented.⁷⁵ In 2008, one local media reported that mine survivors remain “without status, assistance and support.”⁷⁶

Although Algeria made progress according to the Human Development Index, the health system reportedly needed further reinforcement.⁷⁷ Emergency medical care is reasonably well developed, although transportation can be problematic when incidents happen in rural southern desert areas.⁷⁸ Civilians have free access to government hospitals and medical centers. While health services are free of charge,⁷⁹ patients have to cover the costs of accommodation, food and transportation, which not all survivors can afford.

Physical rehabilitation facilities are available nationwide, but services are free only for those registered in the national security system.⁸⁰ The National Office for Equipment and Accessories for Disabled People (Office Nationale d’Appareillages et d’Accessoires pour Personnes handicapées, ONAAPH) under the Ministry of Labor and Social Security produces orthopedic appliances for all persons with disabilities. Appliances are covered by social security for those insured.⁸¹ Replacement devices are available free of charge every five years. The Ben Aknoun rehabilitation center received material, technical and financial support from the ICRC in 2008, but the center had largely ceased to function between July and December 2008. In 2009, the

ICRC planned to end its support to the center as the “Ministry of Health has not shown any interest in the ICRC-assisted center.”⁸² Persons with disabilities who are not registered in the national social security system cannot afford the cost of specialized care, including rehabilitation services.⁸³

Social and economic reintegration is part of the government’s general action program for all persons with disabilities, and specialized programs are in place.⁸⁴ Organizations of persons with disabilities reported that there is a lack of employment opportunities, despite the fact that 1% of jobs must be by law reserved for persons with disabilities.⁸⁵

The Ministry of War Veterans provides pensions for “victims of colonialism” and the Ministry of Interior and Local Governments provides pensions for “victims of terrorism.” In January 2008, the Ministry of War Veterans increased its monthly pensions. Other persons with disabilities receive pensions through the Ministry of Labor and Social Security. Despite promised increases from the government, financial support remains the same as in 2006.⁸⁶ Persons with disabilities reported that pensions do not cover basic needs.⁸⁷

Algeria has legislation to protect the rights of persons with disabilities, but in 2008 the government did not enforce these provisions; “widespread social discrimination” continued to be reported.⁸⁸ Some mine/ERW survivors have called for a review of existing legislation, which they view as inadequate.⁸⁹ On 30 March 2007, Algeria signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol: neither had been ratified as of 1 July 2009.

Victim assistance activities

In 2008, the ICRC continued to support the Ben Aknoun rehabilitation center in Algiers. Four prostheses and 53 orthoses were fitted (a slight decrease compared to 2007, when 13 prostheses and 56 orthoses were fitted).⁹⁰ The ICRC has also built a small physical rehabilitation center for refugees from Western Sahara in Rabbouni; this was operational as of May 2008 and provided orthopedic appliances mainly to mine survivors.⁹¹ As mentioned above, the center largely ceased activities in the latter half of 2008 due to a lack of support from the Ministry of Health.⁹²

In 2008, HI did not implement any VA activities,⁹³ but provided capacity building to organizations working with persons with disabilities and worked to promote disability rights.⁹⁴ In March 2009, it launched some VA activities (local capacity building in data collection and creating a list of available services) in the framework of its RE project.⁹⁵

Support for Mine Action

No national or international mine action funding was reported for Algeria in 2008. In 2007, France reported providing US\$24,548 (€17,904) of in-kind support. In December 2006, UNDP initiated a \$1,200,000 two-year project to support mine action coordination and planning in Algeria. Full funding for the project was reported as of December 2006, with funds applied to programming until December 2008.⁹⁶ The program was extended an additional year as a result of the bombing of the UN building in November 2007.⁹⁷

ANGOLA

2008 Key Data

State Party since	1 January 2003
Contamination	Antipersonnel and antivehicle mines, cluster munition remnants, other ERW
Estimated area of contamination	2007 LIS estimate of between 242km ² and 1,239km ² of mined areas across 2,889 SHAs
Casualties in 2008	At least 52 (2007: at least 48)
Estimated mine/ERW survivors	Unknown but many thousands
Article 5 (clearance of mined areas)	Deadline: 1 January 2013
Demining in 2008	8.32km ² of mined areas 0.27km ² of battle areas 34.96km ² released by survey
Risk education recipients in 2008	Unknown
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$22,136,534 (2007: 19.8 million)

Ten-Year Summary

The Republic of Angola acknowledged using antipersonnel mines as a signatory to the Mine Ban Treaty from December 1997 to April 2002. Angola became a State Party to the Mine Ban Treaty on 1 January 2003. Angola has not enacted national legal measures to implement the treaty. Angola completed destruction of its stockpile of 88,117 antipersonnel mines in December 2006. As of 2007, it reported retaining 2,512 mines for training purposes.

Landmines and explosive remnants of war (ERW) in Angola are the legacy of four decades of armed conflict which ended in 2002. Although mine clearance began in 1994 during the UN Angola Verification Mission, a national baseline of the extent of the problem was not known until a Landmine Impact Survey was completed in 2005. In 2008, the Angolan mine action program included national and international demining operators working in all 18 provinces of the country.

Since April 2002, UNDP has provided support to develop the capacities of the Inter-sectoral Commission on Demining and Humanitarian Assistance (CNIDAH), the national mine action coordination body, and the National Demining Institute (INAD), the government's operational arm for mine action. Significant problems in coordination of the mine action program and reporting on its achievements have persisted, largely as a result of insufficient government commitment to mine action. As of June 2009, it looked unlikely that Angola would meet its January 2013 Article 5 deadline for clearance of mined areas.

There is no complete and reliable set of casualty data in Angola, but between 2000 and 2008 Landmine Monitor identified at least 2,664 casualties (no data was available for 1999). Total casualty estimates run as high as 80,000.

Risk education (RE) has been conducted since 1999 by more than 15 organizations, including UNICEF, international and national NGOs, the ICRC and INAD, and through the mass media and schools, coordinated by CNIDAH. Since 1999, emergency RE has gradually moved to a more community-based approach focusing on risk reduction. In 2006, a development approach using participatory methods was introduced. By the end of 2008, the level of RE had decreased significantly, becoming inadequate.

While overall services for mine/ERW survivors improved after the end of the conflict in 2002, services for survivors and other persons with disabilities remained limited as of 2009. In some sectors, deterioration has been noted since 2005. As part of its commitment to the Nairobi Action Plan 2005–2009, Angola created a victim assistance plan, but it remained largely unimplemented due to a lack of funds and capacity.

Mine Ban Policy

Angola signed the Mine Ban Treaty on 4 December 1997 and ratified on 5 July 2002, becoming a State Party on 1 January 2003. Angola has not formally reported any legal measures to implement the Mine Ban Treaty.

As of July 2009, Angola had not submitted its annual updated Article 7 transparency report, due 30 April 2009. Angola did not provide a report in 2008. It has submitted four previous reports.¹

Angola attended the Ninth Meeting of States Parties in Geneva in November 2008, where it commented on the Article 5 deadline extension request submitted by Zimbabwe, and made statements on victim assistance and mine clearance. It also attended the intersessional Standing Committee meetings in May 2009, where it made statements on mine clearance and victim assistance.

Angola has not made known its views on key issues of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training). It is particularly notable that Angola has not spoken on these issues, given its history of mine use and participation in joint military operations.²

Angola is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions in December 2008, but had not ratified as of 1 July 2009.³

Production, transfer, use, stockpile destruction, and retention

Angola states that it has never manufactured antipersonnel mines.⁴ It is not believed to have exported them in the past. While Landmine Monitor has not confirmed any instances of use of antipersonnel mines since Angola ratified the Mine Ban Treaty, the government has acknowledged using antipersonnel mines while it was a signatory to the treaty, from December 1997 to April 2002, when a peace agreement was signed with the National Union for the Total Independence of Angola (União Nacional para a Independência Total de Angola, UNITA).⁵

Angola completed destruction of its stockpile of antipersonnel mines on 28 December 2006, just ahead of its 1 January 2007 treaty deadline. It destroyed 81,045 mines between October and December 2006, in addition to 7,072 antipersonnel mines of 12 types apparently destroyed between September and December 2003.⁶

¹ Angola submitted an undated report in 2007, covering the period from April 2006 to March 2007. Previous reports were submitted on 3 August 2006, 3 May 2005, and 14 September 2004. The initial report was due 30 June 2003.

² See *Landmine Monitor Report 2000*, pp. 81–83; *Landmine Monitor Report 2001*, pp. 123–125, and *Landmine Monitor Report 2002*, p. 362.

³ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 29–30.

⁴ Article 7 Report (for the period April 2006 to March 2007), Form E.

⁵ See *Landmine Monitor Report 2004*, pp. 121–122. Although the treaty had not entered into force for Angola, the ICBL and some States Parties protested Angola's use of mines, noting that it could be considered a breach of its international obligations as a signatory. There have been sporadic and unconfirmed reports of new use of antipersonnel and antivehicle mines since the end of the war, with allegations focused on criminal groups.

⁶ See *Landmine Monitor Report 2007*, pp. 141–143, for additional details.

In its most recent Article 7 report, Angola reported retaining 2,512 antipersonnel mines under Article 3 of the Mine Ban Treaty.⁷ Angola has not provided an update on mines retained since 2007, and has yet to provide details on the intended purposes and actual uses of its retained mines, as agreed by States Parties at the First Review Conference in 2004.

Scope of the Problem

Contamination

Angola is heavily contaminated with landmines and explosive remnants of war (ERW), including cluster munition remnants. Contamination is the result of more than four decades of armed conflict, which ended in 2002. More than 40 different types of mines from 15 countries have been found during clearance operations.⁸

Estimates of the extent of the mine problem in 1993 spoke of millions of landmines littering one-third of the country's land.⁹ It was not until June 2007, following completion of the Landmine Impact Survey (LIS), that a more measured and realistic description of contamination in each of the country's 18 provinces (all of which are contaminated) was achieved.¹⁰

The LIS identified 3,293 suspected hazardous areas (SHAs) in 1,988 mine/ERW-impacted communities in 383 of Angola's 557 comunas (districts). These impacted communities represent 8% of the 23,504 communities in the country, affecting an estimated 2.4 million people. Three-quarters of all impacted communities and casualties were in just eight provinces: Benguela, Bié, Cunene, Kuando-Kubango, Kuanza Sul, Malanje, Moxico, and Uíge, with Moxico the most heavily impacted province. Cabinda, Luanda, and Namibe provinces were found to have the least impact from mines.¹¹ As of March 2009, the national database managed by the Inter-sectoral Commission on Demining and Humanitarian Assistance (Comissão Nacional Intersectorial de Desminagem e Assistência Humanitária, CNIDAH) showed that 998 SHAs from the LIS—30% of the total—had been released (through cancellation, technical survey, or clearance) or clearance was either ongoing or CNIDAH had not received a completion report.¹²

Yet the extent of residual contamination is not known with any precision, and different operators have contrasting views on estimates of the total size of mined and battle areas in the country. In the four provinces where it carried out survey for the LIS (Benguela, Bié, Huambo, and Kuando-Kubango), HALO Trust applied a more rigorous methodology for measuring suspected areas, which resulted in an average SHA size only one-ninth of those measured by the other LIS operators.¹³ The results from the LIS show that HALO identified 35% of the total number of SHAs, but as a result of polygon mapping (more precise delineation of the perimeters of suspected areas) measured only 6.4% of the total suspect area.¹⁴ Furthermore, in June 2008, HALO, based on data from its polygon-mapped areas and from its own past clearance records, indicated that on average only one-quarter of the SHAs required physical clearance.¹⁵

⁷ Article 7 Report (for the period April 2006 to March 2007), Form D. This is considerably more than the 1,460 mines Angola previously indicated it would retain. It includes 13 types of mines not previously listed as retained, and the amounts of all 12 types previously listed have changed. See *Landmine Monitor Report 2007*, p. 144.

⁸ See *Landmine Monitor Report 2008*, p. 131.

¹⁴ Email from Southern Craib, Programme Manager, HALO, 20 June 2008.

¹⁵ Ibid.

CNIDAH, for planning purposes, based on the results of HALO's polygon mapping, estimated the total area might be as little as 242km² compared to the 1,239km² measured by the LIS.¹⁶ The former UNDP Information Management Advisor, Mohammad Qasim, however, could not see any consistent pattern when analyzing tasks completed by all demining operators since the LIS and he concluded it was "premature" to estimate there was as little as 242km² of contaminated area.¹⁷ Moreover, despite the extensive coverage of the LIS, which included all but 19 of the 563 comunas, the community-based survey did not identify contamination on all of the bridges, roads, and other infrastructure not directly associated with local villages. CNIDAH planned to survey the 19 comunas in 2009 that were not accessible during the LIS, pending funding for the project.¹⁸ The return of internally displaced persons and refugees may also lead to the discovery of new SHAs that were not recorded by the LIS. Demining operators believe that many mined areas remain to be identified.¹⁹

The extent to which Angola continues to be affected by cluster munition remnants is also unclear. Prior to 2009 at least two types of cluster munitions had been found in Angola: the Russian-made PTAB-2.5 K0 and the AO-2.5 RT. As of February 2008, according to data and completion reports from NGO operators in the national database at CNIDAH, Norwegian People's Aid (NPA) had reported clearing 13 submunitions in the municipality of Ebo in Kuanza Sul province; Mines Advisory Group (MAG) had reported clearing 140 submunitions in Moxico province; and HALO had reported clearing 230 submunitions in Kunhinga municipality in Bié province.²⁰ As of 29 June 2009, demining NGOs in Angola reported they had not found more submunitions since those reported in February 2008.²¹

Casualties

As in previous years, there is no reliable and complete data on the number of casualties in 2008 in Angola. Landmine Monitor received "nationwide" information from CNIDAH and the National Demining Institute (Instituto Nacional de Desminagem, INAD); data for Moxico province from CNIDAH, MAG, and DanChurchAid (DCA); and demining accident information from NPA, HALO, and Santa Barbara Foundation (StB). However, the formats made available did not allow cross-checking and assembling a cumulative total. In addition, CNIDAH information provided in 2009 did not match the January–June 2008 casualty data CNIDAH provided in July 2008, reportedly because the date in the files received was said to be the date of entry and not the date of incident.²²

INAD provided summary data on 67 new mine/ERW casualties in 2008 (12 killed and 55 injured). At least 40 casualties were men, seven women, 18 boys, and two girls. INAD declined to provide incident dates, locations, civilian-military status, device type, or activity at the time of the incident to allow cross-checking with other data sources.²³

¹⁶ SAC, "Landmine Impact Survey, Republic of Angola, Final Report," Washington, DC, November 2007, p. 31.

¹⁷ Email from Mohammad Qasim, Acting Chief Technical Advisor and Information Management Advisor, UNDP/CNIDAH, 12 March 2009. Analysis is, however, impeded by the failure to systematically include the amount of land released in clearance reports. For example, if a SHA measures 100,000m² and after technical or other survey it is necessary to clear only 20,000m², the other 80,000m² are not reported as released. Mohammad Qasim did not provide an explanation for this reporting method but believed CNIDAH sees a more accurate estimate of the landmine problem as counting the number of SHAs that have been cleared. Email from Mohammad Qasim, UNDP/CNIDAH, 12 March 2009; and email from Mohammad Qasim, 6 May 2009.

¹⁸ UN, "2009 Portfolio of Mine Action Projects," New York, November 2008, p. 31. DCA had previously expressed concern to Landmine Monitor that CNIDAH might not have the capacity to update the LIS with the results of the survey. Email from Eva Veble, Head, Humanitarian Mine Action Unit, DCA, 25 June 2008.

¹⁹ Interviews with Johan P. Botha, MAG, Luena, 17 May 2009; and with Adriano Gonçalves, Senior Officer, CNIDAH, in Geneva, 27 May 2009.

²¹ Emails from Zlatko Vezilic, Operations Manager, NPA, 29 June 2009; Richard Grindle, Programme Manager, HALO, 27 June 2009; and Thomas Roth, Director, StB, 29 June 2009.

²² Email from Pedro Ribeiro Toka, Information Systems National Advisor, UNDP/CNIDAH, 19 June 2009.

²³ Data provided by email from Luke Atkinson, Chief Technical Advisor, UNDP/INAD, 19 June 2009.

From other sources, Landmine Monitor was only able to verify 52 new mine/ERW casualties in Angola in 2008 (23 killed and 29 injured); information that could not be cross-checked was excluded and casualties are certainly higher. At least 41 of the casualties identified by Landmine Monitor were civilian, including 17 boys, 12 men, four girls, three women, and four females and one male of unknown age. Four were military and three were deminers; all age/gender/status were unknown for four casualties. Antipersonnel mines caused 16 casualties, antivehicle mines eight, ERW 15, and unknown devices 13.

In 2008, CNIDAH stated that annual casualties had decreased from some 250 per year in 2002–2005 to 50 per year due to increased demining and RE efforts. It was further added that most casualties were children and the majority of incidents were caused by ERW.²⁴

According to the United States Department of State, CNIDAH reported 18 people killed and 43 injured in 2008.²⁵ However, national data provided to Landmine Monitor by CNIDAH only included 26 casualties in 2008 (13 killed and 13 injured),²⁶ which did not include at least 16 of 19 casualties recorded by CNIDAH in Moxico (9 killed and 10 injured).²⁷ MAG in Moxico recorded three injured casualties that were not included in CNIDAH Moxico data (two soldiers and one civilian).²⁸ DCA recorded eight casualties in Moxico, which were all included in the regional CNIDAH data.²⁹ In July 2008, CNIDAH reported 47 casualties to the end of June 2008 (10 killed and 37 injured); these were all excluded by Landmine Monitor from casualty totals because the incident data could not be re-verified.³⁰

Additionally, NPA recorded one person injured in a demining accident in 2008³¹ and HALO recorded one deminer injured when a vegetation cutter set off a fragmentation mine in Bié. StB reported one accident in Kuanza Sul when one deminer was injured due to a failure to follow procedures.³² None of these casualties were recorded in CNIDAH data. Landmine Monitor also identified one incident in the media when on 6 October 2008 two people were killed and two injured in an antivehicle mine incident when their car drove off the main road in Kibala, Kuanza Sul province.³³ The US Department of State further reported landmine incidents involving “construction workers, mostly Chinese, while rebuilding roads and railroads.”³⁴ None of the casualty data received included foreign nationals.

Due to the incompleteness of the data, comparisons with previous years are impossible. For 2007, casualty figures ranging between 48 and 127 were reported.³⁵

²⁷ CNIDAH, “Relatório Provincial” (“Provincial Report”), Luena, 16 December 2008; and CNIDAH data provided during Landmine Monitor field mission in Moxico province, May 2009. For one casualty included in the national CNIDAH data, insufficient data was available to verify whether it was included in the data provided to Landmine Monitor.

²⁸ Email from Danny Kavanagh, Country Programme Manager, MAG, 24 June 2009.

²⁹ Email from Hendrix Chilongu, Mine RE/CL Supervisor, DCA, 22 June 2009.

³⁰ Casualty data for 2005–2008 provided by email from Mohammad Qasim, UNDP/CNIDAH, 8 July 2008; and see *Landmine Monitor Report 2008*, p. 142.

³¹ See *Landmine Monitor Report 2008*, p. 142.

³² Email from Anna Kudarewska, Researcher, Landmine Monitor, 30 April 2009.

³³ “Kwanza-Sul: Mina faz dois mortos e igual número de feridos” (“Kwanza-Sul: Mine kills two and injured the same number”), *Jornal de Angola* (Luanda), 8 October 2008.

³⁴ US Department of State, “2008 Country reports on Human Rights Practices: Angola,” Washington, DC, 25 February 2009.

³⁵ See *Landmine Monitor Report 2008*, pp. 140–142.

Casualties continued to occur in 2009 with at least eight casualties (four killed and four injured) to the end of May. In Moxico, CNIDAH recorded five casualties and MAG recorded one additional person injured. CNIDAH in Luanda recorded two additional casualties in Lunda Sul.³⁶ INAD recorded one woman killed and one man injured.³⁷

The cumulative number of mine/ERW casualties is not known. Angola has stated several times that there are an estimated 80,000 survivors.³⁸ In 2006, however, the Ministry of Assistance and Social Reintegration (MINARS) stated that 70% of 89,170 registered persons with disabilities were mine/ERW survivors.³⁹ This would amount to approximately 62,500 people. The media reported in 2008 that the UN estimates there are some 23,000 mine survivors.⁴⁰

The LIS data is considered to be the most reliable source of casualty information; it identified 341 recent casualties (168 killed, 159 injured, and 14 unknown) in 173 communities.⁴¹ The number of non-recent casualties is unknown. Most casualties were male (232 or 68%), which is also below the international average of about 80%. Some 75% of casualties were aged between 15 and 44 years. Of total casualties, 15% were military. The most common activity at the time of the incident was traveling (30%), followed by collecting wood/water (17%), and farming (11%). One-third of casualties occurred in Moxico province (111), followed by Bié (58).⁴² Most of those killed or injured while traveling were not from the communities where the incidents occurred, which resulted in a lack of detail about these casualties.⁴³

In addition to the LIS, fewer than 300 casualty records were entered into the Information Management System for Mine Action (IMSMA) database at CNIDAH in Luanda. The first casualties were entered at the start of the LIS and “almost no data before that.”⁴⁴ Landmine Monitor identified at least 2,664 mine/ERW casualties between 2000 and 2008 (no data is available for 1999), including 877 people killed, 1,644 injured, and 143 of unknown status.⁴⁵

Risk profile

People are at most risk in Moxico, followed by the provinces in northern Angola.⁴⁶ While there is a high level of awareness, people are at risk while conducting livelihood activities including collecting water and food, firewood, making charcoal, and hunting.⁴⁷ Most mined areas are not marked.⁴⁸

Socio-economic impact

Landmines affect the daily lives of the people of Angola in many ways. The LIS identified access to drinking water, housing, and public services as problems related to mines and ERW. Lack of access to drinking water is a problem nationwide but is particularly acute in Kuanza Norte, Kuanza Sul, Lunda Sul, Malanje, and Moxico provinces. Water and electricity distribution for much of the country is also affected, due to the widespread practice of mining high-voltage electricity pylons, reservoirs, and dams during the years of conflict.⁴⁹

⁴⁹ SAC, “Landmine Impact Survey, Republic of Angola, Final Report,” Washington, DC, November 2007, pp. 48–51.

Two World Bank papers on Angola address the impact of landmines. The Environmental and Social Management Framework Final Report concludes that the presence of landmines throughout the country inhibits access to land and is an environmental limitation that undermines development.⁵⁰ The areas cleared are being primarily used for housing and farming: sometimes construction and farming begins before formal handover tasks with local officials are completed.⁵¹ An unpublished World Bank study on the economic impact of landmines reports that although economic models show that mines have affected the overall economy, in Angola there is largely a lack of evidence and studies to back up general statements about that impact.⁵²

Landmines also have an environmental impact in Angola. Mine contamination in Kuando-Kubango province was cited as one of the obstacles to creating the new Kavango Zambezi Transfrontier Conservation Area, the world's largest game park on the borders of Angola, Botswana, Namibia, Zambia, and Zimbabwe. *National Geographic* reported that "since the end of the war in 2002, elephants have begun to go back to the Luiana Partial Reserve in Angola's sparsely populated Kuando-Kubango province that borders southwest Zambia and Namibia. When the initial migration began a number of elephants had their trunks and legs blown off by mines, condemning the animals to agonizing deaths. But the elephants that followed have since avoided those areas." According to Elephants Without Borders, "in order to re-establish and sustain wildlife communities in Luiana Partial Reserve, it is critical that the area be declared a national park and that the land mines are cleared." More than 130,000 elephants are waiting to be allowed to move from Botswana through the park. This process has been held up until the park is free of the threat of mines.⁵³

Mine action has created thousands of jobs in rural areas where in March 2009 unemployment was reported to be as high as 48%.⁵⁴ With dozens of international and national organizations and commercial demining companies⁵⁵ operating in Angola, mine clearance projects provide "a good number of jobs" in the rural areas. This has created a dynamic and competitive labor market in which turnover among deminers, in particular with some NGOs, is high as a result of commercial demining companies offering higher salaries. NGOs reported the turnover causes disruptions in operations and lower outputs as more time is needed for recruiting and training.⁵⁶

Program Management and Coordination

Mine action

The mine action structure in Angola has evolved into a complicated mix of government bodies that coordinate poorly, if at all, and which lack financial transparency. CNIDAH, created in 2001 by presidential decree 54/2001,⁵⁷ is responsible for mine action policy development, planning, priority-setting, coordination, and management of the implementation of Angola's obligations under the Mine Ban Treaty, and reports directly to the Council of Ministers. CNIDAH is also

⁵⁷ Presidential Decree No. 54/2001.

responsible for the accreditation of commercial demining companies and, in principle, these companies send their clearance reports to CNIDAH.⁵⁸ CNIDAH's 18 provincial operations offices (one in each province) determine annual priorities based on NGO priority tasks, the LIS, provincial plans, and requests from traditional leaders and other NGOs.⁵⁹

In order to separate coordination and operational responsibilities, in 2002 the government of Angola also created INAD as a public institute responsible for demining and training operations under the auspices of the Minister of Assistance and Social Reintegration.⁶⁰ INAD takes directions from the government rather than CNIDAH. Araújo Kapapelo Nunda, the general assistant to the director of INAD's Technical Department, declared in February 2008: "Our priorities are defined by the central Government. At the moment, we are demining the railways, enlarging the roadsides and intervening on places where undertakings helping with the process of reconstruction and development of the country will be built or rehabilitated."⁶¹ In May 2009, INAD stated that they were fully funded by the government and had "everything" they needed, but the director general would not provide any figures for the level of support it was receiving.⁶²

Coordination problems have seemingly been compounded since the establishment of the Executive Commission for Demining (Comissão Executiva de Desminagem, CED) in December 2005 to coordinate and manage mine clearance by INAD, the Angolan Armed Forces (Forças Armadas Angolanas, FAA), and the National Reconstruction Office (Gabinete de Reconstrução Nacional, GRN).⁶³ The CED is composed of representatives from the three operators, reports to the President of Angola, and is managed by the Minister of Assistance and Social Reintegration. It functions exclusively at the operational level and participates in the planning process with the same status as other mine action operators. The CED does not have a fixed budget for mine action.⁶⁴

Two reports suggest that the GRN has ample assets to carry out its mission and maintain some independence from CNIDAH. The Ministry of Finance reported the GRN reconstruction budget for 2007 was AOA8,693,107,667 (approximately US\$118 million). It was also reported by *Le Monde diplomatique* in June 2008 that the GRN raised its own money, estimated to be in the billions of dollars, using future oil revenues as leverage.⁶⁵

According to CNIDAH, the work performed by certain commercial companies does not follow the priorities set out in CNIDAH's annual workplan. Private contractors take orders from their client, the GRN, whose mandate is funding infrastructure projects such as roads, railways, bridges, dams, hospitals, schools, and other buildings under the national development plan.⁶⁶

In 2008, the Council of Ministers was scheduled to vote on legislation that would clarify the roles of the CED, INAD, FAA, and CNIDAH. Under the proposed legislation the CED and CNIDAH would remain separate entities. Under Angolan law, a commission has only a temporary life. The proposed legislation would change CNIDAH's status from a commission to an agency, thereby granting CNIDAH a more permanent status.⁶⁷ However, as of May 2009 the Council of Ministers had not voted on the legislation.⁶⁸

Risk education

CNIDAH is responsible for the management, coordination, and monitoring of RE. It was supported by UNICEF until the end of 2008. Three national coordination meetings were held in 2008.⁶⁹ RE is also coordinated at the provincial level, through regular meetings run by the CNIDAH provincial offices. UNICEF reported that coordination is variable, and NPA reported that the frequency of meetings had decreased in Malanje province.⁷⁰ Organizations are accredited to carry out RE activities by CNIDAH.⁷¹

National standards for RE exist, and it is conducted according to a methodology developed in 2006 with UNICEF and NGOs called the Solution Based Methodology (SBM). SBM involves the establishment of community focus groups, consisting of community leaders and members, with whom NGOs meet to discuss the mine/ERW problem and to come up with solutions. Participatory Rural Appraisal techniques such as community mapping and seasonal calendars are used. This is a shift from the previously used message-based methodology. A guidebook for SBM has been produced.⁷²

RE activities are recorded in IMSMA,⁷³ although data provided to Landmine Monitor does not include all RE activities.⁷⁴

Victim assistance

CNIDAH is responsible for the planning, coordination, and monitoring of all victim assistance (VA) activities through its Sub-commission for Assistance and Reintegration. The Sub-commission is made up of relevant ministries, the UN, and NGOs.⁷⁵ However, CNIDAH's VA coordinator noted that coordination had been difficult due to internal reorganization and logistical challenges at CNIDAH. Coordination meetings had been irregular, partly because of the elections in 2008.⁷⁶ Overall coordination within ministries and with civil society was weak.⁷⁷

MINARS is responsible for disability issues in general and, in the context of VA, it is responsible for reintegration services. The Ministry of Health (MoH) is responsible for medical care for survivors and for one of the main programs coordinating assistance to survivors and persons with disabilities, the National Program for the Rehabilitation of People with Physical and Sensorial Disability (PNR).⁷⁸

CNIDAH is responsible for producing an annual VA progress report to monitor assistance provided to survivors.⁷⁹ In 2008, it produced two reports covering its own coordination efforts but not implementation achievements in the sector.⁸⁰ CNIDAH stated that it needed technical support and increased cooperation from ministries and implementers to compile this kind of information.⁸¹

⁸¹ Interview with Madalena Neto, CNIDAH, in Geneva, 28 May 2009.

Due to the increased decentralization, the National VA Plan 2007–2011 (see Strategic mine action plan section below) needs to filter down to provincial authorities. The vice-governors are responsible for provincial coordination, and local authorities are responsible for allocating relevant budgets,⁸² but VA is often not seen as a priority and budget allocations vary accordingly.⁸³

Data collection and management

Data collection and management are also at the heart of problems with Angola's mine action program. In Geneva in May 2009 at the Standing Committee meetings, CNIDAH stated it did not have all of the clearance data because of a rapid expansion of commercial companies and INAD's increased capacity. CNIDAH requested assistance from other States Parties in information management, though it did not specify the type of assistance it was seeking.⁸⁴ As a result of database problems, Angola decided not to submit an Article 7 report for 2008.⁸⁵

The data collection system begins in the provinces where mine clearance operators send their reports each month to the CNIDAH provincial office. The provincial offices do not enter the data into IMSMA, which Angola uses to record mine action information. Instead they forward it to CNIDAH in Luanda where it is entered into the database. Some NGOs also email duplicate copies of their data directly to CNIDAH in Luanda each month. However, all of the information does not seem to arrive in Luanda. The NGO operators reported that they are often requested to resend data weeks or months after having submitted it to the provincial CNIDAH office and sending it direct to Luanda. Based on the requests, the NGOs assume the previously sent data had been lost.⁸⁶

Luanda then sends each provincial office an updated "read-only" database.⁸⁷ In turn, however, the provincial offices do not always receive the updated database. For example, according to Chile Manuel Chicanha, the Liaison Officer at CNIDAH in Luena, the "read-only" database in Moxico in May 2009 did not show any change from the LIS data—even though for more than three years MAG, DCA, and others have been clearing high and medium-impact communities. "Luanda is still working on it," Chicanha told Landmine Monitor.⁸⁸ INAD, based in Luanda a short distance from CNIDAH, also reported not receiving an updated database as promised.⁸⁹ According to UNDP, the return time could take "a couple of months," leaving the provincial offices with a frequently outdated database on which to base its planning.⁹⁰

Despite all these problems, on 31 March 2009 the UNDP capacity-building project ended, leaving CNIDAH without an international advisor for the database.⁹¹ In May 2009, however, it was reported that UNDP was restructuring its support for mine action in Angola within a broader framework that combined work on disarmament, demobilization, and reintegration, and small arms and light weapons. A key component of the new structure would be efforts to secure and disseminate mine action data between CNIDAH at the national level, its provincial offices, and all mine action operators.⁹²

⁹² UNDP, "Technical Specialist (Information Management Systems for Mine Action)," www.reliefweb.int.

As evidenced above, casualty data collection in Angola remains incomplete and inconsistent and has possibly deteriorated compared to previous years. It is believed that casualties remain under-reported.⁹³ CNIDAH is responsible for storing casualty data in IMSMA, which was reportedly functioning properly. However, only casualties since 2004 that were received on IMSMA forms were entered. Data from some organizations was not included in IMSMA because it was incomplete or not submitted for inclusion in the IMSMA database.⁹⁴ Analysis of national and regional CNIDAH IMSMA data shows many discrepancies. Landmine Monitor received, as in previous years, information submitted to CNIDAH, which did not appear to be included in the data provided by CNIDAH.⁹⁵

In 2008 and 2009, Landmine Monitor field visits noted that sources traditionally aware of incidents, such as the police and village chiefs, did not report incidents to CNIDAH.⁹⁶ CNIDAH noted that challenges in collecting data included the fact that CNIDAH only played a coordinating role and depended on operators for information while not one operator was assigned to collect the information.⁹⁷ INAD also records casualty data but it was not known if this was shared with CNIDAH in 2008.

⁹³ Email from Mohammad Qasim, UNDP/CNIDAH, 12 March 2009; and email from Mohammad Qasim, 28 April 2009.

⁹⁶ Observations and discussions with operators during Landmine Monitor field mission, Moxico province and Luanda, 9–14 March 2008 and 11–22 May 2009.

⁹⁷ Response to Landmine Monitor questionnaire by Pedro Ribeiro Toka, UNDP/CNIDAH, 17 June 2009.

Analysis of the data provided to Landmine Monitor shows unsystematic information provision by data collectors as well as a lack of person, device type, and activity information. Database fields are often not filled, are completed unsystematically, and are contradictory.⁹⁸ It was also noted that the incident date was not the actual date of the incident but the date the report was entered into IMSMA, sometimes years later. This would include all the information provided to Landmine Monitor previously,⁹⁹ making the data's reliability even more questionable.

In May 2009, CNIDAH reported that it had started a nationwide survivor survey, which would be completed in 2011.¹⁰⁰

Plans

Strategic mine action plan

LIS data (interim results from 12 provinces) served as the basis for developing Angola's latest strategic mine action plan.¹⁰¹ On 6 September 2006, the National Mine Action Strategic Plan for 2006–2011 was approved by the Council of Ministers.¹⁰² Within the time period it aims to resolve the mine issues in all high-impact communities and half of the medium-impact communities.¹⁰³

CNIDAH planned to review the strategic plan in October 2009 with the help of an international consultant.¹⁰⁴ In preparation for the strategy review, a second annual meeting on demining was held in Luanda on 14 May 2009 at the army's General Headquarters to review the results of clearance operations from 2006–2008 and identify activities that would support the implementation of Angola's development plan.¹⁰⁵ According to Engineer Leonardo Sapalo, INAD's director general, the meeting concluded that more time was needed to clear all mines and this would be reflected in the revised strategic plan.¹⁰⁶

As part of its commitment to the Nairobi Action Plan 2005–2009, Angola developed a set of objectives in 2005, which were reworked in 2007 to become the national VA plan (Action Plan on National Integrated Action 2007–2011).¹⁰⁷ One version was published in 2007 in the Mid-Term Review of the Status of Victim Assistance in the 24 Relevant States Parties,¹⁰⁸ but Landmine Monitor received a more detailed version from CNIDAH in 2008.¹⁰⁹ A final version had not been presented as of May 2009.

Overall, the aim of the plan was to improve service provision for all components of VA for 80% of mine/ERW survivors and/or affected communities. Given that there could be up to 80,000 mine/ERW survivors, this is a challenging target. In addition, many of the objectives focused on capacity-building and institutional strengthening, awareness-raising, and information gathering, rather than service provision.¹¹⁰ In 2008, it was reported that full implementation of the plan was scheduled to start in 2009,¹¹¹ but due to a lack of capacity and financial means, CNIDAH had

¹¹¹ Government of Angola/CNIDAH, "Mine Action in Angola Strategic Plan 2006–2011," Luanda, 2006, p. 50.

not been able to operationalize the plan or monitor relevant activities as of May.¹¹² CNIDAH has met with several ministries and operators to discuss how they envisioned implementing their responsibilities under the plan. It also had several fundraising meetings and visited projects to assess their needs.¹¹³ VA is also included in the Strategic Mine Action Plan 2006–2011 as one of its strategic goals.¹¹⁴

Priority-setting

Provincial authorities are responsible for annual operational workplans.¹¹⁵ At the Ninth Meeting of States Parties, Angola stated its priorities as: clearing agricultural areas, schools, hospitals, and recreation areas, and demining and rebuilding roads and bridges.¹¹⁶ CNIDAH provincial offices provide a priority task list to demining NGOs from which the NGOs then select the tasks they will undertake during the year.¹¹⁷ According to NPA, many of the provincial priority tasks focus on roads, houses, and official buildings.¹¹⁸

Integration of mine action with reconstruction and development

In its 2007 annual report on Angola, UNDP cited the incorporation of mine action operations into the government's development plans at both the national and provincial levels as one of its main challenges in 2008.¹¹⁹ From 2008–2010, government priorities include making more land accessible to expand agricultural output in order to diversify national revenue that relies mostly on oil and minerals; developing an infrastructure for the 2010 African Cup of Nations football tournament, which will be hosted in Angola; and building one million houses and improving communication networks throughout Angola.¹²⁰ In two positive developments towards achieving these targets, agricultural production increased 28% in 2007, and 2008 clearance results from INAD indicate they verified and cleared 160km² to permit the laying of fiber-optic cables.¹²¹

National ownership

Commitment to mine action and victim assistance

Angola has demonstrated some commitment to mine action, in particular through its adoption of a five-year strategic plan and by providing funding to mine action (even though the exact amount is unknown). Nevertheless, as this report indicates, there are significant problems with issues such as financial transparency, information management, and technical capacity within the key national institutions, seemingly with no ready solutions.

At the ministerial level, there appears to be a lack of progress in creating national ownership on VA/disability issues. The government was said to have other priorities, and 2008 elections diverted attention elsewhere.¹²² Yet some awareness was raised to include disability in the national political agenda, to improve legislative frameworks, and to more actively involve

persons with disabilities. Even though service provision remained fragmented and was mainly carried out by non-governmental operators, the number of persons with disabilities visibly living in undignified conditions decreased and they were more able to assert their rights.¹²³

As part of its commitment to the Nairobi Action Plan 2005–2009, CNIDAH has worked on improving coordination on VA/disability issues. It organized broad stakeholder meetings and created thematic working groups in 2006–2007,¹²⁴ with the help of a short-term international consultant who also stimulated the development of the VA plan.¹²⁵ CNIDAH acknowledged that, without international technical support, these efforts had slowed in 2008 and that longer-term technical assistance was needed to improve its coordination efforts. CNIDAH continued to raise the importance of VA with the relevant ministries, but it does not have the mandate to direct ministries responsible for implementation of VA/disability activities.¹²⁶

National management

Angola is fully in charge of its mine action program although its management of the program is plagued with persistent problems, with overlapping or unclear mandates between the different government institutions that have responsibilities for mine action. Moreover, Angola still relies heavily on international advisors and organizations for key parts of its mine action program. UNDP has supported mine action through three separate projects, of which one remained ongoing as of June 2009.¹²⁷

In May 2005, UNDP established the Rapid Response Fund (RRF) in order to have a mechanism to quickly access funding for mine action after the departure of the UN Office for the Coordination of Humanitarian Affairs (OCHA) in 2004. The RRF provided funds to 23 projects in mine clearance, RE, and VA as well as for the LIS, with mixed results. The evaluation team granted “highly successful” status to only eight of the 23 projects. The RRF ended in 2008 after three extensions.¹²⁸

UNDP supported CNIDAH through an 18-month project that ended on 31 March 2009 to train the management, planning, quality control, and data processing departments, as well as the staff for 18 provincial offices and the funding of national technical advisors. At the end of the project CNIDAH was left without technical support for its national mine action database.¹²⁹

As of May 2009, the remaining UNDP mine action support project was the three-year direct execution project with funding from Japan. The aim of the project, which includes six technical advisors, was to enhance INAD’s role as the national mine clearance operator.¹³⁰

In 2008–2009, the PNR, one of main disability programs, was increasingly dysfunctional (see Victim assistance section below) due to a lack of involvement from the responsible ministry (MoH). Since its inception, the PNR has not been able to function without support from international technical advisors. Its main challenges are related to budgeting, management, staff training and retention, and ensuring quality.¹³¹ It was added that sufficient budget should be available for VA/disability issues, but that it was unclear if it was actually used.¹³²

¹³² Interview with Madalena Neto, CNIDAH, in Geneva, 28 May 2009.

National budget

There is no centralized reporting for government of Angola allocations to mine action. Instead any knowledge of government funding to national mine action operators since 2002 has been sporadic, although funding appears substantial. The FAA received \$7 million for mine action from the government in the period immediately following the signing of April 2002 peace accords.¹³³ On 8 September 2004, the media reported a government announcement that it was investing \$16 million in mine clearing equipment and the training of nine new demining brigades for INAD.¹³⁴ In 2005, the government reportedly allocated \$3 million for mine action to INAD.¹³⁵ All mine clearance and verification for national development is now said to be funded by the government through the GRN, but the amount of this support is unknown.¹³⁶

National mine action legislation and standards/Standing operating procedures

National mine action legislation to clearly define the roles and responsibilities of CNIDAH, the CED, INAD, FAA, and government ministries, and to provide the framework for funding policies and regulations was drafted in 2007.¹³⁷ As of May 2009, the Council of Ministers had not approved it.¹³⁸

Angola has not developed national mine action standards. Each demining operator uses its own standing operating procedures (SOPs).¹³⁹ INAD, which also has its own SOPs, does not conduct clearance to international standards.¹⁴⁰

Program evaluation

No evaluation of Angola's mine action program has yet been conducted. In 2008, UNDP commissioned an evaluation of the 2005–2008 RRF and found that the RRF provided positive but limited outcomes. Among its contributions was funding to complete the LIS, mine clearance of more than 500,000m², and the marking of 92km of suspected roads. It also funded some RE and VA projects. The RRF was established as a means to rapidly respond to a need. However, the evaluation deemed the RRF ineffective, with limited impact when compared to its original aims, owing to disorganization, insufficient staff, and inadequate monitoring.¹⁴¹

Demining and Battle Area Clearance

Demining in Angola began in 1994 in the midst of armed conflict. International NGOs were the predominant demining operators until 2007, when INAD greatly expanded its operational capacities and commercial companies were formed to benefit from significant government funding for mine action through its infrastructure reconstruction projects. The international NGOs largely concentrate on provincial priorities based on the LIS results while INAD, the FAA, and the commercial companies are tasked by the government to clear and verify areas tied to national development priorities. As of March 2009, 89% of the work reported to CNIDAH had been done by seven NGOs (DCA, HALO, MAG, MgM, NPA, StB, and INTERSOS, which closed its demining operations in 2007).¹⁴²

INAD is the government's operational arm for mine action. It conducts clearance in every province and, somewhat unusually, reports its results as well as the results of the police and army demining units to the Ministry of Assistance and Social Reintegration.¹⁴³ INAD also

operates a training center in Viana, a town outside Luanda, with technical support from UNDP. INAD certifies the graduates of the school as deminers. INAD reported they asked a number of NGOs to send their new deminers to the school for training.¹⁴⁴

CNIDAH's list of demining operators in Angola in 2008 included INAD, the FAA, and 46 registered national commercial and NGO mine clearance companies, of which CNIDAH had accredited 21.¹⁴⁵ The bulk of clearance has been conducted by international NGOs.

Demining by NGOs in 2008

In November 2008, at the Ninth Meeting of States Parties, Angola reported clearance of 5.4km² of SHAs, 423km of road, and 19.3km of railway between January and July 2008. During these operations, 91,311 antipersonnel mines, 74 antivehicle mines, and 915,177 items of UXO were said to have been destroyed.¹⁴⁶ In comparison, NGO operators reported to Landmine Monitor 4.56km² cleared and another 34.96km² either cancelled or reduced for calendar year 2008 (see table below) and found many fewer mines and UXO than reported by Angola at the Ninth Meeting of States Parties.¹⁴⁷

Demining in 2008 by NGO operators (not including roads)

Demining operators	Mine clearance (m ²)	Battle area clearance (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	UXO destroyed	Area cancelled (km ²)	Area reduced (km ²)
DCA	200,463	0	33	1	430	N/R	N/R
HALO	2,550,000	0	7,338	4,686	10,033	1.80	0

Total	4,561,000	270,000	10,093	4,781	17,551	6.60	28.36

N/R= not reported

INAD reports clearance according to the type of task (e.g. whether it was clearance of a road, school, or powerline). In 2008, INAD conducted clearance or verification on nine different kinds of SHA. Landmines (or other ordnance) were found at only seven of the 29 work sites. The majority of INAD's work was in clearing 1.4km² of land and verifying another 159km² in order to lay fiber-optic cables as part of Angola's national development program. Although almost 250km² of land was said to have been verified or cleared (see table below), INAD found just 102 mines and 336 items of UXO. INAD also conducted clearance at five airports, including in Benguela, where 76 mines were found. No mines were found at the other airports.¹⁴⁸

¹⁴⁴ INAD reported it cleared 244km of road in 2008. Interview with Eng. Leonard Sapalo, INAD, Luanda, 21 May 2009.

Airports	Benguela, Huambo, Huíla, Kuando-Kubango, Uíge	76	0	47	83,288	0.00
Schools	Bié	0	0	0	3,627	0.00
Powerlines	Lunda Norte	0	0		6,750	0.23
Other	Bengo	1	0	3	12,801	0
Total		102	10	336	2,555,992	244.36

Demining by commercial companies

Commercial demining operators are contracted by other companies working on construction, communications, energy, and diamond projects.¹⁴⁹ It is believed much of the work is verifying land as being free from mines, rather than conducting full clearance to remove mines.¹⁵⁰ The little data available on the work of the commercial companies seems to indicate that the output does not contribute very much to clearing SHAs according to the National Mine Action Strategic Plan 2006–2011.

CNIDAH conducts quality assurance on commercial demining projects and determines when the cleared land should be handed over to the community for use.¹⁵¹ INAD reported, however, that in agreement with CNIDAH they certify their own clearance work on electricity towers, railways, roads, and other infrastructure as it is difficult for CNIDAH to keep up with the work. If not, according to INAD, clearance would come to a stop. However, it is planned that CNIDAH will eventually certify all infrastructure projects.¹⁵²

¹⁵² Interview with Eng. Leonardo Severino Sapalo, INAD, Luanda, 17 May 2009.

Battle area clearance in 2008

In 2008, NPA reported battle area clearance (BAC) on 270,000m² of land.¹⁵³ No other operator, including government and national NGOs and commercial companies, reported BAC in 2008.

Explosive ordnance disposal

In March 2009, CNIDAH for the first time provided data on the extent of explosive ordnance disposal (EOD) operations conducted from 2004 to April 2009. During this period CNIDAH recorded 5,225 EOD tasks, in which 85,507 items of UXO and 287,954 items of abandoned explosive ordnance were found, most reportedly in Zaire province.¹⁵⁴ MAG, in Moxico, is said to be responsible for more than 20% of completed EOD tasks. According to MAG's technical operations manager, it conducts EOD tasks nearly every day.¹⁵⁵ In 2008, HALO responded to 301 EOD callouts, and destroyed 7,843 items of UXO and 2,004 items of stray ammunition. Between 2004 and April 2009 HALO responded to 1,150 EOD callouts and destroyed a total of 18,553 items of UXO and 9,556 items of stray ammunition.¹⁵⁶

Road clearance

The LIS identified blocked roads as a nationwide problem with a particularly high impact in Bié, Huambo, and Moxico provinces.¹⁵⁷ According to INAD, all major roads have been cleared and were being paved with asphalt as planned by the Ministry of Public Works and Road Institute of Angola, who are responsible for the road project. The clearance of secondary roads over the next four years is one of the current reconstruction priorities.¹⁵⁸ At the end of 2008, NPA stopped clearing roads, because the government had declared that commercial companies and INAD would conduct these tasks, and began clearing only SHAs.¹⁵⁹

Angola reported 423km² of road had been cleared or verified in 2008.¹⁶⁰ HALO reported that investment in rebuilding roads and bridges has vastly improved movement for its mine clearance teams and improved logistics in the Benguela, Bié, and Huambo provinces, a region known as Plano Alto.¹⁶¹

Land release

Angola has been trying—so far without success—to adopt a land release policy since the completion of the LIS in 2007. Data from the LIS indicated that the Angolan landmine problem could take decades to resolve if clearance capacity was not increased and if the same methods of operation continued.¹⁶² Although CNIDAH did not adopt a land release policy in 2008 as it planned, the Geneva International Centre for Humanitarian Demining (GICHD) assisted NPA in developing and implementing the Land Release Concept, a model for non-technical survey methods to release land. CNIDAH has endorsed NPA as a partner for developing the Land Release Concept in Angola.¹⁶³

¹⁵³ Email from Aubrey Sutherland, NPA, 9 March 2009.

¹⁶¹ Email from Megan Latimer, HALO, 4 March 2009.

¹⁶² SAC, "Landmine Impact Survey, Republic of Angola, Final Report," Washington, DC, November 2007, p. 16; and email from Mohammad Qasim, UNDP/CNIDAH, 12 March 2009.

¹⁶³ Jan Isaksen and Christian Larssen, CMI, *NPA Mine Action Programme in Angola Review 2004–2007 Appraisal 2008–2010* (Oslo: NORAD, January 2009), p. 22, www.norad.no.

Using the Land Release Concept, NPA conducted 125 non-technical surveys on SHAs identified by the LIS, covering 24.3km², and cancelled 29 SHAs, measuring 4.8km² in total.¹⁶⁴ Similarly, in Moxico province MAG cancelled 28km² in 27 communities using their own methodologies. In the process, 43 SHAs that originally measured 33km² in the LIS were reduced by 85% to 5km². Another 18 SHAs were cancelled because the land had been in use for more than two years for construction and three years for farming without a mine incident. All cancellation reports were submitted to CNIDAH.¹⁶⁵

HALO cancelled 88 SHAs from its database in 2008. Cancellation criteria for HALO includes: land that has been farmed for three years or more without any incidents, land that is being used for other purposes (housing and infrastructure) with no incidents reported for three years, and SHAs that have been cleared by another operator which follows the same safety practices and clearance standards. If a SHA meets the criteria, both the beneficiaries and the local authorities must sign a statement declaring the area is not mined and is safe to use. CNIDAH is provided with a copy of the statement. Periodically, HALO also uses technical survey and mechanical assets for area reduction.¹⁶⁶

INAD has not adopted a land release policy, although UNDP advisors have introduced the concept to them.¹⁶⁷ In recognition of the importance of land release in meeting its Article 5 obligations, at the Standing Committee meetings in May 2009, Angola requested assistance from other States Parties to adopt a land release policy.¹⁶⁸

Marking and fencing

A CNIDAH workshop on area reduction and marking, held in Benguela province in February 2008, decided that concrete pillars should be placed every 15m and linked with barbed wire. It was suggested that national institutions should buy and place the pillars, but this marking system was considered too expensive by the demining operators.¹⁶⁹ In general, fencing and marking is not widely practiced in Angola. For example, HALO does not mark low-impact SHAs because marking materials are often taken by local residents and end up as roofing tiles or building materials. As tasks are surveyed, HALO marks the perimeter with red paint or stones in order to indicate that the area within is a SHA, especially in areas that are close to villages or areas of activity. This marking is explained to the local authorities and the community, who are often already avoiding the area.¹⁷⁰

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Angola is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 January 2013. It is difficult to measure the progress being made in Angola. The government, through the CED, FAA, and INAD, has substantially increased clearance assets since 2005, but data on their achievements is scarce and of poor quality. INAD, for example, believes the lack of a complete database of known mined areas will prevent Angola from meeting its Article 5 deadline for the clearance of mined areas.¹⁷¹

Demining from 2003–2008 (includes only international NGOs)

Year	Mine clearance (km ²)	Battle area clearance (km ²)	Other land release (km ²)
2008	4.56	0.27	34.96
2007	3.24	0.09	1.75
2006	4.64	0.32	16.58
2005	12.25	0.04	0.24
2004	10.67	N/A	N/A
2003	3.53	N/A	N/A
Total	38.89	0.72	43.53

N/A = not available

At the Eighth Meeting of States Parties, Angola stated that it had allocated human and financial resources to tackle the mine problem in the whole country, but the target set was achievable only if technical and operational demining capacity was doubled by the government and NGOs. The statement did not mention the likelihood of a need to request a deadline extension.¹⁷²

In the UN 2008 Portfolio of Mine Action Projects, published in November 2007, Angola's entry states, "The strategic plan is a basis for fulfilling the Government's commitment to the anti-personnel mine-ban treaty. If it is achieved on time, the Government will have one more year to remove all marked SHAs, thus meeting the mine clearance deadline of 1 January 2013."¹⁷³ However, after a meeting in Luanda in May 2009 convened to review demining achievements in 2006–2008 and to prepare for a revision of the previous five-year strategy, participants from INAD and CNIDAH stated their belief that it would be difficult to meet the current Article 5 deadline.¹⁷⁴

Risk Education

The level of mine/ERW RE activity had reduced significantly by the end of 2008, even though the need is high. RE was implemented by 14 national and international NGOs in 15 provinces. INAD also has an RE team in each of its 15 brigades operating throughout the country,¹⁷⁵ although its activities are limited and the teams do not appear to be active everywhere.¹⁷⁶ Some national NGOs were supported by UNICEF and Handicap International (HI) until December 2008. UNICEF phased out RE because it was no longer a national program priority, they had been working on it for 10 years, and casualties had been reduced.¹⁷⁷

Most national NGOs, including those supported by UNICEF and HI, use the SBM methodology, although some also conduct emergency message-based RE. International NGOs implementing clearance activities conduct community liaison, including non-technical survey.¹⁷⁸

¹⁷⁷ Interview with Carlos Seixas, UNICEF, Luanda, 11 May 2009.

¹⁷⁸ Interview with Nelson Hiyonanye, CNIDAH, Luanda, 12 May 2009.

Materials are used sparingly in Angola, and mainly as visual aids to support RE sessions. DCA does not give out leaflets or other materials to communities, as they are not found to be useful.¹⁷⁹

RE is not integrated into the school curriculum because it was developed in 2002, and it was not possible to include RE at the time. RE is conducted in schools in high-impact areas, and training and resources are provided to teachers.¹⁸⁰ UNICEF reported that more than 200,000 primary school students were reached in 2008.¹⁸¹

In some provinces RE was conducted through radio¹⁸² but not in Moxico, because it was expensive and the radio frequency did not reach the areas required.¹⁸³

RE is now closely integrated with mine action. Organizations carrying out RE liaise closely with CNIDAH provincial offices and provide information to communities on how to report contamination and casualties, generally to municipality offices, as the information will then go to the CNIDAH provincial office. RE teams gather information on contamination and casualties and record it on IMSMA forms to provide to CNIDAH provincial offices (see Data collection and management section above). They also liaise directly with clearance organizations and VA organizations in their locale.¹⁸⁴ MAG, DCA, and HALO respond to reports of contamination.¹⁸⁵ MAG's community liaison (CL) teams are mainly engaged in survey and impact assessment. MAG acquired a geographic information system capacity in 2008, which is managed by the CL department. Community marking is included in the SBM, and NGOs supported by UNICEF and HI implement this, as well as Angola Red Cross (Cruz Vermelha de Angola, CVA) volunteers.¹⁸⁶ CNIDAH provides paint to communities for this purpose.¹⁸⁷ DCA does not encourage community marking, and Exame de Abelhas reported that they do not have the capacity to do it.¹⁸⁸ A GICHD CL workshop was conducted in early 2008.¹⁸⁹

In 2008, UNICEF conducted regular monitoring visits to its partners, and was always accompanied by CNIDAH personnel, who also conducted their own separate monitoring visits. Both CNIDAH and UNICEF reported that they were happy with the way RE was being implemented according to the new methodology developed.¹⁹⁰ HI monitored the work of its partners, and the international NGOs have their own internal monitoring system.

As well as a shortage of funding, RE also faces logistical challenges. Although UNICEF lent its partners vehicles, they were often damaged by the poor road conditions.¹⁹¹

Through the national coordination meetings, CNIDAH and UNICEF's NGO partners discussed the achievements of RE, noting that implementation of the SBM had allowed more communities to be reached (allowing better identification of risk areas), that there was a decrease in casualties, but that the decrease in funding meant an uncertain future for RE, data collection, and reporting of casualties.¹⁹² No other evaluations have been conducted.

RE Activities in 2008¹⁹³

Organization	Type of activity	Location	No. of beneficiaries
CVA	Working with focus groups in communities	15 out of 18 provinces	Not available
Palanca Negro	SBM	Malanje	6 municipalities, 19 comunas
CAPDC	SBM	Luanda Sol	3 municipalities, 11 comunas
Club de Jovens	SBM	Huíla	6 municipalities, 23 comunas
Secut Bagos	SBM	Uíge	5 municipalities, 7 comunas
Exame de Abelhas	SBM	Moxico	4 municipalities, 7 comunas, total 29,762 people
Kalofulofu	N/A	Moxico	3,080
International Humanitarian Organisation (OHI)	SBM	Bié	100 communities
Mines Victim Association (AVMI)	SBM	Benguela	36 communities
Child Support Group (GAC)	SBM	Huambo	30 communities
MAG	Community Liaison: survey, impact assessment, and RE	Moxico	11,302 people
DCA	CL and RE	Moxico	17,702 people
HALO	RE/CL conducted by minefield and survey supervisors alongside demining	N/A	15,930 people
NPA	Limited CL and RE with clearance operations	N/A	No figures available
INAD	Limited RE, message-based	Capacity, but not necessarily active, in all provinces	N/A

N/A = not available

Leonardo Severino Sapalo, INAD, Luanda, 21 May 2009; and email from Megan Latimer, HALO, 26 March 2009.

UNICEF has tried to help national NGOs with fundraising to continue their work into 2008, but only two received funding to continue work into 2009.¹⁹⁴ CNIDAH and the CVA have a draft agreement in place to conduct RE in 2009, but in May 2009 they were waiting for approval to work.¹⁹⁵ MAG was gathering knowledge, attitude, and practice data in mid-2009, planning to issue a report in August.¹⁹⁶

RE has been conducted in Angola for more than 10 years by UNICEF, international and national NGOs working in partnership. ICRC worked with the CVA, INAD, and school teachers. Some 20 organizations have been involved, with RE reaching a peak of over 800,000 beneficiaries in 2003, after which it decreased in scale.¹⁹⁷ The LIS reported that some areas were under-provided with RE.¹⁹⁸

UNICEF supported the national coordination body—the National Institute for Removal of Obstacles and Explosive Devices (Instituto Nacional de Remoção De Obstáculos E Engenhos Explosivos, INAROREE) until 2001, and then CNIDAH—in providing capacity-building to NGOs, supporting school-based RE programs, conducting mass media RE, and financial support. RE planning became decentralized to the provincial CNIDAH office level in 2004.¹⁹⁹ In 2004, community mine action committees were introduced. The committees were reported to be challenging to maintain, however, as the members asked for incentives.²⁰⁰ In 2006, RE shifted to a development approach. New participatory methods were introduced in order to consider local threats and risk-taking behavior.²⁰¹

Victim Assistance

The total number of survivors is unknown, but there are many thousands. In May 2009, CNIDAH said that the situation of mine/ERW survivors had improved in recent years, mainly due to better medical and socio-economic services.²⁰² It was further noted that improvements to the road network enabled survivors to reach existing services.²⁰³ Nevertheless, most survivors and persons with disabilities had limited access to services, particularly in rural areas, due to insufficient transportation and financial means.²⁰⁴ Some of the main challenges noted were: providing comprehensive assistance to survivors/persons with disabilities, utilizing improved infrastructures/mechanisms to actually enhance service provision, and reinforcing coordination.²⁰⁵

Despite fast economic growth, Angola's health indicators remained among the worst in the world and social infrastructure, including health centers, schools and human resource capacity, remained "extremely poor."²⁰⁶ The US Department of State reported that "in many areas, health care was limited or nonexistent."²⁰⁷ In 2008, Angola reported that several provincial hospitals

had been upgraded and health centers had been constructed in several mine-affected areas, which also received ambulances.²⁰⁸

Angola also said in May 2009, that it “continued its efforts to guarantee the quality, sustainability and accessibility” of services by providing qualified staff and equipment.²⁰⁹ But it acknowledged that this was the area with the least progress.²¹⁰ In reality, access to physical rehabilitation seems to have deteriorated compared to 2007 and definitely compared to 2005. As of August 2008, all international organizations had withdrawn support to the physical rehabilitation sector for which the MoH is responsible through the PNR. The program aimed to create a national sustainable physical rehabilitation capacity, and was increasingly dysfunctional as a result of a lack of involvement by the ministry.²¹¹ In 2009, the program was still functioning though with more logistical constraints and a reduced capacity to respond after the end of European Commission funding in 2007.²¹² None of the centers are fully operational, salaries are not paid, and materials are not available.²¹³

Since the departure of the international supporting organizations, the rehabilitation centers have seen patient numbers decrease rapidly, as no one covers their transportation costs²¹⁴ and the government does not buy materials or components. It was also noted that international organizations pulled out of Angola without ensuring that sustainable alternatives were in place.²¹⁵ Services were said to be only available for those who could afford to receive treatment abroad.²¹⁶ All this would appear to contradict the situation Angola portrayed in its VA plan covering 2007–2011, which stated, “almost always survivors have access to [rehabilitation] services.”²¹⁷

For psychosocial support, the government mainly relied on the activities of national NGOs and disabled people’s organizations (DPO), and on the survivors’ family networks.²¹⁸ The government also maintained that the “Miss Landmine Beauty Pageant” contributed to raising awareness about the issue.²¹⁹ Services remained limited, due to the non-existence of formal counseling infrastructure and a lack of trained staff.²²⁰

Economic reintegration of mine/ERW survivors is a priority area for Angola and several government-sponsored and NGO initiatives exist, which are said to have more than 10,000 beneficiaries.²²¹ Angola also reported this figure of 10,000 beneficiaries reached in 2007 and

²²¹ Statement of Angola, Ninth Meeting of States Parties, Geneva, 28 November 2008.

June 2008.²²² Despite more employment of young persons with disabilities in 2008, educational and employment opportunities for persons with disabilities remained limited.²²³ Survivors rarely had access to vocational training and employment schemes because they were not aware these services existed; the government rarely provided incentives to promote economic opportunities for persons with disabilities; and services were not accessible and limited in rural areas.²²⁴ In November 2008, Angola reported the development of a Strategy for Special Needs Education 2009–2015 and the construction of five accessible schools.²²⁵ Mine/ERW survivors do not appear to benefit from this plan, which was originally developed in 2006 (with a 2007–2015 timeframe).²²⁶

Angola has fragmented legislation to protect the rights of persons with disabilities, but the government did not effectively enforce it.²²⁷ Work on the compilation and unification of existing disability legislation has stalled due to election-related legislative work.²²⁸ In November 2008, the National Assembly reportedly started the approval procedure of the Protection Law for Disabled Persons created in 2000,²²⁹ no further progress was reported as of May 2009.²³⁰ As of 1 July 2009, Angola had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

An HI impact assessment showed that while people still feel “pity” for persons with disabilities, people are more aware of equal rights for persons with disabilities, increased community participation, employment, and education rather than just charity.²³¹

An evaluation of the UNDP Angola RRF between 2005 and 2008 noted that the VA component of the RRF had been “relatively cost efficient provided that the intended target groups in remote rural areas with little access... actually were the main beneficiaries.”²³² The evaluators were not able to visit beneficiaries and the evaluation had to be based on information provided by the implementers, which was sometimes missing and did not always include beneficiary statistics. It was also concluded that the support provided was not comprehensive.²³³

Progress in meeting VA26 victim assistance objectives

Angola is one of 26 States Parties with significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors.²³⁴ Angola presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005 and revised them in 2006 and 2007. The latest revision was to be used as the National VA Plan 2007–2011 (see Strategic

mine action plan section above). Most of the deadlines have been set for 2011 and objectives were not focused on service provision.²³⁵ Due to a lack of capacity impeding implementation and coordination of the plan, most of the objectives due for completion in 2009 do not appear to be on track:

- **Data collection:** No reliable data collection mechanism is functional, and comprehensive data is not available; despite a temporary improvement in 2007 there was no noticeable coordination and capacity improvement.
- **Medical care:** New health centers were constructed, but no progress was reported on improving first responder capacity and access to services.
- **Physical rehabilitation:** None of the objectives were achieved, notably improved national sustainability; increased training; increased repair/replacement capacity; and assumption of financial and technical responsibility for producing three-quarters of the mobility devices to assist 80% of survivors needing them.
- **Psychosocial support:** No progress was reported on expanding psychosocial services to rehabilitation centers and hospitals,²³⁶ strengthening capacity, the creation of a survivor network or projects at the regional level;²³⁷ the only area of progress might be in the inclusion of survivors in special education.
- **Economic reintegration:** Some cooperatives were created and small business projects started in cooperation with the private sector and multinational companies, and more young persons with disabilities were employed. But economic reintegration remained a weak point.²³⁸
- **Laws and public policy:** Disability legislation had not been approved and strengthened as scheduled. Advocacy efforts did take place (including the Miss Landmine Beauty Pageant).

The Mine Ban Treaty Implementation Support Unit undertook one process support visit in 2007. Angola included a VA/disability expert on its delegation at the intersessional Standing Committee meetings in 2005, 2006, 2007, and 2009, and at each Meeting of States Parties and reported on VA at all meetings. Angola provided VA information in its annual Article 7 transparency reports submitted in 2005 and 2006.²³⁹

Victim assistance activities

CNIDAH was not able to provide reliable and complete statistics on the number of survivors assisted in 2008. Due to the PNR's poor functioning, rehabilitation statistics were no longer available. MINARS stated that 21,350 persons with disabilities received socio-economic reintegration services in 2008.²⁴⁰ The ministry also claimed that it supported 89,170 out of an estimated 150,000 persons with disabilities in the country.²⁴¹ CNIDAH in Moxico province reported that the Luena rehabilitation center had assisted 480 survivors in 2008.²⁴²

²⁴⁰ “Milhões de angolanos já foram reintegrados” (“Millions of Angolans already reintegrated”), *Jornal de Angola* (Luanda), 30 December 2008.

²⁴¹ “Programas de apoio a deficientes criam empresas e cooperativas” (“Programs to support persons with disabilities starting businesses and cooperatives”), *Jornal de Angola*, 4 December 2008.

²⁴² CNIDAH, “Relatório Provincial” (“Provincial Report”), Luena, 16 December 2008.

The Angolan Association of Disabled Persons (Associação dos Deficientes de Angola, ANDA) reported supporting 1,500 persons socio-economically through the “Come with me” project in 2008. ANDA also distributed 248 motor-taxis in partnership with the local NGO Causa Solidaria.²⁴³ The Center for the Promotion and Development of Communities (CAPDC) suffered financial challenges and had to lay off most of its staff.²⁴⁴

In 2008, the German Society for Technical Cooperation (Deutsche Gesellschaft für Technische Zusammenarbeit, GTZ), present in Angola since 1995, ended its collaboration agreement on physical rehabilitation with the MoH in August 2008, and also ended its support to the community-based rehabilitation (CBR) project of the NGO League for the Reintegration of Disabled Persons (Liga de Apoio à Integração dos Deficientes). It started a new collaboration with the Institute of Socio-Professional Reintegration of Former Combatants for vocational training in Gabela, Kuanza Sul province; two cooperatives for disabled persons were also created in Porto Amboim, Kuanza Sul province.²⁴⁵

In 2008, HI continued its support for two disabled people’s organizations in Huambo in conducting socio-economic reintegration activities benefiting 102 persons with disabilities (30% mine survivors). It also supported 17 disabled people’s organizations or local NGOs in Benguela, Huíla, and Huambo provinces with training and with raising awareness of disability in public and private institutions. HI also continued its CBR projects and conducted 4,263 peer support home visits for persons with disabilities in Benguela, Huíla, and Namibe provinces; 309 people received medical care, 404 socio-economic support, 300 material support, and 853 were referred to other appropriate services (146 survivors). In 2008, HI conducted an impact assessment of its CBR activities and it was noted that perceptions of disability had improved in the target area after two years of implementation. Since HI started its activities in Angola in 1995, it has moved from direct implementation and support for physical rehabilitation (facing challenges similar to those explained above) to support of local associations, community-based and socio-economic activities.²⁴⁶

In July 2008, the ICRC ended its support to the physical rehabilitation sector after nearly 30 years in Angola, “believing that the country has all the necessary means to provide effective physical rehabilitation services.”²⁴⁷ Over the years, it constructed the rehabilitation centers in Huambo and Kuito, renovated the main center in Luanda, donated materials and components, provided institutional support to CNIDAH and the PNR, trained staff, and covered transport costs for patients. In 2008 to the end of June, the three centers supported by the ICRC produced 420 prostheses (72% for mine/ERW survivors) and 80 orthoses (1% for mine/ERW survivors); in total 3,048 people were assisted. Since 1979, the ICRC has produced 33,041 prostheses (41% for mine/ERW survivors) and 962 orthoses (7% for mine/ERW survivors).²⁴⁸ It was reported that the centers’ productivity and capacity decreased after the ICRC’s departure.²⁴⁹

Support for Mine Action

Landmine Monitor is not aware of long-term comprehensive cost estimates for meeting mine action needs (including RE and victim assistance) in Angola. The National Mine Action Strategic Plan 2006–2011 includes among its five primary goals the establishment of a national mine action capacity “sustainable by national resources” after the end of major international assistance.²⁵⁰ The plan projects an overall decline in international mine action funding from 2006 to 2011.²⁵¹

²⁴⁸ *Ibid.*

²⁴⁹ Interview with Madalena Neto, CNIDAH, in Geneva, 28 May 2009.

²⁵⁰ Government of Angola/CNIDAH, “Mine Action in Angola Strategic Plan 2006–2011,” Luanda, 2006, p. 18.

²⁵¹ *Ibid.*, pp. 14–15.

CNIDAH distributes and manages some funds allocated by national and international donors; advises the Angolan government on national funding issues; and liaises with government and donors on the impact on mine action of national development projects, and inclusion of mine action costs in relevant project budgets.²⁵² CNIDAH coordinates with the Council of Ministers on national development priorities, and acts as a strategic partner of the Ministry of Finance in coordinating the national budget for mine action.²⁵³

National support for mine action

Angola did not report national funding to mine action in 2008. It did not report national funding in 2007, but stated that the national government had allocated “both human and financial resources” to fulfill its Article 5 obligations, without specifying funding amounts.²⁵⁴ The National Mine Action Strategic Plan 2006–2011 commits the Angolan government to providing substantial funds “from 2006 onwards” to resource, equip and train manual and mechanical demining brigades.²⁵⁵

International cooperation and assistance

In 2008, 12 countries reported providing \$22,136,622 (€15,032,278) to mine action in Angola. Reported mine action funding in 2008 was 12% more than reported in 2007.

At the Ninth Meeting of States Parties, Angola reported on the need for additional international assistance to support its VA programming.²⁵⁶ At the Standing Committee meetings in May 2009, Angola reported increasing difficulties in gathering and reporting information on mine action results due to the large number of operators conducting programs in the country. It called for assistance in support of land release and Article 7 reporting, citing the obligations under Article 6 of the Mine Ban Treaty.²⁵⁷

Without adequate reporting of cost estimates or national support to mine action programs, it is not possible to evaluate the sufficiency of funds in meeting Angola’s mine action needs. Nevertheless, 2008 funding levels were relatively strong, and funds committed by the European Commission (EC) in 2009 (see below) will further strengthen Angola’s capacity to fulfill its treaty obligations.

Norwegian funding to NPA in Angola is part of a NOK24 million (approximately \$4.26 million) funding agreement signed in January 2008 and covering the period 2008 to 2010.²⁵⁸

HALO reported funding in 2008 from the United States, the European Commission (EC), the United Kingdom, Finland, Japan, Switzerland and Ireland.²⁵⁹ No funding to HALO was reported by Finland, Japan, or the US in 2008; the EC also did not report funding to Angola in 2008.

In addition to its specific monetary contributions in 2008 to national mine action initiatives, the EC announced in May 2009 that it had committed €39 million (\$57 million) during 2008 to mine action in a number of states. Although states receiving aid were specified, the amounts and projects supported were not differentiated, and as of June 2009 were still to be determined. The EC stated simply that funds are “to support future action” in recipient states.²⁶⁰ Angola was among the states named as recipients within the overall commitment. However, in June 2009 the EC reported to Landmine Monitor that the commitment “can be subject to changes” before its final adoption by the EC.²⁶¹

ARGENTINA

Ten-Year Summary

Argentina became a State Party to the Mine Ban Treaty on 1 March 2000. It has not enacted domestic implementation legislation. Argentina completed destruction of its stockpile of more than 90,000 antipersonnel mines on 4 December 2003. Argentina originally indicated it would retain 13,025 mines for training, but decided to convert most to inert “exercise mines.” Since 2004, the number of retained mines has decreased from 1,772 to 1,268. In December 2005, States Parties agreed to a proposal by Argentina and Chile for expanded reporting on mines retained for training and development purposes. Argentina served as co-chair of the Standing Committee on the General Status and Operation of the Convention from September 2006 to November 2007 and co-chair of the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies from November 2008 to December 2009.

Argentina has asserted that the “illegal occupation” of the Malvinas/Falkland Islands has “effectively prevented [it] from having access to the anti-personnel mines...in order to fulfill the obligations undertaken in the Mine Ban Treaty.” On 27 April 2009, Argentina submitted a request for a 10-year extension to its Article 5 deadline. The request was to be formally considered by the Second Review Conference in November–December 2009.

Scope of the Problem

Argentina reports that it is mine-affected by virtue of its claim to sovereignty over the Malvinas/Falkland Islands.¹ On ratifying the Mine Ban Treaty, Argentina submitted a declaration reaffirming “its rights of sovereignty over the Malvinas, South Georgia and South Sandwich and the surrounding maritime areas which form an integral part of the territory.”² There is a sovereignty dispute over the islands between Argentina and the United Kingdom.³

The islands were mined, mostly by Argentina, during its armed conflict with the UK in 1982.⁴ A joint UK-Argentine feasibility study, the plan for which was first announced in 2001,⁵ was completed by Cranfield University in July 2007 and issued by a Joint Working Group of the two states in October 2007.⁶ It identified 117 mined areas covering 13.15 km², which represents approximately 0.1% of the area in the Malvinas/Falkland Islands.⁷ There is also UXO, including a number of areas containing cluster munition remnants resulting from the use of BL-755 bombs by the UK.

In interviews with the ICBL, Argentina has reiterated its claim that there are no known mined areas or suspected hazardous areas on the mainland.⁸ In March 2009, the Ministry of Defense acknowledged that a number of mineral mining companies had inquired about the presence of landmines in Salta province before starting operations; the companies were told that there were no mined or suspected hazardous areas.⁹

⁸ Interviews with Gustavo Ainchil, Director, Department of International Security, Nuclear and Space Affairs, Ministry of Foreign Affairs and International Trade, Buenos Aires, 23 March 2009; and Navy Capt. (ret.) Carlos Nielsen, Advisor, Joint Chiefs of Staff of the Armed Forces, Buenos Aires, 25 March 2009.

⁹ Interview with Susana Carranza, Department of International Affairs, Ministry of Defense, Buenos Aires, 25 March 2009.

In June 2007, forensic anthropologists began excavating a possible burial site at an army ammunition storage area in Tucumán province and found what they believed to be landmines on the site. The Tucumán Federal Court ordered an investigation to determine if the area contained explosive devices.¹⁰ In October 2008, the investigation was completed, and the burial site was determined to be free of mines.¹¹ No other similar investigations have been requested or conducted according to the Ministry of Foreign Affairs.¹²

Program Management and Coordination

Argentina has a Humanitarian Demining Office under the Office of the Joint Chiefs of Staff of the Armed Forces. This office is in charge of dealing with relevant international treaties, including the Mine Ban Treaty.¹³

In 2008, the Geneva International Centre for Humanitarian Demining delivered two workshops for Argentina on the Information Management System for Mine Action (IMSMA) covering the latest advancements in the IMSMA software.¹⁴

Demining

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Argentina is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2010. In its Article 7 reports and Convention on Conventional Weapons Amended Protocol II Article 13 reports, Argentina has asserted that the “illegal occupation” of the Malvinas/Falkland Islands has “effectively prevented [it] from having access to the anti-personnel mines...in order to fulfill the obligations undertaken in the Mine Ban Treaty.”¹⁵ On 27 April 2009, Argentina submitted a request for a 10-year extension to its Article 5 deadline.¹⁶ The request was to be formally considered by the Second Review Conference of the Mine Ban Treaty in Colombia in November–December 2009.

Support for Mine Action

In its Article 5 clearance deadline extension request, Argentina provided an overall budget of US\$250 million for clearance operations in the Malvinas/Falkland Islands. The budget includes \$15 million for capacity-building, \$160 million for five years of full-scale clearance operations, \$72 million for three subsequent years of reduced operations, and \$3 million for redeployment of personnel.¹⁷ Argentina has not reported in detail on resource mobilization strategies to cover costs projected within the request, nor has it provided a detailed annual breakdown of operational and other expenses.

BANGLADESH

2008 Key Data

State Party since	1 March 2001
Contamination	Scattered UXO
Casualties in 2008	3 (2007: 0)
Estimated mine/ERW survivors	Unknown but at least 285

Ten-Year Summary

The People's Republic of Bangladesh became the first South Asian country to ratify the Mine Ban Treaty in September 2000. It has yet to enact domestic legislation to implement the treaty. Bangladesh served as co-rapporteur and then co-chair of the Standing Committee on Stockpile Destruction from September 2003 to December 2005. Bangladesh completed destruction of its stockpile of 204,227 antipersonnel mines in February 2005. It retained 12,500 mines for training, but has never reported consuming any of these mines in training activities. Bangladesh is not believed to be mine-affected, although it has a problem with explosive remnants of war (ERW). No mine casualties have been reported since 2001, although ERW and improvised explosive devices continued to cause casualties. No systematic mine/ERW risk education activities have been reported. Few mine/ERW survivors received prosthetic or rehabilitation assistance and socio-economic assistance was seriously lacking.

Mine Ban Policy

Bangladesh signed the Mine Ban Treaty on 7 May 1998 and ratified it on 6 September 2000, becoming a State Party on 1 March 2001. Bangladesh established a national committee to oversee implementation of the treaty in August 2001, but has not yet enacted domestic legislation to implement the treaty. In May 2009 Bangladesh reported, "Necessary implementation measures are in progress;" it has made similar claims since 2002 in all previous Article 7 transparency reports.¹ Bangladesh submitted its eighth Article 7 report on 15 May 2009, covering the period from 1 March 2008 to 28 February 2009.²

Bangladesh attended the Ninth Meeting of State Parties in November 2008 and the intersessional Standing Committee meetings in May 2009, but made no statements. Bangladesh has not made known its views on key issues of interpretation and implementation of Articles 1 and 2 (joint military operations with states not party to the treaty, foreign stockpiling, transit of antipersonnel mines, and antivehicle mines with sensitive fuzes or antihandling devices).

Bangladesh is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines. Bangladesh last submitted an annual Amended Protocol II Article 13 report in 2006. It is not party to Protocol V on Explosive Remnants of War. As of 1 July 2009, Bangladesh had not signed the Convention on Cluster Munitions.

¹ Article 7 Report, Form A, 15 May 2009. In its second Article 7 report, submitted in April 2003, Bangladesh reported that domestic legislation to implement the Mine Ban Treaty was in its "final stage of preparation."

² Previous reports were submitted on 30 April 2008, 28 February 2007, 24 March 2006, 29 March 2005, 28 April 2004, 29 April 2003, and 28 August 2002.

Production, transfer, use, stockpile destruction, and retention

Bangladeshi officials have stated that the country has never produced or exported antipersonnel mines and never used antipersonnel mines within the country or along its border.³ Bangladesh completed destruction of 189,227 stockpiled antipersonnel mines in February 2005. Bangladesh had mines manufactured by China, India, Iran, Pakistan, the United States, and the former Yugoslavia.⁴

Islamist, Maoist, Marxist, and other armed groups associated with some political parties manufacture and use command-detonated improvised explosive devices (IEDs).⁵ None have been known to use victim-activated IEDs that function like antipersonnel mines.

Mines retained for research and training

Bangladesh has retained 12,500 antipersonnel mines for research and training under Article 3 of the treaty, which is the second highest number among State Parties. The number of antipersonnel mines retained since Bangladesh's first Article 7 report in 2002 has remained essentially unchanged.⁶ This indicates that mines are not being consumed during training or research activities. In its Article 7 reports, Bangladesh has not used the expanded Form D for reporting on retained mines that State Parties agreed to in 2005. The form is intended to ensure that States Parties are transparent about the precise intended purposes, actual uses, and future plans for use of retained mines.

In the past, Bangladesh Army officials have stated that they require a large number of retained mines because deminer training requires live rather than dummy mines and because engineering units and training facilities are spread all over the country.⁷ They have also said that training with live mines is necessary to fulfill Bangladesh's role in UN peacekeeping missions.⁸

Bangladesh has stated that its stockpile of Claymore mines can only be used in command-detonated mode, but has not described what specific measures were taken to ensure that its 2,499 Iranian M18A1 Claymore-type mines can only be used in command-detonated mode, as has been urged by other States Parties.⁹

No new recoveries or seizures of antipersonnel mines have been reported in Bangladesh for the past two years. In previous years, Bangladesh has recovered antipersonnel mines in weapons caches in various parts of the country.¹⁰

Scope of the Problem

Contamination

Bangladesh is affected by ERW, with both UXO and abandoned explosive ordnance, including arms caches from World War II and the independence war of 1971, still found in different parts of the country.¹¹ Casualty data also indicates a threat from IEDs, though the extent is not known. Many IEDs, although believed to be command-detonated, result in unstable ERW.¹²

³ Interview with army officials, Army Headquarters, Dhaka, 25 March 2008; and statement of Bangladesh, Eighth Meeting of States Parties, Dead Sea, 18 November 2007.

⁴ See *Landmine Monitor Report 2005*, pp. 156–157.

⁵ For a recent media account of Islamist groups manufacturing explosive devices, see Julfikar Ali Manik with Shariful Islam, "Militants' 'ammo factory' busted," *Daily Star* (Dhaka), 25 March 2009; and see *Landmine Monitor Report 2007*, p. 165.

⁶ Bangladesh initially listed 15,000 retained mines, including 2,500 M18A1 Iranian Claymore-type mines. In 2005, it changed the M18A1 number to 2,499 for unknown reasons. In its last three Article 7 reports, it removed all 2,499 from the list of retained mines, explaining that the devices should not be counted as antipersonnel mines, since they could only be used in command-detonated mode, which is not prohibited under the Mine Ban Treaty.

⁷ Interview with army officials, Army Headquarters, Dhaka, 25 March 2008.

⁸ See *Landmine Monitor Report 2007*, p. 166.

⁹ Article 7 Report, Form B, 28 February 2007.

¹⁰ See *Landmine Monitor Report 2007*, p. 166; *Landmine Monitor Report 2006*, p. 184; and *Landmine Monitor Report 2005*, p. 156.

¹¹ See *Landmine Monitor Report 2007*, p. 167; and *Landmine Monitor Report 2005*, p. 158.

¹² NVI-Bangladesh, "Survey of IED Casualties," updated 31 March 2009.

There is no evidence of remaining mined areas. Bangladesh has reported no known or suspected mined areas in the country.¹³ In talks with Myanmar officials on border security issues in June 2008, however, Bangladesh proposed a survey of the border for mines, and the two sides agreed to jointly remove any that were found.¹⁴ No further progress had been reported as of 1 April 2009.

Casualties

In 2008 and to March 2009, no new mine casualties were reported in Bangladesh. The last reported mine casualties occurred in June 2001.¹⁵ At least two incidents involving ERW occurred in 2008: a farmer was injured by a bomb while digging, and a girl and a woman were killed when the girl tried to pull the pin out of an abandoned grenade.¹⁶ The number of IED casualties in 2008 is unknown but it was noted that while IED use had decreased following a state of emergency in 2007, it increased slowly through 2008. Between January and March 2009, one boy was killed and 22 people were injured by IEDs.¹⁷

Bangladeshi casualties also continued to occur in Kuwait with at least three people injured in two mine/ERW incidents.¹⁸ The actual figure may be higher as there is no systematic data collection and casualties are often described as “Asian.” Since 2006, most reported casualties in Kuwait were Bangladeshi workers usually shepherding or collecting scrap metal.¹⁹ One Bangladeshi military deminer was injured in Juba, Sudan, in 2008.²⁰

The total number of mine/ERW/IED casualties in Bangladesh is not known. Between 1993 and June 2001, at least 64 people were killed and 131 injured in reported landmine incidents.²¹ The Bangladesh Freedom Fighters’ Welfare Trust identified 148 people who lost limbs in antipersonnel mine incidents during the 1971 independence war.²² Nonviolence International-Bangladesh (NVI-Bangladesh) identified 1,863 explosives casualties (192 killed and 1,671 injured) between March 1999 and December 2008.²³

Program Management and Coordination

Mine/ERW/IED survivors receive the same services as other persons with disabilities. The Ministry of Social Welfare, the Department of Social Services, and the National Foundation for Development of Disabled Persons are the main government bodies responsible for addressing the needs of persons with disabilities.²⁴ In 2008, the government appointed disability focal points in various ministries, divisions, and agencies.²⁵ As there is no national mine/ERW/IED casualty data collection mechanism, incidents are likely unreported.

²⁵ “CA for protecting rights of disabled,” *Bangladeshnews.com.bd*, 28 February 2008, www.bangladeshnews.com.bd.

Risk Education

In 2008–2009, no formal mine/ERW risk education activities were reported. In its most recent Article 7 report, Bangladesh noted that efforts to warn the population were not required due to the absence of suspected mined areas,²⁶ although the army previously stated that awareness programs about ERW and IEDs would be helpful.²⁷ Following a reported landmine explosion on the Bangladesh-Myanmar border in November 2008, border guards from both sides warned the local population against entering the area.²⁸

The only formal mine/ERW risk education reported between 1999 and 2009 consisted of brief training sessions in 2004.²⁹

Victim Assistance

The estimated number of survivors is unknown, but at least 285 (excluding IED survivors). Assistance to civilian mine/ERW survivors remains inadequate. The only facility able to provide specialized treatment and prosthetic devices near affected areas is the Memorial Christian Hospital in Cox's Bazar district, which distributes prostheses free of charge to people who are unable to pay.³⁰ Access to quality devices was limited. Technicians lacked training opportunities and experience. Equipment was often not functioning or obsolete.³¹

In early 2009, the Memorial Christian Hospital organized a medical “camp” to distribute prostheses free of charge in the southwestern Sidr region. Due to funding problems, it was the first camp since June 2007.³² However, since 1998 only two camps were held in areas that have been mine-affected and few mine/ERW survivors have received prostheses through these camps.³³

Annual Landmine Monitor field visits to Ukhia and Naikongchari sub-districts since 2006 have shown that the economic situation of survivors and casualties' families continued to deteriorate.³⁴ By 2009, many survivors visited in past years had moved away from their villages for economic reasons.³⁵

Military mine casualties receive assistance at military hospitals and facilities.³⁶ The government provides medical assistance and social assistance payments for people registered as disabled freedom-fighters and families of the martyred through the Bangladesh Freedom Fighters Welfare Trust. In 2009, the Trust requested a 20% increase to fund payments.³⁷

In 2008, the ICRC Special Fund for the Disabled (SFD) continued to support the Bangladesh Rural Advancement Committee (BRAC), the Limb and Brace Center, and the Center for Rehabilitation of Paralyzed (CRP) and its satellite center.³⁸ Following SFD advice to enhance

BELARUS

Ten-Year Summary

The Republic of Belarus became a State Party to the Mine Ban Treaty on 1 March 2004. It has cited various articles of its criminal code as national implementation measures, as well as decrees specific to antipersonnel mines. Belarus failed to meet its 1 March 2008 stockpile destruction deadline and is therefore in violation of the Mine Ban Treaty. It finished destroying its 294,775 non-PFM type antipersonnel mines in 2006, but still possesses 3.37 million PFM-type mines. It is in the process of finalizing a new project with the European Commission to complete stockpile destruction. Belarus reports retaining 6,030 antipersonnel mines for research and training purposes, but no mines have been consumed in such activities.

Belarus has continued major clearance operations of World War II ordnance, particularly UXO. It has a significant residual mine threat, but no known mined areas. Since 1999, Landmine Monitor has reported 52 mine/explosive remnants of war (ERW) casualties in Belarus. In the same period, the Ministry of Defense reported 62 ERW casualties (19 killed and 43 injured); it was not possible to determine where these two cumulative totals overlap. No mine casualties have been reported in Belarus since 2004, and ERW casualties have been decreasing.

Risk education has been implemented by the Ministry of Defense's explosive ordnance disposal teams, and awareness messages have also been disseminated through the media. Belarus has never had a national victim assistance program. Survivors receive free basic healthcare, but services are inadequate. In general, benefits, services, and legal protection for persons with disabilities are minimal.

Mine Ban Policy

Belarus acceded to the Mine Ban Treaty on 3 September 2003, becoming a State Party on 1 March 2004. Belarus has cited various articles of its criminal code as national implementation measures, as well as decrees specific to antipersonnel mines.

Belarus submitted its sixth Article 7 report on 30 April 2009, covering calendar year 2008.¹

Belarus attended the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings in May 2009. At each of the meetings, Belarus provided updates on stockpile destruction (see Stockpiling and destruction section below).

Belarus has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Belarus has said it did not produce or export antipersonnel mines after independence in 1992, and never used antipersonnel mines for protection of its borders or for other purposes.²

Belarus is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines.³ It submitted the annual report required by Article 13 in August 2008. Belarus ratified Protocol V on Explosive Remnants of War on 29 September 2008.⁴

¹ Previous reports were submitted on 30 April 2008, 30 April 2007, 24 April 2006, 9 May 2005, and 23 June 2004.

² Statement by Aleh Shloma, Representative of Belarus, First Committee of the UN General Assembly, New York, 21 October 2004.

³ When it joined Amended Protocol II on 2 March 2004, Belarus deferred for nine years compliance with the protocol's requirements for self-destruction and self-deactivation of remotely delivered antipersonnel mines. This deferral will become irrelevant when Belarus completes destruction of its stocks of PFM antipersonnel mines to comply with Article 4 of the Mine Ban Treaty.

⁴ On 30 April 2008, the President signed a decree on accession; the instrument of ratification was submitted on 29 September 2008.

Belarus has not signed the Convention on Cluster Munitions.⁵

Stockpiling and destruction

Belarus failed to meet its deadline of 1 March 2008 to destroy all stockpiles of antipersonnel mines it owns or possesses, or are under its jurisdiction or control.⁶ It is therefore in violation of the Mine Ban Treaty and will remain so until destruction of the stockpile is completed.

Belarus still possesses 3,371,984 PFM-type mines.⁷ This number is unchanged since the end of 2006, when Belarus completed destruction of its non-PFM antipersonnel mines.⁸ The stockpile includes: 1,790,064 PFM-1 blast mines in KSF-1 cassettes; 707,072 PFM-1S blast mines in KSF-1S cassettes; 413,712 PFM-1S blast mines in PFM-1S canisters; and 461,136 PFM-1S blast mines in Uragan (Hurricane) 220mm rocket warheads.⁹

Destruction of PFM mines

As of mid-2009, Belarus could not state when it would complete the destruction of its remaining stockpile and be compliant with its treaty obligation. In May 2009, Belarus told States Parties that it hoped to conclude the preparatory phase of the project in the first half of 2010.¹⁰

Belarus has stated that it requires international assistance in order to destroy its remaining PFM-type antipersonnel mines.¹¹ A project funded by the European Commission (EC) to provide technical and financial resources to Belarus for destruction underwent competitive tendering in 2006, but the project was subsequently cancelled after an evaluation committee, with the participation of a representative from the government of Belarus, unanimously concluded that a

⁵ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 190–191.

⁶ In informing States Parties that it would not meet the deadline, Belarus stated that it “is not capable to destroy over 3.3 million stockpiled PFM type mines in terms stipulated in the Convention.... The international community has no experience so far in destruction of large quantity of the PFM mines with the environmentally appropriate technology. Open detonation of this type of mines may cause severe consequences for population and environment and is therefore unacceptable. There has always been an understanding that the issue of PFM type mines is unique from the point of view of the Convention.... We have repeatedly stated that the Republic of Belarus has no possibilities to accomplish the destruction of the stockpiled PFM mines without the assistance of the international community. In this regard we welcome and highly appreciate the contribution of the European Community in solving this issue. In the spirit of transparency the Republic of Belarus has always informed the States Parties to the Ottawa Convention on implementation of the arrangements reached with the European Commission on this issue.” Note Verbale and Non-Paper sent from the Permanent Mission of Belarus to the UN in Geneva to the Permanent Mission of Jordan to the UN in Geneva (as President of the Eighth Meeting of States Parties), 18 February 2008.

⁷ Article 7 Report, Form B, 30 April 2009. This total does not include 6,030 other types of mines retained for training purposes. Belarus’s original stockpile of antipersonnel mines inherited from the Soviet Union totaled approximately 4.5 million. Belarus destroyed approximately 300,000 antipersonnel mines between 1992 and 2003. In its first Article 7 report submitted in June 2004, Belarus declared a total of 3,988,057 antipersonnel mines, including 3.37 million of the PFM-type. It subsequently declared a stockpile of 3,676,389 antipersonnel mines at the end of 2004, with the difference primarily being the reclassification of 200,847 OZM-72 mines and 110,766 MON mines as command-detonated munitions. Belarus declared a stockpile of 3,672,789 antipersonnel mines as of the end of 2005.

⁸ Article 7 Report, Form B, 30 April 2007. In cooperation with the NATO Maintenance and Supply Agency and interested donor countries, Belarus completed the destruction of 294,775 stockpiled antipersonnel mines other than PFM-type mines in December 2006. This included 45,425 PMN, 114,384 PMN-2, 12,799 POMZ-2, 64,843 POMZ-2M, and 57,324 POM-2 antipersonnel mines. A total of 217,133 mines were destroyed by open detonation, and 12,799 POMZ-2 and 64,843 POMZ-2M mines were disassembled at Belarusian industrial plants. Also in 2006, Belarus destroyed the victim-activated components of its 5,536 MON-type and 200,826 OZM-72 mines.

⁹ Article 7 Report, Forms B and G, 30 April 2009.

¹⁰ Statement of Belarus, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

¹¹ See, for example, Statement of Belarus, Ninth Meeting of States Parties, Geneva, 26 November 2008; and Statement of Belarus, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

technically compliant bidder could not be identified.¹² The funds were therefore “decommitted,” and the process to secure new EC funds and initiate a new project had to begin all over again.

Belarus concluded a €4 million (US\$5,890,400) agreement with the EC for a new project to destroy PFM stockpiles on 22 January 2008.¹³ Belarus reported to States Parties in June 2008 that “given that the process within the new EC project remains sophisticated there is no warranty that the project will be implemented successfully in reasonable time. In this connection we are not in a position to indicate any timelines for the project being started and finalized.”¹⁴

Following the recommendation of the Ninth Meeting of States Parties in November 2008, Belarus has provided reports on its progress toward meeting its stockpile destruction obligations.¹⁵ In May 2009, Belarus informed the treaty’s Standing Committee on Stockpile Destruction that Belarus and the EC had been able to agree to a Terms of Reference document, as well as technical specifications and a timetable for the preparatory phase of the project.¹⁶ It said that after a location for destruction was agreed upon, Belarus and the EC would approve a final version of the project agreement, and the EC would begin a competitive tendering process to select a company to carry out destruction.¹⁷ Belarus told States Parties that it “is ready to exert maximum efforts for the successful completion of the joint project,” and that it has taken steps to avoid repetition of mistakes that led to cancellation of the previous project in 2006.¹⁸

An EC assessment mission took place in Belarus from 8–11 June 2009 to determine a location for destruction.¹⁹ The EC published the tender notice, with a budget of €4 million (\$5,890,400), on 18 July 2009. It states that the project is aimed at destruction of the mines “within 24 months from signature of the contract.”²⁰

Mines retained for research and training

In May 2009, Belarus reported retaining 6,030 antipersonnel mines for research and training purposes.²¹ This number has remained constant since Belarus first declared it in June 2004, indicating no mines have been consumed (destroyed) in training activities.²² Belarus has said that it retains antipersonnel mines for training of mine detection dogs, testing of protective equipment and mine detectors, and training of personnel.²³ Belarus has not used the reporting format for retained mines agreed by States Parties in 2005, and has not reported in detail on the intended purposes and actual uses of its retained mines as agreed by States Parties in 2004.

¹² The procurement notice was posted on 27 June 2006, and the service tender procedure was cancelled on 29 August 2006. See EC Tender Electronic Database, “Destruction of PFM-1 series ammunition in Belarus, Service Procurement Notice,” 2006/S 119-126162, 27 June 2006; and EC Tender Electronic Database, “Destruction of PFM-1 series ammunition in Belarus, Cancellation of a service tender procedure,” 2006/S 163-174807, 29 August 2006.

²¹ Article 7 Report, Form D, 30 April 2009.

²² Belarus cited 7,530 retained mines in June 2004, but subsequently decided to re-classify 1,500 OZM-72 mines as command-detonated munitions no longer considered under the scope of the Mine Ban Treaty. The mines retained include: 1,500 PMN; 1,512 PMN-2; 1,500 POMZ-2; and 1,518 POMZ-2M.

²³ Interview with Maj.-Gen. Sergei Luchina, MoD, and Valery Kolesnik, Ministry of Foreign Affairs, in Geneva, 15 June 2005.

Scope of the Problem

Contamination

Belarus is primarily contaminated by large quantities of ERW, mainly UXO from World War II, World War I, and even from the Napoleonic Wars. There is also a significant residual mine problem from World War II, although there are no known or suspected mined areas.²⁴ Government officials have claimed that 353km² of the country is contaminated with explosive ordnance.²⁵ Heavy contamination has been reported in Brest, Minsk, Mogilev, and Vitebsk regions.²⁶ The majority of the contaminated areas are said to be agricultural land or forest. None of the areas are marked or fenced, and little information is available to indicate the potential density of contamination.²⁷

Casualties

No mine casualties have been reported in Belarus since 2004. In December 2008, one man was killed while tampering with UXO in Minsk region.²⁸ This was a decrease from 2007 when three casualties occurred in two ERW incidents. In 2009, no new mine or ERW casualties were reported as of 30 May.

From 1999 to 2008, Landmine Monitor reported 52 mine/ERW casualties in Belarus (19 killed and 33 injured), and at least 14 casualties were children. In the same period, the Ministry of Defense (MoD) reported 62 ERW casualties (19 killed and 43 injured); it was not possible to determine where these two cumulative totals overlap.²⁹ Forty-five casualties were caused by ERW, five by mines, and two by an improvised explosive device (IED).³⁰ Between 1944 and 31 March 2009, the MoD recorded 6,177 mine/ERW casualties: 2,667 people killed and 3,510 injured.³¹ Most mine/ERW survivors in Belarus were injured by World War II ordnance or during military service in Afghanistan in the 1980s. It has not been reported how many survivors are still alive, and the total number of mine/ERW survivors in Belarus is still not known. The Belarus Prosthetic Rehabilitation Center (BPRC) has officially registered 97,410 persons with disabilities with rehabilitation needs.³²

Program Management and Coordination

Belarus does not have a national mine action authority or mine action center. Mine action is managed by the MoD, which nominally holds clearance data. It does not use the Information Management System for Mine Action,³³ but it does maintain and regularly update a mine/ERW casualty database.³⁴ The Belarus Campaign to Ban Landmines (BCBL) also collects data through media monitoring and field visits.

³³ Letter from Col. Igor Lisovsky, Head of Engineer Forces, MoD, 27 March 2008.

³⁴ Interview with Col. Alexander Tihonov, MoD, Minsk, 25 March 2009.

Demining

Demining and explosive ordnance disposal (EOD) is conducted by both MoD and Ministry of Interior personnel. Since the end of World War II, Belarus's Engineer Forces have reportedly found and destroyed more than 27 million items, mostly UXO but also some landmines.³⁵ In 2008, the MoD received 613 call-outs and destroyed 7,153 ERW, including 59 landmines.³⁶ The Ministry of Interior received 3,500 call-outs³⁷ and destroyed 16,419 ERW, including 74 landmines.³⁸ No data exists on the size of area cleared or otherwise released.

Risk Education

Limited mine/ERW risk education (RE) has been conducted over the past few years, and there are no national standards for RE.³⁹

In 2008, the ministries of defense, interior, and education informed the population about the ERW threat.⁴⁰ The MoD continued its RE activities in areas where clearance operations were planned, using its EOD teams. The entire population was targeted for RE, as mines/UXO are said to be found throughout the country.⁴¹ In 2008, 1,058 RE meetings were conducted, approximately the same number as in 2007. Around 64,000 people were reached, including some 31,000 children. RE messages were also given through television, radio, and print media.⁴²

The MoD has been delivering RE through its EOD teams alongside clearance operations since the mid-1990s. It launched a formal RE program in 2004, consisting of the dissemination of messages through the media—including the broadcast of documentary films—and presentations. This continued through to 2009. RE was reportedly provided to youth in grades 11–12 undergoing pre-prescription military training in 2005.

Plans to include RE in the school curriculum have been in place since 1999. Although material was developed,⁴³ this has not been implemented, and in 2007 the Ministry of Education stated that the issue was not relevant.⁴⁴ In the same year, however, a one paragraph section on the threat of mines and ERW was included in secondary school textbooks dealing with safety issues.

Belarus did not include information on RE in its latest Article 7 or CCW Amended Protocol II Article 13 reports.⁴⁵

Victim Assistance

The number of survivors in Belarus is unknown but there are at least 60.⁴⁶ There have never been specific victim assistance (VA) programs in Belarus, but survivors have access to state-operated healthcare. Basic medical care is free of charge, although hospitals are reportedly

⁴⁶ Belarus reported 60 injured ERW casualties between 1997 and 2008. Republic of Belarus, "ERW Database," Discussion Paper 2/REV.1, 2008 Meeting of Experts of the States Parties to CCW Protocol V, May 2009, p. 2.

“undersupplied.”⁴⁷ Most amputees receive prosthetic devices free of charge, purchased from the BPRC by local authorities. In 2008, the BPRC assisted 53,767 people, but disaggregated data on mine/ERW survivors was not recorded. The BPRC also continued vocational training programs for persons with disabilities in 2008.⁴⁸

An assessment in 2008 revealed that the needs of most persons with disabilities in Belarus remain unmet.⁴⁹ The Ministry of Labor and Social Security is the main government agency responsible for protecting the rights of persons with disabilities, but government benefits for persons with disabilities were reportedly “minimal” and “ineffectual.”⁵⁰

Belarus has national disability laws. Legislation mandates that transport and government buildings be accessible for persons with disabilities, but these provisions have rarely been enforced.⁵¹ On 2 February 2009, the Council of Ministers agreed on funding for vocational opportunities and workplace accessibility for persons with disabilities.⁵²

As of 30 May 2009, Belarus had not signed the UN Convention on the Rights of Persons with Disabilities. As in the past, Belarus did not include information on mine/ERW casualties or VA in its latest Article 7 report.⁵³

Support for Mine Action

No national funding for mine action was reported by Belarus in 2008, as in 2007. Landmine Monitor is not aware of comprehensive long-term cost estimates for meeting mine action or RE needs in Belarus. Belarus has reported that no funding support for VA is necessary, as the national healthcare infrastructure meets the country’s VA needs.⁵⁴ A tender for allocating EC funding of €4 million (\$5,890,400) for destruction of Belarus’ stockpile of PFM-type mines was released in July 2009 (See Stockpiling and destruction section above.)

BHUTAN

Ten-Year Summary

After little involvement with the Ottawa Process and the Mine Ban Treaty, the Kingdom of Bhutan acceded to the treaty in August 2005. Prior to joining, it consistently voted in favor of the annual UN General Assembly resolution calling for the treaty's universalization. When Bhutan submitted its only Article 7 transparency report in May 2007, it revealed for the first time a stockpile of 4,491 antipersonnel mines, all of which it has retained for training. Bhutan also acknowledged for the first time its past use of antipersonnel mines. In 2007, Bhutan reported that it had cleared the 103 antipersonnel mines that it had laid on its territory, but it did not formally declare compliance with its Article 5 obligations at a meeting of States Parties.

Mine Ban Policy

Bhutan acceded to the Mine Ban Treaty on 18 August 2005, and the treaty entered into force on 1 February 2006. Bhutan has not indicated if it has undertaken any new national measures to implement the treaty.¹

As of July 2009, Bhutan had not submitted its annual Article 7 report, due 30 April 2009. It did not provide an annual update in 2008. Bhutan submitted its initial Article 7 report on 29 May 2007.

Bhutan did not attend the Ninth Meeting of States Parties in November 2008 in Geneva or the May 2009 intersessional Standing Committee meetings. Bhutan has not made its views known regarding matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party to the treaty, mines with sensitive fuzes or anti-handling devices, and mines retained for training).

Bhutan is not party to the Convention on Conventional Weapons, and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.²

Use, stockpiling, production, and transfer

Bhutan's initial Article 7 report, in contrast to earlier statements, revealed that it possesses antipersonnel mines and has used them in the past.³ Bhutan maintains a stockpile of 4,491 antipersonnel mines, all of which it has stated it will retain for training purposes.⁴

Bhutan has not provided any details on the intended purposes and actual uses of its retained mines, as agreed by States Parties. The number of mines it wishes to retain appears more than absolutely necessary for a small armed force that does not engage in mine clearance, domestically

¹ Article 7 Report, Form A, 29 May 2007, states, "In Bhutan's case, the treaty would be 'self-enacting' under domestic law since Chapter IV, clause 29 of the Civil & Criminal Procedure Code of Bhutan 2001 states that 'The Royal Court of Justice shall apply International Convention, Covenant, Treaty and Protocol that are duly acceded by the Royal Government of Bhutan and ratified by the National Assembly of Bhutan.'"

² A Ministry of Foreign Affairs official said that Bhutan would have participated in the Oslo conference and signed the Convention on Cluster Munitions, but was constrained by the lack of human and financial resources, including the availability of only one person in the legal section of the ministry in the capital. Interview with Ministry of Foreign Affairs official requesting anonymity, Royal Embassy of Bhutan, New Delhi, 29 January 2009.

³ Article 7 Report, Forms C, D, E, F, and H, 29 May 2007. Bhutan previously stated several times that it had not produced, imported, exported, stockpiled, or used antipersonnel mines. The Article 7 report confirms Bhutan has no production facilities.

⁴ Article 7 Report, Form D, 29 May 2007. The stockpile consists of 1,740 M14 mines and 2,751 M16 mines. Bhutan did not provide any technical characteristics of the mines, as called for in Article 7, but their specific designations are typical of Indian-manufactured mines.

or internationally, on an ongoing basis. Bhutan's treaty-mandated deadline for destroying any stockpiled antipersonnel mines that are not retained for training purposes is 1 February 2010. Bhutan has not indicated whether or not it has destroyed any stockpiled antipersonnel mines in the past.

Bhutan previously used antipersonnel mines on tracks to camps maintained by Indian insurgents in Gorbakunda and Nganglam on the Bhutanese side of the Manas Wildlife Sanctuary.⁵

During 2008, there appeared to be an increase in the use of improvised explosive devices (IEDs) by non-state armed groups operating in Bhutan.⁶ However, none of the reported incidents appear to have involved mine-like, victim-activated IEDs, and Landmine Monitor could find no evidence of insurgents using factory-made antipersonnel mines.

Scope of the Problem

Bhutan reported in 2007 that it had laid a total of 103 antipersonnel mines in two locations on its side of the Manas Wildlife Sanctuary, which straddles the border with India. These included 62 antipersonnel mines laid on tracks that Bhutan said led to an insurgent camp in the Gorbakunda area and 41 antipersonnel mines laid on tracks that it said led to camps of Indian insurgents in Nganglam sub-district.⁷ The date of emplacement was not given. Bhutan stated it had removed the mines after three attempts that proved difficult and hazardous because monsoon rain had dislodged the mines from recorded locations, and because of rough terrain.⁸ The Royal Bhutan Army lost two soldiers when a patrol was sent to check the mines in one of the areas. While trying to locate the mined track, some of the mines exploded, and two soldiers were killed.⁹

Bhutan remains on the Mine Ban Treaty Implementation Support Unit's (ISU) list of countries with Article 5 obligations,¹⁰ presumably as it has not formally declared compliance with Article 5 clearance obligations to a meeting of States Parties.

Police said Communist Party of Bhutan insurgents based in Nepal used what was reportedly a landmine in an ambush in which they killed four government rangers in the Sarpang district of southern Bhutan at the start of 2009.¹¹

BOSNIA AND HERZEGOVINA

2008 Key Data

State Party since	1 March 1999
Contamination	Antipersonnel and antivehicle mines, UXO
Estimated area of contamination	1,683km ² (31 December 2008)
Casualties in 2008	39 (2007: 30)
Estimated mine/ERW survivors	Unknown but estimated 3,919
Article 5 (clearance of mined areas)	Deadline: 1 March 2019 Original deadline: 1 March 2009
Demining in 2008	Mined area clearance: 3.16km ² Area cancellation and reduction: 81.64km ²
Risk education recipients in 2008	24,500
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$24.6 million (2007: \$17.1 million) National: \$16.2 million (2007: \$13.7 million)

Ten-Year Summary

Bosnia and Herzegovina (BiH) became a State Party to the Mine Ban Treaty on 1 March 1999. It completed destruction of its stockpile of more than 460,000 antipersonnel mines in November 1999. In addition, from 1998 to 2006, BiH authorities and international troops collected and destroyed at least 38,500 mines from the populace. There have been several reports of use of antipersonnel mines in criminal activities, most recently in 2003. BiH passed national implementation legislation in 2004. The number of retained mines reported has fluctuated, including increases in 2007 and in 2008 to a total of 2,282.

Mine action in the aftermath of the 1992–1995 conflict was highly decentralized and engaged a wide spectrum of organizations but has changed dramatically in the past decade, particularly after the 2002 Demining Law created a Demining Commission and the Bosnia and Herzegovina Mine Action Center. These provided a national focus for assessing the extent of the problem and coordinating and regulating responses to it. A Landmine Impact Survey completed in 2003 found 1,366 communities, or nearly half those surveyed, to be mine-affected. Survey and clearance has resulted in release of almost 1,300km² in the past decade, but difficulties identifying the location and extent of BiH's mostly small, nuisance minefields, poor planning, and shortfalls in funding slowed clearance and led BiH to apply in 2008 for a 10-year extension of its Article 5 deadline. The extension request was approved by the Ninth Meeting of States Parties in November 2008, but BiH is already behind schedule in implementing its plan for the extension period.

As of June 2009, BHMIC could provide data on a total of 459 mine/explosive remnants of war (ERW) casualties (214 killed and 245 injured) recorded between 1999 and 2008. The number of casualties reported annually declined from 1999 to 2004, but has increased slightly since then.

Extensive mine/ERW risk education (RE) has been conducted since 1999 by numerous organizations, through school- and community-based RE, and the media. Neither of two major evaluations of RE in 2007 identified a causal relationship between RE implementation and casualty rates in BiH.

Emergency services improved with international funding. General health and rehabilitation services for mine survivors improved gradually, bolstered by the ongoing presence of a government-funded community-based rehabilitation system throughout the country. Most

direct assistance continued to be provided by NGOs and, increasingly, by national NGOs. Psychological support and socio-economic reintegration opportunities increased but remained inadequate despite continued input by NGOs and international donors. Progress was made in the adoption of a national disability policy, but little progress was made towards the adoption of legislation to ensure the rights of persons with disabilities, including mine survivors.

Background

BiH is an independent state, but under international administration. The 1995 Dayton peace accord, which ended the 1992–1995 war, set up two separate entities: a Bosniak-Croat Federation of Bosnia and Herzegovina (FBiH), and the Bosnian Serb Republic (Republika Srpska, RS), each with its own president, government, parliament, police, and other bodies. Overarching these entities is a central Bosnian government and rotating presidency. In addition, the district of Brčko is a self-governing administrative unit, established as a neutral area placed under joint Bosniak, Croat, and Serb authority.¹

Mine Ban Policy

BiH signed the Mine Ban Treaty on 3 December 1997 and ratified it on 8 September 1998, becoming a State Party on 1 March 1999. On 29 December 2004, parliament approved a law amending the criminal code to apply penal sanctions for violations of the treaty.²

BiH participated in the Ninth Meeting of States Parties in Geneva in November 2008, where it made a statement on victim assistance (VA) and gave a presentation on its request for an extension of its Article 5 mine clearance deadline. It also attended the intersessional Standing Committee meetings in Geneva in May 2009 and made a statement on mine clearance.

BiH submitted its annual Article 7 report in 2009, covering calendar year 2008. It used voluntary Form J to provide additional information on casualties, mine clearance, and VA. BiH submitted nine previous Article 7 reports.³

In July 2008, the BiH Ministry of Defense responded to a Landmine Monitor inquiry about its views with respect to interpretation and implementation of Articles 1 and 2 of the treaty.⁴ On Article 1, it stated that if “engaged in joint military operations with its allies, Armed Forces of Bosnia and Herzegovina can not be engaged in the process of planning and preparing military action where will be used antipersonnel mines.”⁵

On Article 2 and the issue of antivehicle mines with sensitive fuzes, BiH made specific reference to TMRP-6 antivehicle mines, which have tilt rods. It appears that the BiH Ministry of Defense does not believe that such mines are explicitly prohibited by the Mine Ban Treaty but will consider ways to ensure that such mines cannot be victim-activated and function as antipersonnel mines.⁶

¹ “Country Profile of Bosnia-Herzegovina,” *BBC Online*, news.bbc.co.uk.

² “Law on Amendments to the Criminal Code of Bosnia and Herzegovina,” *Official Gazette*, No. 61/04. Article 193a forbids the development, production, storage, transportation, offer for sale or purchase of antipersonnel mines. The penalty for such offenses is between one and 10 years’ imprisonment. If death or injury occurs to people or animals, or if there is damage to the environment, the person or people involved shall be punished by imprisonment of no less than five years or by a long-term prison sentence.

³ Previous reports were submitted in 2008 (for calendar year 2007), April 2007, 30 May 2006, 6 May 2005, 17 May 2004, 1 April 2003, 20 May 2002, 1 September 2001, and 1 February 2000.

⁴ Email from Denis Selimovic, Senior Expert, Ministry of Defense, 29 July 2008. This email stated it constituted “official opinion from [Ministry of Defence] MOD BiH.” BiH has not expressed its views on the permissible number of mines retained for training under Article 3.

⁵ BiH told Landmine Monitor in 2003 that it “will not participate in joint military operations with any forces planning, exercising or using antipersonnel mines.” It also said that BiH will not allow the storage or transit of antipersonnel mines belonging to other countries in or through its territory. Fax from Ministry of Foreign Affairs, 29 April 2003.

⁶ Specifically, it said that the BiH Ministry of Defense “does not mean that TMRP-6 antivehicle mine is not considered under definition of antipersonnel mines. This mine is intended for incapacitating and demolition of enemy armored and other combat and transport vehicles.... this mine could be activated by human touch, but this way is one of way activated. Further, the BiH Ministry of Defence will consider correct legal mechanism how to reduce use of this mine in order to remove possibility for the mine to be activated by the human being.”

BiH is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines. It submitted an annual report as required by Article 13 in 2008. BiH is also party to Protocol V on Explosive Remnants of War.

BiH signed the Convention on Cluster Munitions in December 2008, but had not yet ratified it as of 1 July 2009.⁷

Production, transfer, use, and illegal stores

BiH has stated that production of antipersonnel mines ceased by 1995.⁸ It has reported on the conversion of production facilities.⁹ BiH is not known to have exported antipersonnel mines. After BiH joined the treaty, Landmine Monitor noted several cases of use of mines in criminal activities,¹⁰ but no such incidents have been reported since 2003.

In past years, authorities on numerous occasions found illegal stores of mines, but none were discovered between 2006 and the first half of 2009. The Dayton peace accord allows international military forces to search for and collect illegally held weapons, including mines.¹¹ The European Force (EUFOR), which took over from the Stabilisation Force (SFOR) in December 2004, has not conducted any Operation Harvest arms collection activities since 2006, but retains the right to do so.¹²

Stockpile destruction and retention

BiH declared completion of its antipersonnel mine stockpile destruction program in November 1999, with a total of 460,727 mines destroyed.¹³ This number has been amended annually since 2003 and was changed to 463,921 mines in the latest Article 7 report, covering calendar year 2008.¹⁴ No explanation has been given for the changes. Presumably these are newly discovered stocks, mines turned in by the population, or illegal mines seized from criminal elements.¹⁵

In September 2006, BiH reported that it had discovered more than 15,000 MRUD (Claymore-type) directional fragmentation mines during inspections of weapon storage sites.¹⁶ It said that although the mines were not specifically prohibited by the Mine Ban Treaty, BiH had made a

⁷ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 44–45.

⁸ Interview with members of the Demining Commission, Sarajevo, 30 January 2003. BiH inherited the mine production facilities of the Socialist Federal Republic of Yugoslavia in Bugojno, Goražde, Konjic, and Vogošće.

⁹ See *Landmine Monitor Report 2004*, p. 193; and Article 7 Report, Form E, April 2007.

¹⁰ See *Landmine Monitor Report 2004*, p. 194.

¹¹ Once seized or collected, mines and other weapons are held under international control until destroyed. Mines found by the police and EUFOR are destroyed by either the Civil Protection Agency or NPA under the supervision of EUFOR. A EUFOR spokesperson told Landmine Monitor, “Civil Protection is the organization which coordinates the destruction of all seized weapons and ammunition. In order to carry out this task they are assisted by other organizations such as military EOD teams (including EUFOR EOD teams), non-government organizations, etc.” A demining official told Landmine Monitor that mines found or confiscated by the police and EUFOR are counted in the Civil Protection Agency numbers of destroyed mines. See *Landmine Monitor Report 2007*, p. 183.

¹² See *Landmine Monitor Report 2007*, p. 183. Operation Harvest began as an SFOR initiative in 1998 to collect unregistered weapons from private holdings under amnesty conditions. From 1998 to late 2006, about 38,500 landmines were collected.

¹³ Article 7 Report, Form G, 1 February 2000. Destruction was carried out at various locations by the two entity armies with SFOR assistance. The stockpile consisted of 19 types of mines.

¹⁴ Article 7 Report, (for calendar year 2008), Form G. The number was amended in previous years to 460,925 for year 2003, to 461,634 for year 2004, to 462,351 for year 2005, to 463,198 for year 2006, and to 463,489 for year 2007. Article 7 Reports, Form G, (for calendar year 2007), April 2007, 30 May 2006, 6 May 2005, and 17 May 2004.

¹⁵ In 2003, SFOR found very large additional quantities of antipersonnel mines among old munitions, after the entity armies requested assistance with downsizing military storage sites and dealing with old munitions in storage. An SFOR publication reported that several hundred thousand antipersonnel mines were awaiting destruction at these sites. By March 2004, 2,574 antipersonnel mines, 31,920 antivehicle mines, and 302,832 detonators had been destroyed. Landmine Monitor has been unable to obtain updated information on further destruction or new discoveries at storage sites of antipersonnel mines. The BiH government has not formally reported the existence of these newly discovered stocks of antipersonnel mines, has not provided details on numbers and types of mines, and has not made known the timetable for destruction of the mines. See *Landmine Monitor Report 2006*, p. 202.

¹⁶ See *Landmine Monitor Report 2007*, p. 184, for more details.

decision to destroy the mines for humanitarian reasons as well as to show its commitment to the aims of the treaty.¹⁷ BiH reported that, as of April 2007, about 5,000 mines had been destroyed, with the intention to complete destruction in May 2007, but it has not provided information on completion.¹⁸ According to BiH, “Representatives of UNDP, NATO, and the OSCE [Organization for Security and Co-operation in Europe] have controlled the whole process of destruction.”¹⁹

Mines retained for research and training

At the end of 2008, BiH retained 2,274 antipersonnel mines for training purposes, as well as 116 MRUDs.²⁰ This is an increase of 665 mines from the end of 2007, when BiH reported retaining 1,619 mines and 157 MRUDs,²¹ which again was an increase from the end of 2006, when it reported retaining 1,550 mines and 158 MRUDs.²² BiH has not explained these increases or the overall inconsistencies in its reporting on retained mines over the last few years.

BiH’s Article 7 reports submitted in 2008 and 2009 have indicated, however, that all of the retained antipersonnel mines are fuzeeless.²³ In its 2007 Article 7 report BiH did not state that any of the retained mines were fuzeeless, while its 2006 report stated that 876 retained mines were fuzeeless and 1,299 were active.²⁴ BiH has not explained these changes.

Of the 2,274 antipersonnel mines (other than MRUDs) reported as retained at the end of 2008, 1,023 are held by demining agencies, 557 by the BiH Mine Detection Dog Center (MDDC), 351 by the BiH Mine Action Center (BHMAC), 333 by the BiH Armed Forces, and 10 by the RS Civil Protection Agency.²⁵ A comparison of the Article 7 reports for 2008 and 2007 indicates that antipersonnel mines, other than MRUDs, held by demining operators have increased by 207: mines held by MDDC increased by 276, mines held by BHMAC increased by 45, mines held by the BiH Armed Forces increased by 125, and mines held by the RS Civil Protection Agency increased by two.

BiH has stated that its retained mines are used for training mine detection dogs (MDDs).²⁶ While providing more facts about its retained mines, BiH has still provided few details on the intended purposes and actual uses of the mines, as agreed by States Parties in 2004. BiH has not used the expanded Form D on retained mines as agreed by States Parties in 2004.

¹⁷ It stated that the mines are “designed to be used with an electrical initiation system,” and therefore are not considered antipersonnel mines under the Mine Ban Treaty. However, it also noted that “since they are not adapted to ensure command-detonation, MRUD mines can be technically considered as anti-personnel mines.” Statement by Amira Arifovic-Harms, Counselor, Ministry of Foreign Affairs, Seventh Meeting of States Parties, Geneva, 20 September 2006. Use of Claymore-type mines in command-detonated mode is permitted under the Mine Ban Treaty, but use in victim-activated mode (with a tripwire) is prohibited.

¹⁸ In April 2007, BiH indicated that of the 15,269 MRUD mines, 14,701 mines would be destroyed by mid-May 2007, 396 were transferred to EUFOR for training, 20 were donated to Germany, two were destroyed immediately and BiH intended to retain about 150 mines for training. The 14,701 mines were transported to a workshop in Dobojo and by mid-April about 5,000 had been destroyed. Article 7 Report, Form J, April 2007.

¹⁹ Statement of BiH, Standing Committee on Stockpile Destruction, Geneva, 23 April 2007.

²⁰ Article 7 Report (for calendar year 2008), Form D. The 2,274 antipersonnel mines include 61 ROB and 10 PMR RP mines—two mine types not previously listed by BiH—as well as 206 PMA-1, 735 PMA-2, 597 PMA-3, 291 PMR-2A, 4 PMR-3, 154 PROM-1, 8 PMR-Capljinka, and 208 PMR2A-vjezbovna.

²¹ Article 7 Report, (for calendar year 2007), Form D. The 1,619 antipersonnel mines included 127 PMA-1, 634 PMA-2, 319 PMA-3, 132 PMR-2A, 15 PMR-3, 92 PROM-1, 92 PMR-Capljinka, and 208 PMR2A-vjezbovna. Form D states a total of 1,920 mines, but the numbers in the form add up to 1,930 mines.

²² Article 7 Report, Form D, April 2007. The 1,550 mines included 118 PMA-1, 610 PMA-2, 484 PMA-3, 203 PMR-2A, three PMR-3, 126 PROM-1, and six PMR-Capljinka.

²³ Article 7 Report (for calendar year 2008), Form B; and Article 7 Report (for calendar year 2007), Form B.

²⁴ Article 7 Report, Form B and Annex, “Review on Number of Retained Mines in Bosnia and Herzegovina,” 30 May 2006.

²⁵ Article 7 Report (for calendar year 2008), Form D. Since the previous report, MDDC has seen an increase of 162 PMA-3, 98 PMR-2A, and 27 PROM-1. BHMAC has an increase of nine PMA-1, nine PMA-2, 18 PMA-3, and nine PROM-1. The RS has an increase of one PMA-2 and one PMR-2A. BiH Armed Forces have seen an increase of 14 PMA-1, 41 PMA-2, 35 PMA-3, 16 PMR-2A, and 19 PROM-1. Finally, the demining companies have seen a decrease of 84 PMR-Capljinka, and an increase of 56 PMA-1, 50 PMA-2, 63 PMA-3, 44 PMR-2A, seven PROM-1, 61 ROB, and 10 PMR RP.

²⁶ Article 7 Report, Annex “Review on Number of Retained Mines in Bosnia and Herzegovina,” 30 May 2006.

Scope of the Problem

Contamination

BiH is heavily contaminated with mines and ERW, primarily as a result of the 1992–1995 conflict related to the break-up of the Socialist Federal Republic of Yugoslavia.²⁷ The parties to the conflict placed mines extensively along confrontation lines to block troop movements and around strategic facilities but lines moved frequently, leaving contamination that is extensive and generally low density.²⁸

Most minefields are in the zone of separation between BiH's two political entities—FBiH and RS—which is 1,100km long and up to 4km wide,²⁹ but mines were placed throughout the country in all types of soil and vegetation.³⁰ In southern and central BiH, mines were often used randomly, with few records kept. Some of the affected territory is mountainous or heavily forested, but the fertile agricultural belt in Brčko district is one of the most heavily contaminated areas.³¹ There is also a significant but unquantified problem with UXO, including a small residual threat from cluster munition remnants.³²

BiH lacks sufficient or reliable data to determine the number of remaining mines or their location. BHMAC's database holds records of 19,000 minefields but it estimates that this represents only 50–60% of the real number. Most minefields have a relatively small number of mines, often laid individually or without any pattern. Even where minefield records exist, in many cases they do not show exact locations of minefields or individual mines.³³ According to BHMAC, some 220,000 mines remained to be cleared.³⁴ This is a far smaller estimate than earlier years, when it cited up to one million mines. As a result of a new general assessment conducted in preparation for the Article 5 deadline extension request and analysis of clearance records, BHMAC found there are an average of nine mines per affected hectare (10,000m²).³⁵

At the end of 2008, BHMAC reported 1,683km² of contaminated land (3.29% of BiH territory), down from 1,738km² a year earlier. BHMAC identified 12,167 micro-locations (with an average size of 0.14km²).³⁶ In its Article 5 deadline extension request submitted in 2008, BiH projected that by the start of the requested extension in 2009 it would have 1,573km² of contaminated land³⁷ implying clearance of 165km² in 2008, but results for the year showed it missed this target by 110km².³⁸

Casualties

In 2008, BHMAC reported 39 mine/ERW casualties (19 people killed and 20 injured) in 21 incidents/accidents; 37 were male and the gender of two was unknown, 38 were adult and the age of one was unknown. Of the total, nine deminer casualties occurred in six accidents (six deminers killed and three injured). Mines caused the majority of casualties (29) in 17 incidents/accidents; most mine types were not reported but antipersonnel mines caused at least four casualties. ERW caused eight casualties in three incidents and one unknown device incident caused two casualties. The activity most connected with civilian mine/ERW incidents was collecting wood (17 casualties). Another five casualties occurred in an incident at a scrap metal yard, but the nature of the activity at the time was not recorded by BHMAC. The number

³⁸ BHMAC, "Mine Action Annual Report, Bosnia and Herzegovina, 2008," undated but 2009, p. 7.

of casualties in 2008 increased from the 30 mine/ERW casualties (eight people killed and 22 injured, including seven deminers) recorded in 2007.³⁹ The 2008 total was the highest annual total number of casualties in BiH since 2004.⁴⁰

Casualties continued to occur in 2009, with five casualties (three killed and two injured) recorded in the BHMIC database as of June. Three of these casualties (two killed and one injured), in three incidents, were civilians. The other two casualties (one killed and one injured) in one accident, were deminers.⁴¹

As of June 2009, BHMIC could only provide data on a total of 459 mine/ERW casualties (214 killed and 245 injured) recorded between 1999 and 2008. BHMIC reporting indicated that there were at least 589 casualties from 1999–2008, of whom 229 people were killed, another 156 injured, and 204 unknown.⁴² Data provided to Landmine Monitor by BHMIC contained discrepancies which could not be resolved immediately due to data verification underway at BHMIC.⁴³

As of June 2009, BHMIC was still using three dissimilar casualty data records and could not indicate which was the most correct or reliable.⁴⁴ BHMIC estimated that the unified database, which was reportedly nearing completion, contained approximately 7,300 casualty entries, with some 100 to 200 more requiring revision or verification.

The total number of survivors, or people injured, was not available as of 16 June 2009.⁴⁵ In April 2009, BHMIC reported 1,660 casualties from 1996–2008, including 488 people killed, another 535 injured, and 639 unknown,⁴⁶ but detailed data provided by BHMIC to Landmine Monitor in June 2009 contained only 1,187 casualties from 1992–2008.⁴⁷

Risk profile

Adult males form the largest casualty group.⁴⁸ People enter contaminated areas for livelihood purposes including cutting firewood, herding, hunting, and collecting scrap metal and herbs. The majority of incidents have taken place in properly marked areas.⁴⁹ The highest number of incidents occurs during spring and autumn, during the peak of agriculture activities and firewood collection.⁵⁰

Socio-economic impact

A general assessment of the mine situation in BiH conducted by BHMIC in 2007 identified 1,631 mine/ERW impacted communities, up from 1,366 in the Landmine Impact Survey (LIS) in 2003. The assessment estimated that mines/ERW directly influence the lives of 921,513 people, including 154,538 in high-impacted communities, 342,550 in medium-impacted communities, and 424,425 in low-impacted communities. Of the total number of impacted communities, 122

or 7.5% were high-impacted, 625 or 38.3% medium-impacted, and 884 or 54.2% low-impacted. On this basis, BiH remains one of the world's most mine-affected countries.⁵¹

Most impacted communities are in rural areas where people depend economically on contaminated land. BHMAL reports that “inhabitants of major cities have a relatively safe economic and social life in comparison with population living in rural area, which depends economically on access to mine contaminated areas.” Two-thirds of the affected population are returnees, mostly living in villages.⁵²

Program Management and Coordination

Mine action

The Demining Commission under the BiH Ministry of Civil Affairs and Communication supervises the state-wide BHMAL and represents BiH in its relations with the international community on mine-related issues. The Demining Commission's three members, representing the three ethnic groups in BiH, propose the appointment of BHMAL senior staff for approval by the Council of Ministers, report to the Council on mine action, approve the accreditation of demining organizations, and facilitate cooperation between the two separate entities that together comprise BiH. The Demining Commission mobilizes funds for mine action in cooperation with the Board of Donors, which includes the embassies of donor governments, the European Commission (EC), the UN, and the International Trust Fund for Demining and Mine Victims Assistance (ITF).⁵³

BHMAL, established by the Decree of Bosnia and Herzegovina Council of Ministers in 2002,⁵⁴ is responsible for regulating mine action and implementing BiH's demining plan, including accreditation of all mine action organizations.⁵⁵ By the end of 2008, BHMAL was supported by a part-time UNDP advisor and, until mid-2008, a UNICEF advisor for RE.⁵⁶ BHMAL operates from its headquarters in Sarajevo through two mine action offices—formerly autonomous Entity Mine Action Centers (EMALs)—and eight regional offices. The two entity offices deal with regional offices on planning, survey, and quality control/assurance. Quality assurance (QA) inspectors are based in the regional offices.⁵⁷ In 2008, BHMAL coordinated the work of 35 accredited demining organizations.⁵⁸

Risk education

BHMAL is responsible for managing and coordinating RE. In 2008, it focused on monitoring the implementation of RE standards and standing operational procedures (SOPs), and on coordination, supervision and integration of RE with other mine action activities.⁵⁹ UNICEF's technical advisor left BHMAL in mid-2008, but UNICEF continued to provide some financial and capacity-building support. In addition, UNICEF continued to support school-based RE and development, and piloted mine action planning at the level of affected municipalities.⁶⁰

Accreditation and additional accreditation processes for organizations engaged in RE activities continued.⁶¹

⁶¹ BHMAL, “Mine Action Annual Report, Bosnia and Herzegovina, 2008,” undated but 2009, p. 16.

The working group responsible for drafting a sub-strategy for RE for 2009–2019 held five meetings in 2008, organized by BHMIC with the support of UNICEF, but the sub-strategy developed was still pending approval as of May 2009.⁶² Organizations that developed the strategy consisted of government and non-governmental organizations: BHMIC; RS Civil Protection Agency; FBiH Civil Protection Agency; Brčko District Civil Protection Agency; Red Cross Society of BiH (RCSBiH); ICRC; INTERSOS; Posavina bez mina; Norwegian People's Aid (NPA); STOP Mines; and UNICEF, which supported the process financially.⁶³

Victim assistance

BHMIC is responsible for VA coordination, which is implemented through working group meetings with service providers, including relevant ministries, NGOs, and international organizations.⁶⁴ In 2008, committees were established at the entity level to transfer the Disability Policy in BiH into the appropriate local legislative (entity and cantonal) frameworks for implementation. VA planning will be linked to the policy's implementation.⁶⁵

BHMIC's Mine Action Strategy 2005–2009 contained a VA sub-strategy that aimed to create a standardized information system on mine casualties; improve coordination between organizations working on mine victim assistance by establishing working bodies; develop quality standards for orthopedic and medical rehabilitation; enhance professional development, vocational training, and employment of mine survivors; and amend existing legislation on the rights of persons with disabilities.⁶⁶

A VA sub-strategy for 2009–2019 drafted in 2008 focused on the provision of comprehensive assistance, development of sustainable systems, improved coordination and data collection, and adjustment of existing laws.⁶⁷

In addition, in May 2008, the BiH Council of Ministers reviewed and officially adopted a Disability Policy. The policy proposed the development of an institutional model for assessing the legal status and needs of all persons with disabilities; accessible social security for persons with disabilities; improved rights for working conditions; and inclusion of persons with disabilities in medical care, rehabilitation, education, training, and employment. Mine survivors and their representatives had input in the drafting of the document.⁶⁸

Due to the dual-entity and multi-cantonal governance systems of BiH, there can be no practical national ownership of VA, or of disability issues generally.⁶⁹ BHMIC is responsible for VA coordination, but not its management.

Data collection and management

Casualty data management is the responsibility of BHMIC which enters data into the Bosnia and Herzegovina Mine Action Information System (BH MAIS) database. Monthly RE activity reports are also entered into the database.⁷⁰

⁷⁰ BHMIC "Mine Action Annual Report, Bosnia and Herzegovina, 2008," undated but 2009, p. 16.

In 2008, RCSBiH, together with the NGO HOPE'87 and BHMAL, worked on revising casualty records from seven databases that had been provided by partner organizations and compiled by BHMAL into a single database in 2006.⁷¹ The unified database project missed its planned completion date of November 2008 but was reportedly nearing completion in June 2009.⁷² Data is shared with ministries and NGOs who have signed a memorandum of understanding with BHMAL. The unified database was also due to be integrated into the health information system by 2009.⁷³ Integration means that data shared with entity ministries will be used to improve planning of health services according to locations with the greatest needs.⁷⁴

From 1996 to 2005, the ICRC and the RCSBiH collected mine casualty data and provided up-to-date information on mine/UXO incidents nationwide. Several other databases on casualties or survivors were maintained by NGOs, and casualty data was collected during the 2003 LIS. In 2005, responsibility for the ICRC/RCSBiH casualty database was passed to BHMAL. In 2006, the RCSBiH continued to operate its database due to a lack of capacity at BHMAL and there were still four separate mine/ERW casualty or survivor databases, but planning for the current unification and verification of the data was underway.⁷⁵ A system for recording VA services to individual survivors was established by BHMAL in 2007. Complete data from service providers for 2008 had not been received as of June 2009.⁷⁶

Plans

Strategic mine action plan

BHMAC conducted a general assessment of mine action at the end of 2007 and beginning of 2008 and used the results, together with financial, operations, and resources plans as the basis for a new BiH Mine Action Strategy 2009–2019, which was approved on 24 April 2008.⁷⁸

The assessment calls for revision of national mine action legislation in order to:

- establish stable and continuous funding of mine action from government and local authority budgets;
- develop local government responsibility for mine action with a focus on planning and prioritizing, RE, and measures prohibiting movement of ERW;
- criminalize the destruction or removal of mine warning signs; and
- improve the social security of deminers.⁷⁹

The new strategy sets BiH the target of becoming free of mines by 2019. To accomplish this, BiH has set seven strategic goals, including “elimination” of the threat of mines, increased funding for mine action, RE, VA, technical development and research, and advocacy. It also foresees three future revisions of the strategy in 2012, 2015, and 2017.⁸⁰

BiH identifies three priority categories of suspected hazardous areas:

1. areas needed for movement of the local population and occasional users and locations with resources for economic development;
2. locations that are used occasionally or border first priority locations; and
3. remote areas along former confrontation lines, without known minefields but with possible ERW, and unused by the local population.⁸¹

The first and second categories are to be released through general and technical survey and clearance with continuing prevention measures, including urgent and permanent marking and RE. The third category will be dealt with through urgent and permanent marking, RE, and the introduction of a law imposing penalties for trespassing on marked and/or fenced mined areas.⁸²

⁸¹ Article 5 deadline Extension Request (Revision), 27 June 2008, p. 10.

⁸² BiH presentation of Article 5 deadline Extension Request, Ninth Meeting of States Parties, Geneva, 25 November 2008.

BiH Armed Forces and the Civil Protection Agencies submitted their strategies in February 2009 to BHMAC, which confirmed they are in compliance with the national mine action strategy.⁸³ The strategies were also sent to the Demining Commission for approval but as of July 2009 had not been accepted.⁸⁴

The VA sub-strategy had not yet been officially adopted as of 24 July 2009.⁸⁵

National ownership

Commitment to mine action and victim assistance

The involvement of BiH's Council of Ministers in the oversight of mine action underscores the importance national leaders attach to a sector that is regarded as a key to recovery from the 1992–1995 conflict. Mine action has been essential to the rehabilitation of essential infrastructure, to facilitate the return of up to 2.2 million people displaced by fighting, and to open up land and other resources. Until 2008, however, BiH did not commit its own funding to mine action and depended entirely on international donor support, which left a big gap between the resources available and the sector's financial needs. BiH was stepping up its financial commitment to mine action by seeking to pass a mine action law that would remedy this deficit and mobilize the necessary funding from national sources (see National mine action legislation section below).⁸⁶

The BHMAC staff responsible for VA coordination and casualty data management are nationals and no involvement of external advisers was reported.⁸⁷ Budgeting for VA was to be linked to the VA sub-strategy of the BiH Mine Action Strategy 2009–2019.⁸⁸

National management

The BiH mine action program is fully nationally managed. Since December 2008, there have been no international advisors for mine action in BiH.⁸⁹

National budget

International donors provided almost all funding for mine action with only a small amount coming from local budgets and entity governments. BiH has repeatedly cited lack of financial support as one of the main reasons for slow progress in clearance over the past 10 years.⁹⁰

The Mine Action Strategy 2009–2019 estimated the cost of completing clearance by 2019 at BAM790 million (US\$594.3 million).⁹¹

National mine action legislation

The 2002 Demining Law created the present framework for managing mine action in BiH, ending the previous autonomy of the EMACs.⁹² A new mine action law under consideration by parliament as of March 2009 provides for federal, state, and municipal governments to make up any shortfall in donor support in order to provide stable and continuous funding of mine action.⁹³

National mine action standards/Standing operating procedures

BHMAC has drawn up 15 chapters of national standards that it says are based on and in compliance with the International Mine Action Standards.⁹⁴ All demining organizations have their own internal QA staff. Final quality control is undertaken by BHMAC inspectors.⁹⁵

The general survey SOPs were revised in 2008 and include new chapters focusing on general assessment of the mine situation. The basis of the new SOPs is collection of more comprehensive data on impacted communities and mined areas. This approach will provide important information for RE implementation as well as improved community liaison, which will lead to better prioritization.⁹⁶ No SOPs for VA were reported.

Demining and Battle Area Clearance

BiH had 35 accredited demining organizations at the end of 2008, including six governmental bodies (BiH Armed Forces, FBiH Civil Protection Agency, RS Civil Protection Agency, Brčko District Civil Protection Agency, MDDC, and the RCSBiH), 14 NGOs (nine local and five international) and 15 commercial companies (13 local and two international). Accredited organizations operated a total of 37 machines, 1,336 detectors of different types, and a total of 45 accredited MDD teams.⁹⁷

BHMAC had 58 surveyors, deployed in 29 survey teams. Eight senior planning officers were assigned to regional offices. BHMAC also had 36 inspectors in regional offices in Sarajevo and Banja Luka, and in the Department for Quality Assurance headquarters, which between them conduct 8,000 inspections a year.⁹⁸

Identification of hazardous areas

BiH has continued general, systematic and technical survey since 1998, spurred by the low quality of minefield records in BiH.⁹⁹ The Mine Action Strategy 2009–2019 calls for completing general survey activities by 2012 in order to provide a basis for revising the mine action strategy.¹⁰⁰

In 2008, BHMAC survey teams surveyed a total of 142.97 km² (4% more than planned), resulting in preparation of 628 projects for technical survey and clearance.¹⁰¹ The teams surveyed 2,088 suspected areas, including 1,061 areas that were resurveyed, 862 newly surveyed, and 165 locations that were found to have no identified risk.¹⁰² Some 29km² of land was released as a result of general survey and 41km² was released after systematic survey involving desk analysis of suspected areas.¹⁰³

NPA remains the only organization that supports BHMAC in general survey, land release, and preparing tasks for technical survey and clearance, working from BHMAC regional offices in Brčko, Pale, and Travnik.¹⁰⁴ NPA surveyed a total of 34.7km², releasing 23.1km² and identifying 11.6km² as suspect.¹⁰⁵

Regional BHMAC offices have permanently marked 88 areas covering 8.8km² (one-quarter of the 35km² which they plan to mark).¹⁰⁶ A further 18 permanent marking tasks covering a total area of 1.3km² were being carried out as of January 2009, and tenders had been invited for 10 more projects on an area of 699,900m².¹⁰⁷

As part of general survey operations, BHMAC's survey teams placed 6,487 mine-warning signs in 2008, a little more than half the planned number. RE NGOs placed 155 signs for urgent marking.¹⁰⁸

¹⁰⁸ Ibid.

Mine clearance

Demining operators manually cleared 3.16km² in 2008, up more than one-third compared with 2007 but as in previous years, BiH still cleared much less—barely half—of the amount planned.¹⁰⁹ BHMAC stated that planning was realistic in terms of available capacity but it did not receive sufficient funding to deploy all the available assets. A further 11.6km² was released through technical survey.¹¹⁰ Demining operations combined with all forms of survey resulted in release of a total of 84.8km², representing less than half (46.2%) of the amount planned.¹¹¹

In the bid to meet its Article 5 deadline extension request goals, BHMAC set a target of releasing 151.67km² in 2009, including 9.5km² through demining, 21.5km² through technical survey, and 115.75 km² through general and systematic survey. BHMAC projected the total cost for 2009 at around €40 million (approximately \$58.9 million). It reported in May 2009 that it had secured 65% of the funding needed and expected to cover the shortfall through “rebalancing of local budgets.”¹¹²

The share of demining organizations in total clearance operations in 2008 remained almost unchanged from 2007.¹¹³ Eleven NGOs cleared nearly half (47.25%) of the total demined area, eight commercial companies cleared 32.38%, and state bodies, including three Civil Protection Agencies and the Armed Forces, cleared 20.4%.¹¹⁴

There were six demining accidents in which six deminers were killed and three injured during 2008.¹¹⁵ All accidents are recorded as the result of mistakes made while clearing mines. All six fatalities were caused by PROM-1 mines, five occurring during technical survey operations and one during demining. The fatalities included a deminer from the RS Civil Protection Agency killed in March, two deminers from Demira also killed in March, two Tehnoelektro deminers killed in July, and a UEM deminer killed in October. Deminers from Demira, N&N IVSA company, and the BiH Army suffered injuries.¹¹⁶

Quality assurance/Quality control

BHMAC conducted 5,479 technical inspections (68.48% of planned inspections) on 567 demining sites in 2008, an average of 9.67 inspections per demining site. These resulted in 32 decisions calling for re-clearance and 10 decisions temporarily suspending clearance operations.¹¹⁷

¹¹⁸ Ibid, pp. 8–11.

¹¹⁹ HI reported it cleared 51,473m² of mined area, 33 antipersonnel mines, two antivehicle mines and 11 UXO. Email from Emmanuel Sauvage, Regional Programme Director, South-East Europe, HI, 4 September 2009.

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, BiH was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. BiH submitted the first draft of its request for a 10-year extension of its Article 5 deadline in March 2008 together with a new strategy for clearance. A revised version was submitted in June 2008 and presented at the Ninth Meeting of States Parties, which approved the request but noted that BiH “still faces a significant remaining challenge in order to fulfill its obligations under Article 5.” It also observed that “success is contingent upon increased performance in technical survey, an ongoing, although decreasing, high level of donor funding and the initiation of and thereafter constantly increased funds provided by local governments.”¹²⁰

The Mine Action Strategy 2005–2009 had called for reducing the mine/UXO risk and its associated socio-economic impact “to an acceptable level.”¹²¹ The strategy for 2009–2019 envisions BiH free of mines by 2019,¹²² but BHMAL still says achieving this target is conditional on receiving adequate external financing.¹²³

Demining from 1999–2008¹²⁴

Year	Mine clearance (km ²)	Area released by survey (km ²)
2008	3.16	81.64
2007	2.34	170.36
2006	3.30	236
2005	4.00	219
2004	4.20	480.5
2003	6.67	57.26
2002	6.33	0
2001	5.54	0
2000	7.11	0
1999	6.55	0
Total	49.20	1,244.79

BiH failed to meet the first target set by its extension request, whereby as of the start of the extension period in 2009 it was to have reduced the estimated area of contamination to 1,573km². To achieve this, BiH should have completed clearance and area reduction or cancellation of 165km² in 2008, but it achieved only a little over half of this amount (85km²).¹²⁵ Moreover, the extent of the residual task remains unclear and the assumptions on which completion within 10 years are based appear unrealistic when compared with past performance.¹²⁶

¹²⁰ Decision on the BiH Article 5 deadline Extension Request, Ninth Meeting of States Parties, 28 November 2008.

¹²³ Interview with Ahdin Orahovac, BHMAL, in Šibenik, 17 April 2008.

¹²⁴ See previous editions of Landmine Monitor.

¹²⁵ Article 5 deadline Extension Request (Revision), 27 June 2008, p. 26.

¹²⁶ See *Landmine Monitor Report 2008*, pp. 180–181.

A lack of funding was responsible for BiH missing its targets in 2008 as it did in previous years.¹²⁷ The extension request draws attention to past funding constraints on operations and notes “a big discrepancy between realistic needs for mine action in BiH and possibilities of the country and its supporters.”¹²⁸ Yet the extension request still envisages a rise of more than half in projected mine action expenditure to more than BAM78 million (\$58.7 million) a year from 2009–2019 without showing how this will be achieved. Close to half of the projected funding in 2009 and two-thirds of funding in 2019 was supposed to come from “new sources (local government budgets).”¹²⁹

Risk Education

In 2008, 16 organizations were accredited to conduct RE.¹³⁰ RE was conducted through school-based RE, community integrated mine action plans (CIMAPs), and by clearance organizations. In 2008, 24,500 people were reached through RE, an increase from 9,176 in 2007 but lower than 2006, when 31,021 people were reached.¹³¹

RE management training was held by BHMIC with UNICEF support for the representatives of 10 organizations (governmental, NGO, and commercial).¹³² A national NGO, STOP Mines, provided training for 27 RE instructors from 13 organizations, with the financial support of UNICEF and Handicap International (HI).¹³³

In 2008, a new planning methodology was implemented to improve mine action planning at a municipal level and develop an interactive combination of different mine action components (clearance, technical survey, permanent marking, RE, and VA) within the municipality. This plan aims to give more responsibility to local government and involved the local community in the decision making process.¹³⁴

Community Integrated Mine Action Plans (CIMAPs) continued to be developed and implemented during 2008: 10 CIMAPs were prepared and seven of these were implemented. CIMAPs are developed for every impacted community and integrate general survey data with RE data. They include a separate RE assessment within the CIMAP. Following two RE evaluations in 2007, meetings with the ministries of education were initiated and UNICEF supported BHMIC by employing a consultant to further develop the municipal mine action planning system.¹³⁵

In 2008, BHMIC met with the entity and cantonal ministries of education to discuss integration of RE into the education system. Although all 13 ministries of education were invited, only four attended.¹³⁶ RE is integrated into the school curriculum as an extracurricular lesson, to be conducted six times a year in high-impacted communities, and four times a year in low-impacted communities. However, although all materials were developed and distributed to schools, the proper training was not conducted and the program was not functional as of July 2009.¹³⁷

NGOs engaged in RE activities conducted marking of hazardous areas.¹³⁸ UNICEF provided 3,700 mine-warning signs to BHMIC for emergency marking.¹³⁹

EUFOR	Doesn't have accreditation but conducts RE according to its special status provided by Dayton Peace Accords	RE implementation	21 communities across BiH	6,928 children

Extensive RE has been conducted since 1999, through BHMIC and the EMACs, UNICEF, UNDP, ICRC, and the RCSBiH, the ministries of education, Civil Protection Agencies, and numerous NGOs. Methods included school-based RE, community-based RE, media, and data

gathering.¹⁴¹ By 1999, all primary school teachers were trained in RE, and it has been conducted in secondary schools since 2000.¹⁴² RE has been conducted through theatrical productions of “Little Red Riding Hood” and through sport by the NGO Spirit of Soccer.¹⁴³ In 2000 RE began to focus on returnees and refugees.¹⁴⁴ RE has also been conducted by SFOR for its troops. HI ran a project in 2004–2007 to develop sustainable RE capacity in schools and communities.¹⁴⁵ An evaluation in 2007 found that there was no uniform method of teaching, the level of participation by schools was unclear, and there was no monitoring by BHMAL. However, HI ended its support to RE in December 2006, so it was unclear how the recommendations of the evaluation could be implemented.¹⁴⁶

Coordination mechanisms, working groups and RE standards have existed for at least 10 years,¹⁴⁷ but have been developed over the years. In 2002, UNICEF appointed an RE specialist to develop BHMAL’s capacity.¹⁴⁸ In 2003, RE started to be more closely integrated with mine action and clearance organizations started to conduct RE.¹⁴⁹ By March 2004, an RE strategy was developed that integrated RE into the overall mine action strategy. By the end of 2004, BHMAL had developed a system for RE planning at community level through the CIMAPs.¹⁵⁰

In 2006, BHMAL developed SOPs for RE.¹⁵¹ In 2007, 10 out of the 23 organizations that applied did not fulfill requirements for accreditation contributing to a sharp downturn in RE activity.¹⁵² An evaluation of the UNICEF program found that the SOP was unnecessarily restrictive and hindered community participation. It also concluded there was no longer a need for UNICEF support, based on low casualty rates, a limited risk-taking group, and the established capacity of BHMAL and Civil Protection Agencies.¹⁵³

Victim Assistance

The total number of survivors is unknown due to BHMAL’s continuing work to verify and unify data; a 2005 estimate put the number at approximately 3,919.¹⁵⁴ The main improvement in services to mine/ERW survivors since 1999 has been increased emergency response capacity and faster response times since 2006.¹⁵⁵ In 2008, emergency medical care and transportation was reportedly adequate and improving. Demining and Civil Protection Agency personnel are usually first on the scene of an incident and provide emergency transportation of mine/ERW survivors.¹⁵⁶

Healthcare systems overall are generally reported to be adequate. Health services are free of charge for people with life-threatening conditions or with insurance, but approximately 50% of persons with disabilities did not have health insurance.¹⁵⁷ The Ministry of Health (MoH)

of the FBiH has noted that many people, including mine survivors, who do not register for unemployment benefits within the prescribed 30-day period, experience a lack of access to health insurance and health services. From 2008–2009, the cantons of the FBiH accepted an arrangement with the FBiH MoH to provide a basic package of healthcare services to all people, including mine survivors, who are not insured. As of May 2009, the arrangement was yet to be fully implemented.¹⁵⁸

In the last decade, BiH has faced many challenges in providing rehabilitation and prosthetics services, including poor quality devices, lack of trained technicians, and few choices of services for survivors. However, the situation has improved and BiH now has a wide range of health and rehabilitation facilities available to mine/ERW survivors. The FBiH has rehabilitation centers, spas, and 38 community-based rehabilitation (CBR) centers for psychological and physical rehabilitation, which provide assistance to mine survivors. The RS has 23 CBR centers situated within other health institutions. BiH reported that CBR centers significantly improved access to the rehabilitation services by mine survivors.¹⁵⁹ From 2008–2009, there was a nationwide survey of the centers, to assess the outputs of the CBR system, as well as its existing capacity and needs. As of May 2009, some 42 of the 60 CBR center questionnaires on accessibility, equipment, staff education levels and community connection had been returned and analyzed.¹⁶⁰

New developments were reported in capacity-building of rehabilitation services. The Miracles Center for Prosthesis and Care in Mostar, completed in August 2008, was specifically built to provide for the needs of mine survivors. The center also offers short-term free accommodation for beneficiaries who have to travel to access care at the center.¹⁶¹ However, Miracles, a British NGO, reported a continuing lack of prosthetic technicians qualified to international standards in BiH.¹⁶²

In 2008, the NGO Human Study, in cooperation with Don Bosco University of El Salvador, the International Society for Prosthetics and Orthotics (ISPO), and HI, began implementation of a prosthetic and orthotic education program to address the lack of modern services and trained practitioners in the Balkans region. The course was providing distance education in prosthetics and orthotics to ISPO category II for 13 students in the region (one from BiH, six from Croatia, one from Macedonia, and five from Serbia).¹⁶³ In 2008, the Center for International Rehabilitation (CIR) in Tuzla ran a project for prosthetic training of students from BiH for ISPO category II accreditation. In 2009, the FBiH MoH continued cooperation with the CIR to improve national prosthetics capacity.¹⁶⁴ By October 2008, HOPE'87 established pain therapy departments linked to clinical centers and CBR centers. In 2008, HOPE'87 also worked on a project aimed at creating a pain management network throughout BiH, to be completed by early 2010.¹⁶⁵

As in past years, in 2008, BiH stated that psychological support was available through CBR centers which were reported to be fully operational and open to all in need.¹⁶⁶ According to recent research, however, there is a lack of political will to address psychological support needs and consequently, funding for services is minimal. There remained a high level of need for psychosocial assistance for people who have suffered war and postwar trauma, including mine survivors. Stigmatization of psychological support remained a problem, particularly among war veterans who are often referred to psychiatric institutions and centers for mental health, which

principally treat severe psychiatric disorders. Psychiatric clinics in Sarajevo and Tuzla have specific departments for the treatment of traumatic stress.¹⁶⁷

The great majority of persons with disabilities are unemployed.¹⁶⁸ The Fund for Employment of Persons with Disabilities of the RS co-financed an NGO economic reintegration project for mine survivors that ended in October 2008.¹⁶⁹ In 2007, engagement of the Fund in economic reintegration for mine survivors was announced as a plan for implementing BiH victim assistance objectives.¹⁷⁰ All reported economic assistance activities for survivors are provided by NGOs.

The law in both entities prohibits discrimination against persons with disabilities but discrimination persisted in employment, education, access to health care, and other state services. Laws requiring that buildings are accessible to persons with disabilities were not adequately enforced. Discrimination between civilian and military survivors persisted, the latter receiving a privileged status above civilian war injured.¹⁷¹ In 2008, access to education for students with disabilities improved. The Office of the Ombudsperson for Persons with Disabilities was set up and a National Implementation Plan on Social Inclusion 2007–2008 was produced.¹⁷² FBiH legislation for improving economic reintegration of persons with disabilities was still pending final approval in early 2009.¹⁷³

BiH signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol on 29 July 2009 but has not yet ratified either.

Progress in meeting VA26 victim assistance objectives

BiH is one of the States Parties with significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing for the care, rehabilitation and reintegration of survivors.¹⁷⁴ BiH presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005. The objectives were not revised and no plans to achieve them have been presented.¹⁷⁵ Only three of the BiH’s 14 objectives were time-bound and no clear responsibilities were assigned for their implementation. Of the three time-bound objectives, only one—to increase efficiency of medical interventions by 2009—was completed by the deadline. The other two, to integrate mine casualty data collection into a nation-wide injury surveillance system by 2009, and to ensure every mine survivor has access to psychological support services, if needed, by 2009 were yet to be accomplished as of June 2009.¹⁷⁶

In 2007, BiH convened two VA workshops to refine objectives and elaborate a VA plan. However, results from these workshops were only used to guide the 10-year sub-strategy and not the work for the period under review (2005–2009).

BiH included a VA expert on its delegation to the intersessional Standing Committee meetings in 2007, and at the Meetings of States Parties in 2005, 2007, and 2008.¹⁷⁷

Victim assistance activities

Landmine Survivors Network BiH (LSN BiH)¹⁷⁸ continued the implementation of its program in BiH, while completing its transition to becoming a national NGO. In 2008, LSN BiH provided assistance to at least 635 survivors who received peer support services. LSN BiH made 5,258 home visits and 217 hospital visits to survivors and other amputees, 170 new survivors/amputees entered the program, 16 survivors/amputees were in groups for social integration, 39 in groups for economic integration, 90 survivors/amputees in groups for advocacy and rights of persons with disabilities, 157 received direct assistance packages, and 15 survivors were assisted in getting prosthetic orthotic devices. More than 200 survivors participated in LSN social, cultural, educational, and sporting events. LSN BiH provided 30 survivors with small business training, assisted in helping to get 37 small businesses started and extending another 50 small businesses, and helped four survivors/amputees find employment.¹⁷⁹ LSN BiH reported that 92% of the survivors helped with their economic reintegration activities continued to run their own businesses, and 12% of the survivors it assisted employed additional workers.¹⁸⁰

In 2008, Mercy Corps Scotland assisted 86 mine survivors (six more than began the project initially) with economic reintegration activities, in cooperation with LSN BiH. Of the total beneficiaries, some 80% were engaged in agriculture and 20% in craft, production, or services. The program continued in mid-2008 with a new group of 90 survivors receiving economic reintegration packages in an 18-month project due to finish in January 2010, and another 20 survivors receiving only education support.¹⁸¹

One mine survivor received assistance at the Institute for Rehabilitation Republic of Slovenia, with the support of LSN BiH.¹⁸² LSN BiH also organized the 10th Sitting Volleyball tournament in September 2008.¹⁸³ The International Sitting Volleyball tournament was held in Sarajevo in May 2008 with support from the ITF. The NGO ECO Sport Group provided sports diving activities for mine survivors in 2008, as in past years. STOP Mines also continued their socio-economic reintegration support program, “Sustained Professional Rehabilitation of Mine Victims in BiH,” which was due for completion in June 2009.¹⁸⁴

World Vision United States assisted 56 people (18 children), including mine survivors, with prosthetics and rehabilitation at the University Clinical Centre in Tuzla.¹⁸⁵

From 2008–2009, the NGO Amputee Association (Udruženje Amputiraca, UDAS) based in Banja Luka provided information on healthcare for amputees, economic reintegration assistance in cooperation with LSN BiH, as well as sporting and art and cultural activities for mine survivors and other amputees.¹⁸⁶

Support for Mine Action

In its revised Article 5 deadline extension request, submitted in June 2008, BiH estimated funding needed to meet its mine clearance obligations at BAM790.4 million (\$594.3 million) for the period 2009–2019. The budget consists of BAM742.4 million (\$558.5 million) for survey, area reduction, clearance and QA; BAM13.9 million (\$10.5 million) for RE; BAM32.4 million (\$24.4 million) for VA; BAM850,000 (\$639,000) for research and development; and BAM920,000 (\$677,000) for advocacy.¹⁸⁷ Annual cost estimates are roughly consistent across the extension period, averaging BAM79 million (roughly \$59.5 million per year, with a low of BAM75.28 million (\$56.6 million) in 2018 and a high of BAM80.14 million (\$60.3 million) in 2012.¹⁸⁸

BiH's revised Mine Action Strategy 2009–2019 acknowledges the need to continue transition from international to national and local responsibility for resource mobilization, but states that BiH still must rely on substantial international donor support for fulfillment of its current mine action strategy. Beginning in 2008, the strategy calls for annexes and amendments of national mine action law to "secure additional and continuous funding through national budgets."¹⁸⁹

The revised Article 5 deadline extension request cites a lack of funding along with the scale of the mine problem as the main reasons for BiH's failure to fulfill its mine clearance obligations in line with the original treaty deadline.¹⁹⁰ The request states that the adoption of new mine action legislation (pending as of June 2009) would "create conditions for stable and continuous funding" from local budgets. The Mine Action Strategy 2009–2019 calls for annual reviews and adjustments of financial plans, and for funding from national sources to increase each year beginning in 2009.¹⁹¹

National support for mine action

In 2008, overall spending on mine action was €31 million (\$45.7 million). Of this amount, roughly €20 million (\$29.5 million) or 65% was reported to have come via the ITF or bilateral funding from international donors.¹⁹² This would leave approximately €11 million (\$16.2 million), or 35%, in funding from national sources (including federal and local sources). In its revised Article 5 deadline extension request, BiH projected national allocations totaling BAM20.1 (\$15.1 million) in 2008.¹⁹³ In comparison, in 2007 BHMAL reported national funding totaling BAM19,419,177 (\$13,618,669), or 40.4% of total funds.

For the 2009–2019 extension period, of the approximately €400 million (\$589 million) total estimated cost for mine clearance, BiH has projected that €325 million (\$479 million), or 81%, will come from state budgets.¹⁹⁴

In December 2008, the director of BHMAL stated that national funds for mine clearance came mainly from the Armed Forces and Civil Protection Agencies budgets, with some additional funds coming from municipalities, cantons, the electrical utility, and forestry agencies. The director stated that overall allocation of funds is not regulated in BiH and, without more active involvement by the government in financing mine action, international donors may withdraw their support.¹⁹⁵

International cooperation and assistance

In 2008, 11 countries and the EC reported providing \$24,550,453 (€16,671,501) to mine action in BiH, which is approximately 43% more than reported in 2007. According to BiH's proposed mine clearance strategy, annual donor support for mine action during the period 2008–2012 is projected to be €10–15 million, decreasing gradually afterward to €2.5 million a year in the last years of the extension.¹⁹⁶

In May 2009, BiH stated that, with “regular funding,” it could achieve its mine clearance targets for 2009 as reported to the Standing Committee meetings. Total funds required for mine action in 2009 were estimated to be roughly €40 million, with 65% of funds being raised as of May 2009. BiH stated that the remaining funds would likely be covered by “rebalancing of local budgets.”¹⁹⁷

Funding at 2008 levels, with both national and international contributions totaling roughly \$39.8 million, is not sufficient to meet BiH's mine action needs according to its own plans described in the Article 5 deadline extension request. In both 2007 and 2008, reported international funds did not take into account the costs of VA, which only one donor reported funding directly in 2008, although the ITF reported contributions to VA during this period.

The ITF reported that 53% of BiH's mine clearance program is funded via the ITF.¹⁹⁸ In 2008, it allocated \$18,232,963 (59%) to BiH.¹⁹⁹ Funds for BiH were allocated to mine and UXO clearance, structural support, VA, RE, training, and other operational or program expenses.²⁰⁰

In addition to the above funds, Sweden provided funds for UNDP through ITF and contributions to the ITF in 2008 were also reported from Belgium, Hungary and the United Kingdom, as well as from local and national sources and NGOs.²⁰¹

BURUNDI

2008 Key Data

State Party since	1 April 2004
Contamination	Antipersonnel mines, UXO
Estimated area of contamination	Unquantified; small residual mine and ERW threat
Casualties in 2008	4 (2007: Unknown but eight reported)
Estimated mine/ERW survivors	Unknown but estimated 523–1,311
Demining in 2008	Clearance of 29,445m ² of mined/battle areas Release of 53,384m ² of suspected mined/battle areas
Article 5 (clearance of mined areas)	Deadline: 1 April 2014
Support for mine action in 2008	International: \$1,094,632 (2007: \$1 million)

Ten-Year Summary

The Republic of Burundi became a State Party to the Mine Ban Treaty on 1 April 2004. It enacted national implementation legislation in October 2008 and completed stockpile destruction in March 2008. There were credible allegations of use of antipersonnel mines by both government and rebel forces in the past, but none involving government forces since the treaty entered into force in April 2004, and none involving rebels since peace negotiations started in May 2006.

Despite being slow to initiate a demining program, Burundi has made significant progress in addressing its mine problem since international NGOs initiated clearance operations in 2005. By May 2009, Burundi was close to fulfilling its Article 5 obligations for the clearance of mined areas well in advance of its 1 April 2014 deadline. Burundi's antipersonnel mine problem has proved to be less than originally feared. It also has a residual threat from explosive remnants of war (ERW).

From 1999 to 2008, Landmine Monitor identified 826 mine/ERW casualties (218 killed, 523 injured, and 85 unknown), though there is a lack of effective data collection. Mine/ERW risk education activities continued to decrease in 2008, as a response to the reduced level of need resulting from previous risk education activities and the clearance of most hazardous areas. Burundian survivors, along with other persons with disabilities, have limited access to support or services.

Mine Ban Policy

Burundi signed the Mine Ban Treaty on 3 December 1997 and ratified it on 22 October 2003, becoming a State Party on 1 April 2004.

The Burundi National Assembly adopted a national implementation law on 25 September 2008, followed by the Burundi Senate on 28 September 2008. The law was promulgated by the President of Burundi on 10 October 2008.¹ Although Burundi reported the enactment of the law at the Ninth Meeting of States Parties, it did not provide further details on the law's contents in its Article 7 transparency report submitted in 2009.

¹ Statement of Burundi, Ninth Meeting of States Parties, Geneva, 24 November 2008.

Burundi submitted its fifth annual Article 7 report on 30 April 2009. The report covers the period from 30 April 2006 to 30 April 2009.²

Burundi participated in the Ninth Meeting of States Parties in Geneva in November 2008, where it made statements during the general exchange of views, as well as statements on mine clearance and victim assistance (VA). Burundi also attended the intersessional Standing Committee meetings in May 2009, where it also provided information on mine clearance and VA.

Burundi has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party to the treaty, foreign stockpiling or transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Burundi is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions in December 2008, but had not yet ratified as of 1 July 2009.³

Production, transfer, use, and stockpiling

Burundi has stated that it has never produced antipersonnel mines.⁴ It is not known to have exported antipersonnel mines. There have been credible allegations of use of antipersonnel mines by both government and rebel forces in the past.⁵ Since the Mine Ban Treaty entered into force for Burundi on 1 April 2004, there have been no confirmed instances of use of antipersonnel mines by the army.

Burundi completed the destruction of its stockpile of antipersonnel mines on 17 March 2008, ahead of its treaty-mandated deadline of 1 April 2008. It destroyed a total of 664 mines, including 591 POMZ-2M and 73 TS-50 mines.⁶ The 664 mines destroyed exceeded the 610 reported as stockpiled as of April 2007.⁷

Burundi has reported retaining two POMZ-2M and two TS-50 mines for training purposes.⁸

In its Article 7 report submitted in 2009, Burundi reported that in April 2009 a cache of 41 TS-50 antipersonnel mines was discovered in the village of Mabayi, Cibitoke province. It said the mines were being held for the time being by Mines Advisory Group (MAG), which indicated that the mines were subsequently destroyed.⁹

After stockpile destruction in 2008 and 2009, Burundi stated that the total number of mines held by the National Forces of Liberation (Forces Nationales de Libération, FNL),¹⁰ the last remaining rebel group, remained to be confirmed.¹¹ The FNL and the government signed a

² Previous reports were submitted on 1 July 2008 (covering the two-year period from 30 April 2006 to 30 April 2008), 30 April 2006, 9 August 2005, and 8 November 2004. The November 2004 report is not posted on the UN website, but Landmine Monitor has a copy.

³ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 49.

⁴ Article 7 Reports, Form E, 8 November 2004 and 9 August 2005.

⁵ See *Landmine Monitor Report 2004*, pp. 234–237. Burundi officials have regularly denied allegations against government forces.

⁶ Twelve of the POMZ-2M mines were from former rebel National Council for the Defense of Democracy-Forces for the Defense of Democracy (Conseil National pour la Défense de la Démocratie-Forces pour la Défense de la Démocratie, CNDD-FDD) stocks, and the rest were from army stocks. UNDP and MAG provided assistance with the destruction program. CNDD-FDD signed the Geneva Call Deed of Commitment in 2003. Statement of Burundi, Standing Committee on Stockpile Destruction, Geneva, 2 June 2008. See also Article 7 Reports, Forms F and G, 1 July 2008 and 30 April 2009.

⁷ Statement of Burundi, Standing Committee on Stockpile Destruction, Geneva, 23 April 2007. In this statement, Burundi informed States Parties that, after reviewing its mine inventory, it concluded that it had 610 antipersonnel mines in stock, and not the 1,212 previously declared on several occasions.

⁸ Article 7 Report, Form D, 30 April 2009.

⁹ Ibid, Forms B and D; and email from Julie Claveau, Country Programme Manager, MAG, 3 August 2009.

¹⁰ FNL was formerly known as Palipehutu-FNL. In January 2009 they formally dropped the first part of their name in order to become a political party.

¹¹ Article 7 Reports, Form B, 1 July 2008 and 30 April 2009. In April 2007, Burundi stated that its reporting on stockpiles could not be considered complete until the FNL revealed its stockpile, which it had not done up to that time. Interview with Remy Bacamurwanko, Director, Mine Action Section, Ministry of Defense, in Geneva, 26 April 2007.

Cessation of Hostilities Agreement on 26 May 2008.¹² In April 2009, FNL combatants began demobilization and the surrender of weapons to the African Union Special Task Force.¹³ There have been no reports of antipersonnel mines being handed in.

Landmine Monitor has not received any allegations of mine use since May 2006, when negotiations to end hostilities began. Prior to May 2006, the government had accused the FNL of sporadic mine use.¹⁴

Scope of the Problem

Contamination

As of May 2009, Burundi had a small residual threat from mines and ERW, the legacy of 13 years of internal conflict.¹⁵ DanChurchAid (DCA) declared that more than 90% of “known hazardous areas” were cleared before operations were disrupted by persistent threats from FNL non-state armed groups (NSAGs).¹⁶ The Swiss Foundation for Mine Action (FSD) stated that despite the lack of any declaration of Article 5 compliance by the government, no “meaningful clearance work” was left to be done.¹⁷

Burundi has declared that only two suspected hazardous areas (SHAs) remained from the more than 230 identified by an FSD general survey in 2005–2006 as well as subsequent survey by demining operators.¹⁸ The uncompleted areas are in Mpishi, Mussigati commune, and Mwico, Kanyosha commune; these are located in Bujumbura Rural and Bubanza provinces, respectively.¹⁹ FSD cautioned, however, that a further 58 SHAs had been recorded in the first half of November 2008 on the hills facing the Kibira park area as a result of FNL activity.²⁰ However, the information about the SHAs, which resulted from a new general survey by FSD, was quite general. FSD’s former program manager believed that the number of affected areas would prove to be considerably lower than initially reported.²¹

The FSD general survey identified a widespread but low intensity ERW threat that included mortar rounds, rockets, rocket-propelled grenades, artillery shells, and aircraft bombs.²² According to MAG, there is a particular problem with hand grenades: “Accidents also happen

¹² “Declaration Conjointe du Palipehutu-FNL et du Gouvernement de la Republique du Burundi Relative a la Cessation des Hostilités” (“Joint statement of Palipehutu-FNL and the Government of the Republic of Burundi Relating to the Suspension of Hostilities”), Bujumbura, 26 May 2008. The agreement requests the Joint Verification and Monitoring Mechanism (JVMM) to begin demobilization of combatants as per the previous 7 September 2006 Comprehensive Ceasefire Agreement. The 2006 agreement required the FNL to refrain from new mine use and sanctioned the JVMM, which included international monitors. Comprehensive Ceasefire Agreement, Dar es Salaam, 7 September 2006. when children play with grenades, unaware of the risks.”²³ Burundi has also indicated that an ERW threat might exist within the Kibira and Rukoko parks, which had been impossible to access because of FNL presence.²⁴

Casualties

As in previous years, the Humanitarian Department for Mine/UXO Action (Direction de l’Action Humanitaire contre les Mines et Engins non explosés, DAHMI) was unable to provide reliable casualty data for Burundi; information is therefore incomplete. In 2008, Landmine Monitor identified at least four new mine/ERW casualties, including two killed and two injured in two incidents. Two of these casualties were recorded by DAHMI, and two were reported in the media.²⁵ DAHMI identified one additional incident which could not be included in the Information Management System for Mine Action (IMSMA) database due to lack of information.²⁶

Casualties continued to be reported in 2009, with at least three people injured in three incidents as of May.²⁷ In February, a female of unknown age was injured in a mine incident in a house compound in Kanyosha (Bujumbura Rural province).²⁸ In March, a 12-year-old boy was injured by a mine while collecting wood in Musigati (Bubanza province).²⁹ In a separate incident in March, another person was injured in a field in Buterere (Bujumbura Mairie province).³⁰ There have also been reports of cows killed by mines around Kibira park, but the information has not been confirmed.³¹ DAHMI stated that casualties from the 2009 incidents had not yet been entered into IMSMA.³²

The total number of mine/ERW casualties in Burundi remains unknown and unverified. DAHMI reported at the end of 2008 that 1,561 casualties were registered (16% killed and 84% injured).³³ In 2008, however, Burundi reported several different figures, including 1,549, 1,551, and 1,556, always repeating that 16% were killed and 84% injured.³⁴ DAHMI stated that inconsistencies were due to double counting of IMSMA forms, but that the database has been “cleaned up” and verified.³⁵

From 1999 to 2008, Landmine Monitor identified at least 826 mine/ERW casualties, including 218 killed, 523 injured, and 85 of unknown status. Information on device type, activity, location, gender, and age was not systematically reported, and data provided by relevant authorities appeared to be conflicting. It appears that casualty rates started decreasing sharply in 2005 (14 casualties) and remained relatively low in the following years (2006: 15 casualties; 2007: eight casualties). However, during the same time period, mine action authorities were less capable of providing information.³⁶

³⁴ See *Landmine Monitor Report 2008*, p. 198. No period was given for when the casualties occurred.

³⁵ Email from Jean-Baptiste Hatungimana, DAHMI, 28 May 2009.

³⁶ Telephone interview with Jean-Baptiste Hatungimana, DAHMI, 11 May 2009; and see *Landmine Monitor Report 2008*, p. 197.

In May 2009, Burundi reported that the majority of casualties were adults between 21 and 50 years (50%), followed by youth between one and 20 years of age (34%). The majority of casualties were farmers (75%), followed by students (11%), and military personnel (3%). Burundi reported that the decrease in casualty rates since 2004 is due to risk education (RE) activities.³⁷

There is little data on persons with disabilities. In August 2008, a national census was completed in Burundi,³⁸ which included one question on the type of disability and one on the cause of disability.³⁹ As of August 2009, results of the census had not yet been released.⁴⁰ A 2006–2007 disability survey by Handicap International (HI) found that one in four (680 out of 2,630) persons with disabilities had been injured by mines and ERW.⁴¹ In March 2009, HI launched an assessment of the status of persons with disabilities in six provinces, but the results were not ready as of 2 June 2009.⁴²

Program Management and Coordination

Burundi's oversight of mine action has been vested in the National Civil Protection Service, within the Ministry of Interior and Public Security.⁴³ In April 2009, the service became the General Directorate for Civil Protection, and a new director was appointed.⁴⁴ On 11 February 2008, Burundi officially inaugurated DAHMI.⁴⁵

DAHMI is responsible for the coordination of mine action activities but does not coordinate or implement VA, which is the responsibility of several different ministries. The Ministry of National Solidarity reportedly has overall responsibility for VA.⁴⁶ Following its assessment mission in November 2004, the UN Mine Action Service (UNMAS) drafted a national VA strategy for Burundi, which has never been implemented.⁴⁷

Data collection and management

Burundi uses IMSMA.⁴⁸ In 2008, casualty data collection in Burundi remained inadequate, and no progress was made in expanding the coverage, accuracy, and detail of the IMSMA database. Although it was announced that IMSMA would be fully operational by December 2006 and detailed, verified data would be available by September 2007,⁴⁹ this was not the case as of May 2009. DAHMI reported that, although data collection was ongoing, as of October 2008 it was not able to enter data into IMSMA for logistical reasons.⁵⁰

In June 2008, Burundi announced that the Ministry of Health and the Ministry of Interior and Public Security would undertake “a survey of victims in all the country,” starting in July 2008.⁵¹ However, since then, no progress was reported.

Plans

Strategic mine action plans

The main goal for the mine action program in 2009 was “strengthened national capacities for peaceful reintegration and socioeconomic community recovery, including for vulnerable people and mine survivors.”⁵²

National ownership

Commitment to mine action and victim assistance

Burundi’s commitment to mine action has been inconsistent since becoming a State Party. In 2005, Landmine Monitor noted that clearance operations had been slow to start. According to remarks by the head of the government’s National Civil Protection Service reported in December 2004, “Two years after the cease-fire, there is still no systematic mine clearance program.”⁵³ In 2008, however, the UN praised the swift implementation of the action plan “owned by national authorities,” and noted that it might make Burundi one of the first mine-affected countries in Africa to meet its Article 5 obligations before the deadline prescribed in the Mine Ban Treaty.⁵⁴

At the Eighth Meeting of States Parties in November 2007, Burundi stated that its objective was to develop a VA strategy and create a national committee to coordinate assistance to persons with disabilities.⁵⁵ At the Ninth Meeting of States Parties, it announced that two workshops on assistance to persons with disabilities were organized in 2008 (2–3 April and 20–21 November) to help prepare a national plan of action in 2009.⁵⁶ No further updates were reported as of May 2009.⁵⁷ Therefore, guidelines for Burundi’s VA implementation remain limited to the so-called coherent victim assistance program which it has been presenting at international meetings since 2006.

⁵⁶ Statement of Burundi, Ninth Meeting of States Parties, Geneva, 28 November 2008.

⁵⁷ Statement of Burundi, Standing Committee on Victim Assistance and Socio-Economic Reintegration, Geneva, 26 May 2009.

Persons with disabilities are not differentiated from other vulnerable people.⁵⁸ Despite identifying a need for specific programs for persons with disabilities in its 2006 Poverty Reduction Strategy Paper, Burundi did not report on progress achieved in its 2009 Annual Progress Report.⁵⁹

In November 2008, Burundi announced the creation of a national committee to monitor the African Decade of Persons with Disabilities, composed of government and civil society organizations.⁶⁰ However, this committee has not yet been formed and the African decade ends in 2009.

National management

Management of Burundi's mine action program has been fully nationalized. The Burundi Mine Action Coordination Centre (BURMACC) (previously called the UN Mine Action Coordination Centre, UNMACC) began work in June 2004 under the auspices of the UN Operation in Burundi, with support from the UN Office for Project Services and UNMAS. The UNMAS program was completed on 31 July 2006 and moved under the administration of the government of Burundi with UNDP support. The center was functionally operational in 2005.⁶¹ DAHMI replaced BURMACC in 2008.⁶² In 2004–2008, UNDP provided mine action capacity-building support to the government of Burundi. This support ended in 2008.⁶³

National mine action legislation and standards/Standing operating procedures

The mandate for DAHMI followed the signature of an official decree by General Evariste Ndayishimiye, Minister of Interior and Public Security, in October 2007.⁶⁴

No national mine action standards were adopted in Burundi. However, FSD noted that “DAHMI insisted that all sites were left ‘metal free’ (not just ‘mine free’) and consequently, many tasks required ‘full excavation’ clearance methods to be adopted. This required the full removal and checking of the top 15cm of soil, which hugely impacted on clearance productivity rates.”⁶⁵ The two NGO operators used their own standing operating procedures for demining operations.⁶⁶

Demining and Battle Area Clearance

Demining and battle area clearance operations are now the sole responsibility of DAHMI, following the closure of the DCA and FSD programs in 2008. Demining in Burundi only uses manual methods.⁶⁷ MAG has been assisting Burundi with its management of ammunition and weapons storage areas and the destruction of surplus weaponry, and it has also conducted destruction of several items of UXO.⁶⁸ A joint MAG/Burundi National Police (Police Nationale Burundaise, PNB) team, created in July 2008 to support the civilian disarmament campaign launched by the government in 2006,⁶⁹ includes disposal of any ERW encountered.⁷⁰

Mine and battle area clearance in 2008

Operator	Area cleared (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	ERW destroyed	Area released by survey (m ²)
DCA	9,077	2	0	53	23,089
FSD	20,368	5	0	11	30,295
Total	29,445	7	0	64	53,384

Progress since becoming a State Party

Burundi is required by Article 5 of the Mine Ban Treaty to destroy or ensure the destruction of all antipersonnel mines under its jurisdiction or control as soon as possible, but not later than 1 April 2014. Despite being slow to initiate a demining program, Burundi has made significant progress in addressing its mine problem since international NGOs initiated clearance operations in 2005 (see table below), although as of May 2009 a small residual threat remained to be dealt with before it could declare compliance with Article 5. Security concerns caused the intended completion date of April 2008 to be postponed.⁷¹ Burundi had subsequently aimed to destroy all antipersonnel mines in mined areas as well as be free of ERW by the end of 2008.⁷²

Demining in 1999–end 2008⁷³

Year(s)	Area cleared (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	ERW destroyed	Area released by survey (m ²)
2008	29,445	7	0	64	53,384
2007	12,834	24	0	40	25,000
2006	35,647	10	0	1,434	205,027
2005	1,998	0	0	698	15,500,000
1999–2004	0	0	0	0	0
Total	79,924	41	0	2,236	15,783,411

Risk Education

RE activities continued to decrease in 2008, due to the reduced level of need resulting from previous RE activities and the clearance of most hazardous areas.⁷⁴ The number of incidents has also reduced significantly. DCA believes that continuing to provide RE would simply create unnecessary fear.⁷⁵ Burundi did not report on RE activities for 2008 in its Article 7 report submitted in 2009.⁷⁶

HI ended its activities in March 2008 because it perceived the mine threat to be marginal.⁷⁷ DCA also ended its RE project in early 2008 to focus its attention on small arms and light weapons awareness activities, a need identified from RE sessions. In January 2008, DCA handed over its RE project to its national partner, the National Council of Churches in Burundi (Conseil

⁷⁷ Email from Stephan Jooris, HI, 28 May 2008.

National des Eglises au Burundi).⁷⁸ An external evaluation of DCA's RE activities in 2007 found it effective to work through "an established, authoritative and active church network."⁷⁹ DCA also continued to provide limited safety messages through its explosive ordnance disposal and survey teams and through the distribution of materials, reaching 21,174 people. The population was informed on how to report contamination to DCA.⁸⁰

In its Article 7 report submitted in 2008, Burundi reported that DAHMI had developed and distributed new RE materials with support from UNICEF, although it was not specified when these activities had taken place.⁸¹ Two national demining organizations, the Demining Center in Central Africa (Le Centre de Déminage en Afrique Centrale, CDAC) and the Burundian Demining Center (Centre Burundais de Déminage, CBD), established in 2008 by former national staff of international NGOs, have reported including RE in their mandate and conducted some limited RE activities in 2008, including the distribution of materials.⁸²

Earlier RE was conducted by a variety of actors, including the Ministry of Defense,⁸³ BURMACC,⁸⁴ HI,⁸⁵ and UNICEF.⁸⁶ DCA implemented RE in 2004–2005 for Burundian refugees in Tanzania⁸⁷ and a project with the church network in April 2006.⁸⁸

Victim Assistance

The total number of survivors is unknown but is estimated at between 523 and 1,311.⁸⁹ In May 2009, Burundi recognized that its VA efforts were still weak and called for international assistance.⁹⁰ The Ministry of Interior and Public Security acknowledged that not all persons with disabilities received assistance, due to a lack of financial resources.⁹¹ In November 2008, Burundi reported the following as its main VA challenges: the ratification of the UN Convention on the Rights of Persons with Disabilities, the approval of the national plan for community-based rehabilitation, the promulgation of the law on disability, and the creation of a training school for physiotherapists and orthopedic technicians.⁹²

A long period of civil war has damaged Burundi's healthcare system.⁹³ While there is little data available, war victims, including mine/ERW survivors, have put an additional strain on the healthcare system. While progress has been registered in the field of healthcare since 2007, access and overall performance remained problematic.⁹⁴ In 2008, public health centers

continued to lack personnel and supplies.⁹⁵ A strike by healthcare personnel from November 2008 to April 2009 to protest against low wages and poor working conditions adversely affected the delivery of services.⁹⁶

Services for persons with disabilities in Burundi continued to be delivered mostly by NGOs.⁹⁷ NGOs are in charge of providing first-aid to mine/ERW survivors at the incident site and transfer to hospitals.⁹⁸ About 10 to 20% of patients requiring orthopedic surgery needed to be treated abroad.⁹⁹ The government distributes cards for people displaced by the war, including persons with disabilities, which give access to free healthcare. However, the card is not accepted everywhere and does not cover all costs.¹⁰⁰

There are four rehabilitation centers and orthopedic workshops in Burundi, one run by the government and the other three by religious associations with support from HI.¹⁰¹ In 2008, nine physiotherapists were trained by the NGO African Medical Assistance, but in the absence of a training school for rehabilitation specialists and ortho-prosthetic technicians, the availability of qualified staff remained a problem.¹⁰² Waiting lists to obtain prosthetic and orthotic devices remain long and the cost for appliances variable.¹⁰³

Socio-economic reintegration opportunities for mine/ERW survivors remain largely non-existent, although there are some income-generating projects targeting vulnerable persons, including persons with disabilities.¹⁰⁴

Burundi's constitution prohibits discrimination against persons with disabilities, but there is no specific disability law or action plan. The draft law on disability adopted by the Council of Ministers in 2007 had not been passed as of May 2009.¹⁰⁵ Burundi signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol on 26 April 2007 but had not ratified it as of 1 July 2009.

Progress in meeting VA26 victim assistance objectives

Burundi is one of the 26 States Parties making up the VA26 group, with significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors.¹⁰⁶ Burundi did not formally present its 2005–2009 objectives as part of its commitment to the Nairobi Action Plan. However, it presented various versions of its “coherent victim assistance program” in April and November 2007, June 2008, and May

¹⁰⁶ UN, “Final Report, First Review Conference of the States Parties to the Convention on the Prohibition of the Use, Stockpiling, Production and Transfer of Anti-Personnel Mines and on Their Destruction,” Nairobi, 29 November–3 December 2004, APLC/CONF/2004/5, 9 February 2005, p. 99.

2009.¹⁰⁷ The May 2009 version of Burundi's "coherent victim assistance program" included six objectives and seven actions that remain incomplete and are not SMART (specific, measurable, achievable, relevant, and time-bound).¹⁰⁸ The data collection action included in the June 2008 version was removed from the May 2009 version.¹⁰⁹ Progress on any of the objectives and actions in this program appears to be unrelated to their VA program goals. Even though Burundi has announced since 2007 that the development of a VA strategy is one of its priorities, the plan had not been presented as of May 2009.

In 2008, a process support visit was undertaken by the Mine Ban Treaty Implementation Support Unit on behalf of the co-chairs of the Standing Committee on Victim Assistance and Socio-Economic Reintegration.¹¹⁰

Burundi participated in the workshop on advancing landmine VA in Africa in Nairobi in 2005.¹¹¹ Burundi reported on its VA activities at meetings of States Parties in 2006–2008 and at the Standing Committee meetings in 2005 and 2007–2009.¹¹² At most meetings, it gave largely identical statements on the situation of VA. Burundi used the voluntary Form J of its annual Article 7 reports to provide an update on VA activities in 2005, 2006, and 2008, but not in 2007 or 2009.¹¹³ Burundi included a VA expert on its delegation to the Standing Committee meetings in 2007 and 2008, and at all meetings of States Parties since 2006.¹¹⁴

Victim assistance coverage

It is not known how many mine/ERW survivors received assistance in 2008 or in the last 10 years as no specific VA programs were implemented and survivors have not been differentiated from war victims or other vulnerable people.¹¹⁵

In 2008, HI continued to support five rehabilitation centers by providing equipment and materials, training technicians, and supporting the management of the centers. In June 2008, HI launched a community-based rehabilitation project in Ruyigi province. HI also supported local associations of persons with disabilities in conducting awareness on the rights of persons with disabilities.¹¹⁶

In 2008, the ICRC continued to support one private hospital treating weapon-injured people. With ICRC support, 286 weapon-injured people were treated in referral hospitals. The ICRC also trained 702 volunteers in first-aid.¹¹⁷

¹⁰⁷ See *Landmine Monitor Report 2008*, p. 201; and "Fact sheet – Burundi: Actions de prise en charge des Personnes en Situation de Handicap (PSH) et Assistance aux victimes de la guerre" ("Burundi: Actions to take care of Persons with Disabilities (PWD) and Assistance to war victims"), presented at the intersessional Standing Committee meetings, Geneva, May 2009.

Other organizations providing services to war victims, including mine/ERW survivors, included HealthNet TPO, Oxfam-Quebec,¹¹⁸ the Network of Associations of Persons with Disabilities in Burundi (Réseau des Associations de Personnes Handicapées du Burundi), and Survivor Corps, which established an office in Burundi in 2009.¹¹⁹

Support for Mine Action

Landmine Monitor is not aware of a comprehensive long-term cost estimate for meeting mine action needs in Burundi. In 2008, UNDP continued to support mine action programming in Burundi, including facilitating “the effective coordination and monitoring of mine action activities at a national level.” In April 2007, Burundi reported that UNDP services were necessary only until the end of 2007.¹²⁰ However, UNDP support continued in 2008 with a project budget of \$997,629 (€677,461).¹²¹ One of Burundi’s three mine action “end goals” for 2007–2008 included the aim of incorporating mine action funding into the national budget.¹²² No progress on the development of a dedicated national mine action budget was reported for 2008.

Burundi’s “coherent victim assistance program,” presented at the intersessional Standing Committee meetings in April 2007, included some goals for capacity development and noted some financial and material shortfalls in VA programs including “insufficient infrastructure,” insufficient financial support for micro-credit programs, and a lack of equipment for sport and cultural programs, but it did not include detailed resource mobilization strategies.¹²³ No further strategies for raising funds for VA were reported in 2008.

National support for mine action

The government of Burundi did not report national funding for mine action in 2008, nor did it provide valuations of government contributions to VA programming and support services.

International cooperation and assistance

In 2008, two countries, Austria and Switzerland, reported providing \$1,094,632 (€743,333) to mine action in Burundi. Reported international mine action funding in 2008 was 1% higher than the previous year. Welt Ohne Minen (World Without Mines) contributed \$120,000 to FSD in 2008 for mine clearance.¹²⁴ Pending determination of the extent of its landmine problem, Burundi’s overall mine action budget needs remain uncertain, and there is not enough information to measure the adequacy of international funding.

2008 International Mine Action Funding to Burundi: Monetary¹²⁵

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Austria	FSD	Mine clearance	\$294,520 (€200,000)
Switzerland	FSD	Mine clearance	\$800,112 (CHF865,360)
Total			\$1,094,632 (€743,333)

CAMBODIA

2008 Key Data

State Party since	1 January 2000
Contamination	Antipersonnel and antivehicle mines, submunitions, other ERW
Estimated area of contamination	649km ² of mined areas was expected to require full clearance (August 2009)
Casualties in 2008	269 (2007: 352)
Estimated mine/ERW survivors	43,926
Article 5 (clearance of mined areas)	Deadline: 1 January 2010
Demining in 2008	63.26km ² (2007: 55.31km ²)
Risk education recipients in 2008	380,300
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$28 million (2007: \$30.8 million) National: \$1.8 million (2007: \$1.15 million)

Ten-Year Summary

The Kingdom of Cambodia became a State Party to the Mine Ban Treaty on 1 January 2000. In 1999, Cambodia adopted national ban legislation and declared completion of its destruction of 71,991 stockpiled antipersonnel mines. Yet it continues to discover and destroy thousands of additional stockpiled mines each year, more than 133,000 from 2000 to 2008. Thailand made a serious allegation of new use of antipersonnel mines by Cambodia on their border in October 2008. Cambodia served as co-chair of the Standing Committee on Technologies for Mine Action from 1999 to 2000, and as co-rapporteur and then co-chair of the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies from 2002 to 2004, as well as co-rapporteur and then co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration from 2006 to 2008. Cambodia hosted regional Mine Ban Treaty meetings in 2003 and 2007.

Cambodia remains one of the world's most mine- and explosive remnants of war (ERW)-affected states—and is also affected by cluster munition remnants—but clearance of mined areas has increased sharply in recent years with the adoption of new methods and equipment while land reclamation by farmers and cancellation of suspected land through survey has drastically increased land release by the demining program. In April 2009, Cambodia submitted a request for a 10-year extension to its treaty deadline for clearance of 1 January 2010.

At least 7,300 mine/ERW casualties were recorded between 1999 and 2008 of a total of more than 60,000 casualties since 1979. Extensive risk education has been conducted in Cambodia for over 10 years, implemented by the Cambodian Mine Action Center and other NGOs, and the Ministry of Education, Youth and Sports. Over the years the approach has shifted from awareness-raising to risk reduction, with stronger integration into mine action, and links with development. An evaluation in 2008 acknowledged the achievements of RE in Cambodia but concluded that a more targeted and cross-sectoral approach combined with improved communications will be needed to change behavior.

Throughout 1999 to 2008, even the basic needs of many mine/ERW survivors and persons with disabilities were not fulfilled; assistance was almost exclusively provided by NGOs that were facing increasing donor fatigue. As part of its commitment to the Nairobi Action

Plan, Cambodia developed a national disability plan for 2009–2011 after a nearly two-year consultation process.

Mine Ban Policy

Cambodia signed the Mine Ban Treaty on 3 December 1997 and ratified on 28 July 1999, becoming a State Party on 1 January 2000. Domestic implementation legislation—the Law to Prohibit the Use of Anti-personnel Mines—took effect on 28 May 1999.¹ Cambodia submitted its tenth Article 7 report in 2009, covering calendar year 2008.²

Cambodia participated in the Ninth Meeting of States Parties in Geneva in November 2008, where its year-long term as co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration ended. Cambodia made statements during the general exchange of views and a session on compliance that mostly addressed Thailand’s allegation of new mine use (see Use section below). Cambodia also spoke on victim assistance, its 2010 mine clearance deadline, and the United Kingdom’s extension request.

Cambodia participated in the Bangkok Workshop on Achieving a Mine-Free South-East Asia from 1–3 April 2009, the second in a series of regional meetings convened in the lead-up to the treaty’s Second Review Conference. At the intersessional Standing Committee meetings in May 2009, Cambodia made statements on victim assistance and its Article 5 mine clearance extension request (see Plans section below).

Cambodia has not made its views known on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Cambodia is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It has not submitted an annual report under Article 13 of the protocol since April 2008. Cambodia is not a party to CCW Protocol V on Explosive Remnants of War. As of 1 July 2009, Cambodia had not signed the Convention on Cluster Munitions.³

Production, transfer, stockpile destruction, and retention

The government has reported that it does not have any antipersonnel mine production facilities, and that it has not exported antipersonnel mines.⁴

The Royal Cambodian Armed Forces (RCAF) destroyed its declared stockpile of 71,991 antipersonnel mines between 1994 and 1998, and in February 1999 the RCAF Deputy Commander in Chief formally stated that the RCAF no longer had stockpiles of antipersonnel mines.⁵ In 2000, Cambodia reported an additional stockpile of 2,035 antipersonnel mines held by the national police, which were subsequently destroyed.⁶ Cambodia regularly declares that there have been no antipersonnel mine stockpiles in the country since 2001.⁷

However, police and military units still frequently discover antipersonnel mines in various locations and from various sources around the country. Many are from previously unknown arms caches left from decades of war.⁸ Informal (“village”) demining and the scrap metal trade also account for some of the newly discovered stocks of mines.

¹ The law bans the production, use, possession, transfer, trade, sale, import, and export of antipersonnel mines. It provides for criminal penalties, including fines and imprisonment for offenses committed by civilians or members of the police and the armed forces. It also provides for the destruction of mine stockpiles.

² The report is undated, but was submitted to the UN in April 2009. The report submitted in 2008 was also undated, covering calendar year 2007. Previous reports were submitted on 27 April 2007, 11 May 2006, 22 April 2005, 30 April 2004, 15 April 2003, 19 April 2002, 30 June 2001, and 26 June 2000.

³ For details on cluster munitions policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 193–195.

⁴ Article 7 Report (for calendar year 2008), Forms D and E. In the 1970s Cambodia manufactured one type of antipersonnel mine, the KN-10 Claymore-type mine, and various armed groups made improvised mines in the past.

⁵ See *Landmine Monitor Report 1999*, p. 391, for annual destruction totals.

⁶ Article 7 Report, Form B, 26 June 2000.

⁷ Article 7 Report (for calendar year 2008), Form F. This has been repeated since 2004.

⁸ *Ibid.*

Discovered mines are supposed to be reported to the Cambodia Mine Action and Victim Assistance Authority (CMAA), and handed over to the Cambodian Mine Action Center (CMAC) for destruction.⁹ In February 2008, Cambodia stated that it destroys newly discovered stocks immediately.¹⁰

Cambodia has declared that a total of 133,478 antipersonnel mines were found and destroyed from 2000 to 2008, including 13,665 in 2008 (9,698 by CMAC; 2,713 by HALO Trust; and 1,254 by Mines Advisory Group).¹¹ Cambodia stated these mines were “reported by local communities.”¹²

Mines retained for research and training

As in previous years, in its Article 7 report covering 2008, Cambodia declared that it does not retain any antipersonnel mines for training or development purposes.¹³ However, Cambodia has reported transfer of mines for training and development purposes to the CMAC training center each year.¹⁴ It reported that in 2008 Cambodia transferred for training purposes 519 antipersonnel mines “from various sources and Demining Units/CMAC that were found in the Mined Areas.”¹⁵ This is the first time Cambodia has been explicit that these mines used for training were removed from the ground by deminers, and were not newly discovered caches.

Cambodia has not yet reported in any detail on the intended purposes and actual uses of mines kept for training—a step agreed by States Parties at the First Review Conference in 2004. Cambodia has not utilized expanded Form D for reporting on retained mines, as agreed by States Parties in 2005.

Use

Until 2008, there had not been any specific allegations of use of antipersonnel mines by government forces since Cambodia signed the Mine Ban Treaty in 1997.

On 6 October 2008, a Thai paramilitary Ranger stepped on an antipersonnel landmine while on patrol in disputed territory between Thailand and Cambodia, near the World Heritage Site of Preah Vihear. A second soldier stepped on an antipersonnel mine while attempting to aid the first injured. Both lost their legs. This took place three days after an exchange of gunfire between Thai and Cambodian military units at the same location.

Thai authorities maintain that the area was previously clear of landmines. The Thailand Mine Action Center (TMAC) sent a team to investigate which found some PMN2-type antipersonnel mines. TMAC stated that the mines were newly placed. The sequence of discovery was detailed on the Thailand Ministry of Foreign Affairs website.¹⁶

Cambodian authorities stated that the Thai investigation of the incident site was a unilateral incursion on Cambodian territory undertaken without their consent or participation, and denounced the action. The Cambodian Ministry of Foreign Affairs stated that the Thai Rangers had entered Cambodian territory in an area known to contain antipersonnel mines and were injured by mines laid during previous armed conflicts.¹⁷

⁹ Ibid.

¹⁰ See *Landmine Monitor Report 2008*, p. 206.

¹¹ Article 7 Report (for calendar year 2008), Form G. Mines destroyed in previous years included: 8,739 in 2000; 7,357 in 2001; 13,509 in 2002; 9,207 in 2003; 15,446 in 2004; 16,878 in 2005; 23,409 in 2006; and 20,268 in 2007.

¹² Article 7 Report (for calendar year 2008), Form G.

¹³ Ibid, Form D1a.

¹⁴ Cambodia reported in 2007 that 594 mines were transferred for development and training. See Article 7 Report (for calendar year 2007), Form D2. Cambodia has reported a total of 3,450 mines transferred for training purposes from 1998–2007.

¹⁵ Article 7 Report (for calendar year 2008), Form D2.

¹⁶ Thailand Ministry of Foreign Affairs, “Diplomatic Corps briefed on Thailand-Cambodia Border Incidents,” Press release, 4 February 2009, www.mfa.go.th.

¹⁷ Cambodian Ministry of Foreign Affairs and International Cooperation, “Statement of the Spokesman of the Ministry of Foreign Affairs and International Cooperation,” Press release, 17 October 2008, www.mfaic.gov.kh and Cambodian Ministry of Foreign Affairs and International Cooperation, “MFA.IC Note,” 23 October 2008, www.mfaic.gov.kh.

The Coordinator of the Thailand Campaign to Ban Landmines (TCBL) visited the site at the invitation of TMAC and Thailand's Ministry of Foreign Affairs. She observed, "The mines which were displayed as recovered from the site showed no rust on their metal parts. Identification numbers on the mines were clearly visible, and did not appear to have been exposed to the elements very long. Local villagers informed me that they regularly used the path where the incidents took place."¹⁸

Thailand stated that the Royal Thai Army has never possessed PMN2 mines.¹⁹ Cambodia's annual transparency reports indicate that PMN2 mines are commonly found during mine clearance operations.²⁰ It has also reported stockpiling PMN2 mines in the past.²¹

On 17 October 2008, representatives of the Thai Ministry of Foreign Affairs, Ministry of Defense, and TMAC met an ICBL/TCBL mission and presented information from Thailand's investigations into the incident. Subsequently Thailand made this information available to the Ninth Meeting of States Parties in Geneva in November.²²

Cambodia made several statements on the incident at the Ninth Meeting of States Parties. Cambodia said that "it was with great sadness that we learned of the allegations that Cambodia had contravened their obligations under the Ottawa Convention by laying new mines along the Thai Cambodian border. For a country that has suffered such heavy losses, the claim that we had contravened the most basic and fundamental tenet of the Convention came as a great surprise. In the clearest possible language, we deny the insinuations made to that effect. Cambodia has written two official letters through the Implementation Support Unit of the AP Mine Ban Convention to provide clarification, and the Ministry of Foreign Affairs and International Cooperation of Cambodia sent out an official bilateral response last week outlining its response to specific allegations."²³

Cambodia also said, "Given the seriousness of the claims and the importance which Cambodia places on its international commitments, the Royal Government of Cambodia immediately ordered the formation of a Fact Finding Commission to thoroughly review the situation 3 days after receiving the request for clarification from Thailand... The Commission will complete its work in the near future, and we will share the findings of the report with Thailand and those concerned and other interested parties. To clarify to the meeting, I would like to confirm that the accident happened in a confirmed minefield on Cambodian territory."²⁴ Cambodia has not subsequently made a Fact Finding Commission's report publicly available.

It would appear from available evidence that this incident involved new use of antipersonnel mines, but Landmine Monitor is not able to determine who was responsible for the use. To Landmine Monitor's knowledge, other States Parties have not pursued a resolution to this issue between Cambodia and Thailand.

On 1 April 2009, another Thai soldier was reportedly wounded by an antipersonnel mine at the same location during further armed conflict between the two countries.²⁵

¹⁸ Interview with Emilie Ketudat, Coordinator, TCBL, Bangkok, 18 October 2008.

¹⁹ Thailand Ministry of Foreign Affairs, "Diplomatic Corps briefed on Thailand-Cambodia Border Incidents," 4 February 2009, www.mfa.go.th. Thailand's Article 7 report submitted in April 2008 stated that the Royal Thai Army retained 10 "PMN2" mines. However, its April 2009 report records that the Royal Thai Army retained 10 "PMN" mines; reports from 2004–2006 also cite "PMN."

²⁵ "Cambodia, Thai border clash leaves two dead," *Agence France-Presse* (Phnom Penh), 2 April 2009.

Scope of the Problem

Contamination

Nearly three decades of war left Cambodia as one of the countries most severely affected by landmines and ERW. After more than 15 years of humanitarian demining, the landmine threat is mainly concentrated in 21 districts in six provinces along Cambodia's western and northern border with Thailand, including the 1,046km-long K5 mine belt. This was installed by the Vietnamese-backed government in the mid-1980s in an attempt to seal the border against infiltration by anti-regime guerrilla groups based on the Thai border. It represents Cambodia's densest contamination, reportedly with up to 2,400 mines per linear kilometer.²⁶

UXO, including cluster munition remnants, and abandoned explosive ordnance is found throughout the country. During the Vietnam War, the United States dropped more than a million tons (one billion kg) of general purpose bombs and at least 26 million submunitions on Cambodia, mainly BLU-24, BLU-26, and BLU-61 submunitions. This bombing is estimated to have left between 1.9 million and 5.8 million cluster munition remnants, mostly in the southeast and the sparsely populated northeast, along the border with Vietnam.²⁷ However, a 2006 study of ERW in Cambodia found that more than 80% of the ordnance being cleared was ground artillery and munitions, and less than 20% was air ordnance.²⁸

By 2009, Cambodia had yet to fully determine the extent of contamination. In April 2009, Cambodia submitted an initial request for an extension to its Mine Ban Treaty Article 5 deadline for mine clearance, which put forward an estimate that 672km² of mined areas remained for full clearance, 1,864km² remained to be released through technical and non-technical survey, and 2,008km² were to be released through cancellation of database entries.²⁹ It also stated, however, that current data "presents a suspect area that all in the sector know is a massive, inaccurate and highly distorting snap-shot."³⁰ A revised request submitted in August 2009 put the area requiring clearance at 648.8km² but said stakeholders believed a Baseline Survey started in August 2008 would reduce this figure.³¹

A national ERW strategy published by the CMAA in January 2008 says a 2004 estimate that Cambodia had 427km² of "priority minefields requiring formal clearance" had been "validated by recent trends, even if some of these areas remain to be further defined by current area reduction efforts."³²

In the past three years, demining NGOs have identified more than 1,000km² of land which the LIS identified as suspect that has been reclaimed by the population. Accordingly, the CMAA has removed this area from the database of land requiring clearance.³³ A clearer estimate is expected from a baseline survey by demining NGOs of 21 districts with the most landmine casualties in recent years, which started in August 2008 and was due to be completed in a year.³⁴

Casualties³⁵

In 2008, the Cambodia Mine/UXO Victim Information System (CMVIS) recorded 269 new mine/ERW casualties in Cambodia (47 people killed and 222 injured) in 154 incidents. This is a 24% decrease compared to 2007 (352) and confirms the downward casualty trend started in 2006.

³⁴ Email from Pascal Rapillard, Policy and External Relations, GICHD, 4 September 2009.

³⁵ Unless noted otherwise, casualty data 1979–May 2009 provided by Cheng Lo, Data Management Officer, CMVIS, 19 June 2009.

Reasons for the continued decrease were said to include continued community involvement in mine action and risk education (RE).³⁶

The vast majority of casualties were civilian (251), including 136 men, 75 boys, 22 girls, and 18 women. Seven casualties were deminers (all men); six were injured during antipersonnel mine clearance and one while off-duty. Nine casualties were soldiers, including three Thai soldiers injured in two incidents in Preah Vihear, and two were police. The nationality of one person was unknown and the remaining people were Cambodian. As has been the case since 2001,³⁷ most casualties were caused by ERW (146 or 54%), including seven by unexploded submunitions. Antipersonnel mines caused 72 casualties, antivehicle mines 45, victim-activated improvised explosive devices (IEDs) five, and one casualty was caused by an unknown device.

More than half of the ERW casualties were children: 65 boys (or 86% of total mine/ERW child casualties) and 11 girls. Three-quarters of child ERW casualties happened while handling ERW or standing-by when others were doing this (38 and 19 respectively). In total, there were 76 civilian casualties due to handling (64 ERW, seven mines, and five improvised explosive devices, IEDs) and 50 casualties because of standing near such activities (32 ERW and 18 mines). Motives for handling mines/ERW were: playing/curiosity, usually by hitting or throwing the device (51); fishing (10); selling scrap metal (seven); making the area safe (five), and reusing it as a weapon (three). CMVIS data shows that two IED casualties were caused by handling a device while fishing and three others while trying to re-use the IED as a weapon.

The other most common activities leading to incidents were traveling (33), clearing new land for use (23), or collecting wood (16). People were most at risk of becoming casualties in or near their livelihood areas: villages/built-up areas (77), agricultural land (62), orchards (39), and foraging areas (34). Eleven casualties happened on or near military bases; no civilian or military casualties happened on demining sites. No casualties were reported due to “informal demining,” probably because this activity decreased due to penalties or fewer reports because of the penalties.

Casualties occurred in 19 of 24 provinces, including two where there were no casualties in 2007 (Kampong Chhnang and Prey Veang). Mine casualties occurred in eight provinces.³⁸ Four provinces with casualties in 2007 did not record casualties in 2008 (Kampot, Krong Preah Sihanouk, Phnom Penh, and Stueng Traeng). However, as in 2007, just two provinces accounted for 44% of all casualties—Battambang (32% or 87, up from 82 in 2007), followed by Banteay Meanchey (31, down from 55 in 2007). Other provinces with 20 or more casualties were, as in 2007, Oddar Meanchey (27), Krong Pailin (22), and Preah Vihear (22). The most significant decrease was noted in Siem Reap (14, down from 32).

In total, 63% of casualties reported receiving RE, compared with 83% in 2007.

The number of reported casualties continued to fall in 2009, with 128 (19 killed and 109 injured) by the end of May; casualties for the same period in 2008 were 152. Twelve casualties were soldiers, including two Thai soldiers and two deminers. ERW caused 60 casualties (23 handling and 12 by-standing), antipersonnel mines 48, antivehicle mines 17, and IEDs three.

Ten-year summary

As of 31 May 2009, the CMVIS database contained records on 63,402 mine/ERW casualties in Cambodia: 19,476 killed and 43,926 injured since 1979. Of these, 7,300 were recorded between 1999 and 2008, including 1,385 killed and 5,915 injured.³⁹ Some 14% of casualties suffered amputations and of these, 84% were caused by mines.⁴⁰ Between 2000 and 2005, casualties

³⁸ Banteay Meanchey, Battambang, Krong Pailin, Mondol Kiri, Otdar Meanchey, Preah Vihear, Pursat, and Svay Rieng.

³⁹ 1999: 1,153; 2000: 858; 2001: 826; 2002: 847; 2003: 772; 2004: 898; 2005: 875; 2006: 450; 2007: 352; and 2008: 269. See also, Kingdom of Cambodia, “National Plan of Action for Persons with Disabilities, including Landmine/ERW Survivors 2009–2011,” Phnom Penh, February 2009, p. 9 (mentioning 63,217 casualties between 1979 and August 2008).

⁴⁰ Ibid.

remained relatively constant, but a sudden 50% drop occurred in 2006 and has continued since. The drop was then ascribed to favorably seasonal conditions, greater economic opportunities, and increased community involvement in mine action planning and prioritization. Additionally, policing of the scrap metal trade and informal demining in some provinces might have contributed.⁴¹ No follow-up study has been made, but it is assumed that demining and priority-setting contributed most to the decrease.⁴²

The largest casualty group between 1999 and 2008 were men (4,544), followed by boys (1,823), women (520), and girls (413). The majority of casualties were civilian (3,973); 191 were security forces, 106 deminers, 28 informal deminers, and 62 other/unknown. For 2,940 people the military-civilian status was not recorded, but their activities showed that only 192 of these were engaged in military, demining or “other” activity, and 951 were children or women. It can, thus, be assumed that up to 6,721 casualties (92%) were civilian.

Half of the casualties were caused by ERW (3,676), including 159 submunition casualties. It is likely that submunitions casualties are under-reported as CMVIS only started differentiating these from other ERW casualties in September 2006.⁴³ Antipersonnel mines caused 1,970 casualties (27%), antivehicle mines 690, unknown mines 822, IEDs 141, and an unknown device one. Most common activities at the time of the incident were: handling mines/ERW (2,565 including 1,075 boys); farming (1,045); traveling (943); and being a by-stander (823). Casualties occurred in all provinces in Cambodia, but most in Battambang (1,942), Banteay Meanchey (1,172), Oddar Meanchey (690), Krong Pailin (612), and Preah Vihear (457). Most casualties happened in villages or built-up areas (2,057) or in rice fields (1,082).

Accurate information about the number of persons with disabilities in Cambodia and their living circumstances is lacking. Limited information was included in the 2008 census but was not available as of July 2009. In early 2009, the National Institute of Statistics developed a test form for a pilot survey on disability. If suitable, this could become part of the national disability survey planned by the Ministry of Social Affairs, Veterans and Youth Rehabilitation (MoSVY).⁴⁴

Risk profile

People are at risk from landmines in the northwest and northern provinces bordering Thailand, and from UXO in these areas and the northeastern provinces bordering Vietnam.⁴⁵ The majority of areas have not been marked.⁴⁶

Incidents are caused by involuntary contact through routine livelihood activities, such as farming and forestry,⁴⁷ and by the intentional handling of UXO, especially by adolescent males. People may move UXO to a perceived safe place. Scrap metal collection remains a significant problem, although a law against scrap metal collection and possibly a drop in metal prices has had a positive impact on trends.⁴⁸ Out-of-school youth may be particularly vulnerable.⁴⁹

Increasing population and demand for agricultural land continues to prompt people to move into mine- and UXO-affected areas.⁵⁰ The region east of the Mekong river may become a higher priority for RE as areas open up for development and people migrate there.⁵¹

Socio-economic impact

Despite the sharp fall in casualties in recent years, Cambodia's mine and ERW problem still represents a major obstacle to social and economic development. According to the CMAA, ERW "severely affect rural livelihoods by impeding access to productive resources, markets and basic social services, land for agriculture and resettlement, irrigation, roads, access to water, health centers, schools and other rural infrastructures. When located near archeological sites, landmines and ERW also severely affect economic activities and the development of tourism, which is a major source of revenues for Cambodia."⁵²

Program Management and Coordination

Mine action

The CMAA, set up in September 2000, regulates and coordinates mine action, responsibilities previously assigned to CMAC.⁵³ The CMAA has six departments whose responsibilities include regulation and accreditation of all operators, preparing strategic plans, managing data, and quality control.⁵⁴ Prime Minister Hun Sen is the CMAA President, and a senior government minister (Secretary of State of the Council of Ministers), Prak Sokhonn, brought in as second CMAA Vice President in June 2005, leads the dialogue with donors as the chair of a Government-Donor Technical Working Group for Mine Action.⁵⁵

The CMAA's day-to-day management is in the hands of the Secretary-General. In January 2008, the government appointed Secretary-General Sam Sotha additionally as Cambodia's ambassador on mines and cluster bombs.⁵⁶ In December 2008, however, Prime Minister Hun Sen replaced him in both jobs with Chum Bun Rong, a former General Director of the Social Fund without previous experience in mine action.⁵⁷

Risk education

The CMAA also regulates and coordinates mine/ERW RE. An external evaluation was conducted by UNICEF in October 2008 to look at the capacity needed for the government to facilitate the transition to national implementation of programs and to inform the forthcoming revision of strategy.⁵⁸

Coordination meetings of the Technical Working Group for Mine Risk Education (MRE TWG), consisting of stakeholders from government institutions, operators, and development partners occur at the national level, and operators meet regularly to refine messages.⁵⁹ The CMAA/UNICEF evaluation reported that coordination is generally good, although it suggested that less formal CMAA coordination would also be useful.⁶⁰

⁵² CMAA, "National Strategy on Explosive Remnants of War," Phnom Penh, January 2008, p. 6.

⁵³ CMAC is the leading national demining operator, but does not exercise the wider responsibilities associated with the term "center." Set up in 1992, CMAC was assigned the role of coordinator in the mid-1990s. It surrendered this function in a restructuring of mine action in 2000 that separated the roles of regulator and implementing agency and led to the creation of the CMAA.

⁵⁴ "A Study of the Development of National Mine Action Legislation," GICHD, November 2004, pp. 64–66. The departments are: regulation and legislation, planning, monitoring and database, VA, coordination and public relations, administration, personnel and logistics, and finance.

⁶⁰ "Evaluation of Mine Risk Education in the Kingdom of Cambodia," CMAA/UNICEF, October 2008.

RE activities are monitored internally by individual operators and externally by the CMAA. However, the CMAA/UNICEF evaluation found that, “strategy and program indicators are mainly quantitative, without specific target groups being described, and focus primarily on program activities and outputs, rather than behavioral outcomes and impacts.”⁶¹

Victim assistance

The CMAA delegated coordination of victim assistance (VA) to the MoSVY and Disability Action Council (DAC) by subdecree in 2001.⁶²

In April 2009, the process started to transform the Steering Committee for Landmine Victim Assistance into the National Disability Coordination Committee (NDCC). The committee’s work would be expanded from coordinating VA plans to a general coordination role for the disability sector. The NDCC will be chaired by the minister of MoSVY; DAC is the secretariat; and relevant ministries, service providers and disabled people’s organizations (DPOs) would be members.⁶³ The NDCC was approved by the Prime Minister in early August⁶⁴ although members had met regularly before approval was granted. However, practical coordination between ministries was limited and even more limited between the CMAA and MoSVY.⁶⁵

The MoSVY is responsible for disability issues in general, favoring a mainstreaming approach to VA in its general structures.⁶⁶ The MoSVY delegates responsibilities to provincial and district offices. However, due to its initial focus on veterans only, its structure at all levels is insufficient to deal with the broader disability mandate. Its branches are “often under-resourced, inexperienced, or reluctant to implement MoSVY directives.”⁶⁷ Commitment of local offices varies.⁶⁸

DAC and its various working groups, which include national and international operators and advisors, provide technical advice to the MoSVY, but since 2006 have had limited capacity to do so.⁶⁹

Data collection and management

In 2008, the CMAA gave priority to overhauling its database, with technical support from Norwegian People’s Aid (NPA), as a critical requirement for preparing a new 10-year strategic plan. The plan was intended to accompany its request for an extension of its Article 5 deadline under the Mine Ban Treaty (see Summary of efforts to comply with Article 5 section below).⁷⁰

An assessment of the CMAA’s database needs by Australian Volunteers International in 2007 found that the CMAA had not set documentation or reporting standards, that these differed between operators, and that the CMAA had difficulty obtaining data in a useable format and on a regular basis. Individual data providers had some good data management procedures but worked in isolation. Moreover, the RCAF, police, and newly established commercial operators were “not reporting any clearance or EOD [explosive ordnance disposal] information to the

CMAA on a regular basis.⁷¹ In June 2008, operators started reporting clearance data to the CMAA using a standard format which underwent further revision in 2009.⁷²

Until 2007, the CMAA operated with a self-built database adapted from an old version of the Information Management System for Mine Action (IMSMA). In 2007, the CMAA installed the latest version of IMSMA and staff received training from the Geneva International Centre for Humanitarian Demining (GICHD), but the system had difficulties accepting existing data. As a result, NPA prepared an updated dataset of contamination in 2008 using an alternative tool (Microsoft Access).⁷³ By August 2008, NPA had reconciled existing data but the CMAA continued to have difficulties providing a coherent assessment of contamination, because of data losses and differences in operators' survey procedures and classifications of demining interventions.⁷⁴

RE data is kept only in paper form, and the CMAA/UNICEF evaluation recommended the integration of RE data into a central CMAA database to facilitate a more integrated approach to implementation.⁷⁵

CMVIS has operated a casualty database since 1994. Casualties are reported through a network of Cambodian Red Cross (CRC) field staff and by CMVIS data gatherers deployed at the district and provincial levels, and then entered into the database. Throughout 1999–2008, CMVIS data collection has been adequate and continuous improvements were made to the system, most recently at the end of 2007.⁷⁶ CMVIS data is used for planning and prioritization of VA, RE, clearance, and EOD tasks. It widely distributes monthly and annual reports.⁷⁷

Handicap International-Belgium (HI-B) ended its technical assistance to CMVIS at the end of June 2009 and planned to finish its financial support at the end of 2009,⁷⁸ stating that CMVIS should progressively be taken over by national partners. HI-B noted that in 2007–2008 Cambodian counterparts were reluctant to proceed with this integration.⁷⁹ In April 2009, the CRC and CMAA signed a memorandum of understanding to ensure the future sustainability and integration of CMVIS in mine action.⁸⁰ But it was noted that it was “important that CRC gains the necessary skills to maintain the standards currently delivered by CMVIS.”⁸¹

HI-B continued to state that the ongoing decrease in casualties indicated a diminished need for data collection; it added that CMVIS should concentrate on its core business of casualty data collection and not implement its VA services survey, or RE and VA activities. Therefore further decreases in CMVIS staff could be envisioned.⁸² CMVIS noted that while casualties decreased the territory to cover remained the same, resulting in challenges to continuing nationwide coverage and maintaining links with community focal points. The main issue was that data gatherers covering several provinces were not always familiar with the communities, which often resulted in certain communities providing less information. CMVIS also noted that increased dependence on volunteers could in the longer term affect the quality of collected data. But it did not think there was significant under-reporting.⁸³

In April 2007, as part of its agreement with HI-B, CMVIS began a survivor survey to collect data on assistance received and socio-economic indicators. HI-B found that this information existed elsewhere and that focusing on mine/ERW survivors was discriminatory and consequently withdrew technical support in August 2008.⁸⁴ As of July 2009, the survey remained suspended pending improvements to the questionnaire.⁸⁵ Nevertheless, other operators have repeatedly stated that this information is needed for more effective VA and that gathering “information to assess quality of life of survivors and victim assistance services received, on an ongoing basis” is one of the key objectives in Cambodia’s 2009–2011 VA plan.⁸⁶ The MoSVY was also seeking CMVIS advice on management of disability data.⁸⁷

Plans

Strategic mine action plans

The CMAA, supported by other stakeholders, worked in 2009 on a new national mine action strategy (NMAS) in conjunction with its preparation of an Article 5 deadline extension request. The strategy was due to include: an agenda for transparent use of aid; “a basic mine action strategy” drafted with GICHD assistance; “a combination of strategies” for demining, ERW, and RE; and a national action plan for disabled people, as well as the extension request. The CMAA expected to present it to the Mine Ban Treaty’s Second Review Conference in November–December 2009.⁸⁸

The CMAA set up a task force to draft the strategy under its Deputy Secretary-General, Prum Sophamonkol, and included representatives of UNDP, NGO operators, the National Center for Peace Keeping, and six technical reference groups, which in the past had met only when required and which were reactivated to work on the NMAS in June 2009. The Task Force was to report to a Review Committee led by CMAA Secretary-General Chum Bun Rong.⁸⁹

Cambodia’s initial Article 5 extension request submitted in April 2009 acknowledged problems in drawing up a detailed workplan in the absence of precise data on the extent of the residual problem, but set out a range of initiatives to be pursued including:⁹⁰

- a Baseline Survey, starting in August 2009, focusing on the 21 most contaminated districts to be completed in 2010, and to be completed countrywide by 2012;
- development of a national standard for land release (CMAS 15), regarded as a “critical activity” that will contribute to increased productivity;
- release through clearance by operators who will commit the majority of their resources to the 21 most affected districts and concentrate “the overwhelming majority” of clearance on Classification A mined areas (the extension request states that some 470km² will be cleared by 2019 with a clearance rate of 40km² a year from 2011 and an annual productivity increase of 2% a year); and
- drafting a sector-wide NMAS and improving planning and prioritization processes.

The CMAA published a national ERW strategy in January 2008 which sets out a vision that “by 2015, Cambodia will be a country where ERW do not represent an immediate threat for the civilian population (work towards zero victims), and where national resources are available to deal with the remaining ERW contamination through an efficient reporting network and

⁸⁸ Statement by Chum Bun Rong, Secretary-General, CMAA, NMAS workshop, Phnom Penh, 6 July 2009.

⁸⁹ CMAA, “Plan for the development of a National Mine Action Strategy,” Phnom Penh, undated but June 2009, p. 3; and telephone interview with Melissa Sabatier, Mine Action Program Manager, UNDP, 13 July 2009. The six TRGs were for: Demining (survey, marking, and clearance); Information Management; Mine Risk Education; Victim Assistance; Gender; and Monitoring and Evaluation.

⁹⁰ Article 5 deadline Extension Request (Revision), 24 August 2009, pp. 53–54.

appropriate intervention/disposal capacity, under Government coordination and regulation.”⁹¹ The ERW strategy was not put into operation but was expected to feed into the provisions for ERW in the new NMAS.⁹² It recommended that Cambodia ratify CCW Protocol V, thus committing Cambodia to clearing all ERW.⁹³

The strategy identified the CMAA as the regulatory and policy-making authority for ERW action. Short-term goals included:

- develop the RCAF’s capacity as a “national ERW operator;”
- develop CMAC’s response capacity by increasing the number of EOD teams, strengthening skills, including multi-item demolition;
- pilot and expand a response system involving the police, community networks, and operators;
- safe storage of munitions; and
- reduce the number of annual ERW victims to 115 by 2010.⁹⁴

By 2015, the strategy called for:

- the creation of a “national ERW center” as a repository of expertise and as a training center, allowing the phasing out of international assistance;
- a national intervention capacity provided by RCAF, which is to be involved “as a matter of priority in ERW clearance related to major national infrastructures,” and by a reformed CMAC “focused mostly on ERW response, fully integrated in Government and with national budget;”
- a central database located in the CMAA; and
- quality assurance and monitoring by the CMAA.⁹⁵

Risk education plans

The RE strategy for 2006–2012 aims to reduce casualties by empowering affected communities to identify appropriate and effective risk education/reduction approaches, and integrate these efforts with broader humanitarian and development activities, including VA.⁹⁶

Victim assistance plans

The National Plan of Action for Persons with Disabilities, including Landmine/ERW Survivors 2009–2011, is Cambodia’s VA plan. It was developed as part of Cambodia’s commitment to the so-called VA26 process (see Victim Assistance section below). The drafting process started in July 2007 under the coordination of an international consultant and later a national coordinator in an AUSAID-funded project through the Australian Red Cross (ARC) and was finalized in February 2009. The plan was approved by the MoSVY and CMAA in April 2009, and by the Prime Minister in August 2009.⁹⁷ The initial timeframe for the plan, which was also presented at the Ninth Meeting of States Parties in November 2008, was 2008–2011.⁹⁸

The plan was created in broad consultation with stakeholders and through focus group meetings. One of its main aims was to strengthen MoSVY capacity, while linking this to “direct actions and building a solid relationship...with the clients whether they be landmine/ERW survivors or other persons with disabilities, advocacy groups, or NGO implementing agencies.”⁹⁹ The plan contains objectives and plans for data collection, medical care, physical rehabilitation, psychosocial support, economic reintegration and laws, and public policies, and it assigns responsibilities to relevant ministries. The future roles of DAC and the CMAA are unclear.¹⁰⁰

⁹⁹ Kingdom of Cambodia, “National Plan of Action for Persons with Disabilities, including Landmine/ERW Survivors 2009–2011,” Phnom Penh, February 2009, p. 8.

¹⁰⁰ *Ibid.*

Non-governmental stakeholders estimated that the plan was not conducive to real action and contained plans that were too broad, unclear and in some cases unrealistic, particularly because of the level of responsibility placed on the MoSVY with its limited capacity.¹⁰¹ Monitoring of the plan will be conducted through visits to relevant ministries and operators. This effort started in 2009 to complete the status report template developed by the co-chairs of the Standing Committee on Victim Assistance and Socio-Economic Reintegration for the purpose of the Second Review Conference.¹⁰²

In addition to the 2009–2011 VA plan, the MoSVY and the five international physical rehabilitation service providers signed a memorandum of understanding in June 2008 under which the ministry committed to gradually take over all financial responsibility for the management of physical rehabilitation services by 2011.¹⁰³

The CMAA expressed interest in increased involvement in VA, but noted that it did not have sufficient human and financial resources.¹⁰⁴ The CMAA's VA department is responsible for providing regular reports on VA. In 2007, DAC was delegated responsibility for compiling the annual VA report. While a report was prepared for 2007, it did not exist for any other years. The CMAA noted that this was due to a lack of data provided from the MoSVY and DAC.¹⁰⁵

Integration of mine action with reconstruction and development

Cambodia's "Rectangular Strategy," setting out the government's platform for national economic and social development in 2004–2008, identified agricultural development as the "first rectangle" and clearance of mines as a component of agricultural development.¹⁰⁶ The National Social Development Plan 2006–2010, based on the Rectangular Strategy, gives priority to rural development as the quickest route to alleviating poverty and recognizes mine clearance as "very important for making arable land safe for cultivation and to prevent death and lifelong handicaps caused by severe injuries." It also includes demining, UXO clearance, and VA among Cambodia's Millennium Development Goals.¹⁰⁷ Senior Minister Prak Sokhonn stated in July 2009 that the NMAS would be aligned with the second phase of the Rectangular Strategy and the update of the National Social Development Plan for 2009–2013.¹⁰⁸

A GICHD study reported "there is a consensus among government ministries that the mine action programme should begin 'mainstreaming' itself (i.e. using government systems established at the national, provincial, and commune levels for planning, priority-setting, etc., rather than 'stand-alone' mechanisms for mine action)."¹⁰⁹

The practical mechanism for integrating mine action and broader community needs are eight Mine Action Planning Units (MAPUs), which are responsible for planning and prioritizing clearance under guidelines laid down by a subdecree issued in November 2004, and operational guidelines issued by the CMAA in February 2007.¹¹⁰ MAPUs work with local authorities to identify community priorities, and with operators to prepare annual task lists which are reviewed and approved by Provincial Mine Action Councils. Mine action in provinces without MAPUs is coordinated with provincial authorities.

Operators express support for the MAPU system, under which they also propose sites for clearance and make a selection of tasks for the coming year in negotiation with MAPUs; but they have also expressed concern that the units are under-resourced, raising questions about their long-term sustainability after training support from Australian Volunteers International stopped in mid-2008.¹¹¹

HALO also noted a contradiction between the 2007 guidelines, which state that clearance should target “worst contaminated areas,” and the MAPU focus on task selection according to socio-economic impact. HALO noted that the K5 mine belt represents the heaviest concentration of mines, but sections of the belt that are not close to communities “are therefore being left off MAPU workplans (despite a persistence of incidents) in favor of land that can demonstrate post-clearance beneficiaries.”¹¹²

The Cambodian Millennium Development Goals, and the National Strategic Development Plan 2006–2010 have linked mine action to poverty reduction, and both plans support activities to reintegrate mine/ERW survivors. The NSDP also aimed to reduce mine/ERW casualties to zero by 2020. However, neither plan mentions activities or targets for persons with disabilities (including survivors).¹¹³

National ownership

Commitment to mine action and victim assistance

Government commitment to mine action is reflected by Prime Minister Hun Sen’s position as President of the CMAA and reference to mine action in national development plans.¹¹⁴ A report by GICHD on the need for a new national mine action strategy found “strong support both among mine action stakeholders and government ministries/agencies.”¹¹⁵

Government capacity to conduct VA/disability activities is “in its infancy,” according to an NGO assessment.¹¹⁶ The fulfillment of the 2009–2011 VA plan is largely dependent on the MoSVY’s capacity to take on a leadership role. Actors noted that the MoSVY was becoming more involved but were also concerned that disability was not a priority.¹¹⁷ It was also noted that the MoSVY lacked sufficient financial resources and that it was understaffed, but a national disability advisor, funded by AUSAID, started in the ministry on 1 July 2009.¹¹⁸ Involvement of other ministries was limited.¹¹⁹

DAC noted in May 2009 that the national budget allocation to disability was low, and that “structures lack human resources and technical and financial capacity to fully respond to the needs of the disability sector.”¹²⁰

In 2007–2008, the ARC (funded by AusAID) provided extensive support to coordination of VA/disability efforts to re-engage and reactivate mechanisms that had been defunct under DAC.¹²¹ HI-F and HI-B continued to support DAC through various projects in 2008 in its efforts to remain the coordination body for the disability sector.¹²²

¹²² Email from Marie-Pierre Guicherd, South East Asia Desk Officer, HI-F, 4 September 2009.

All actors agreed that service provision was almost exclusively carried out by NGOs and DPOs and that this would remain unchanged. It was noted that even after the end of the VA plan in 2011, the MoSVY would not have the financial capacity to conduct VA/disability activities.¹²³ Several operators also mentioned donor fatigue and increased funding challenges, which would make it difficult to maintain the same level of operations in Cambodia in the medium- to long-term.¹²⁴ Equally, the viability and sustainability of DAC, which depended exclusively on external funding, was questioned, unless national contributions increase.¹²⁵

National management

The CMAA, supported by UNDP and working closely with stakeholders, is the focal point for mine action and developing a national mine action strategy. A concept paper in June 2009 said the NMAS should incorporate “concrete measures to enhance Government ownership and capacity to deal with Cambodia’s landmine/ERW problem over the long term.”¹²⁶

National mine action legislation

A royal decree dated 4 September 2000, and a subdecree dated 8 August 2001, define the CMAA’s roles and responsibilities; the 2001 subdecree also confirmed CMAC’s status as a service provider.¹²⁷

National mine action standards/Standing operating procedures

The CMAA has drafted 29 chapters of Cambodian mine action standards, of which the first five came into effect in August 2006, covering accreditation and licensing; monitoring demining organizations; the storage, transportation, and handling of explosives; and the reporting of demining accidents. Another six chapters covering, among other issues, standards for mine and UXO clearance, were approved and came into effect in February 2007. As of April 2009, two chapters on marking and baseline survey had been provisionally approved, a chapter on mechanical clearance was awaiting approval, and the remaining 15 chapters were in draft form.¹²⁸ In 2009, work started on drafting standards for land release.¹²⁹ There are draft national standards for RE but as of April 2009 they had not been completed.¹³⁰

Demining and Battle Area Clearance

Demining is conducted by three NGOs: CMAC, HALO, and MAG, which have operated in Cambodia since the 1990s. The CMAA began accrediting operators in 2006 and accredited all three NGOs in October 2006. In 2007, CMAC also started demining on behalf of Australian mining company BHP Billiton, which was exploring for bauxite in the northeastern province of Mondolkiri; in April 2009 CMAC reported it had completed its engagement and the site was mine-free.¹³¹

The CMAA has also accredited three international commercial companies and a Cambodian company: BACTEC, Milsearch (International), Phoenix PCL, and the Cambodian Demining Service.¹³² BACTEC mainly provides support to mineral exploration companies.¹³³

¹³³ Interview with Burt Kearney, General Manager, Asia, BACTEC, Phnom Penh, 30 April 2008.

The RCAF had not applied for accreditation as of July 2009, but with backing from the Prime Minister it has conducted demining on behalf of government ministries, mainly in support of infrastructure projects.¹³⁴ Discussions were underway with the CMAA on accrediting at least some of the RCAF engineers for demining. Cambodia's initial Article 5 deadline extension request projected the RCAF would clear more than one-third of the remaining mined area but the revised submission dropped this projection. It stated, however, that RCAF accreditation would make a significant contribution to increased productivity and as such was "seen as a major priority for the CMAA." It included RCAF's accreditation as a milestone to be achieved in 2009.¹³⁵

RCAF engineers have also conducted demining for the UN Mission in Sudan since 2006, rotating a new unit every year.¹³⁶ The third contingent, comprising 139 engineers, deployed in June 2008,¹³⁷ and a fourth team of 52 deminers was due in Sudan in June 2009.¹³⁸ Cambodia also announced in March 2009 that it would send soldiers to Chad and the Central African Republic, also to undertake demining in support of UN peacekeeping operations.¹³⁹

Identification of hazardous areas

As part of its Article 5 extension request preparations, the CMAA and operators recognized the need for a Baseline Survey to provide more reliable data on which to determine the extent of remaining mine and ERW contamination and to set priorities for clearance. The extension request outlined plans to conduct the survey in two phases. The first phase was to cover the 21 "focus" districts, which accounted for 93% of mine casualties in the past five years. The survey's first phase started in August 2009 and was due to take one year to complete.¹⁴⁰ The second phase covering the remainder of the country was to be completed in 2012. Operators agreed the results of the survey will supersede the LIS.¹⁴¹ CMAC was due to conduct the survey with 13 survey teams for 13 districts, HALO with six teams for six districts, and MAG with two teams for two districts.¹⁴²

The Baseline Survey is seen as an important opportunity to get around flaws in available data on mine action contamination and operations, and to present the first coherent dataset since the start of mine action in Cambodia (see Data collection and management section above). The CMAA and operators paved the way for the survey by agreeing to standing operating procedures, a common survey report form, and a system of classifying affected or suspected land agreed by CMAA and operators.¹⁴³ This provides a platform for strategic planning and prioritization and for a process of releasing or reclassifying land.¹⁴⁴ Operators started a pilot survey to field test the survey methodology on 6 July 2009.¹⁴⁵

Under the land classification matrix, land will be categorized as either:

- *Mined area*, including land with dense concentrations of antipersonnel mines (A1), a mixture of antipersonnel and antivehicle mines (A2), just antivehicle mines (A3), or land containing scattered or nuisance mines (A4);
- *Residual threat*, land including ERW (B1), or land with no verifiable mine threat (B2); or

- *End state*, including reclaimed land returned to productive use for three years or more without accident or evidence of mines (C1), land released by survey (C2), cleared land (C3), and “unmined land” (with no indication from local communities or previous survey) (C4).

The formula calls for concentrating clearance assets on land classified as A1 or A2 and for further investigation of A3 and A4 land before deploying clearance teams. It says clearance assets should only be deployed to B-classification land where there is a community need, and should not be deployed to C-classified land.¹⁴⁶

Mine clearance

Demining operations continued in 2008 at about the same level as in previous years, increasing clearance of mined areas about 4% over 2007 although numbers of items cleared were lower. The amount of land area reduced or canceled also dropped, to 482km² in 2008 from 557km² the previous year.¹⁴⁷

Debate continued among operators, MAPUs, and other stakeholders on whether clearance should concentrate on densest concentrations of mines or tasks supporting community and development priorities.¹⁴⁸ Tensions between Thailand and Cambodia led to interruptions in tackling some border tasks. In 2009, Senior Minister Prak Sokhonn stated that the CMAA and the Ministry of National Defense had agreed that no orders would be issued to halt border demining; that, in areas where the border is not clearly demarcated, demining operations required the approval of the two countries’ Joint Border Commission; and that demining should concentrate on other priorities rather than border areas that are disputed.¹⁴⁹

CMAC, with some 2,400 personnel, reported it had targeted clearance of nearly 30km² in 2008 and fell short of that figure mainly as a result of cross-training 650 deminers on courses that included EOD and battle area clearance, mapping, and minefield management. CMAC expected the training to raise productivity, and in 2009 it targeted clearance of 35.1km². CMAC also worked with NPA in developing technical survey and land release protocols intended both to meet international standards and increase the rate of land release. GICHD also provided assistance on technical survey and land release.¹⁵⁰ In 2009, it was preparing its own five-year strategic plan (for 2009–2013) in parallel with its involvement in discussions on the Article 5 extension request and a new NMAS.¹⁵¹

CMAC set up eight battle area clearance teams in 2007 for its BHP Billiton contract. It also sees a long-term role in tackling ERW contamination as economic development and demand for land expand into areas mainly affected by ERW and in response to heightened international attention resulting from the Convention on Cluster Munitions. In 2008, it moved demining teams from the western border with Thailand to eastern Cambodia, partly in response to US interest in funding clearance of ERW contamination resulting from US bombing in the 1970s.¹⁵²

HALO, with five international and some 1,200 national staff, operated about 100 eight-person manual clearance sections, two mechanical teams, three EOD teams, and eight survey teams. HALO concentrated operations on areas close to the Thai-Cambodian border with heavy concentrations of mines, including parts of the K5 mine belt,¹⁵³ and accounted for more than half (54%) the total antipersonnel mines cleared in 2008 (see table below). Productivity has been helped by use of HSTAMID detectors, which reduce the number of signals for investigation and are now used by 20 of its clearance sections.¹⁵⁴

¹⁵³ Interview with Tim Porter, Program Manager, HALO, Siem Reap, 1 April 2009.

¹⁵⁴ HALO, “Mine clearance in Cambodia–2009,” January 2009, p. 12.

MAG continued to operate in northwestern Cambodia with around 500 staff, deploying 21 manual clearance teams, three mine detection dog teams, one technical survey team, seven community liaison teams, three brush-cutting teams, six mapping teams, and three research and development teams. It increased the number of EOD teams from five to seven, reflecting the demand for collecting ordnance from villagers. Operations benefited from wider use of brush-cutting trimmers and the use by two teams of dual sensor HSTAMIDS detectors. MAG also invested in new Minelab detectors after encountering difficulties with other equipment finding minimum-metal mines below depths of 7cm.¹⁵⁵

Demining in 2008¹⁵⁶

Demining operators	Mine clearance (km ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	UXO destroyed*	Area reduced or cancelled (km ²)
CMAC	27.65	25,543	497	114,101	201.52
HALO	6.97	37,542	215	8,308	90.35
MAG	3.24	4,538	119	19,813	190.29
NGO total	37.86	67,623	831	142,222	482.16
RCAF**	27.50	1,878	37	9,822	0
Total	65.36	69,501	868	152,044	482.16

* Operators do not distinguish in their reporting between UXO and abandoned explosive ordnance.

** It is not known how much of this total is area reduction or cancellation rather than physical clearance, but it is likely to be substantial.

Quality assurance/Quality control

The CMAA undertakes quality assurance (QA), supported by UNDP, which in 2007 contracted BACTEC to provide technical assistance. BACTEC's contract ended in mid-July 2009 when UNDP recruited a technical adviser to support QA.¹⁵⁷ In February 2008, the CMAA raised the number of QA teams from two to four, with two of them working from bases in the provinces (Battambang and Kampong Cham).¹⁵⁸ Operators reported QA teams had become more effective as they gained experience.¹⁵⁹ In a final report on its engagement, BACTEC observed "the entire CMAA organization is geared to react rather than to be proactive" and suffered from lack of funding, and weak administration and logistics.¹⁶⁰

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Cambodia is required to clear all antipersonnel mines from mined areas under its jurisdiction or control as soon as possible, but not later than 1 January 2010.

In April 2009, Cambodia submitted a request for a 10-year extension "commencing January 2010 and concluding December 2019." The request estimated the area requiring full manual clearance at 672km² necessitating annual clearance of about 80km² a year from 2011, more than double the annual clearance by NGOs in recent years, and costing a total of US\$529

million.¹⁶¹ Four months later in August 2009, Cambodia submitted a revised request that estimated 648.8km² of land required demining and projected the cost at \$330 million.

The revised request observed that the current capacity of demining organizations would clear some 470 km² and thus would be insufficient to complete clearance within 10 years. It added that “with a 38% increase of financial resources made available to the sector and a greater involvement of the RCAF in addressing the remaining challenge, productivity rates can be increased which may make completion of clearance of all known minefields within the extension period possible.” However, it warns that on current estimates “the problem for Cambodia will go beyond 2019 if funding levels do not increase” and acknowledges that competing demands for funding, locally and globally “will make it very challenging for Cambodia’s mine action sector to maintain the current capacities.”¹⁶²

The ICBL concluded that Cambodia would only be able to provide States Parties with a meaningful estimate of remaining mine contamination, workplan, and cost estimate after the results of the first phase of the Baseline Survey. ICBL recommended States Parties give Cambodia a two-year extension to allow for completion of the survey’s first phase and analysis of its findings.¹⁶³

Demining from 1999–2008

Year	Mine clearance (km ²)*	Area reduced or cancelled (km ²)
2008	37.86 (63.26)	482.16
2007	36.34 (55.3)	557.02
2006	35.4 (51.9)	303
2005	30.8 (40.6)	85.4
2004	18.9 (32.0)	0
2003	17.3 (41.7)	0
2002	17.6 (34.71)	0
2001	15.4 (21.87)	0
2000	12.18 (32.19)	0
1999	12.53 (N/R)	0
Total	234.31 (373.53)	1,427.58

* Brackets indicate clearance including RCAF’s reported results.

Risk Education

There are four main approaches to RE in Cambodia: message-based approaches (awareness-raising, public information, and education); livelihood/integrated mine action approaches; law enforcement and monitoring of the scrap metal trade; and community participation in mine action processes.¹⁶⁴ In 2008, RE was conducted by CMAC, Ministry of Education, Youth and Sports (MoEYS), National Police, CRC, clearance operators, and other NGOs. At the provincial level the Provincial Mine Action Committee prioritizes and coordinates messages.¹⁶⁵ CMVIS data informs operator activities.¹⁶⁶

Although the RE strategy aims to empower affected communities to identify appropriate and effective risk education/reduction approaches, the CMAA/UNICEF evaluation found that, “direct RE activities are still essentially awareness raising however with a focus on risk avoidance. The main strategy is information dissemination, targeting a broad target population, although some specific risk behaviours have been incorporated into the messages.”¹⁶⁷

¹⁶⁶ “Evaluation of Mine Risk Education in the Kingdom of Cambodia,” CMAA/UNICEF, October 2008, p. 8.

¹⁶⁷ Ibid, p. 6.

One method of RE delivery is through CMAC's program, "Community Based Mine UXO Risk Education and Reduction through national police and community resource mobilization."¹⁶⁸ Since late 2001, CMAC has operated networks that link communities to district authorities. Community-based Mine UXO Committees (MUCs), comprised of government employees and community volunteers, form a link with District Focal Points, which are members of the local authorities.¹⁶⁹ In the northwest, the approach is called community-based mine risk reduction (CBMRR). In the southeast, it is called community-based UXO risk reduction (CBURR), but this is less well developed at the community level.¹⁷⁰ The MUCs use Participatory Learning in Action to understand the problem and then work with development agencies and government authorities to incorporate mine action in the community development plan. Contamination reports are passed to the District Focal Points who request clearance from operators. An increase in CBURRs in 2008 resulted in an increase in spot UXO reports, which were usually met with a response.¹⁷¹ The MUCs also deliver RE messages through schools, and maintain minefield markings.¹⁷² Messages are cross-sectoral, along with HIV, gender issues, etc.¹⁷³ CMAC intends that every district in the country will have the capacity for community-based risk reduction.¹⁷⁴

RE continued to be included in the school curriculum in a project implemented by the MoEYS, with support from RE operators.¹⁷⁵ In 2008, directors and inspectors were trained and supported to observe teaching practices, interview children and parents to assess behavior change, and meet with teachers to provide advice and refresher training.¹⁷⁶

RE campaigns also take place at the district level on television and radio.¹⁷⁷

RE is well integrated into other components of mine action.¹⁷⁸ Clearance organizations conduct community liaison. MAG undertakes CL as a core activity that ensures affected communities are consulted and involved at every stage of the mine action process. EOD teams routinely provide informal RE on practicalities such as how to report mines or UXO, as well as safety briefings during clearance operations.¹⁷⁹ Challenges in 2008 included lack of resources and collecting reports from the MoEYS.¹⁸⁰

RE materials are shared among the implementing organizations, and are all in Khmer language. Informal evaluations of material are conducted at the MRE TWG meetings. The CMAA prepares materials for the army and police while other operators prepare their own.¹⁸¹

RE Activities in 2008¹⁸²

Organization	Type	Type of activity	Location	No. of beneficiaries
CMAC	National organization	Five programs: Mine Risk Education and Reduction; Community-Based Mine Risk Reduction; Mass Media (television, radio); UXO Risk Reduction through Scrap Metal Dealers; and Community-Based UXO Risk Reduction	17 of the 24 affected provinces: Banteay Meanchey, Battambang, Kampong Cham, Kampong Speu, Kampong Thom, Kandal, Kratie, Mondolkiri, Oddar Meanchey, Pailin, Preah Vihear, Prey Veng, Pursat, Ratanakiri, Siem Reap, Stueng Traeng, and Svay Rieng	434 CBMRR networks (total beneficiary numbers unavailable); CBURR network reached 89,908 beneficiaries including 397 scrap dealers/collectors
CRC	International organization	Volunteers working with fishermen, hunters, newcomers, wood collectors, veterans, scrap metal collectors, and in and out of school children; CMVIS project staff (employed by CRC); emergency RE where they collect data and where incidents have occurred, and on request from other operators in remote areas	All provinces	31,958
HALO	NGO	RE alongside clearance activities	Banteay Meanchey, Battambang, Oddar Meanchey, Pailin, and Siem Reap	35,915
HI	NGO	RE in cooperation with the National Police, and development operators; focus on scrap metal trade	Pailin, Rattanak Mondoul, Sala Krau, and Samlot	1,534
MAG	NGO	Informal RE through community liaison staff, primarily during EOD tasks	Banteay, Meanchey, Battambang, Kampong Cham, Pailin, and Preah Vihear	RE to 25,171, Community liaison to 27,233
MoEYS	Government	Trained members of the education system: school directors, district education officials, inspectors and staff of teacher training, planning and pedagogical departments	Banteay Meanchey, Battambang, Kampong Cham, Kampong Speu, Kratie, Oddar Meanchey, Pailin, Preah Vihear, and Pursat	2,195 teachers and 145,377 students

¹⁸² Ibid, pp. 15, 17, 21, 23, 25, 26, 28, 36.

Organization	Type	Type of activity	Location	No. of beneficiaries
National Police	Government	Education RE laws pertaining to scrap metal and ERW RE by police UXO teams, gathering information about contamination	Seven target provinces: Banteay Meanchey, Battambang, Kampong Speu, Kandal, Oddar Meanchey, Pailin, and Siem Reap	35,516
RCAF	Military	RE alongside clearance activities, training of trainers	Provinces with ongoing demining	
Spirit of Soccer	NGO	RE through soccer training in schools; Limited RE delivered indirectly through disabled volleyball league according to CMAC	Banteay Meanchey, Battambang, and Pailin provinces	12,726 students
World Vision Cambodia	NGO	RE in communities through RE representatives; house-to-house visits; and RE during community meetings	Rattanak Mondoul, Samlot district of Battambang province, Rovieng district of Preah Vihear province	15 communities, 93 families through house-to-house visits

The CMAA/UNICEF external evaluation in October 2008 concluded: “the MRE sector in Cambodia has been remarkable in adapting its response to the different phases. Overall, coverage has been good with the most affected areas targeted. The program has also been effective in raising awareness and knowledge of risk avoidance strategies. Messages while relevant in the early stages of the program are less relevant in the current context and need some revision to ensure they are more contextually specific. Impact is harder to assess and it is difficult to gauge the extent to which MRE has resulted in changes to the reduction of mine/UXO risk taking behavior...A more targeted and cross-sectoral approach based on principles of Communication for Behavioural Impact (COMBI) will be needed to change behavior...MRE should also increasingly be integrated into wider development and clearance interventions with the ultimate aim of mine/UXO risk being perceived as a cross-cutting issue, integrated into overall safety strategies and managed by existing local government structures. This is a key strength of the CBMRR approach which could potentially be expanded to aid the transition to national ownership.”¹⁸³

Extensive mine awareness has been conducted in Cambodia for over 10 years. CMAC coordinated RE until 2000, when it became the role of the CMAA. RE has evolved with the recognition that awareness-raising alone was insufficient as people were driven to take risks through economic necessity.¹⁸⁴ Traditional mine awareness needed to broaden its approach to develop the capacity of communities to fully participate in mine action and providing RE. In 2004, UNICEF began to fund a full-time RE coordinator for the CMAA.¹⁸⁵ In 2005, a strategy was developed to improve integration of RE in mine action and community development, to strengthen national coordination, and to integrate RE in the school curriculum.¹⁸⁶ Because of the continued high rate of incidents, a revised strategy for 2006–2012 was developed, which

sought to empower affected communities to identify appropriate and effective RE/reduction approaches and integrate these efforts with broader humanitarian and development activities. In 2006, RE capacity increased, but beneficiary numbers decreased as RE increasingly targeted at-risk groups through integration with community development and small income-generation activities.¹⁸⁷

Victim Assistance

The national VA plan mentioned that households headed by a “person disabled by war or landmines live in poverty at levels almost three times higher than if the disability was due to other causes.”¹⁸⁸

Medical care is usually not free of charge and the cost of continuing care is especially prohibitive. Emergency transport is not widely available and the lack of roads in remote areas is also an obstacle. Emergency care to mine/ERW survivors is usually limited to government facilities. Complex trauma care is only provided by an Italian NGO, Emergency, in Battambang. Training of health staff is basic and coordination in the sector is limited. Under the Health Equity Funds, some medical costs can be covered, but this is not systematic for all persons with disabilities.¹⁸⁹

Physical rehabilitation services, run with the support of, or by, five international operators, are well organized and good quality, particularly for amputees. Accommodation, transport, and meals may also be included.¹⁹⁰ However, transport costs are often only reimbursed afterwards, which still poses problems for patients.¹⁹¹ Coordination among service providers is good.

The physical rehabilitation sector in Cambodia is under the authority of the MoSVY, which also provides limited assistance, including some government staff, minimal monetary contributions towards the operational costs, tax exemptions, land and buildings. However services are predominantly provided by international operators.¹⁹² The MoSVY started a process of taking over responsibility for the rehabilitation sector by the end of 2010 (see Plans section above) but the sector continued to operate almost exclusively on international funds.

A review in 2008 showed that the MoSVY on average completed 50% or less of its management, financial, and technical responsibilities, whereas the operators scored much higher.¹⁹³ Operators noted that the MoSVY had not started paying its small financial contribution (less than 5%) to the running costs of the centers as of April 2009. But their main concern was keeping staff who would now be paid at government salary levels that are much lower than those they previously received and who might not meet civil service criteria for employment.¹⁹⁴ The ICRC foresaw fewer challenges as it already worked with government staff on government salaries, although it did pay incentives.¹⁹⁵

As in previous years, there were 11 physical rehabilitation centers and orthopedic workshops covering 24 provinces. But operators noted that this number might decline after 2011 due to decreasing donor commitments. It was estimated the MoSVY would not have the financial

¹⁹⁵ Interview with Yann Drouet, ICRC, Phnom Penh, 7 April 2009.

capacity to completely manage the centers after 2011 and that further international contributions would be needed.¹⁹⁶ Only HI-B envisioned exiting by 2011, and HI-F handed over the Spinal Cord Injury Centre to the MoSVY in December 2008. However, the MoSVY started its financial contributions only in April 2009,¹⁹⁷ severely hampering the center's operations.¹⁹⁸ Operators also noted that there was an over-concentration of centers near Phnom Penh¹⁹⁹ and improvements could be made in outreach and referral.²⁰⁰

Community-based rehabilitation services under the MoSVY and with UNICEF financial and technical support expanded to 19 provinces by 2009. UNICEF was also finalizing guidelines for community-based organizations.²⁰¹ The physical rehabilitation services also extended their services to include community-based rehabilitation activities such as on-the-spot repairs of assistive devices, patient follow-up and referral and home care.²⁰²

As of 2008, there was no national mechanism to provide psychological or psychiatric support. Some limited services are offered through the Ministry of Health's mental health units or referral hospitals, but they do not function well. There is only one facility providing training for health staff on basic psychological issues. After reviewing performance of province and district branches of the MoSVY, it was considered necessary to develop a psychosocial support policy. NGOs providing psychosocial support and activities were expanded through the community-based rehabilitation network and the development of self-help groups.²⁰³ The number of self-help groups continued to grow, providing psychosocial peer support, economic benefits and awareness-raising. Most self-help groups are supported by NGOs, but these did not coordinate sufficiently and exchanges of experiences were lacking.²⁰⁴

Few persons with disabilities have access to education and survivors can often not afford education for their children. Efforts were made to improve this through the MoEYS. The Ministry of Labor and Vocational Training is responsible for vocational training centers, but services for persons with disabilities at these centers need strengthening. Vocational training and economic reintegration for survivors are carried out mostly by NGOs, but the success rate of job placements is low.²⁰⁵ Cambodia noted in its Article 7 report for 2008 that, "many [economic reintegration] projects have been postponed or ended due to the lack of funding."²⁰⁶

On 3 July 2009, the King of Cambodia signed the Law for the Protection and Promotion of the Rights of People with Disabilities.²⁰⁷ The law was first drafted in 2000, redrafted in 2004, and submitted to the government in 2006.²⁰⁸ All actors in Cambodia stated that having approved legislation was crucial to improved VA and disability implementation. The Cambodia Disabled People's Organization (CDPO) acknowledged, however, that some amendments

were needed to bring the legislation in line with the UN Convention on the Rights of Persons with Disabilities.²⁰⁹ Cambodia signed this convention and its Optional Protocol on 1 October 2007, but had not ratified as of 1 July 2009. Social and employment discrimination remained considerable.²¹⁰ Buildings remained inaccessible.²¹¹

Progress in meeting VA26 victim assistance objectives

Cambodia is one of 26 States Parties with significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation and reintegration of survivors.²¹² As part of its commitment to the Nairobi Action Plan, Cambodia presented its objectives in 2005;²¹³ most of these objectives were not SMART (specific, measurable, achievable, relevant, and time-bound) criteria.²¹⁴ At the end of 2008, revised objectives and plans to achieve the objectives were presented in the form of the National Plan for Persons with Disabilities, including Landmine/ERW Survivors 2009–2011.²¹⁵

As the 2009–2011 VA plan was only finalized in early 2009, some operators who had been consulted had not yet received the final plan.²¹⁶ Others found it too early to comment on its implementation. However, they noted that their activities were in line with the plan.²¹⁷ Some noted that a further implementation plan was needed and that implementation of the plan would probably be limited to what is realistically feasible.²¹⁸ Another main challenge would be to find funding for the plan.²¹⁹

When looking at the 2005–2009 objectives, uneven progress was made:

- Data collection: CMVIS activities continued throughout, but the survey of assistance received by survivors was not conducted.
- Emergency and continuing medical care: no progress reported on specific health sector strategy development or on the plan to provide free hospital care for survivors.
- Physical rehabilitation: services functioned adequately, but long-term national sustainability remained questionable (see above).
- Psychological support and social reintegration: plans and guidelines for psychosocial support were not developed.
- Economic reintegration: self-help groups were established, but income generation, employment and educational opportunities did not increase.
- Laws and public policy: the draft disability law was adopted and the VA action plan was developed, but other legislation was not under revision and there was limited disability awareness.

²¹⁸ Interviews with UNICEF, Phnom Penh, 7 April 2009; DAC, Phnom Penh, 10 April 2009; and CMAA, Phnom Penh, 6 April 2009.

²¹⁹ Interview with Teresa Carney, ARC, Phnom Penh, 6 April 2009.

At the intersessional Standing Committee meetings in May 2009, Cambodia mentioned progress on establishing the National Disability Coordination Committee, recruitment of the disability advisor, the memorandum of understanding between the CMAA and CMVIS, and legislative progress. Challenges were also mentioned, but there was no discussion of implementation.²²⁰

At the Eighth Meeting of States Parties in November 2007, Cambodia assumed the role of co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration. Cambodia included a VA/disability expert on its delegation to meetings of States Parties from 2006–2008, and at the intersessional Standing Committee Meetings in 2005, 2007, 2008, and 2009. It also reported on VA in its annual Article 7 report and at meetings every year from 2005–2009.²²¹

Victim assistance activities

Numerous organizations are active in the disability/VA sector. Only those that provided updated information for 2008 are included below. More detail on their activities and on other organizations is mentioned in previous Landmine Monitor reports and a listing is available from DAC.²²²

2008 VA activities²²³

Organization	Type	Activities	Number of mine survivors assisted
ARC	NGO	Support to partners including the CRC, CMVIS, and Landmine Survivors Assistance Fund (small grants)	See partners CRC and CMVIS
Association for Aid and Relief (AAR)	NGO	Vocational training	649 persons with disabilities (289 survivors), living standard of 70% increased
Austcare	NGO	Referral, economic reintegration self-help groups (with CDPO), awareness	338 survivors (215 income generation and 123 referral); total beneficiaries: 385

Organization	Type	Activities	Number of mine survivors assisted
Cambodia Trust (CT)	NGO	Physical rehabilitation, training, economic reintegration	Mobility devices for 625 survivors; physical rehabilitation for 1,590; income generation for 185; vocational training for 149; educational support for 365 (all survivors); total beneficiaries: 6,432.
Cambodian Development Mission for Disability	NGO	Comprehensive community-based rehabilitation	48 survivors; total beneficiaries: 5,948.
Cambodian War Amputees Rehabilitation Society	NGO	Economic reintegration	Vocational training for 716 survivors and loans to 101; total beneficiaries: 991.
Capacity Building of People with Disabilities in Community Orgs.	NGO	Referral, awareness, educational support	
Cambodian Disabled People's Organization	DPO	National coordination	Policy and representing persons with disabilities nationally and in 20 provinces through 34 DPOs; 9,603 members (1,267 survivors)
CMVIS	National organization	Referral, material aid, transport and medical costs and disability awareness	21 survivors received transport or medical costs, 9 house repairs, 80 referrals, 16 funeral aid, 41 emergency food kits, 412 awareness
CRC	National society	Micro-finance loans and material aid	100 loan beneficiaries, 80 latrines and water filters, and 60 water tanks
Disability Development Services Pursat (DDSP)	NGO	Self-help groups, economic reintegration, referral, community-based rehabilitation	Multiple services for 98 survivors (various community-based rehabilitation for 20, social reintegration for 98, income-generating activities for 32); total beneficiaries: 1,015
Economic and Social Relaunch of Northwest Provinces in Cambodia	NGO	Agriculture training	31 survivors; total beneficiaries: unknown
Emergency	NGO	Medical care	95 survivors; total beneficiaries: unknown

Organization	Type	Activities	Number of mine survivors assisted
HI-B	NGO	Physical rehabilitation, partner support, extensive community-based rehabilitation	1,263 mobility devices produced; 2,484 repaired (55% for survivors in Siem Reap); 71 survivors included in self-help groups. Total beneficiaries: 5, 037.
HI-F	NGO	Physical rehabilitation, livelihood project	436 survivors assisted at rehabilitation center (170 prostheses provided); 254 survivors part of livelihood project
ICRC	International organization	Physical rehabilitation	1,675 prostheses (86% for survivors) and 1,394 orthoses (2.5% for survivors); total beneficiaries: 10,201
Jesuit Service Cambodia	NGO	Economic reintegration, rehabilitation, peer support, awareness, material support and referral	10 persons with disabilities received vocational training; 902 peer support; 85 access to education/accommodation; 1,012 wheelchairs; 63 tricycles; 1,512 referrals; total beneficiaries: unknown
National Center for Disabled Persons	NGO	Referral, education, awareness, self-help groups	Awareness for 1,832 and support to 30 self-help groups.
Opération Enfants du Cambodge	NGO	Home-based physical rehabilitation, education and economic reintegration	825 survivors received multiple services and 1,571 children of survivors were assisted; total beneficiaries: 2,926
Veterans International	NGO	Physical rehabilitation, self-help, economic reintegration	3,686 mobility devices including 1,560 repairs (45% for survivors); total beneficiaries: 5,870
World Vision Cambodia	NGO	Self-help groups	105 persons with disabilities; total beneficiaries: 1,059 households

Support for Mine Action

Landmine Monitor is not aware of comprehensive cost estimates for all areas of mine action, including RE and VA, in Cambodia. Its revised Article 5 deadline extension request, estimated the cost of clearance of some 470km² up to 2019 at \$329.4 million, climbing from \$22 million in 2010 to \$28.7 million in 2014, \$35.2 million in 2017, and \$40.3 million in 2019. The total cost of completing clearance of the estimated 648.8km² of remaining mine contaminated land was put at \$455 million.²²⁴ Because the real extent and nature of contamination in Cambodia remains to be determined, cost estimates are expected to change as results of the Baseline Survey become known. The extension request does not include detailed resource mobilization strategies or plans.

²²⁴ Article 5 deadline Extension request (Revision), 24 August 2009, p. 55.

National support for mine action

In its CCW Article 13 report submitted in April 2008, Cambodia reported national funding to mine action of \$1,550,000 in 2007, which was the same amount as reported in 2006.²²⁵ Cambodia's revised Article 5 extension request reported national contributions had increased from an initial \$200,000 in 2003 to \$3.5 million in 2009 and totaled nearly \$11 million for 2003–2009. The request adds that external funding will “continue to play a crucial role in supporting mine action.”²²⁶

International cooperation and assistance

In 2008, 14 countries reported providing \$28,072,304 (€19,063,088) to mine action in Cambodia, 8% less than reported in 2007. While the full extent of contamination and the total number of landmine survivors are unknown, funding at 2008 levels—combining reported international and national funding—is not sufficient to meet the financial requirements for 2010–2019 cited in Cambodia's Article 5 extension request, or to address the country's substantial victim assistance needs.

In addition to the above, New Zealand reported contributing to capacity development through the CMAC training center in 2008, but did not provide a value for its contribution.²²⁷ HI-F reported funding to support VA programs from the European Commission (EC) (\$439,589) and France (\$64,412) in 2008.²²⁸ Neither the EC nor France reported funding to Cambodia in 2008.

In March 2009, Japan reported ¥548 million (roughly \$5.5 million) in new funding to support the purchase of clearance equipment in Cambodia. The funding comprises phase five of a support agreement between Japan and CMAC, and the equipment includes mine detectors, mine/UXO detectors, and spare parts.²²⁹

International support by Cambodia for mine action

Cambodia has provided three contingents of demining personnel to UN Peacekeeping operations in Sudan since 2006 (see Demining section above).²³⁰ In June 2009, a contingent of 52 demining personnel were sent to Sudan to replace returning personnel.²³¹ Cambodia receives funding from the UN Department of Peacekeeping Operations (DPKO) assessed budget (independent of donor contributions earmarked for mine action) in order to defray the costs of its mine action support in Sudan.²³² Cambodia receives funding from the UN DPKO assessed budget (independent of donor contributions earmarked for mine action) in order to defray the costs of its mine action support in Sudan.²³³ Cambodia did not report the value of these contributions in 2008 or 2009.

CHAD

2008 Key Data

State Party since	1 November 1999
Contamination	Antipersonnel and antivehicle mines, submunitions, other UXO, AXO
Estimated area of contamination	No credible estimate
Casualties in 2008	131 (2007: 186)
Estimated mine/ERW survivors	Unknown but at least 1,588
Article 5 (clearance of mined areas)	Deadline: 1 January 2011 Original deadline: 1 November 2009
Demining in 2008	Clearance of 0.04km ² of mined areas Clearance of 2.85km ² of battle areas Release of 131km ² of suspected hazardous areas
Risk education recipients in 2008	34,376
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$2.1 million (2007: \$0.7 million) National: \$2.6 million (2007: \$2.5 million)

Ten-Year Summary

The Republic of Chad became a State Party to the Mine Ban Treaty on 1 November 1999. National implementation legislation was promulgated in August 2006. Chad completed destruction of its 4,490 stockpiled antipersonnel mines in January 2003. Since then, it has discovered and destroyed an additional 1,418 stockpiled mines. It retains no mines for training purposes.

Chad was unable to meet its 1 November 2009 Article 5 deadline for clearance of mined areas. The reasons were the extent of contamination, armed conflict, and poor management of the mine action program. Chad requested, and was granted, a 14 month extension to conduct a survey of suspected hazardous areas. The survey results will help Chad to determine how much additional time is needed to complete its clearance obligations. The extent to which Chad remains affected by cluster munition remnants is also unknown.

From 1999–2008, Landmine Monitor identified at least 977 mine/explosive remnants of war (ERW) casualties, including 287 killed, 666 injured, and 24 of unknown status although figures might be higher as data collection was inadequate. In total, at least 2,763 casualties were recorded in Chad, but this probably includes 1,686 casualties identified in the 1999–2001 Landmine Impact Survey. Mine/ERW risk education has been implemented directly by National Demining Center teams, in schools and through a network of community volunteers, focusing on refugees and communities in high-impact areas. In 2008, progress was made in integrating risk education in the primary school curriculum. Despite being part of the so-called VA26 group, with responsibility for significant numbers of survivors, mine/ERW survivors receive limited support. Service provision continued to be adversely affected by the armed conflict.

Mine Ban Policy

Chad signed the Mine Ban Treaty on 6 July 1998 and ratified it on 6 May 1999, becoming a State Party on 1 November 1999. National implementation legislation was promulgated on 26 August 2006.¹

Chad submitted its annual updated Article 7 report for 2008 on 1 July 2009. It has submitted eight previous reports.²

Chad attended the Ninth Meeting of States Parties in Geneva in November 2008, where it presented its Article 5 deadline extension request and made a statement on victim assistance (VA). Chad participated in the intersessional Standing Committee meetings in May 2009, where it made statements on mine clearance and VA.

Chad was absent from the 2 December 2008 vote on UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty.

Chad has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3. However, in July 2006, Chad sent a letter to Landmine Monitor stating that, with regard to Article 1, “we will reject any rules of engagement permitting use of antipersonnel mines and will refuse to order them as well. We will also reject participation in any joint operation if our military forces derive any military benefit from use of antipersonnel mines and we will not provide security or transportation of antipersonnel mines.”³

Chad is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions in December 2008, but had not yet ratified it as of 1 July 2009.⁴

Production, transfer, stockpiling, and use

Chad is not known to have produced or exported antipersonnel mines. It completed destruction of its stockpile of 4,490 antipersonnel mines in January 2003. It destroyed 1,365 newly discovered stockpiled mines from 2003 to early 2005, and reported later in 2005 the destruction of an additional 42 mines discovered in a container abandoned by the Libyan army.⁵ Chad reported destroying another 11 stockpiled antipersonnel mines in 2007, but did not report details of the locations or sources of the mines.⁶

In all of its Article 7 reports Chad has reported that it does not retain any antipersonnel mines for training purposes.

It is alleged that smugglers lift and sell landmines found in mined areas in Chad bordering Niger.⁷

In the past, there have been occasional allegations of use of antipersonnel mines by Chadian forces, but no compelling evidence has been presented and the government has strongly denied the charges.⁸

Scope of the Problem

Contamination

Chad is contaminated by mines and ERW resulting from the 1973 Libyan invasion and 30 years of internal conflict, which continues to this day, but the precise nature and extent of this contamination remains to be quantified. The UN has referred to “vast quantities of unexploded

¹ Article 7 Report, Forms A and J, 1 April 2007. For the text of the law, see www.icrc.org.

² Previous Article 7 reports were submitted on 1 April 2008, 1 April 2007, 1 September 2006, 27 September 2005, 27 May 2004, 30 April 2003, 29 April 2002, and 12 December 2001.

³ *Landmine Monitor Report 2006*, p. 273. Chad has still not made known its views on issues related to foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training.

ordnance and other explosive remnants of war” across eastern Chad.⁹ Previous estimates of 670km² of suspected hazardous areas (SHAs) outside the northern Tibesti department, identified as a result of a 1999–2001 Landmine Impact Survey (LIS),¹⁰ are widely believed to overstate the true extent of the problem today. An upcoming survey of SHAs is expected to clarify the situation across most of the country, but it will not include the Tibesti department where most of the contamination is believed to be located.¹¹ Clearance has been completed in two areas—Faya (Largeau) and Ounianga-Kébir—while partial clearance has been conducted of Fada, Gouro, and Wadi-Doum.¹²

In November 2007, the coordinator of the National Demining Center (Centre National de Déminage, CND) claimed that ERW posed a greater humanitarian threat than mines but promised to “expand our minefield survey and clearance capacity, without abandoning our commitment to addressing the ERW contamination that is killing and injuring Chadians now.”¹³ Contamination likely comprises cluster munition remnants. Following the end of the conflict with Libya in 1987, unexploded submunitions and cluster munition containers were found in the Borkou-Ennedi-Tibesti region, Biltine department in Wadi Fira region (northeastern Chad), and east of the capital, N’Djamena.¹⁴ On 3 December 2008, at the signing conference of the Convention on Cluster Munitions, the representative of Chad spoke of “vast swathes of territory” contaminated with “mines and UXO (munitions and submunitions).”¹⁵ No submunitions were formally reported to have been found during demining operations in 2008;¹⁶ however, the CND recorded one dangerous area containing 10 unexploded submunitions in Biltine department in 2008.¹⁷

Casualties

In 2008, Landmine Monitor identified at least 131 new mine/ERW casualties, including 24 killed, 99 injured, and eight of unknown status.¹⁸ Of these, 122 casualties were recorded by the CND and nine were reported in the media.¹⁹ The vast majority of casualties were civilians (120), three were military, and the status of eight remains unknown. Children were the biggest casualty group (65) including 47 boys, nine girls, and nine children of unknown gender; the age of 15 casualties was unknown. Among adult casualties (51), the majority were men (45). Nearly all casualties were caused by ERW (120). The majority of recorded casualties occurred in eastern Chad (49) and in N’Djamena (47). Activities at the time of the incident were not recorded systematically, but verification was ongoing as of May 2009.²⁰

¹⁹ Ibid.

²⁰ Interview with Assane Ngueadoum, CND, in Geneva, 28 May 2009.

The 2008 casualty rate is a decrease compared to 2007 (188)²¹ and 2006 (139)²² but it is still higher than 2003–2005, due to ongoing conflict. The number of reported casualties is likely to increase as data collection improves. In May 2009, the CND reported that six additional casualties were identified for 2008, but no details were available and verification was ongoing so these casualties were not added to the above total.²³ Casualties are believed to be under-reported because of rapid burial practices for religious reasons, but also due to the size of the country and the ongoing conflict.²⁴

Casualties continued to occur in 2009, but at a lower rate with nine ERW casualties (seven killed and two injured) as of 31 May 2009. On 2 April 2009, one girl was killed and two others injured in Titre village, in Dar Sila region, eastern Chad. They were playing with an ERW they found while looking for water.²⁵ In May 2009, the UN Office for the Coordination of Humanitarian Affairs reported an additional six child casualties, all killed, in eastern Chad.²⁶ In May, the CND reported that no casualties from 2009 were entered into the Information Management System for Mine Action (IMSMA) as verification of data was ongoing.²⁷ It had received partial information on at least 10 incidents, but no further information was available.²⁸

The total number of casualties in Chad remains unknown. The CND could not provide data for the last 10 years due to ongoing problems with information management.²⁹ From data made available to Landmine Monitor in previous years, the CND has registered at least 2,763 casualties (1,167 killed, 1,588 injured, and eight of unknown status) as of December 2008.³⁰ Since 2000, at least 15 clearance staff have been killed and 11 injured.³¹ The LIS identified 1,688 mine/ERW casualties (825 killed and 863 injured) from January 1998 to May 2001.³² The

²¹ See *Landmine Monitor Report 2008*, p. 234; and statement of Chad, Ninth Meeting of States Parties, Geneva, 28 November 2008. Chad reported 188 casualties for 2007 in its statements at the Ninth Meeting of States Parties and at the Standing Committee meetings in June 2008 as well as in its 2008 Article 7 report. However, it only provided detailed records for 186 casualties. CND, “Année 2007: Liste des victimes des mines et de UXOs recensées par le CND” (“Year 2007: list of mine/UXO victims recorded by the CND”), provided by Assane Ngueadom, CND, N’Djamena, 15 April 2009.

²⁹ Ibid.

³⁰ In 2008, Chad reported that up to December 2007, 2,632 casualties were recorded (1,143 killed and 1,489 injured). In 2009, Chad reported that from January to December 2008, 131 casualties were recorded (24 killed, 99 injured, and 8 of unknown status). See *Landmine Monitor Report 2008*, p. 235; Landmine Monitor media monitoring from 1 January 2008–31 December 2008; Landmine Monitor analysis of CND, “Liste générale des victimes des mines et autres engins non explosés/2008” (“General list of mine/ERW victims/2008”), provided by Assane Ngueadom, CND, N’Djamena, 15 April 2009; and email from Assane Ngueadom, CND, 22 May 2009.

³¹ See *Landmine Monitor Report 2008*, p. 235.

³² See *Landmine Monitor Report 2004*, p. 296.

LIS figures are probably included in the CND totals. From 1999 to 2008, Landmine Monitor identified at least 977 casualties, including 287 killed, 666 injured, and 24 of unknown status.³³

There are no reliable statistics on the number of persons with disabilities in Chad. In 2004, the government estimated that 5.3% of the population was disabled. Limb loss due to mines or other weapons was specified as one of the categories of disability, and 1.9% of persons with disabilities were registered under this category.³⁴

Risk profile

The greatest risk from mines is in Borkou-Ennedi-Tibesti region in the north of the country. People are at risk from ERW contamination throughout the country, which increased in January 2008 in and around N'Djamena as a result of combat. The majority of recorded casualties are boys and men living in areas contaminated by ERW, particularly in the capital and in eastern Chad. At-risk groups are herders, farmers and children playing.³⁵

Socio-economic impact

The current extent of socio-economic impact from mines and ERW is unknown. According to the UN, mine and ERW contamination affects the livelihoods and safety of more than 280,000 people.³⁶ These figures, though, relate to the findings of the LIS, and are probably now out of date.³⁷ Continued fighting in the east of the country has added to the problem and its impact. Thus, the UN Secretary-General reported to the Security Council in July 2009 that air attacks by the Chadian armed forces against non-state armed groups (NSAGs) had resulted in a new UXO threat, which subsequently "claimed the lives of at least six children in the Dar Sila region and resulted in school closures and restricted access to farmland."³⁸

Program Management and Coordination

Mine action and risk education

Since a 2007 decree,³⁹ mine action, including risk education, in Chad has been under the responsibility of a Steering Committee, which serves as the interministerial National Mine Action Authority. The Steering Committee, which is chaired by the Secretary-General of the Ministry of Economy and Cooperation,⁴⁰ is responsible for mine action regulation, policy, and resource mobilization.⁴¹

All mine action operations are coordinated by the CND, whose work is overseen by the Steering Committee.⁴² Four CND regional centers coordinate activities within their respective zones in Abéché, Bardaï, Fada, and Faya.⁴³ A "sub-center" was subsequently created by the CND in Am Timan.⁴⁴

³³ See *Landmine Monitor Report 2008*, p. 234 (188 casualties in 2007); *Landmine Monitor Report 2007*, pp. 242, 250 (139 casualties in 2006, 35 in 2005); *Landmine Monitor Report 2005*, p. 240 (32 casualties in 2004, 18 in 2003); *Landmine Monitor Report 2004*, p. 296 (200 casualties in 2002); and *Landmine Monitor Report 2002*, p. 168 (10 casualties in 2001, 76 in 2000, and 148 in 1999).

⁴¹ Ibid.

⁴² For further details see *Landmine Monitor Report 2008*, p. 231.

⁴³ The centers were established under Decree N° 498/PR/PM/MEP/07, issued by the Ministry of Economy and Cooperation on 28 June 2007.

⁴⁴ UN, "2009 Portfolio of Mine Action Projects," New York, November 2008, p. 80.

At the end of 2008, the UN Mine Action Service (UNMAS) set up a mine action center in Abéché within the context of the UN Mission in the Central African Republic and Chad (MINURCAT) and initiated an emergency survey and explosive ordnance disposal (EOD) capacity to ensure the safe deployment of the peacekeeping mission.⁴⁵ Under contract to MINURCAT, MineTech started to deploy its EOD teams in January 2009. MINURCAT planned to establish field offices in Farchana, Goz Beïda, and Iriba in July 2009, which were to have a mine action component.⁴⁶

Victim assistance

The CND is also in charge of coordination, management, and monitoring of VA.⁴⁷ Risk education (RE) and VA fall specifically under the Directorate of Awareness and Victim Assistance (Directorate de la Sensibilisation et Assistance aux Victimes).⁴⁸ In November 2008, Chad reported that the Directorate of Awareness and Victim Assistance works in partnership with NGOs, associations, the ICRC, Ministry of Health, Ministry of National Education, Ministry of Labor, and the Ministry of Social Action and Family,⁴⁹ which is responsible for disability issues.⁵⁰

Data collection and management

Following conflict in the capital in February 2008, all of the CND's computers were stolen, but in August 2008 UNDP reported that new computers had been purchased.⁵¹ Chad is using the latest version of IMSMA, which was installed by the Geneva International Centre for Humanitarian Demining (GICHD) in December 2008.⁵² The Mine Action unit of MINURCAT is also using IMSMA, and data is said to be regularly fed into the CND databases in Abéché and N'Djamena.⁵³

While there have been improvements since 2007, casualty data collection in Chad remains inadequate.⁵⁴ CND field teams collect casualty data and transfer it to the CND's four regional centers and the headquarters in N'Djamena.⁵⁵ Hospitals, local authorities, the ICRC, and NGOs including Mines Advisory Group (MAG) and Médecins Sans Frontières (MSF) also collect casualty data.⁵⁶

Data collection and forms are not standardized among all actors.⁵⁷ The CND reported that data arrives from the field in N'Djamena "slowly" and that it is often incomplete as many actors do not use IMSMA forms, but transfer the information about incidents via radio.⁵⁸ In 2008, the ICRC organized two data collection trainings in Adré and N'Djamena for Red Cross of Chad

⁴⁵ "Report of the Secretary-General on Chad and the Central African Republic," (New York: UN Security Council, 10 August 2007), S/2007/488, para. 80; and see also UN, "2009 Portfolio of Mine Action Projects," New York, November 2008, p. 80.

(CRC) volunteers and staff from the Ministry of Health.⁵⁹ While data is normally stored in IMSMA, in 2009 the CND reported that there was a problem with their database, which resulted in the loss of information. As of May 2009, the CND reported it was working with GICHD to restore the database and retrieve data.⁶⁰

In 2008, the ICRC revised the IMSMA forms for recording RE activities for use by the CND, although data entry did not start until January 2009, and there were no plans to record activities retroactively.⁶¹

Plans

Strategic mine action plans

The 2003–2015 National Strategic Plan to Fight Mines and UXO, drafted in 2002, remains the reference document for mine action, including RE, although its relevance has been superseded by subsequent events, and it was revised in 2005. The following priorities have been defined for 2009 to 2011:

- UXO clearance in the east and southeast of the country, and deployment of rapid response teams to urban centers;
- technical surveys on contaminated regions, particularly Kalaït Fada, Wadi Doum, Kouba Olanga, Bahai, and Gouro;
- demining in the zones of Kalaït, Fada, Ounianga-Kébir, and Wadi Doum;
- improved management of IMSMA;
- systematized RE for risk prevention, and to support clearance and demining operations, along with continued development of the school curricula module;
- design of a VA strategy and enhanced national capacities;
- development of national mine action capacities; and
- leveraging of national, bilateral, and multilateral resources and contributions.⁶²

VA was included in Chad's 2002 National Strategic Plan to Fight Landmines and UXO, revised in 2005 to include the aim of "zero victims" by 2009.⁶³ The plan was integrated in Chad's 2003 Poverty Reduction Strategy, which recognized that ERW exacerbates poverty by creating

new burdens on families and communities.⁶⁴ The target was not attained and the document is now obsolete. In May 2009, Chad stated that the development of a VA plan was ongoing and that funding was needed.⁶⁵ Chad has raised the funding issue since 2005 and further noted in June 2008 that the plan would be completed by the end of 2008 with funding from Canada.⁶⁶ In May 2009, the CND reported that one of the main objectives would be the launch of a disability census including questions on the cause of disability. The CND planned to present the plan to the Second Review Conference of the Mine Ban Treaty.⁶⁷

Integration of mine action with reconstruction and development

To ensure that mine action is integrated into broader development, reconstruction, and humanitarian programs, the national mine action plan was aligned in 2003 with the government's overall reconstruction plans, Chad's Millennium Development Goals, and the National Poverty Reduction Strategy.⁶⁸ According to the chair of the Steering Committee: "The Government is determined that the affected areas are cleared to become a vital part of the fight against poverty."⁶⁹

National ownership

Commitment to mine action and victim assistance

Chad's support to mine action has been uneven since becoming a State Party. A 2005 UN assessment found serious management and financial problems with the program. A national audit in 2006–2007 led to the suspension of the then-coordinator of the National Demining Office (Haut Commissariat National de Déminage, HCND), and resulted in the reorganization of the mine action program, particularly the coordination and management structures.⁷⁰ A new coordinator was appointed on 11 September 2007, several months after the reform of the HCND into the Steering Committee and the CND.

National management

Chad's mine action program is nationally managed with the assistance of UNDP and the UN Office for Project Services (UNOPS) as implementing agency.⁷¹ From July 2008 to April 2009, an institutional development advisor supported the CND's coordinator in efforts to reform the mine action program in Chad.⁷²

National budget

Since the establishment of the HCND in 1998, Chad has financed the salaries of CND staff from the national budget. Since 2008, the amount of national funding is said to have significantly increased, showing a new political commitment to mine action.⁷³

National mine action legislation and standards

The HCND was established by a 1999 presidential decree⁷⁴ that was superseded by a new decree in 2007 that reorganized the coordination and management of the mine action program.⁷⁵ A separate ordinance appointed CND staff, including the coordinator.⁷⁶ National mine action standards were supposed to be developed during 2008, but had not been adopted by May 2009.⁷⁷

There are no national standards for RE, but materials are developed with the support of the ICRC and UNICEF and informed by the needs in Chad, and are therefore considered by the CND to be to international standards.⁷⁸

Demining and Battle Area Clearance

Clearance operations are performed by CND teams, with the support of international NGOs and commercial companies.⁷⁹ As of April 2009, the CND had an operational capacity of two demining units and three EOD teams.

Demining in 2008

In 2008, the mine action program focused on emergency battle area clearance (BAC) and EOD following conflict between government forces and NSAGs.⁸⁰ On 29 July 2008, one of the CND's two demining teams initiated operations in Ounianga-Kébir in the northeast of the country, with funding from the Libyan De-mining Society of the Gaddafi International Charity and Development Foundation and the Chadian government.⁸¹ In September 2008, the second CND team started mine clearance in Fada, also in the northeast. After a quality control mission found technical deficiencies, clearance by both teams was suspended in March 2009. The teams were expected to resume operations in May 2009.⁸²

Battle area clearance in 2008

After NSAG attacks in February 2008, emergency missions were deployed in N'Djamena, Massakory, Massaguet, and Mongo. The CND has reported a total area cleared of 2.8km².⁸³ In July 2008, BAC operations restarted in the eastern Abéché area with the support of MAG (see table below).⁸⁴

In the first quarter of 2009, MAG cleared a further 22,000m² of battle areas, destroying 27,668 ERW and releasing 307km².⁸⁵ During the same period, MINURCAT, through its contractor MineTech, verified 420km of main supply routes between Abéché, Farchana, and Goz Beïda and confirmed them free from contamination: they also visited 105 villages and communities, home to approximately 11,000 people, and collected and destroyed a total of 3,413 ERW.⁸⁶

Demining and battle area clearance in 2008⁸⁷

Operator	Area cleared (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	Unexploded submunitions destroyed	Other UXO destroyed	Area released by survey (km ²)
MAG	42,250	0	0	0	57,258 items	131
CND (mine clearance)	12,572	12	25	N/R	0.376 tons (376kg)	N/R
CND (BAC)	2,828,451	0	0	N/R	55.394 tons (55,394kg)	N/R

N/R = not reported

From December 2008–July 2009, MineTech verified 1,012km of main supply roads in eastern Chad as free of mines and ERW and visited 214 villages in conjunction with road verification and decontamination activities. A total of 10,349 items, including 1,680 ERW and 8,669 pieces of small arms ammunition, were subsequently removed as part of the road verification/clearance process and EOD/BAC emergency clearance activities; 1,333 of the ERW and 7,161 of the small arms ammunition were destroyed.⁸⁸ In May 2009, at Am Dam, following combat between the armed forces and NSAGs, a further 2.92km² area of battlefield was cleared, “providing local populations with access to social infrastructure, such as hospitals and schools, as well as agricultural land.” A total of 1,201 items of ERW and 10,379 items of small arms ammunition were removed and destroyed.⁸⁹

Progress since becoming a State Party

Chad was required by Article 5 of the Mine Ban Treaty to destroy or ensure the destruction of all antipersonnel mines under its jurisdiction or control as soon as possible, but not later than 1 November 2009. Demining operations started in August 2000, but stopped at the end of December 2005 due to lack of funding.⁹⁰ There has since been only intermittent clearance of mined areas.

On 28 July 2008, Chad submitted an extension request for an initial 14-month period (1 November 2009 to 1 January 2011). In the request, Chad attributed the impending failure to meet its Article 5 deadline to a number of factors, including lack of funds, the lack of reliable technical survey (and questionable impact survey data), and poor management within the former HCND.⁹¹ The ICBL stated that far greater progress should have been achieved by the mine action program in Chad after many years of significant UN and donor support.⁹² Moreover, as the Analysing Group’s review of the extension request states, “Chad is unable to provide an accounting of the areas now considered to be no longer dangerous relative to those areas originally suspected of being dangerous.”⁹³

⁸⁷ MAG data in response to Landmine Monitor questionnaire by Ronald-Paul Veilleux, MAG, 22 April 2009; and see Article 7 Report, Forms G and J, 1 July 2009.

⁸⁸ The remainder of the items removed were put in temporary storage or handed over to the Chadian army. Email from Marie-Anne Menier, Mine Action Unit, MINURCAT, 28 August 2009.

⁸⁹ “Report of the Secretary-General, on the United Nations Mission in the Central African Republic and Chad” (New York: UN Security Council, 14 July 2009), S/2009/359, para. 54.

⁹⁰ Analysis of the Chad Article 5 deadline Extension Request, Submitted by the President of the Eighth Meeting of States Parties on behalf of States Parties mandated to analyze requests for extensions, 19 November 2008, p. 2.

⁹¹ Article 5 deadline Extension Request, 29 July 2008, pp. 5–6.

⁹² Statement of ICBL, Ninth Meeting of States Parties, Geneva, 25 November 2008.

⁹³ Analysis of the Chad Article 5 deadline Extension Request, Submitted by the President of the Eighth Meeting of States Parties on behalf of States Parties mandated to analyze requests for extensions, 19 November 2008, p. 2.

According to the UNDP's institutional development advisor, the first period of the extension was intended to allow the mine action program to:

- undertake a technical survey to clearly determine the residual contamination, and to develop an accurate and realistic action plan to address it;
- deploy demining sections in the north and east of the country, an effort requiring the composition of a new demining section; and
- revise Chad's procedures for land release.⁹⁴

A second extension request will be submitted on the basis of the planned survey and demining results.⁹⁵ At the Ninth Meeting of States Parties, the ICBL welcomed the request for a short amount of time to conduct the necessary surveys to clearly determine the remaining contaminated area.⁹⁶ The ICBL cautioned, however, that the Tibesti department will need to be cleared before Chad can declare completion of Article 5 obligations.⁹⁷

The CND coordinator hoped to present the request for a second extension at the 2010 Meeting of States Parties to avoid a gap between the two extension periods during which Chad would be technically in violation of the treaty. This means that the technical survey of SHAs must be completed by March 2010 in order to prepare a realistic operational plan and a new extension request in time.⁹⁸ In May 2009, Chad declared that the survey would start in June 2009.⁹⁹

Risk Education

RE provision continued to decrease in 2008, as 34,376 people were reached through CND teams, a reduction from 41,883 in 2007.¹⁰⁰ Preparations for conducting RE in schools took place in 2008, resulting in a significant increase in RE in the first half of 2009.¹⁰¹ In February 2008, the highest priorities for RE became conflict-affected areas in western Chad, as well as in and around N'Djamena.¹⁰²

There were three types of RE activities in 2008: direct awareness sessions, integration of RE into the school program, and training of trainers to create a sustainable community-based RE capacity.¹⁰³ RE through street theater was conducted in N'djamena.¹⁰⁴ MAG conducted some limited community liaison.¹⁰⁵

RE activities were planned based on information from the LIS, traditional community leaders, and casualty reports. The reduction in casualties was attributed to RE by the CND, which concludes that RE is still needed because of high levels of illiteracy and large geographic areas that are difficult to reach.¹⁰⁶

The CND implements RE through its three three-person RE teams, based in regional centers. The team in Abéché center received training in 2008.¹⁰⁷

¹⁰⁵ Email from Ronald-Paul Veilleux, MAG, 30 April 2009.

¹⁰⁶ Interview with Assane Ngueadoum, CND, in Geneva, 28 May 2009.

¹⁰⁷ Interviews with Ahaya Mallowa and Fadoul Ahmat, CND, N'Djamena, 14 April 2009; and with Assane Ngueadoum, CND, in Geneva, 28 May 2009.

In 2008, progress was made in putting RE into the primary school curriculum. The curriculum, teachers' guidelines and classroom materials were developed by the Ministry of Education and the CND. The aim was to provide knowledge and teach children about safe and unsafe behavior. The target areas were locations with a high rate of child casualties, and N'Djamena and the surrounding affected areas. Teachers were trained in 2008 and 2009 to start work in schools in 2009.¹⁰⁸

The ICRC conducted a five-month-long needs assessment in 2008 in Mongo, Bitkine, Massaguet, Massakory, Adré, Goz Beïda, Biltine, Abou Goulem, Forchana, and Miele, to develop an RE program with the CRC.¹⁰⁹

Activities in 2008¹¹⁰

Organization	Type of activity	Geographical location	No. of beneficiaries
CND	UXO emergency RE, direct RE, community-based RE, and training of trainers	Abéché, Am Zoer, Fada, Massaguet, Massakory, Mongo, N'Djamena, and Ounianga-Kébir	34,376
CND, Ministry of Education, UNICEF	School-based RE	N'Djamena and surrounding areas	150 school inspectors trained, 2 staff each in 345 schools
MAG	Limited community liaison prior to clearance		No figures available
ICRC and CRC	Training of CRC volunteers	Adré, Biltine, Massakory, and Mongo	Not available

The CND and UNICEF developed an "image box" teaching aid containing laminated posters. ICRC developed a user manual to accompany it, but it had not been printed as of April 2009.¹¹¹

Media was used for RE, including radio, television, and newspapers, although access and the cost of putting spots on television limits coverage.¹¹² Some emergency messages were broadcast on radio in early 2008 after the conflict in N'Djamena.¹¹³

Prior to 2004, RE was only provided alongside clearance operations, with the creation of volunteer focal points to exchange information with the CND (until 2007, the HCND). The ICRC also broadcast radio messages. The 1999–2001 LIS identified a need for a focused RE program to reduce tampering with munitions. In 2004, an RE director was appointed at the HCND and a UNICEF consultant was also appointed. UNICEF started a project to support RE in 2005, and since then RE has been mainly implemented by the HCND/CND with support from UNICEF, which trained a large network of community volunteers and distributed materials. RE was delivered in schools. Since 2005, MAG has also helped to spread RE messages. RE

has focused on refugees and communities in high-impacted areas. In 2006, RE activities were increased in and around N'Djamena due to renewed conflict.¹¹⁴

Victim Assistance

The total number of survivors is unknown, but is estimated to be at least 1,588.¹¹⁵ In May 2009, Chad reiterated its commitment to VA and acknowledged that the progress made since the First Review Conference to improve the lives of survivors had not been sufficient due to lack of funding. It also stated that, despite government goodwill, it was difficult to address the needs of mine/ERW survivors, when basic needs of the population are not being met.¹¹⁶

Chad is one of the poorest countries in the world,¹¹⁷ with a volatile security situation.¹¹⁸ Much of the population sees little benefit from oil revenues.¹¹⁹ The government of Chad has a limited capacity to provide medical and social services and many parts of the country are not served.¹²⁰ It is estimated that less than 40% of the population has access to basic healthcare.¹²¹ According to the ICRC, in eastern Chad, healthcare services were “breaking down.”¹²² NGOs providing humanitarian relief in the conflict areas continued to be the target of attacks, further limiting assistance.¹²³

Emergency medical care is available at health posts, but the time required to reach the facilities varies from several hours to several days. The road network does not allow the quick transfer of patients.¹²⁴ The most serious cases are transferred to N'Djamena,¹²⁵ and when possible abroad.¹²⁶ There is a lack of specialized staff and very few facilities can carry out complex surgery.¹²⁷ In 2008, the CND trained medical personnel both among its staff and from other organizations.¹²⁸ In May 2009, a project was launched in Abéché with United States Department of State financial support, to equip a burn center and finance the purchase of ambulances.¹²⁹

Reportedly, mine/ERW survivors can receive free medical care, if the patient receives a document from the CND.¹³⁰ It is unclear how many survivors received free medical care.

¹¹⁴ See previous editions of *Landmine Monitor*.

¹¹⁵ In 2008, Chad reported that up to December 2007, 2,632 casualties were recorded (1,143 killed and 1,489 injured). In 2009, Chad reported that from January to December 2008, 131 casualties were recorded (24 killed, 99 injured, and 8 of unknown status). See *Landmine Monitor Report 2008*, p. 235; *Landmine Monitor* media monitoring from 1 January 2008–31 December 2008; *Landmine Monitor* analysis of CND, “Liste générale des victimes des mines et autres engins non explosés/2008” (“General list of mine/ERW victims/2008”), provided by Assane Ngueadoum, CND, 15 April 2009; and email from Assane Ngueadoum, 22 May 2009.

Physical rehabilitation services are limited to two centers: the Kabalaye Physical Rehabilitation Center (Centre d'Appareillage et de Rééducation de Kabalaye, CARK) in N'Djamena and the Our Lady of Peace Rehabilitation Center (Maison Notre Dame de la Paix, MNDP) in Moundou, both run by local NGOs with support from the ICRC.¹³¹

Access to psychological support, vocational training, and economic reintegration is limited, as are employment opportunities for persons with disabilities. Psychological support is provided by social workers, religious organizations, and organizations for persons with disabilities.¹³² Chad reported that the number of social workers continued to increase in 2008.¹³³ Yet many survivors reported they never received psychological assistance.¹³⁴

The disability legislation approved in May 2007 stipulates access to health, education, socio-economic reintegration, sports, transport, housing, and social security for persons with disabilities.¹³⁵ It is unclear to what extent the law was implemented. Knowledge and recognition of the law's benefits needed to be strengthened.¹³⁶ As of 1 July 2009, Chad has not signed the UN Convention on the Rights of Persons with Disabilities.

Progress in meeting VA26 victim assistance objectives

Chad is one of the 26 States Parties with significant numbers of mine survivors, and "the greatest responsibility to act, but also the greatest needs and expectations for assistance" in providing adequate services for the care, rehabilitation, and reintegration of survivors.¹³⁷ As of May 2009, Chad did not present its 2005–2009 objectives as part of its commitment to the Nairobi Action Plan.

In May 2006, Chad announced its intention to launch a study to determine the number of survivors and their needs, followed by the development of SMART (specific, measurable, achievable, relevant, and time-bound) objectives and the implementation of an action plan. Implementation was conditional on funding.¹³⁸ Informally, Chad also presented some objectives for its 2006 action plan,¹³⁹ which were not achieved.¹⁴⁰ In April 2007, Chad described plans for VA activities for 2007 and appealed for financial support to recruit a consultant to develop a national VA plan.¹⁴¹ In November 2007, Chad reported that the verification of casualty data, an analysis of the situation and the elaboration of an action plan had begun and appealed for international assistance.¹⁴² It repeated the same in June and November 2008.¹⁴³ In May 2009, Chad restated that the development of a VA action plan was ongoing and that funding was needed.¹⁴⁴

Chad presented 10 VA projects in the 2009 UN Portfolio of Mine Action Projects, but, as of May 2009, none had been funded. According to the CND, none of Chad's VA projects presented in previous UN Portfolio of Mine Action Projects had ever received funding.¹⁴⁵

¹⁴⁵ Interview with Assane Nguéadoun, CND, in Geneva, 28 May 2009.

In 2008, the Mine Ban Treaty Implementation Support Unit undertook a process support visit on the behalf of the Standing Committee on Victim Assistance and Socio-Economic Reintegration co-chairs.¹⁴⁶ The outcome of this visit has not been made public.

Chad reported on its VA activities at the meetings of States Parties from 2005–2008, and at the Standing Committee meetings from 2006–2009.¹⁴⁷ At most meetings, it gave similar statements on the VA situation and on the need for financial support. Chad used the voluntary Form J to its annual Article 7 reports to provide updates on VA activities from 2005–2008 and to provide an update on casualty data in 2009.¹⁴⁸ Chad included a VA focal point on its delegation to the intersessional Standing Committees meetings in 2006, 2008 and 2009 and at the meetings of States Parties in 2006 and 2008.¹⁴⁹

Victim assistance activities

The ICRC continued to support the CARK and MNDP rehabilitation centers with raw materials, components, and on-the-job training. It financed the construction of a new physiotherapy department at CARK, which was expected to be completed by the end of 2009. It continued to support a referral system for patients from eastern Chad and covered patients' transportation and accommodation costs. As services at CARK are not free, the ICRC also financed the treatment of 187 people. The two centers assisted 3,315 people and produced 325 prostheses (62% for survivors) and 473 orthoses (4% for survivors). Four Chadian technicians received refresher courses at the ICRC Special Fund for the Disabled (SFD) regional training center in Addis Ababa, Ethiopia.¹⁵⁰ In 2008, 228 weapon-injured were treated with ICRC support, including 10 mine/ERW survivors.¹⁵¹

The CRC, with ICRC support, continued to train and equip personnel in emergency response and ran a horse-and-cart ambulance service in the Adré border region.¹⁵² MSF also provided emergency medical care to weapon-injured, including mine/ERW survivors, in Dogdoré, Goz Beïda and Adré in eastern Chad and in N'Djamena.¹⁵³

The Association of Mutual Aid of Physically Disabled of Chad (Association d'entraide aux Handicapés Physique du Tchad, AEHPT), a local organization based in N'Djamena, supports persons with physical disabilities.¹⁵⁴ In 2008, with the financial support of a local mobile network operator, AEHPT set up a workshop of persons with disabilities that produced 30 tricycles.¹⁵⁵ AEHPT has 1,518 registered members, but it is not known how many of them are mine/ERW survivors.¹⁵⁶

Support for Mine Action

Landmine Monitor is not aware of comprehensive long-term cost estimates for meeting mine action needs (including RE and VA) in Chad. Chad has reported a cost estimate of US\$15 million for completion of mine clearance between 2009 and 2011, with the government of Chad projected to cover \$2 million per year, financial institutions covering \$1.5 million, and

¹⁵⁶ Ibid.

“other international actors” providing \$1.5 million per year.¹⁵⁷ The request covers survey, mine clearance, and land release.

National support for mine action

Chad reported XAF883,731,425 (\$2,562,821) in annual government contributions to mine action as of July 2008.¹⁵⁸ These included XAF4 million (\$1,160,000) to support CND operations.¹⁵⁹ Chad reported national funding of \$2,512,000 to mine clearance and related operations in 2007.¹⁶⁰

International cooperation and assistance

In 2008, three countries reported providing a total of \$2,145,486 (€1,456,937) to mine action in Chad. Reported international funding in 2008 was roughly double that reported in 2007. Funding at 2008 levels is not on target to meet Chad’s mine clearance budget of \$5 million per year. In March 2009, however, Japan made a contribution of ¥762 million (\$7,391,400) to the UN Voluntary Trust Fund for Assistance in Mine Action (VTF) for mine action in the DRC and Chad.¹⁶¹ In May 2009, Chad reported that \$5,586,000 of that amount would be allocated to technical survey and clearance in Wadi Doum. Chad also reported a contribution of \$380,000 from Canada to support CND capacity.¹⁶² These contributions appear to make up much of the shortfall in Chad’s reported budget for mine clearance, but they do not address Chad’s ongoing VA needs.

2008 International Mine Action Funding to Chad: Monetary¹⁶³

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Spain	UN Voluntary Trust Fund, ICRC	Mine clearance, VA	\$1,398,970 (€950,000)
Canada	UNDP	Mine clearance	\$451,996 (C\$481,821)
Belgium	CND	Mine clearance	\$294,520 (€200,000)
Total			\$2,145,486 (€1,456,937)

In addition to the above, Chad reported funding for mine RE training workshops during 2008 from the US via UNICEF. According to Chad’s Article 7 report, the US did not provide funding to Chad in 2008.¹⁶⁴ Chad reported assistance for clearance operations in Ounianga-Kébir from the Libyan De-mining Society of the Gaddafi International Charity and Development Foundation,¹⁶⁵ but it did not report the value of this assistance.

CHILE

2008 Key Data

State Party since	1 March 2002
Contamination	Antipersonnel and antivehicle mines, scattered UXO
Estimated area of contamination	25km ² of mined areas (as of May 2009)
Casualties in 2008	0 (2007: 1) Mines: 0 (2007: 1)
Estimated mine/ERW survivors	Unknown, but at least 26
Article 5 (clearance of mined areas)	Deadline: 1 March 2012
Demining in 2008	44,120m ² of mined areas
Risk education recipients in 2008	Not reported
Progress towards victim assistance aims	Slow, but improving
Support for mine action in 2008	International: \$115,094 (2007: \$420,000) National: Not specified (2007: \$1,340,578)

Ten-Year Summary

The Republic of Chile became a State Party to the Mine Ban Treaty on 1 March 2002. Since 2005, Chile has stated that legislation is in preparation to more fully and specifically implement the Mine Ban Treaty. Chile completed destruction of a stockpile of 300,039 antipersonnel mines in August 2003. Also in 2003, it revised downward the number of antipersonnel mines to be retained for training from 28,647 to 6,245 mines. In 2006, it destroyed an additional 1,292 mines no longer needed for training. It has consumed mines each year during training, leaving a total of 4,083 at the end of 2008. In December 2005, States Parties agreed to a proposal by Chile and Argentina for expanded reporting on mines retained for training and development purposes. Chile served as co-chair of the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies from September 2006 to November 2007, and as co-chair of the Standing Committee on the General Status and Operation of the Convention from November 2008 to December 2009.

In 2002, Chile identified 198 minefields covering 26km² and containing 107,398 mines. This included 15 minefields cleared prior to Chile becoming a state party, but in which clearance was not conducted to international mine action standards. Chile has cleared only a little more than 1km² since 2003, with 75% of this total cleared in just one year, 2006. It is not on course to meet its Article 5 deadline for mine clearance of 1 March 2012.

Between 1999 and 2008, there was no national risk education program in Chile, nor was risk education included in the national mine action plan. Limited activities have been carried out, but these were said to have been insufficient in 2008. In 2002, the President acknowledged the state's responsibility towards mine and explosive remnants of war survivors, and a casualty survey was completed in early 2009. However, little has been done to ensure the availability of victim assistance.

Mine Ban Policy

Chile signed the Mine Ban Treaty on 3 December 1997 and ratified it on 10 September 2001, becoming a State Party on 1 March 2002.

Chile has not adopted comprehensive national legislation, but it has stated on several occasions that legislation to implement the Mine Ban Treaty is being prepared.¹ In May 2009, Chile stated that its existing laws sufficiently cover the various issues required for implementation, citing the Arms Control Act No. 17.798, which addresses all weapons and explosives, including landmines. Chile nonetheless reiterated its intent to adopt specific legislation for the Mine Ban Treaty. The draft legislation in preparation by various ministries would also serve to implement aspects of the Convention on Conventional Weapons (CCW) Amended Protocol II and Protocol V, as well as the conventions on the rights of persons with disabilities and cluster munitions.²

Chile submitted its eighth Article 7 report on 30 April 2009, covering calendar year 2008.³

Chile attended the Ninth Meeting of States Parties in Geneva in November 2008 where it became co-chair of the Standing Committee on the General Status and Operation of the Convention, having served as co-rapporteur the previous year. At the intersessional Standing Committee meetings in May 2009, Chile made statements on national implementation measures, victim assistance, and mine clearance.

While Chile has led States Parties' discussions on mines retained for training (Article 3),⁴ it has not engaged in States Parties' discussions on matters of interpretation and implementation related to Articles 1 and 2.⁵ Thus, Chile has not made known its views on issues related to joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, and antivehicle mines with sensitive fuzes, or antihandling devices.

Chile is party to the CCW and its Amended Protocol II on landmines. As of 1 July 2009, Chile had not submitted an annual Article 13 report covering 2008.⁶ Chile consented to be bound by CCW Protocol V on Explosive Remnants of War on 18 August 2009.

Chile signed the Convention on Cluster Munitions on 3 December 2008, but had not ratified it as of 1 July 2009.⁷

Production, transfer, use, and stockpile destruction and retention

Chile is a former producer, exporter, importer, and user of antipersonnel mines. It has reported that it ended production and export in 1985.⁸ Chile used mines in the 1970s and 1980s along its borders with Argentina, Bolivia, and Peru. In August 2003, Chile completed destruction of its stockpile of 300,039 antipersonnel mines.⁹

According to its latest Article 7 report, Chile had a total of 4,083 antipersonnel mines retained for training at the end of 2008. It consumed 70 antipersonnel mines in 2008 in humanitarian demining training activities. Chile used the expanded Form D in its reporting, but did not project the number of mines to be consumed in 2009.¹⁰

¹ See *Landmine Monitor Report 2007* for a comprehensive review of previous statements on this matter.

² Statement of Chile, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 May 2009.

³ Previous reports were submitted on 30 April 2008, 30 April 2007, 5 May 2006, 2 May 2005, 3 June 2004, 30 April 2003, and 5 September 2002.

⁴ A proposal by Chile and Argentina for a new Form D for expanded reporting on mines retained for training and development purposes was agreed to at the Sixth Meeting of States Parties in November–December 2005. It is aimed at generating more information on the intended purposes and actual uses of retained mines.

⁵ During the June 2004 meeting of the Standing Committee on the General Status and Operation of the Convention, Chile reacted favorably to a Non-Paper circulated by the co-chairs, aimed at facilitating conclusions on these issues by the First Review Conference. It said the paper was a good basis for discussion and possible consensus. Statement of Chile, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 June 2004. Notes by Landmine Monitor/HRW.

⁶ Chile's most recent Article 13 report was submitted on 2 October 2007 for the period September 2006 to September 2007.

⁷ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 56.

⁸ Article 7 Report, Form A, 30 April 2007.

⁹ Chile initially reported destruction of a stockpile of 299,219 antipersonnel mines. See *Landmine Monitor Report 2004*, pp. 300–302. However, Chile's Article 7 reports submitted since 2005 each cited destruction of 300,039 mines from 4 December 1999 to 25 August 2003. See for example, Article 7 Report, Form B, 30 April 2009.

¹⁰ Article 7 Report, Form D, 30 April 2009. It consumed 26 78-F2 FAMAE, 15 CARDOEN M-II, 11 M-35, 10 M-14, and eight CARDOEN M-I mines.

Scope of the Problem

Contamination

Chile is affected by antipersonnel and antivehicle mines and, to a very limited extent, by abandoned or unexploded ordnance, which may include cluster munition remnants.¹¹ As of 31 December 2008, 167 minefields remained to be cleared, down from the original 198 reported in 2002 in 17 municipalities (comunas), approximately 5% of the country's total number of municipalities. This includes 15 suspected hazardous areas demined prior to Chile becoming party to the Mine Ban Treaty, but which were not cleared to international mine action standards.¹² As of 2009, some 25km² of mined areas remained to be cleared, although Chile has cautioned that until clearance is completed all data is "relative."¹³

The mines were all laid on Chile's borders with Argentina, Bolivia, and Peru during the Pinochet regime in the 1970s, when Chile's relations with its neighbors were strained. Contaminated areas are difficult to access and mostly unpopulated. Some minefields in the north are located as high as 5,000m above sea level.¹⁴ However, the vast majority of the mines are located in two of the six mine-affected regions. Of the 198 original mined areas, three-quarters are located in Region XV/Arica and Parinacota (on the border with Peru) and Region II/Antofagasta (desert). These two regions contain 92% of the mines.¹⁵ Seventeen minefields have been identified on five islands in Region XII/Magallanes and Chilean Antarctic, including Hornos Island, on the edge of the Beagle Channel near the entrance to the Drake Passage, which leads to the Antarctic. The climatic conditions on these islands are severe all year round and limit mine clearance to only a few weeks a year.¹⁶ Hornos Island, which has one minefield and is uninhabited, was visited by 6,000 tourists in 2007.¹⁷

All mined areas are said to be marked and fenced, with warning signs in at least three languages.¹⁸

Casualties

No new mine/UXO casualties were reported in 2008 or in 2009 through 23 March.¹⁹ Landmine Monitor has identified 30 casualties (four deaths and 26 injuries) since 1999. Casualties included 25 civilians, four military personnel, and one deminer. Reportedly, immigrants entering the country at illegal crossings along the Peruvian border are at high risk.²⁰ Five of the civilian casualties have been Peruvian nationals (two killed and three injured) who were crossing the Peruvian-Chilean border.²¹

As of February 2009, Chile had confirmed 181 casualties (60% military and 40% civilian) since 1970. Sixty-eight were caused by antipersonnel mines, 57 by antivehicle mines, 20 by UXO, and 36 by an unknown explosive device.²² In comparison, the Chilean NGO the Center for

Information and Humanitarian Assistance in Mined Zones (Centro de Información y Asistencia Humanitaria en Zonas Minadas, Zona Minada) registered 571 military mine/UXO casualties between 1973 and 2005.²³

Program Management and Coordination

Data collection and management

In February 2009, Chile's National Humanitarian Demining Commission (Comisión Nacional de Desminado Humanitario, CNAD) completed the first phase of a casualty survey begun in 2006, which located and contacted all known landmine survivors since 1970.²⁴ This first phase identified survivors, their location, and their injuries, and was being used to develop an assistance plan for victims. The data was collected by the National Police and provided to CNAD, which managed the data using the Information Management System for Mine Action.²⁵ In 2008, CNAD requested further information from the public, to be submitted via their website.²⁶ The Ministry of Planning is using the survey results to determine the "socio-economic situation" of survivors, before identifying appropriate social services and pensions.²⁷ NGOs were initially involved in the casualty survey but expressed serious concerns about its accuracy and methodology, particularly the use of police to implement the project. They withdrew from the project in May 2007 and questioned its results.²⁸

Plans

Strategic mine action plans

In 2007, Chile restructured its national mine action plan to take into account the experiences gained after four years of demining in 2002–2006.²⁹ Each year, an activity plan is produced that allocates specific responsibilities to the institutions that will participate in mine action during the year.³⁰

Disability action plan

CNAD, established on 19 August 2002, is responsible for national implementation of the Mine Ban Treaty, including "humanitarian assistance of victims of antipersonnel landmines, their families and their communities."³¹ The National Fund for the Disabled (Fondo Nacional de Discapacitados, FONADIS), within the Ministry of Planning, is responsible for protecting the rights and social inclusion of persons with disabilities.³² Chile's Action Plan for the Social Integration of Persons with Disabilities (Plan de Acción para la Integración Social de las Personas con Discapacidad) outlines the role of various government ministries in implementing Chile's National Policy for Persons with Disabilities.³³

National ownership

Commitment to mine action and victim assistance

Chile has demonstrated a clear commitment to mine action through the formation of a national mine action authority and allocating annual funding through its national budget for mine action.

³³ Ministry of Planning, "Discapacidad / Plan de Acción" ("Disability / Plan of Action"), undated, www.mideplan.cl.

National management

CNAD is responsible for mine action in Chile. Its main functions are to advise the president and “propose policies, legal norms and plans for complying with the Ottawa Convention.” CNAD is chaired by the Minister of National Defense and includes the undersecretaries of foreign affairs, health, treasury, plus the armed forces’ chief of staff and the heads of the general staff of the armed forces, and CNAD’s executive secretary.³⁴ The Chilean mine action program is nationally executed under the Ministry of National Defense.

National mine action legislation

On 9–10 April 2008, CNAD and the Chilean Campaign to Ban Landmines convened a workshop in Santiago with technical assistance from the Geneva International Centre for Humanitarian Demining to discuss national legislation that would comply with the requirements of the Mine Ban Treaty. Chile has not yet adopted comprehensive national implementation legislation,³⁵ despite the decrees establishing CNAD and regulating its operations as well as administrative regulations governing demining.³⁶ In May 2009, Chile reported that adopting a national mine action law was not a priority for its parliament.³⁷

Demining

The Chilean army and navy conduct clearance, quality assurance, and survey while CNAD funds operations and purchases equipment.³⁸ In May 2009, CNAD stated that national demining standards had been developed.³⁹

Demining in Chile has proceeded slowly. It has been under-resourced, given the difficult terrain and the size of the country. The high altitude of some mined areas combined with severe seasonal weather changes limit demining to only a few months of the year. Chile has its own quality management system, which is said to comply with the International Mine Action Standards.⁴⁰

In 2008, Chile completed clearance of six mined areas in Antofagasta covering an area of 44,119m² and destroyed 5,214 antipersonnel and 1,093 antivehicle mines.⁴¹

Demining in 2008⁴²

Demining Regions	No. of mined areas cleared in 2008	Mine clearance (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed
Region XV/Arica and Parinacota	0	6,041	735	1
Region I/Tarapacá	0	22,933	2	0
Region II/Antofagasta	6	9,432	2,875	632
Region XII/Magallanes and Chilean Antarctic	0	5,714	1,602	460
Total	6	44,120	5,214	1,093

⁴⁰ Statement of Chile, Eighth Meeting of States Parties, Dead Sea, 22 November 2007.

⁴¹ Response to Landmine Monitor questionnaire by CNAD, 8 May 2009.

⁴² Chile does not report on land released other than by clearance, because they know “exactly where the mines are located and how many there are.” Email from Col. Martin Borck, CNAD, 6 May 2008.

In 2008, Chile purchased US\$10.6 million worth of demining equipment, including two Minewolfs, three Bozenas, a number of support vehicles, and equipment for the deminers. Chile planned to increase its personnel from 97 to 205 in 2009 and to form five mechanical demining teams.⁴³ It is therefore expected that productivity will increase significantly. In December 2008, Chile completed the construction of an operational demining base on Hornos Island.⁴⁴

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Chile must destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2012. Chile has cleared a little more than 1km² in six years, with 75% of the total cleared in just one year—2006⁴⁵—leaving almost 25 times that area to be cleared in less than three years. Although Chile purchased significant demining equipment in 2008 and planned to increase the number of demining teams in 2009,⁴⁶ it is not on course to meet its Article 5 deadline.

Demining in 2003–2008

Year	Mine clearance (m ²)
2008	44,120
2007	131,676
2006	731,743
2005	24,500
2004	96,800
2003	900
Total	1,029,739

Risk Education

While CNAD reported that it is “constantly concerned with carrying out prevention activities and mine risk education,”⁴⁷ Chile has no national mine/UXO risk education (RE) strategy; RE was not included in the national mine action plan, and there was a decrease in RE activities in 2008. The mine action budget has not included dedicated funds for RE since 2007.⁴⁸ In 2008, civil society and government representatives recognized that RE activities were insufficient.⁴⁹

Since 2001, however, disparate RE activities were carried out by the Chilean military, CNAD, and some national NGOs. In 2008, Zona Minada continued to implement a limited number of RE activities focused on the province of El Tamarugal and the municipality of Iquique (both in Region I/Tarapacá), despite the end of European Union funding. The total number of beneficiaries is unknown.⁵⁰ CNAD distributed an RE video to organizations and communities

in mine-affected areas, and demining units informed affected communities of demining plans in Arica, near Chile's border with Peru. It also worked with tour operators, park rangers, and the Ministry of Education to carry out workshops for tourists and schoolchildren.⁵¹

Victim Assistance

The estimated number of survivors is unknown, but at least 26. Although CNAD is mandated to coordinate victim assistance (VA), as of February 2009 survivors had not seen any tangible benefits.⁵² The government recognized in 2009 that its VA activities were “relatively delayed in relation to other countries in the region.”⁵³ In 2008, Chile did not have a VA plan, though CNAD reported in February 2009 that it was using the data from the casualty survey to formulate one.⁵⁴ It also identified progress in VA as a priority for 2009.⁵⁵ The “Law of Victims Reparations,” intended to provide a legal framework for rehabilitation and services to survivors, was still in draft form in February 2009, pending review of the financial implications by the ministries of work, planning, and health.⁵⁶

Military survivors receive medical and social care from the army. Most civilians with disabilities, including civilian landmine survivors, qualify for free healthcare through the National Health Fund and social support through the Ministry of Planning. However, the government recognized that “many civilian cases” have problems accessing services because of their poverty or remote location.⁵⁷ In March 2009, an NGO representative met with seven survivors from the municipality of San Pedro de Atacama who all said they had not received government benefits.⁵⁸ As of April 2009, only one survivor had successfully claimed compensation from the government.⁵⁹

FONADIS provides grants, funded by the Chilean government, to national disability organizations and covers the cost of mobility devices for individuals who can demonstrate economic need. It does not maintain records on the number of mine/UXO survivors that have benefited.⁶⁰ There are no international organizations providing disability services in Chile.

Chilean law prohibits discrimination against persons with disabilities, but de facto discrimination continued in 2008.⁶¹ In 2008, FONADIS found that Chile lacked public policies to improve the quality of life for persons with disabilities, who faced inadequate access to healthcare, rehabilitation, education, employment opportunities, and transportation.⁶² On 29 July 2008, Chile ratified the Convention on the Rights of Persons with Disabilities and its Optional Protocol. On 1 April 2009, the Chilean Senate's Health Commission approved reform of Chile's disability policy, encouraging a move from a needs-based to a rights-based perspective, but this awaited approval from the House of Representatives.⁶³

Support for Mine Action

Landmine Monitor is not aware of any long-term comprehensive cost estimates for meeting mine action needs (including RE and VA) in Chile. CNAD and the Ministry of Foreign Affairs jointly set mine action strategy, including for resource mobilization. Costs are set for each fiscal year based on projected needs. Resource mobilization strategies are reported by CNAD to be adequate for raising needed funds.⁶⁴ Specific strategies, however, have not been reported.

National support for mine action

In its May 2009 presentation to the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Chile reported two separate items of national funding in its statements on national and international funding for the period 2004–2009. Chile reported national contributions of \$4,186,696 and \$10,600,000, for a total of \$14,786,696.⁶⁵ This included the \$10.6 million paid for demining machines, a purchase first announced by CNAD in March 2008, while the remaining funds paid for operational and other expenses.⁶⁶ Chile reported national funding totaling \$1,340,578 in 2007.⁶⁷

International cooperation and assistance

Spain reported providing training for 23 mine clearance personnel in Chile in 2008, with a reported valuation of €78,157 (\$115,094).⁶⁸ Spain was the sole reported donor to Chile in 2008. International funding for Chile in 2008 was 72% less than funds received in 2007.

Spain also reported, as a separate funding item for 2008, providing training to 23 mine clearance personnel from Chile, Ecuador, and Peru at the International Demining Center, with a valuation of €133,736 (\$196,940). Spain did not differentiate funding for each recipient state.⁶⁹

COLOMBIA

2008 Key Data

State Party since	1 March 2001
Contamination	Antipersonnel and antivehicle mines, IEDs, UXO, AXO
Estimated area of contamination	Approximately 150,000m ² on 18 military bases; the contamination in civilian areas is unknown
Casualties in 2008	777 (2007: 895)
Estimated mine/ERW survivors	Unknown but at least 6,163
Article 5 (clearance of mined areas)	Deadline: 1 March 2011
Demining in 2008	28,000m ² around 10 military bases and 136,547m ² of hazardous areas in three communities
Risk education recipients in 2008	Unquantified
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$9.1 million (2007: \$8.8 million) National: \$942,000 (July 2007–June 2008: \$1.3 million)

Ten-Year Summary

The Republic of Colombia became a State Party to the Mine Ban Treaty on 1 March 2001. National implementation legislation took effect on 25 July 2002. Colombia dismantled its antipersonnel mine production facilities in November 1999 and completed destruction of its stockpile on 24 October 2004. Colombia served as co-rapporteur and then co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration from 2001 to 2003. During the past decade, the Revolutionary Armed Forces of Colombia (FARC) have increased use and production of antipersonnel mines in many parts of the country. Other armed groups have also used mines, including the National Liberation Army (ELN), and in the past the United Self-Defense Forces of Colombia (AUC).

Colombia is affected by landmines and explosive remnants of war (ERW) as a result of 40 years of internal conflict. Incidents involving landmines or improvised explosive devices have been reported in 31 of the 32 departments, with approximately half of these recorded in Antioquia, Bolívar, Caquetá, Meta, and Santander. The precise extent of the problem remains unclear, although an impact survey was planned to begin in September 2009. Despite starting clearance only in 2005, Colombia has since made steady progress in clearing its 35 mined military bases. Lack of control of certain areas of the country means that clearance of mined areas laid by non-state armed groups will probably not occur in time to meet Colombia's Article 5 deadline of 1 March 2011. Mine action is overseen by the Presidential Program for Mine Action.

Between 1999 and 2008, at least 6,696 casualties of explosive devices occurred in Colombia. Casualties have increased rapidly due to intensified conflict since 2002, making Colombia one of the countries with the most annual casualties in the world. The vast majority of casualties were military, but under-reporting of civilian casualties was certain.

As of 2009, mine/ERW risk education had improved yet it remained insufficient to cover all affected communities. Although capacity and the number of activities increased every year since 1999, no systematic program exists to develop a sustainable risk education capacity. Activities were hampered by ongoing conflict and a lack of demining.

Most civilian survivors in Colombia live in rural areas where services are spread unevenly and of variable quality. In urban centers, sufficient capacity exists to provide the necessary assistance, but distances are long and further hampered by complicated bureaucratic procedures. In principle, a legal framework for comprehensive assistance to survivors (and other victims of conflict) exists, but most survivors are not aware of their rights, not all services are covered, and application procedures are difficult. Services for military survivors are far more comprehensive.

Mine Ban Policy

Colombia signed the Mine Ban Treaty on 3 December 1997 and ratified on 6 September 2000, becoming a State Party on 1 March 2001. National implementation legislation, Law 759, came into effect on 25 July 2002.¹

Colombia submitted its ninth Article 7 report on 30 April 2009, covering the period from 1 January 2008 to 31 March 2009.²

At the Ninth Meeting of States Parties in Geneva in November 2008, Colombia made statements during the general exchange of views, as well as during the sessions on mine clearance and victim assistance.

At the meeting, States Parties agreed to hold the Second Review Conference of the Mine Ban Treaty in Cartagena, Colombia, from 30 November to 4 December 2009 and named Norwegian Ambassador Susan Eckey as President-Designate of the “Cartagena Summit.” Colombia’s Minister of Foreign Affairs Jaime Bermúdez Merizalde made a statement welcoming the decision to hold the Second Review Conference in Colombia. Colombian Ambassador Clara Inés Vargas was named as Secretary-General-Designate of the Second Review Conference.

In early March 2009, coinciding with the tenth anniversary of entry into force of the Mine Ban Treaty, Colombian officials helped launch the “Road to Cartagena” during events held in Bogotá, Geneva, New York, and elsewhere.³ An ICBL delegation visited Colombia in March 2009, where it met with government officials, NGO representatives, and mine survivors to plan for the Second Review Conference.

Several meetings were held in 2009 to prepare for the Second Review Conference. On 2 March, Colombia’s Vice President Francisco Santos Calderón addressed an informal preparatory meeting in Geneva. A formal preparatory meeting was held in Geneva on 29 May 2009, and another was scheduled for 3–4 September 2009.

Colombian officials attended regional meetings scheduled in 2009 in the lead-up to the Second Review Conference. Colombian officials, including Ambassador Vargas, attended the Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas from 24–26 February 2009, where they made a presentation on mine clearance (Article 5) and a statement on the preparations for the Second Review Conference. Colombia also made a statement on victim assistance and participated in the parallel program for victim assistance experts. Colombian officials also attended the Bangkok Workshop on 1–3 April 2009.

During the intersessional Standing Committee meetings in May 2009, Colombia made statements on mine clearance, risk education, and victim assistance.

¹ See Article 7 Report, Form A, 6 May 2005; and *Landmine Monitor Report 2005*, p. 255, for details on penal sanctions and other aspects of the law.

² Eight reports were previously submitted in April 2008, April 2007, and on 29 June 2006, 6 May 2005, 11 May 2004, 27 May 2003, 6 August 2002, and 15 March 2002.

³ Colombia’s Permanent Representative to the UN in New York, Amb. Claudia Blum, spoke at the event held in New York on 2 March 2009, while Colombian Vice President Francisco Santos Calderón addressed the Geneva event on 2 March 2009. See ICBL Newsletter, May 2009; and the Second Review Conference website, www.cartagenasummit.org.

With respect to key matters of interpretation and implementation related to Articles 1, 2, and 3 of the treaty, Colombia stated in 2004 that any mine that is victim-activated is an antipersonnel mine and is banned.⁴ It has not stated its views on the prohibition on “assistance” during joint military operations with states not party to the treaty, on foreign transit or stockpiling, or on mines retained for training.

Colombia is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Colombia has never submitted an annual Article 13 national measures report. Colombia is not party to CCW Protocol V on Explosive Remnants of War.

Colombia signed the Convention on Cluster Munitions on 3 December 2008, but had not ratified it as of 1 July 2009.⁵

The Colombian Campaign against Mines (Campaña Colombiana contra Minas, CCCM) has a network of local coordinators in 22 departments. The CCCM works in cooperation with other national initiatives and organizations aimed at banning mines, helping affected communities, and ending the internal armed conflict. The CCCM continues to promote the end of the use of landmines by Colombian non-state armed groups (NSAGs). At its 2009 national meeting, the CCCM decided to be involved in a new project on humanitarian demining.⁶

Production and transfer

Colombia’s State Military Industry (Industria Militar, INDUMIL) ceased production of antipersonnel mines in September 1998, and destroyed its production equipment on 18 November 1999. As of 2001, INDUMIL was still producing Claymore-type directional fragmentation mines.⁷ Colombia has stated that these mines are used only in command-detonated mode, as permitted by the Mine Ban Treaty. However, Colombia has not reported on steps it has taken to ensure that these mines are used only in command-detonated mode.

The government of Colombia is not known to have ever exported antipersonnel mines. There have been past reports of mines transferred as part of illegal weapons shipments destined for NSAGs in Colombia, but Landmine Monitor knows of no reports since 2003.

NSAGs in Colombia are expert in the production of explosive devices. Colombia’s Article 7 reports contain information on mines produced by NSAGs by type, dimensions, fuzing, explosive type and content, and metallic content, and include photographs and additional information. Twelve different design types are manufactured, which include antipersonnel, antivehicle, and Claymore mines, as well as improvised explosive devices (IEDs). The military states that the mines are sometimes fitted with antihandling devices.⁸

Stockpile destruction and retention

Colombia reported completion of the destruction of its 18,531 stockpiled antipersonnel mines on 24 October 2004.⁹

Colombia’s latest Article 7 report indicates that it retained 586 MAP-1 mines for training purposes as of March 2009, the same number as reported in 2007 and 2008.¹⁰ In March 2007, the coordinator of the Antipersonnel Mines Observatory (Observatorio de las Minas Antipersonal) told Landmine Monitor that Colombia had made a decision in 2006 to destroy all of its

⁴ Oral intervention, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 June 2004. Notes by Landmine Monitor/Human Rights Watch (HRW).

⁵ For details on cluster munition policy and practice, see HRW and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 58–59.

⁶ Email from Camilo Serna Villegas, Operations Coordinator, CCCM, and Alvaro Jiménez Millán, National Coordinator, CCCM, 6 August 2009.

⁷ Interviews with Eng. Sergio Rodríguez, Second Technical Manager, INDUMIL, 5 July 2000 and 24 July 2001.

⁸ Presentation by the Colombian Armed Forces, “Desarrollo Compromiso con la Convención de Ottawa” (“Development commitment with the Ottawa Convention”), Bogotá, 6 March 2006.

⁹ In addition to the 18,531 mines destroyed, the government has reported three other destructions of a total of 3,404 antipersonnel mines. Over the years, there have been many inconsistencies and discrepancies in Colombia’s count of stockpiled mines and their destruction. The Ministry of Defense sent a letter to Landmine Monitor in September 2005 to clarify many of the problems. For details, see *Landmine Monitor Report 2006*, p. 302.

¹⁰ Article 7 Report, Form D, 30 April 2009. See also, Article 7 reports submitted April 2008 and April 2007.

antipersonnel mines previously retained for training.¹¹ It destroyed 300 mines in three separate events in 2006, but has not destroyed any, or consumed any in training activities, since that time.¹² Colombia has never reported in detail on the intended purposes and actual uses of its retained mines, as agreed by States Parties in 2004.

Use

In this reporting period, since May 2008, there has been one allegation of possible use of antipersonnel mines by government forces, in Valle del Cauca's municipality of La Florida on 9 June 2008.¹³ The Ombudsman's office (Defensoría del Pueblo) made a formal complaint to the military, but had not received a response as of June 2009. On 27 August 2009, the Presidential Program for Mine Action (Programa Presidencial de Acción Integral Contra Minas Antipersonales, PAICMA) informed Landmine Monitor that according to data from the Governor's Office of El Valle and *El País* (Cali newspaper), the incident involved a mine planted by the FARC and not the Colombian Armed Forces.¹⁴

Use by Non-State Armed Groups

The Revolutionary Armed Forces of Colombia (Fuerzas Armadas Revolucionarias de Colombia-Ejército del Pueblo, FARC) and the National Liberation Army (Unión Camilista-Ejército de Liberación Nacional, ELN) possess and manufacture antipersonnel mines and IEDs, and use them on a regular basis. In the past decade, paramilitary forces have also used antipersonnel mines, most notably the United Self-Defense Forces of Colombia (AUC) until its disbandment in 2006.¹⁵

In 2008 and 2009, conflict escalated between the army and armed groups, especially in the southwest and east of the country, with an apparent increase in NSAG use of mines. The Colombian army has frequently reported on the use of antipersonnel mines by and the recovery of antipersonnel mines from FARC and ELN, as well as the destruction of explosives factories. Studies have claimed 50,000–100,000 mines have been laid by NSAGs but the precise number is not known.¹⁶

¹¹ The coordinator said the decision was made primarily because the majority of mines laid in the country are of NSAG design and do not correspond to the MAP-1 mines used for demining instruction. Interview with Luz Piedad Herrera, Coordinator, Antipersonnel Mines Observatory, Bogotá, 16 March 2007. Colombia destroyed 300 retained mines in 2006. See *Landmine Monitor Report 2007*, pp. 267–268.

¹² In 2003 and 2004, Colombia reported it retained 986 mines for training. It reduced that number to 886 in 2005 when it decided the larger number was not necessary. It destroyed 300 more mines in 2006 (100 each in March, September, and December), but the number has not changed since December 2006. See *Landmine Monitor Report 2007*, pp. 267–268; and *Landmine Monitor Report 2006*, pp. 302–303.

¹³ On 11 and 18 June 2008, the Permanent Committee for Defense of Human Rights in Valle del Cauca issued two documents detailing possible use of mines by government forces in Valle del Cauca's municipality of La Florida, where FARC has proposed to create a demilitarized zone. According to the documents, at 9:00 on 9 June 2008, local inhabitants heard a gunshot and then an explosion. The next morning, a 68-year-old local man was found dead, allegedly from a mine explosion. According to the documents, the army had been active for several days before the incident and the site had been considered safe until that point. Documents by the Permanent Committee for Defense of Human Rights in Valle del Cauca (Comité Permanente Por la Defensa de Los Derechos Humanos del Valle del Cauca), 11 June 2008 and 18 June 2008.

¹⁴ Letter OF109-00090099 / AUV 33500 to Landmine Monitor from Andrés Dávila Ladrón de Guevara, Director, PAICMA, 27 August 2009. The letter was in response to an inquiry sent by Landmine Monitor on 7 August 2009. The letter said, "These facts allow the PAICMA to conclude that the accident in question was not the result of a mine planted by the Military Forces, but an artifact planted by the illegal Armed Groups that operate in the area and who use them to protect their logistical corridors." The letter also noted that Colombia had destroyed the last of its stockpiled antipersonnel mines in 2004.

¹⁵ Landmine Monitor has not seen reports of mine use by paramilitaries since 2006. See *Landmine Monitor Report 2006*, p. 300; *Landmine Monitor Report 2005*, p. 264; and *Landmine Monitor Report 2004*, p. 324.

¹⁶ OAS, "Section I: National Mine Action Profile – Colombia, OAS Mine Action Project Portfolio 2006–2007," www.aicma.oas.org; and "Colombia and Antipersonnel Mines: Sowing Mines, Harvesting Death, UNICEF, 2000, p. 20.

In September 2008, the army reported that three FARC members and five ELN members turned in 106 antipersonnel mines along with other weapons when they surrendered to the army for demobilization.¹⁷ The report did not indicate which armed group possessed the mines.

FARC

FARC is probably the most prolific current user of antipersonnel mines among rebel groups anywhere in the world.

In late 2008, FARC Commander Alfonso Cano is reported to have stated in an email to his secretariat intercepted by the Colombian military and made public:

“Minefields are the best way to stop the advance of military operations. We know that they are the only thing that stops and intimidates them, for this reason it is requested to increase the training of ‘explosivistas’ [experts in explosives] and to execute as soon as possible plans to instill terror that will avoid an environment of the progressive defeat of the FARC.”¹⁸

FARC has been increasing its recruitment of child soldiers, who are known to carry and deploy antipersonnel mines. Many civilians are injured by these mines, including many children.¹⁹

Since May 2008, the army reported encountering mines in military operations against FARC forces in Antioquia, Bolívar, Caldas, Caquetá, Cundinamarca, Guaviare, Norte de Santander, and Putumayo. The date of placement is often not known.²⁰

In November 2008, the army encountered newly laid FARC mines near La Florida in the municipality of San Carlos, near El Porvenir in the municipality of San Francisco, and in La Selva and La Quebra in the municipality of Argelia, all in Antioquia department.²¹ Also in January 2009, it was reported that the army discovered and destroyed a FARC landmine production facility in La Holanda, in the municipality and department of Arauca, and that the facility contained 124 IEDs, 450kg of explosives, and 150kg of shrapnel.²²

In March 2009, FARC’s 36th Front was accused by the government of laying mines near Highway 25 in the municipality of Yarumal, in the north of Antioquia. Five members of the Colombian military died trying to clear the mines. It is not known when the minefield was laid.²³ In April 2009, the army encountered three explosive booby-traps near the municipality of San Pablo, Bolívar department.²⁴

ELN

In May 2008, the army reported discovering an ELN weapons cache containing 12 antipersonnel mines among other weapons near Sopagá in the municipality of Paya, Boyacá department.²⁵ In June 2008, the army reported discovering another ELN weapons cache containing 12 antipersonnel mines near Guacal in the municipality of Paya, Boyacá department.²⁶ Also in June 2008, the army discovered and destroyed a mine production facility belonging to the ELN near Barranco Ceiba in the municipality of San José del Guaviare, Guaviare department.²⁷

In April 2009, the army encountered an antipersonnel mine and explosive booby-traps while raiding and destroying a clandestine radio station and ELN explosive weapons factory near the municipality of Támara, Casanare department.²⁸ In June 2009, the army blamed the ELN for a civilian mine casualty in the municipality of Samaniego, Nariño department, near the border with Ecuador.²⁹

Scope of the Problem**Contamination**

The precise extent of Colombia's mine and ERW problem remains unclear. According to the UN Mine Action Service (UNMAS), since at least 1990 mines, IEDs, and other explosive ordnance have been used in Colombia during the conflict involving the armed forces, NSAGs, and paramilitary forces.³⁰ It is reported that antipersonnel and antivehicle mines laid by NSAGs are found along routes used by government forces and around NSAG bases, in rural areas, around schools, houses, national parks, indigenous communities' land, and coca production sites.³¹

Analysis of mined areas by the Organization of American States (OAS) shows that NSAGs place activation devices in separate locations approximately five meters apart and connected by wires that cannot be detected by conventional mine detection equipment.³² PAICMA has claimed that NSAGs have made mines and IEDs from cans and plastic bottles and "hung" mines in trees to avoid detection as well as covering them in feces to cause wounds to become infected.³³

Although Colombia maintains a database that includes information from as far back as 1990, the database is more of a conflict monitoring system than an accurate appraisal of Colombia's mine problem.³⁴ So-called "events"—a generic term specific to mine action in Colombia that encompasses "incidents," "accidents," "suspected hazardous areas," "UXO," "deactivation" of

devices, and “military demining”—have occurred in 31 of Colombia’s 32 departments, the only exception being the Caribbean archipelago department of Providencia, San Andrés, and Santa Catalina.³⁵

According to PAICMA, most mined areas are only identified after an incident occurs. There are no records, or even reliable estimates, of the number and exact location of mined areas laid by NSAGs. Suspected hazardous areas (SHAs) are generally in isolated locations scattered across the affected departments, and the security situation is so precarious that there is no guarantee that cleared areas can be released as safe areas.³⁶ As of 31 March 2009, Colombia had recorded 13,822 events involving mines, UXO, and IEDs, of which 9,668 were considered danger areas and 4,154 where incidents occurred. Since 2006, however, the number of reports has decreased each year. Of all the events, 57% have occurred in six of the 32 departments: Antioquia, Bolívar, Caquetá, Meta, Norte de Santander, and Santander,³⁷ and 70% of events are in just 90 of the 1,098 municipalities.³⁸

In 2008, the number of “events” was down by one-third compared to 2007.³⁹ A possible reason for the sharp decline is military setbacks suffered by the two main NSAGs—the FARC and the ELN—since the beginning of 2008.⁴⁰

In addition, 34 military bases are affected by mines laid by the government, of which 18 had been cleared by December 2008. Of the 10 released in 2008, four were cancelled after the technical surveys were completed and no mines were found, and full clearance operations in two other mined areas found no mines either. As of 31 March 2009, therefore, a total of 14 military bases were suspected to be mined.⁴¹ In May 2009, the Monitoring and Evaluation Office of the Government Planning Office reported 22 of the 34 mined military bases had been cleared.⁴² According to the OAS, one previously unknown minefield was identified at the military base at Cerro Curva in 2009 and Colombia planned to include in its next Article 7 report.⁴³

According to PAICMA, no civilians are impacted by the mines protecting military bases as the mined areas are inside the perimeters of the bases.⁴⁴ However, it was reported on 5 July 2009 that one child was killed and another was injured in a mine incident in the municipality of Granada, Meta, in an unmarked area the military uses for training for explosives and munitions.⁴⁵

In December 2008, the European Commission (EC) awarded a contract to an international consortium led by the University of Brussels and the National University of Colombia to a conduct a landmine impact survey (LIS) in Colombia.⁴⁶ As of May 2009, however, the areas the survey would cover had not been decided (see Identification of hazardous areas section below).⁴⁷

Valle	V. Cerrito	Pan Azucar	98	7,500
Valle	Dagua	C. Tokio	93	1,238
Total			2,407	139,440

According to the British Royal Engineers, the main problem in Colombia is nuisance mining and IEDs planted by NSAGs.⁴⁹ In an interview with Landmine Monitor, Colonel Alexander Carmona, the Commander of the Colombian Engineers School, said army troops are the primary target of mines and IEDs, and incidents occur during military engagements as well as during military clearance, when mines are detonated by remote control, “The intent and effect of the mines is massive with multiple casualties for each incident.”⁵⁰ For example, on 17 July 2009 the Colombian army reported that during military operations in the village of Gualanday, in municipality of San José del Guaviare, Guaviare department, they found four IEDs and a gas cylinder bomb, and in the same village while conducting “search and control” operations they found five gas cylinder bombs in what the army called a minefield. In similar operations in the municipality of Sabana de Torres, Santander, in a place known as Las Delicias, the army reported finding and destroying two antipersonnel mines laid by the FARC’s 20th squad. The army also reported finding mines in Santa Rosa, Cauca, and in the village of Alto Cartagena, in the municipality of Samaniego, Nariño department.⁵¹

⁵¹ Colombian Army News Agency, “Military operations permitted the neutralization of several explosive devices,” 13 July 2009, www.ejercito.mil.co.

Casualties⁵²

In 2008, Landmine Monitor recorded at least 777 new casualties due to explosive devices⁵³ in Colombia, including 160 killed and 617 injured. Although there was a 15% reduction in the total number of victims (civilian and military) between 2007 and 2008, the proportion of civilian casualties actually increased during this period from 24% to 35%.⁵⁴ PAICMA recorded at least 904 casualties for 2007, which was significantly lower than the 1,172 recorded in 2006.⁵⁵ The main reason for this decrease would appear to be due to increased government territorial control, but PAICMA also noted that risk education and demining could have played a role.⁵⁶ The CCCM noted that no systematic examination into reasons for decreased casualties has taken place.⁵⁷

PAICMA recorded 763 of the 777 casualties, and Landmine Monitor identified at least 14 additional casualties.⁵⁸ Of these casualties, 266 were civilian, 507 were security forces, and the status of the remaining four was unknown. No NSAG casualties were recorded in 2008 by PAICMA. In the data provided to Landmine Monitor, PAICMA recorded 264 civilian casualties.

However, the ICRC noted that there was substantial under-reporting of civilian casualties, adding that, “the officially quoted figures should be viewed as a minimum number, rather than an exact figure...”⁵⁹ When examining PAICMA data for 2008, the ICRC found that it had registered 103 civilian casualties that were not included in the PAICMA statistics. PAICMA recorded 181 civilian casualties at the time of ICRC examination, which means that there would be at least 284 civilian casualties, and under-reporting “of approximately 56%.”⁶⁰ In May 2009, the ICRC provided PAICMA with details of 842 civilians injured between 1998 and 2009 for inclusion in their database.⁶¹

While PAICMA appears to have included some of these casualties identified by the ICRC in the data it provided to Landmine Monitor, under-reporting of civilian casualties remains certain. In previous years, Landmine Monitor frequently reported that many civilians do not report incidents for fear of being suspected of belonging to NSAGs or of being threatened by NSAGs, and that the majority of mine/ERW casualties are only recorded once they seek government assistance. Additionally, most casualties occur in remote rural areas or areas where conflict is ongoing, and there is a lack of data collection capacity.⁶² In 2008, Handicap International (HI)

⁵² Unless noted otherwise, casualty data for 1982–2009 provided by email from Mariany Monroy Torres, Data Management Advisor, PAICMA, 5 June 2009; and from Ulrich Tietze, Chief Technical Advisor for Mine Action, PAICMA, 17 June 2009.

⁵³ It is impossible to report accurately on the device types causing casualties in Colombia. The vast majority of casualties are caused by IEDs, which can be victim-activated, command-detonated, or have multiple detonation mechanisms. However, PAICMA’s data collection forms only specify two categories: “MAP” (minas antipersonal—antipersonnel mines) and “MUSE” (municiones sin explotar—UXO). The type of device used varies from region to region, based on the NSAG manufacturing the device and on the situation in which they are used. Most actors involved in data collection state that the majority of IEDs used are victim-activated. For more information see *Landmine Monitor Report 2008*, pp. 264–265.

⁵⁴ Email from Leila Blacking, Communications Officer, UNDP, 6 September 2009.

⁵⁵ These figures differ from those reported in previous editions of Landmine Monitor because PAICMA continuously updates its casualty data as information comes in from other sources or as it identifies additional casualties through its activities. In *Landmine Monitor Report 2008*, pp. 261–262, PAICMA recorded 887 casualties for 2007 and 1,167 for 2006.

⁵⁶ Response to Landmine Monitor questionnaire by PAICMA, 13 May 2009.

⁵⁷ Information from Magda Portilla, VA Coordinator, CCCM and Camilo Serma Villegas, CCCM, 15 March 2009.

⁵⁸ PAICMA also recorded five additional military casualties which were clearly the result of a targeted ambush and, through the media, Landmine Monitor identified 10 soldiers injured in the same incident, which were not included in PAICMA data for 2008, nor have they been included in casualty totals above. For more information see: “Rebel landmines kill five Colombian soldiers,” *Xinhua* (Bogotá), 4 May 2008, news.xinhuanet.com.

⁵⁹ ICRC, “Mine Action in Colombia 2008,” Bogotá, 2009, p. 3.

⁶⁰ *Ibid.*, p. 6.

⁶¹ Email from Krisztina Huszti Orban, Legal Attaché, Arms Unit, Legal Division, ICRC, 6 September 2009.

⁶² See, for example, *Landmine Monitor Report 2008*, p. 262; *Landmine Monitor Report 2007*, pp. 282–283; *Landmine Monitor Report 2006*, p. 316; and information received from Magda Portilla, CCCM, 15 March 2009.

noted that 80% of survivors interviewed for its victim assistance study were not recorded by PAICMA.⁶³

Of the civilian casualties in 2008, 54 were killed and 212 injured, including 202 men, 37 boys, 18 women, and nine girls. The majority of casualties were caused by antipersonnel mines (263) and three by ERW. For 115 casualties, the activity at the time of the incident was unknown or “other.” When recorded, by far the most common activity was coca eradication (68, or 45% of known activities), followed by travel (39, or 26%). All but five casualties occurred in rural areas. Casualties occurred in 20 departments, mostly in Nariño (54), Putumayo (44), Antioquia (38), and Meta (34). In Nariño, most casualties happened in conflict-ridden Samaniego (19), and in Meta, most casualties occurred in Vista Hermosa (20), the site of large-scale coca eradication.

The remaining 507 casualties were security forces (105 killed and 402 injured), including one woman, all involved in antipersonnel mine incidents. Casualties occurred in 22 departments, particularly in Meta (96), Antioquia (95), and Caquetá (50). As in previous years, there were more civilian casualties in Nariño among security forces (26); civilians also outnumbered military casualties in Putumayo (14 military). Reportedly, five military casualties occurred during demining in 2008,⁶⁴ but this was not recorded as such in the PAICMA database as for 306 casualties the activity was unknown and for 199 it was “security.”⁶⁵

Casualties continued to be reported in 2009, albeit at an apparently decreased rate, with 240 casualties to 10 June 2009 (36 killed and 204 injured). Of these, PAICMA recorded 214 to 30 April 2009 and Landmine Monitor identified the remaining 26 casualties. Civilians accounted for 67 casualties (28%). The remaining 173 were security forces. All casualties were due to antipersonnel mines, and all but one occurred in rural areas. Most casualties occurred in the departments of Antioquia (47) and Meta (34). For January–April 2008, PAICMA recorded 327 casualties.

Since 2002, PAICMA has recorded 7,945 casualties (1,782 killed and 6,163 injured) between 1990 and July 2009. At least 6,696 casualties (1,483 killed and 5,213 injured) occurred between 1999 and 2008, with the vast majority of casualties starting from 2002 (6,218 or 93%) when the conflict escalated. Between 1999 and 2008, 35% of casualties were civilian (2,323), including 1,507 men, 475 boys, 177 women, and 127 girls (28 adults and nine children of unknown gender). The military accounted for 4,373 casualties, including 1,025 killed and 3,348 injured; all but one were men. NSAG casualties reported previously were not included in this data. For example, PAICMA data provided in June 2008 contained information on 42 NSAG members (including four children).⁶⁶ Nearly all casualties (6,566) occurred in rural areas. Some 96% of casualties (6,397) were caused by antipersonnel mines and 299 were caused by ERW. PAICMA did not provide activity information for the vast majority of casualties (6,165 or 92%). The most common activities recorded for civilians were coca eradication (102) and travel (79). Casualties happened in 31 departments with most casualties recorded in Antioquia (1,473), Meta (754), Caquetá (519), and Norte de Santander (504).

Of all casualties with detailed information (7,715), 696 (both civilian and military) received assistance under the *ruta de atención* (“route of assistance,” see Plans section below) including 484 civilians who received social security coverage. However, this data was still under revision as of mid-June 2009,⁶⁷ and figures were incomplete.⁶⁸

⁶³ Interview with Dominique Delvigne, Country Director, HI, Cartagena, 20 April 2008.

⁶⁴ Information gathered during Landmine Monitor field visit to rural areas in Samaniego municipality (Nariño) and interviews with residents and with the commander of the 14th contra-guerrilla battalion (Batallón Cotraguerrilla 14), 9 April 2008.

⁶⁵ One military casualty was recorded as traveling and one as tampering.

⁶⁶ See *Landmine Monitor Report 2008*, p. 265; Landmine Monitor analysis of casualty data (1990–10 June 2008) provided by email from Mariany Monroy Torres, PAICMA, 18 June 2008.

⁶⁷ Data and information provided by email from Ulrich Tietze, PAICMA, 17 June 2009.

⁶⁸ PAICMA, “Política Nacional de Acción Integral contra Minas Antipersonal 2009–2019” (“National Strategy for Integral Action against Antipersonnel Mines 2009–2019”), v.7.0, Bogotá, 9 October 2008, p. 79.

The ICRC reported that it had recorded at least 2,420 civilian casualties between January 2002 and 31 December 2008, and that the statistics from PAICMA it had at its disposal at the time only included 1,960 casualties for the same time period. ICRC analysis showed that the ICRC had assisted an additional 458 casualties who were not in the PAICMA database. The ICRC added that “This indicates that there is a substantial under reporting of civilian victims, of approximately 23%. It is also highly probable that there are other civilian victims not known either to the ICRC or to PAICMA.”⁶⁹ Some of these casualties have been included in the meantime, as data obtained by Landmine Monitor contained information on 2,075 civilians between January 2002 and the end of 2008.

Risk profile

The casualty rate from landmines, UXO, and IEDs in Colombia is one of the highest in the world. The extent of the problem is unknown, and there is a lack of clearance activities, all of which make risk education an important activity. The most affected department is Antioquia and secondly Nariño. Of Colombia’s 32 departments, 31 have a problem with landmines.

Military personnel make up the largest number of casualties, followed by civilians working in forests and traveling.⁷⁰ An ICRC knowledge, attitude, and practice (KAP) survey in the departments of Antioquia, Meta, and Nariño in 2007 revealed a disappointing level of awareness.⁷¹

Socio-economic impact

Due to the inaccessibility of the rural areas where mine and IED incidents are reported, evidence of the socio-economic impact from mines is scant.⁷² In July 2009, the World Food Program reported violence and conflict in several departments and, in response, were implementing the “Food Assistance to Internally Displaced Persons and Other Highly Food-Insecure Groups Affected by Violence” program, which included food aid to families and communities impacted by mines in Samaniego municipality in Nariño department.⁷³

Program Management and Coordination

Mine action

The National Interministerial Commission on Antipersonnel Mine Action (Comisión Nacional Intersectorial para la Acción contra las Minas Antipersonnel, CINAMA), established on 8 October 2001, is responsible for implementation of the Mine Ban Treaty, including development of a national plan, policy decisions, and coordination of international assistance.

The Antipersonnel Mines Observatory, established in 2002, operated as the technical secretariat of CINAMA until June 2007, when Presidential Decree 2150 created PAICMA. The decree transferred all functions previously held by the Antipersonnel Mines Observatory to PAICMA.⁷⁴

Risk education

PAICMA is responsible for coordinating and monitoring risk education (RE) activities and accrediting organizations, and has four RE staff members.⁷⁵ In 2008, it moved towards a greater coordination role, and away from direct implementation of RE. However, PAICMA had to complete some obligations to deliver RE activities for some local government authorities in 2008. RE coordination meetings are held every two months in Bogotá, and NGOs from

the regions travel there for the meeting. UNICEF and the ICRC participate in the meetings. National standards based on the International Mine Action Standards (IMAS) were developed and there is an accreditation process.⁷⁶

Victim assistance

Victim assistance (VA) is coordinated by PAICMA, which until July 2008 was in the process of reorganizing its VA department. Throughout 2008, PAICMA focused on liaising with government bodies, NGOs, and the private sector involved in VA to improve data collection, to strengthen links between VA service providers, and to examine remaining gaps in VA service provision, as well as awareness-raising.⁷⁷ PAICMA also coordinated the Sub-committee for Integral Assistance to Victims.

Significant responsibility is delegated to departmental authorities, some of which included mine action in their development plans or created mine action committees. The level of attention dedicated to VA was variable.⁷⁸

The Presidential Program for Human Rights is responsible for protecting the rights of persons with disabilities. The Ministry of Social Protection has a disability unit, which develops and coordinates disability strategies, pays disability pensions, and funds activities. The ministry also runs the Solidarity and Guarantee Fund (Fondo de Solidaridad y Garantía, FOSYGA), one of the main assistance funds reimbursing services for conflict victims, through which survivors are most often assisted. The other main assistance fund for victims of violence, including survivors, is operated by the Presidential Agency for Social Action and International Cooperation (Agencia Presidencial para la Acción Social y la Cooperación Internacional, Acción Social).⁷⁹

Data collection and management

Colombia has used the Information Management System for Mine Action (IMSMA) to store its mine action data since 2002. Collecting this information and assessing its accuracy has been difficult. The sources of information in the IMSMA database in Bogota are the Armed Forces, Department of Security Administration (Departamento Administrativo de Seguridad, DAS) and other police and military sources.⁸⁰ Estimates of the number of SHAs are based on incidents involving landmines, IEDs, and UXO, clearance operations by the military, and SHAs registered in the national database.⁸¹

The Antipersonnel Mines Observatory and PAICMA have registered casualty data in IMSMA since 2002. Information is obtained from departmental and municipal authorities, the civil defense, national park guards, daily secret service bulletins, military sources, occasional meetings with survivors, civilians, and the media.⁸² In 2009, PAICMA was reviewing existing data and comparing it with that of service and compensation providers to obtain more information about assistance provided to survivors. This effort is hampered by the fact that operators all use their own databases, which have gaps but also overlap.⁸³ Also, it was reported that some service providers do not record the cause of disability/incident in their registries.⁸⁴

In 2008, PAICMA reported improving its data collection and follow-up of information on casualties for whom little information is available. PAICMA focused on areas it did not prioritize for other VA activities (Caldas and Quindío departments) and identified 45 survivors, some of whom were not previously recorded. PAICMA also organized meetings with survivors to obtain more information.⁸⁵ Although casualty data collection has improved, verification is hindered by conflict and military sources only provide the strict minimum of information.

The ICRC collects casualty and other weapon-contamination data for its own operational purposes and, as of mid-2008, was sharing this data regularly with PAICMA. ICRC data was included in PAICMA information.⁸⁶ PAICMA exchanges information with other organizations such as the OAS, CCCM, Handicap International (HI), and Pastoral Social. Information exchange between the Integral Center for Rehabilitation of Colombia (Centro Integral de Rehabilitación de Colombia, CIREC) and Mi Sangre Foundation has also improved.⁸⁷

Preparations for the LIS started in 2009, but it is unclear what kind of information will be collected on casualties.⁸⁸ The CCCM and other organizations give reports of their activities to PAICMA; PAICMA intended to start entering the data into IMSMA in 2009.⁸⁹

Plans

Strategic mine action plans

Colombia's National Strategic Plan for 2004–2009, approved by the government on 10 August 2004, included four goals:

1. capacity-building and implementing state policy against landmines;
2. reducing casualties and providing assistance;
3. meeting treaty obligations by demining military bases, destroying stockpiles, and “universalizing the fulfillment of the Treaty;” and
4. promoting changes in perception and practice of the population towards mines.

The strategy did not set timelines for each goal.⁹⁰

In February 2009, the National Economic and Social Policy Council (Consejo Nacional de Política Económica y Social, CONPES), which is responsible for all government planning, approved the “National policy for comprehensive action against antipersonnel mines, unexploded ordnance and improvised explosive devices 2009–2019” (Aprobación de la Política de Acción Integral Contra Minas Antipersonal 2009–2019).⁹¹ The plan has four main elements, namely to:

1. coordinate mine action at the national and regional level with appropriate and sustainable interventions;
2. contain contamination from antipersonnel mines and reduce their impact on communities;
3. reduce the level of risk from mines; and
4. ensure mine victims access rehabilitation and social and economic activities.⁹²

The purpose of the 10-year plan, according to PAICMA's director, is to assist communities and people who live in mine-affected areas. He has stated that it is not a plan to meet Colombia's Article 5 obligations, which is the responsibility of the Ministry of Foreign Affairs.⁹³ The overall strategy of the policy is to minimize the socio-economic impact of mines, IEDs, and UXO, and to implement sustainable development programs in mine-affected communities.⁹⁴

In addition to conducting the LIS, priorities for 2009 were the clearance of 10 military bases and of other mined areas in Antioquia, Meta, and Nariño departments. It was also planned to conduct technical surveys in San Carlos in Antioquia, El Dorado in Meta, and Samaniego in Nariño department.⁹⁵ Colombia planned to clear all its military bases before 1 March 2011, its Article 5 deadline.⁹⁶

VA is included in the 10-year plan with the same aim as the National Development Plan 2006–2010, namely to ensure “integral and retroactive attention” to survivors.

The main goals of the 2009–2019 strategy are: providing opportune and complete access to comprehensive rehabilitation and socio-economic inclusion; integrated service provision by government and non-governmental service providers; and complete development and implementation of the VA scheme. Activities, timeframes, and indicators were also included, but PAICMA's role remained largely limited to improving data collection, establishing information exchange conventions, information dissemination and awareness-raising, liaison and facilitation

⁹⁶ *Ibid.*

among service providers, stimulating capacity-building, and developing plans.⁹⁷ Implementation of actual assistance activities is embedded in existing state programs for vulnerable groups or conflict victims.

The main program benefiting mine/ERW/IED survivors as part of a larger group of conflict victims is the *ruta de atención* (“route of assistance”), a legal framework specifying assistance, ranging from first-aid to socio-economic reintegration, which has been in place since 1997.⁹⁸ In principle, assistance under the framework is free of charge for civilian mine/ERW/IED survivors once they are recognized as victims of conflict, violence, or “terrorism” victims; they have one year to complete the administrative procedure. But services are not complete, coordination between sectors fragmented, awareness lacking among service providers and survivors, and bureaucracy complex.⁹⁹ One of the main gaps in the *ruta de atención* is the lack of transport and accommodation for survivors seeking treatment. PAICMA acknowledged this, but in its 2009–2019 plan, PAICMA limited its role to lobbying for the inclusion of transport and accommodation.¹⁰⁰

PAICMA had a VA workplan for 2008, which focused on capacity-building, awareness-raising, and better follow-up of VA activities and data collection, socio-economic reintegration, and channeling resources to RE implementers.¹⁰¹ The measurable objectives for 2008 were 100% of civilian casualties to be reported in 2006–2007, and 50% of older casualties to receive information about their rights and about their progress in the *ruta de atención*. These objectives have not been reached; in total, PAICMA reached 105 survivors (recent and not recent) and for 86 people administrative procedures for their compensation were started.¹⁰²

Integration of mine action with reconstruction and development

The National Development Plan 2006–2010, approved by Congress with Law 1151 of 24 July 2007, refers to assisting victims of landmines as required by Law 418 passed in 1997, but does not make any mention of demining.

National ownership

Commitment to mine action and victim assistance

Colombia has demonstrated an uneven commitment to mine action. It began demining the army bases only in 2005, while criticizing NSAGs for their continued use of mines. It has committed significant funding to the mine action program (see Support for mine action section below).

Through the *ruta de atención*, Colombia manages a large part of assistance to survivors with national resources. It has largely sufficient infrastructure and technical capacities to deal with VA, although its assistance network is mostly centralized in urban areas and access can

depend on territorial control. While the assistance framework was, in principle, comprehensive, NGOs still had to cover significant gaps and were crucial in facilitating access to services for survivors.¹⁰³ In 2008, PAICMA acknowledged that VA was its weakest component and that several gaps, particularly in coordination and monitoring, needed to be addressed.¹⁰⁴ NGOs noted that the government's commitment to disability issues was low and that PAICMA did not make any "visible interventions" on the broader issue of disability to advance the situation of survivors.¹⁰⁵

From 2007–2009, Colombia attracted an increasing number of international operators and funding for VA. Some NGO operators saw an improvement in coordination with PAICMA, but also stated that this improvement was mainly due to efforts of NGOs influencing authorities and making more concerted efforts in accompanying survivors to access assistance.¹⁰⁶ While PAICMA noted that it worked on improving coordination with the Ministry of Social Protection,¹⁰⁷ NGOs noted that coordination between PAICMA and relevant ministries was unclear and that coordination between NGOs, ministries, and Acción Social was limited.¹⁰⁸

The CCCM found that the main progress in VA since 1999 was increased awareness, better geographic coverage, and increased survivor participation; the latter two, however, remained insufficient. HI added that significant improvements had been made in the framework and organization of VA, and that more socio-economic reintegration projects were emerging. However, continued revision according to the emerging needs and improved field implementation was required. HI added that there was no real involvement of survivors in the implementation and monitoring of assistance.¹⁰⁹

National management

Colombia's mine action program has been nationally managed since its inception, with some international support, as detailed below.

External advisors

The role of the OAS is bound by the March 2003 Agreement of Cooperation and Technical Assistance between the General Secretariat of the OAS and the government of Colombia. Under this agreement, the OAS, with the Inter-American Defense Board, has assisted the Colombian army in strengthening its capacity for humanitarian demining. In 2008, the OAS used five international monitors as part of the quality management process for mine clearance at the military sites.¹¹⁰

Colombia has a UN Mine Action Portfolio Country Team that includes representation from the government, UN agencies, international and national NGOs, and the International Organization for Migration. Each year, through a series of multilateral consultations with stakeholders, priorities are determined and a list of projects requiring funding are identified.¹¹¹

¹¹¹ UN, "2009 Portfolio of Mine Action Projects," New York, November 2008, p. 98.

Between 2003 and 2005, UNDP provided two technical advisors to the Antipersonnel Landmines Observatory, but neither held the post for more than a few months.¹¹² In May 2009, the European Commission (EC) hired a technical advisor based at PAICMA. The main tasks of the advisor are to organize three seminars on RE, VA, and humanitarian demining and to monitor the EC-funded LIS.¹¹³

National mine action legislation

In 2002, Law 751 created CINAMA, and Decree No. 3787 in 2003 established the Antipersonnel Landmine Observatory and authorized funding for it. In June 2007, Presidential Decree 2150 created PAICMA to replace the Antipersonnel Mines Observatory.¹¹⁴

National mine action standards/Standing operating procedures

To meet its responsibilities under the Mine Ban Treaty, Colombia developed two National Protocols on Humanitarian Demining: one for military bases and one for mines laid by NSAGs. Both are based on IMAS. The two protocols, akin to standing operating procedures, cover safety, procedures for impact and technical survey, marking, the destruction of UXO, and internal quality assurance, and were updated in 2007 based on lessons learned from demining activities.

Program evaluations

In January 2008, the Geneva International Centre for Humanitarian Demining (GICHD) conducted an evaluation of the 2005–2007 EC Mine Action Strategy in Latin America, including a case study on Colombia. The focus of the case study was assessing the value of EC funding in contributing to mine action in Colombia. The evaluation concluded that mine clearance in Colombia is heavily politicized and under the control of the Colombian army. One indication of the politicization, the evaluation observed, was the lack of distinction between civilian casualties and casualties among the armed forces engaged in combat, a practice the evaluation considered as a “departure from standard practice which is not justified.” The evaluation recommended that Colombia disaggregate the casualty data. The evaluation concluded the real impact of mines on the civilian population was difficult to assess and would remain so until a systematic survey was conducted. Nevertheless, it concluded that “By any measure, Colombia has a very severe mine problem.”¹¹⁵

The Canadian Landmine Fund, as part of a global evaluation of the mine action programs it has funded, conducted field work for the evaluation in Colombia in March 2008.¹¹⁶ The findings of the evaluation were not available as of August 2009.

Demining and Battle Area Clearance

The Colombian Armed Forces is the sole demining operator. The army conducts military counter mine operations to protect government troops and to facilitate the mobility of tactical units. As of September 2009, three platoons were clearing minefields under military jurisdiction and three platoons were conducting “emergency humanitarian demining.”¹¹⁷

Two of the platoons have been assigned to clear mined areas around military bases and the remaining two teams were conducting “emergency humanitarian demining” in areas where NSAGs operate.¹¹⁸ Criteria for determining emergency demining for any given site include: the absence of conflict for one year; the army is in control of the area to ensure security; mines

¹¹⁶ Interview with James Freedman, Consultant, Canadian Landmine Fund, in Geneva, 4 June 2008.

¹¹⁷ Email from Carl Case, OAS, 4 September 2009. In June 2009 PAICMA changed “emergency humanitarian demining to “humanitarian demining in communities.”

¹¹⁸ PAICMA defines military mine clearance as “the destruction of IED that are used illegally in Colombia as antipersonnel mines, which takes place within the military operations in order to provide mobility to the troops.” PAICMA, “Monthly Newsletter, Special Edition,” Bogotá, April 2008, p. 19.

are impacting the population; there is a known landmine problem; and part of the population is displaced.¹¹⁹ PAICMA admits, however, that sometimes political considerations are the primary basis for clearing a village in order to show the government is in control of the area.¹²⁰

At the beginning of 2009, Colombia began assessing how international NGOs could operate in the country to clear mines. HALO Trust had been conducting a mines assessment since September 2008 and has assessed six priority departments (of Colombia's 32 departments) and made detailed field missions to municipalities and villages in Bolívar and eastern Antioquia from June–August 2009. The Colombian government asked HALO to initiate a large-scale civilian demining program as a pilot project for international NGO assistance. Subsequently, HALO recruited and trained senior Colombian staff, and planned to start clearance operations in Antioquia in late 2009.¹²¹ However, new legislation and revised coordination structures were needed before they could be allowed to operate.¹²²

In June 2009, Mines Advisory Group (MAG) conducted exploratory missions to Colombia, and the Office of Weapons Removal and Abatement within the US Department of State conducted a workshop in Bogotá on planning and humanitarian demining.¹²³ In July, MAG was in the process of recruiting a community liaison manager to work with the CCCM to strengthen the capacity of their field teams and local partners, and to implement community liaison and risk reduction education activities, as well as assess other mine action opportunities in Colombia.¹²⁴

Identification of hazardous areas

The EC issued a call for tender on 24 April 2008 to conduct an LIS in Colombia over a 15-month period beginning in September 2008.¹²⁵ In December 2008, a consortium led by the University of Brussels and the National University of Colombia, including Sistemas de Información S.A. (Spain), Humanitarian Technology Consulting (UK), and RK Consulting Ltd. (UK), was awarded the contract for the survey, which officially began in March 2009.¹²⁶

The protocols that guided the global LIS process will be adapted to the situation in Colombia, where there is still active combat in some regions. The consortium will use both paper and electronic means to collect and store data. In July 2009, PAICMA identified Antioquia department, Catatumbo in Norte de Santander department close to the Venezuelan border, Montes de María (a mountainous region on the Caribbean coast), and Nariño department as the four areas where the survey would begin in September 2009.¹²⁷

The survey will be conducted in locations based on safe working conditions, the number of casualties, and the level of suspected contamination.¹²⁸ Affected communities are fearful of reprisals from NSAGs, which impedes the flow of information about dangerous areas and SHAs. If this fear is pervasive in mine-affected communities, it could affect the comprehensiveness of the planned LIS.

¹²⁷ Email from Andrés Dávila Ladrón de Guevara, PAICMA, 12 August 2009.

¹²⁸ Response to Landmine Monitor questionnaire by Pablo Parra, PAICMA, 19 May 2009.

It was planned to begin the LIS in September 2009 in Antioquia, Catatumbo, Nariño, and the Montes de María region.¹²⁹ The project was scheduled to take one year, but PAICMA believed an extension might be required.¹³⁰

Mine clearance in 2008

In 2008, the army's humanitarian demining teams cleared 10 military bases bringing the number of cleared bases to 18 of the 34 believed to be mined. As noted above, on six of the bases (Cerro Luna, El Hobo, Fortaleza, La Argelia, and La Riqueza, and Yatacue) no mines were found during technical surveys and clearance operations.¹³¹ According to Guillermo Leal, South America Regional Coordinator for the OAS mine action program, it is likely the mines were never laid in these locations and indicated it was possible that during future technical surveys in the remaining mined military bases no landmines will be found.¹³² Pablo Parra, PAICMA's Mine Action Advisor, thought no landmines were found in these six locations because years ago the base commanders had ordered that the mines be removed but never reported it.¹³³

In 2008, a total of 28,423m² of SHA was cleared around military bases, resulting in the destruction of 316 antipersonnel mines and 13 items of UXO.¹³⁴

Demining of 10 military bases in 2008¹³⁵

Department	Municipality	Name of base	Area cleared (m ²)	Antipersonnel mines destroyed	UXO destroyed
Valle del Cauca	Toro	La Argelia	1,555	0	0
Valle del Cauca	Roldanillo	El Hobo	1,034	0	0
Norte de Santander	Pamplona	Base de Oriente	10,997	67	1
Arauca	Tame	Biran	2,438	104	0
Valle del Cauca	Dagua	Yatacue	0	0	0
Valle del Cauca	Dagua	Fortaleza	0	0	0
Valle del Cauca	Dagua	La Riqueza	0	0	0
Valle del Cauca	Dagua	Cero Luna	0	0	0
Quindío	Calarcá	Campanario	1,386	126	7
Norte de Santander	Toledo	Toledo	11,013	19	5
Total			28,423	316	13

Technical surveys, or impact surveys as they are called in Colombia, have been conducted on nine SHAs mined by NSAGs in five departments. The nine SHAs range in size from an estimated 5,000m² to 360,000m², with all nine calculated to cover 457,900m². The army's humanitarian demining teams have cleared three of the nine areas. Two were located in San Francisco municipality in Antioquia and one in San Jacinto municipality in Bolívar.

Bajo Grande is an abandoned village in the municipality of San Jacinto in the department of Bolívar, 200km from the city of Cartagena in northern Colombia. Manual clearance of the 360,000m² SHA began in December 2007 with one army platoon of 40 deminers. Houses, yards, roads, and agricultural land were targeted for clearance.¹³⁶ As of August 2009, however, eight months after clearance was completed, and despite promises of development projects such as roads, agricultural land, and new housing, little more than ground breaking for a road had been achieved, according to *La Silla Vacía*, an online news service in Colombia.

There is reportedly no electricity, drinking water, or other public services in the village. During a visit in June 2009, US Department of State official Ed Trimakas said it would be difficult for people to live in the village in these conditions. Apart from 50 men who have occasionally farmed in Bajo Grande since 2007, only five families have returned to the village. With no public services available, the poor condition of the cleared land, and debt among displaced families, some of the cleared land has been sold to a company for 300,000 pesos per hectare (US\$150) for agricultural production and cattle-raising. The local government in San Jacinto municipality has received 128 requests to sell land owned by internally displaced persons (IDPs). The government was said to be investigating whether the IDPs were pressured into selling their land or were threatened by potential buyers.¹³⁷

Elsewhere, in San Francisco department, at San Isidro and Alto El Aguacate, mined areas blocking farmland and a frequently used trail were cleared. During the clearance operations, 100 improvised mines and six items of UXO were destroyed. Clearance of the SHAs in Antioquia, Meta, and Nariño departments continued into 2009.¹³⁸

Humanitarian demining in 2008¹³⁹

Department	Municipality	Community	Area cleared (m ²)	Non-technical land release	Antipersonnel mines IEDs destroyed	UXO destroyed
Antioquia	San Francisco	San Isidro	8,707	0	11	2
Antioquia	San Francisco	Alto El Aguacate	24,194	0	86	0
Bolívar	San Jacinto	Bajo Grande	51,120	52,526	3	4
Total			84,021	52,526	100	6

Under the responsibility of the General Inspector of the Armed Forces, a National Demining School at the Colombian Engineers School is responsible for training army deminers. The OAS, Inter-American Defense Board, British Royal Engineers, and Salamandra Foundation (Fundación Salamandra) provide technical assistance to the training.¹⁴⁰ Demining capacity in January 2009 was 240 deminers.¹⁴¹

¹⁴¹ Presentation by Colombia, Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas, 25 February 2009.

It was planned to add three humanitarian demining teams (120 people) in 2009 and by the end of 2011 to have 14 demining teams including mine detection dog and mechanical clearance teams deployed.¹⁴² Mine clearance operations in areas mined by NSAGs are said to be hindered by poor roads, inclement weather, and vegetation.¹⁴³

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Colombia is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2011. The Antipersonnel Mines Observatory in 2005 said that the government plans to meet the Article 5 deadline in terms of clearance of the minefields under the jurisdiction of the armed forces, but “there is no guarantee that Colombia will be able to declare itself mine-free in 2011, especially if non-State actors do not embrace the principles in the Convention. However, the Government will not ask for any extension until evaluating the possibility to completely fulfill what is established in the Treaty.”¹⁴⁴

In June 2007, the Chief of the Joint Command told Landmine Monitor that Colombia would clear “all mined areas under its control.”¹⁴⁵ At the Eighth Meeting of States Parties in November 2007, Colombia said it would probably request an extension of its Article 5 deadline to address the types of mines manufactured by NSAGs. In the same statement, Colombia reiterated it would clear all mines from its military bases by 1 March 2011.¹⁴⁶

Colombia is making steady progress in clearing the 34 mined military bases. As of May 2009, 14 remained to be cleared. Nevertheless, true progress towards meeting its Article 5 obligations cannot be measured until the full extent of the problem is known. While it was planned to commence an LIS in a limited number of departments in 2009, ongoing security concerns in the rural areas where thousands of events have been recorded will severely limit its coverage. A nationwide survey is needed to ensure that Colombia has made every effort to identify all mined areas, as required by the treaty.

Risk Education

RE in Colombia aims to provide information to enable communities to manage risk themselves. Local government staff, health workers, and teachers are trained in RE, but no systematic program exists to develop a sustainable RE capacity. Some operators deliver RE directly to households, as community gatherings are not possible in remote areas. There are also community liaison clearance activities led by the OAS.¹⁴⁷

RE is insufficient as operators are unable to cover all affected communities. Nariño department has the greatest number of operators but, as it is a large department, the level of activity is inadequate. According to the CCCM, the most important issue is promoting and sustaining the RE program because there are many regions and areas where it is impossible to start demining, hence the focus on RE.¹⁴⁸

A needs assessment was conducted in 2005, and each year the information is updated, based on casualty data, indigenous communities in priority areas, IDPs and returnees, coca eradication activities, and recent conflict.¹⁴⁹ The ICRC conducted a KAP survey in three departments (Antioquia, Meta, and Nariño) in 2007.

¹⁴⁹ Email from Verónica Rios, PAICMA, March 27, 2009.

The CCCM is funded by Spain and receives technical support from UNICEF.¹⁵⁰ The EC funded RE projects by Pastoral Social and the Gobernación de Antioquia (Antioquia departmental government).¹⁵¹ The National Learning Institute (Servicio Nacional de Aprendizaje, SENA) implemented a training course based on its curriculum for “community mine action agents,” which was developed in 2007. However, these were vocational training courses for people who wanted to gain qualifications to increase employment opportunities, and who would not necessarily use the training provided to deliver RE.¹⁵² The department of Antioquia government is the only department that has taken an active role in RE: it has contributed funding to RE projects and has produced materials, including a comic book for children.¹⁵³

The ICRC and Colombian Red Cross (CRC) work together to conduct risk reduction activities and RE. According to the ICRC, “Risk reduction seeks to ensure that weapon contamination-affected communities have safe access to important resources such as water points, schools and agricultural land or undertake other interventions to mitigate the impact of weapon contamination.”¹⁵⁴ In 2008, risk reduction activities included agricultural projects, the provision of accommodation near hospitals to reduce excessive movements on roads, and liaison on prioritization of clearance activities.¹⁵⁵ The ICRC and CRC provide basic safety messages, reaching rural areas that are inaccessible to most other operators, and “while the ICRC seeks to negotiate and facilitate CRC access to affected areas, the ICRC has developed a capacity to undertake risk education in areas where this is not possible, or where CRC capacity does not exist.”¹⁵⁶

A four-day international seminar on RE funded by the EC to build the capacity of Colombian mine action was held in May 2009. Almost 20 organizations and more than 100 people participated.¹⁵⁷

Risk education activities in 2008¹⁵⁸

Organization	Type of activity	Geographic areas	No. of beneficiaries
CCCM and Paz y Democracia	House-to-house visits in remote communities	17 municipalities, 34 villages in Nariño, Chocó, and Cauca departments and the Mojana region	60,522
CCCM with Camaguari	Emergency NGO with indigenous communities (finished December 2008)	Nariño	See above

Risk Education Activities in 2008

Organization	Type of activity	Geographic areas	No. of beneficiaries
OAS	House-to-house visits and mass presentation	Six communities in two municipalities of Bolívar and Antioquia departments	600
PAICMA	Training on standards for RE; training of RE agents—community leaders, teachers, health, and social workers in indigenous communities	16 departments—Antioquia, Arauca, Bolívar, Caquetá, Cauca, Cesar, Córdoba, Cundinamarca, Guaviare, Guajira, Huila, Magdalena, Meta, Nariño, Norte de Santander, and Putumayo	1,433
SENA	Training local authority staff in mine action issues, including RE		342
ICRC and CRC	Risk reduction activities; provision of basic safety messages combined with information on first-aid, victim's rights, etc.	In all 31 departments from CRC centers	11,227
Diakonie/Tierra de Paz	RE in schools	Cauca	250 teachers
Departmental government of Antioquia (with support from the EC)	End of 2007 received EC funding for project to enhance institutionalization and sustainability of RE through inclusion in municipal education plans in 59 municipalities; implementation started in February 2008, resulting in production of comic book	Antioquia	35,080
CIREC Seeds of Hope program	Activities to promote safe behavior and create communication links between affected communities in each region	9 departments, 42 municipalities	168 workshops
Pastoral Social	House-to-house RE	5 departments: Caquetá, Cauca, Meta, Nariño, and Putumayo	10,000
Fundación Restrepo Barco	RE for children and youth	Santander, Nariño, and the Montes de María region	1,993
Military	Ad hoc awareness		Not available

In 2008, materials were developed by a committee consisting of UNICEF, PAICMA, CCCM, and other organizations. In the initial stages, there was coordination with NGOs, but not through to the completion of the materials.¹⁵⁹

UNICEF conducted an evaluation in 2008 of the CCCM RE and VA project in the departments of Cauca, Chocó, and Nariño, and La Mojana region. It found that the messages and methods of delivery were appropriate and, although it was difficult to measure the impact in a short period of time, it concluded that the project had resulted in behavior change. UNICEF identified a need to improve sustainability, and recommended linking with municipal development plans, implementing RE through schools, and linking with public institutions.¹⁶⁰

RE has been conducted over the last 10 years with the support of UNICEF by department governments, national NGOs, the CRC with the support of ICRC, the Antipersonnel Mines Observatory (from 2001 to 2007), and then PAICMA from 2007. Although the level of activity has increased each year, geographic coverage has remained inadequate. A desk needs assessment in 2005 prioritized 100 municipalities in 12 departments, but as of July 2006, most of these had not received RE. Methods have included: seminars, presentations, mass media campaigns, field projects, training of community leaders, RE to children, and in 2005 a project was launched to include RE in the school curriculum. Emergency RE was conducted in 2005 following heavy fighting in Cauca. Lack of coordination was reported to be a problem. The ongoing conflict also hampered RE.

In March 2003, the Antipersonnel Mines Observatory published an RE handbook. In March 2005, a workshop was held to develop best practices, which brought all RE actors together for the first time. In May 2005, a second workshop with GICHD was held to develop an action plan. A national strategic plan for 2005–2009 was developed with technical and financial support from GICHD and Switzerland. In 2005, UNICEF produced two new tools: a fieldwork manual for facilitators and an interactive game for community members. In 2006, the IMAS for RE was translated into Spanish.

Victim Assistance

The number of mine/ERW survivors in Colombia is not known, but is estimated to be at least 6,163. In its 2009–2019 strategy, PAICMA noted that “despite the achievements in providing assistance to victims, there is no certainty that survivors of APs [antipersonnel mines], IEDs and UXO effectively receive integral rehabilitation and social and economic inclusion...” because of a lack of management capacity by service providers, inflexible systems, and the lack of a clear framework for certain types of services.¹⁶¹

The ICRC noted that government and NGOs often have “extremely limited” access in most conflict-affected parts of the country, resulting in a limited capacity to respond and restricted access for civilians to services. It was added that the government has the capacity to manage health and other services, but not in all parts of the country, and capacity varies over time and location due to conflict.¹⁶²

Colombia possesses an extensive, but unequally distributed, network of hospitals with well-trained staff. Mine/ERW survivors usually receive emergency care, which is free of charge. However, the timeliness and quality remained variable due to a lack of capacity at the community health level.¹⁶³ Departmental capitals have the capacity to carry out comprehensive surgical and

rehabilitation assistance. The Colombian Association for Physical Medicine and Rehabilitation was cited as stating that only some 15% of persons with disabilities received medical care adequate to their condition.¹⁶⁴ According to the ICRC, follow-up assistance is more difficult, as “a significant minority are often refused treatment by hospitals, who are either unaware of their obligations or are worried about the financial implications....”¹⁶⁵ Referral is not systematic and a lack of financial means, long distances, and ongoing conflict hamper civilian access to these follow-up services. Service providers are strained by the decreased budget allocated by the government for those without private insurance, and reimbursement delays occasionally disrupted service provision.

Rehabilitation centers are usually of good quality, but only available in major cities and few outreach services are available. Services are provided by the government, private centers, and NGOs. In 2008, the Ministry of Social Protection worked on draft standards for prosthetic-orthotic services and on establishing a training program with support from the ICRC,¹⁶⁶ and within the framework of the 2008–2012 program to strengthen the integral rehabilitation system, supported by the Japan International Cooperation Agency and PAICMA. This program—working with departmental health secretaries in Valle del Cauca and Antioquia, two university hospitals, service providers, and rural health promoters—was in the planning stage in 2008, and implementation and study visits started in February 2009.¹⁶⁷

Mine/ERW survivors are entitled to psychosocial assistance for one year after the incident, but services are virtually non-existent. According to PAICMA, however, psychosocial services were not fully developed or implemented.¹⁶⁸ Psychosocial services do not exist at community-level hospitals.¹⁶⁹ Survivors can access free vocational training at SENA, but these courses are not adapted to the needs or education levels of the mostly rural survivors. Reportedly, only 7,000 of Bogotá’s 100,000 persons with disabilities had access to public education.¹⁷⁰ Economic reintegration opportunities for mine/ERW survivors are limited, even though these are, in principle, included in the *ruta de atención*. It was said in 2009 that “only a negligible percentage of weapon contamination victims are currently benefiting from government or other projects to help them become economically self sufficient.”¹⁷¹ This is partly because of a lack of expertise and partly because of a lack of awareness.¹⁷² PAICMA noted the lack of any systematic income-generating activities, and stated that although the local authorities are crucial in these activities, they do not know what role they are expected to play.¹⁷³

Mine/ERW survivors and the families of those killed by these devices can claim one-time government compensation and reimbursement of treatment costs within one year of the incident under various legislative frameworks. The most recent decree is Decree 3990 of October 2007, which meant to streamline procedures.¹⁷⁴ However, the complexity of procedures “often

¹⁷⁴ For more detailed information see *Landmine Monitor Report 2008*, p. 271.

hinder[s], rather than improve[s], access to services.”¹⁷⁵ Both PAICMA and operators noted that Decree 3990 encountered problems since its implementation started in 2008.¹⁷⁶ The most common problems were: the stricter definition of who is eligible; more documentary proof needed; shorter timeframes in which documents need to be furnished by authorities; and a reduction of time for rehabilitation. In addition, the same awareness problems remained, as did gaps for transport and accommodation. Service provision was extended to cover more medical services and to make the provision of mobility devices to children less time-bound,¹⁷⁷ but gaps remained, particularly for psychosocial support and economic reintegration.¹⁷⁸

The military provides health and rehabilitation services to its personnel, but the level of services differs between professional soldiers and those performing military service. The military is not able to provide sufficient socio-economic reintegration or pensions to professional soldiers who then often need to turn to charities and civilian services.

Colombia has specific legislation protecting the rights of persons with disabilities, but its implementation is limited due to a lack of capacity, coordination, and leadership. On 30 March 2007, Colombia signed the UN Convention on the Rights of Persons with Disabilities, but not its Optional Protocol. As of 1 July 2009, Colombia had not ratified the convention.

Progress in meeting VA26 victim assistance objectives

Colombia is one of 26 States Parties with significant numbers of mine survivors, and with “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors.¹⁷⁹ Colombia presented its four 2005–2009 objectives at the Sixth Meeting of States Parties in 2005. The objectives have not been updated since;¹⁸⁰ four equally broad objectives have been elaborated in the 2009–2019 strategy. PAICMA stated in 2009 that the objectives reflect the actions taken under the *ruta de atención* and PAICMA’s activities.¹⁸¹

Most of Colombia’s objectives related to data collection and the development of strategies. Progress was made on all objectives, but the actual benefits for survivors remain to be seen. In 2008, PAICMA acknowledged that the objectives were not SMART (specific, measurable, achievable, relevant, and time-bound), but also said VA was incorporated into larger programs for conflict victims or poor people, such as the *ruta de atención*.¹⁸²

A VA expert from Colombia was present at the intersessional Standing Committee meetings from 2006–2009 and at meetings of States Parties from 2006–2008. VA experts also participated in workshops held in Managua, Nicaragua in February 2009 and April 2005. Colombia included detailed information on plans in the statements it made at all intersessional meetings and meetings of States Parties between 2005 and 2009 and in Form J of its Article 7 reports from 2005–2009.

Victim assistance activities

There are many assistance providers in Colombia; only those providing updated information have been included below.¹⁸³

¹⁸⁰ Response to Landmine Monitor questionnaire by PAICMA, 13 May 2009.

¹⁸¹ *Ibid.*

¹⁸² Interview with Zoraida Delgado Sierra, PAICMA, Bogotá, 24 April 2008.

¹⁸³ A detailed list of VA operators in Colombia is available from PAICMA. CONPES, “Política Nacional de Acción Integral contra Minas Antipersonal (MAP), Municiones sin Explotar (MUSE) y Artefactos Explosivos Improvisados (AEI)” (“National Strategy for Integral Action against Antipersonnel Mines (AP), Unexploded Ordnance (UXO), and Improvised Explosive Devices (IED)”), Bogotá, 16 February 2009, p. 13.

In 2008, PAICMA worked on increasing awareness about VA services for service providers, authorities, and survivors through workshops and meetings; some 105 survivors in Santander and 150 local authority service providers in Huila and Caquetá were reached. PAICMA also stimulated training on the ruta de atención through other channels and supported some survivors identified during meetings or through data collection in accessing assistance (see above).¹⁸⁴

Of the 139 survivors monitored by PAICMA in the first half of 2008, only 86 received medical assistance covered by FOSYGA and 62 received compensation through Acción Social.¹⁸⁵

Within the framework of EC funding for RE and VA in 2008, the departmental government of Antioquia monitored assistance and referral of 247 survivors, cooperated on psychosocial support in five municipalities with the University of Antioquia, visited 15 municipalities to promote the establishment of survivor organizations, and organized awareness-raising workshops in 59 municipalities.¹⁸⁶

No formal prosthetic-orthotic curriculum exists in Colombia, and in 2008–2009 work was undertaken to establish a course by the Ministry of Social Protection, SENA, and the ICRC. Additionally in 2009, three technicians started courses at the Don Bosco University in El Salvador, and several others started distant learning courses.¹⁸⁷

In 2008, the CCCM ended its cooperation with the Spanish NGO Moviment Per la Pau (Movement for Peace) and in 2009 entered a partnership with Mercy Corps (with funding from the US Agency for International Development, USAID) for a three-year VA project. In 2008, the CCCM opened a farm in Girón (Santander department) where survivors can live and work during their rehabilitation.¹⁸⁸ After winning a USAID tender, Mercy Corps started VA activities in 2009. The work includes construction of a rehabilitation facility in the departmental hospital of Nariño.¹⁸⁹ In 2008 and 2009, US Department of State funded the CCCM RE projects in Antioquia.¹⁹⁰

CIREC continued to provide physical rehabilitation (center-based and through “rehabilitation brigades”), socio-economic assistance to survivors, as well as capacity-building and peer support through its Seeds of Hope groups. Some 513 prostheses and 3,478 orthoses were produced; the rehabilitation brigades assisted 624 people; and peer support groups operated in 42 municipalities. CIREC also organized awareness-raising workshops on disability and the ruta de atención. In 2008, CIREC organized a patient evaluation of its services: some 81% were satisfied with the treatment they had received, 92% with the staff competencies, and 71% with the quality of mobility devices provided.¹⁹¹ The US Department of State has partnered with CIREC’s Seeds of Hope project since 2006 supporting medical brigades and association development in 10 municipalities.¹⁹²

In 2008, the national secretariat of Pastoral Social provided individual psychosocial support for survivors and their families in five southern departments and organized workshops for the affected communities. It assisted 93 survivors and another 171 family or community members.

Pastoral Social also assisted 97 survivors and 64 family members with the administrative process to apply for assistance.¹⁹³

In 2009, the ICRC reported that of the 2,420 civilian casualties recorded between 2000 and 2008, the ICRC had provided economic support and/or medical support to 936 (39%).¹⁹⁴ In 2008, the ICRC continued its awareness training on the *ruta de atención* for community leaders, teachers, and local and departmental authorities, combined with RE messages, in some 32 municipalities. First-aid refreshers and trauma care training were provided to more than 400 health staff. The ICRC paid for transport and accommodation during medical or physical rehabilitation for some 331 weapon-injured people.¹⁹⁵ In 2008, the ICRC supported five physical rehabilitation centers, assisting 14,370 persons with disabilities, including assisting 152 mine/ERW/IED survivors with prostheses and 18 with orthoses. It covered the full cost of treatment for 103 of these survivors. Training and facility upgrades were also supported.¹⁹⁶

In 2008, HI continued to expand and diversify its VA activities to provide more comprehensive assistance. It developed quality guidelines for integral assistance, facilitated access to services, and raised awareness among service providers. HI also built the capacity of survivors and persons with disabilities to participate in community coordination/representation and increased their involvement in the management of assistance provision. It also continued its community-based rehabilitation for persons with disabilities and technical advice to the Fundación REI rehabilitation center. In 2008, 124 survivors, including 14 injured in 2008, received multiple services: all received psychosocial support, 90 received physical rehabilitation, 40 peer support, and three economic reintegration assistance; 217 medical care services and 96 mobility devices were covered. An additional 480 persons with disabilities received physical rehabilitation (and 150 of these also received psychosocial support).¹⁹⁷

During 2008, the OAS facilitated the assistance of and covered the treatment, accommodation, and transport costs for 77 mine/ERW survivors at CIREC. In coordination with PAICMA, the OAS also supported vocational training for 35 survivors at SENA. Of those 35, five had found employment by July 2009 and 11 had received financial assistance to start their business.¹⁹⁸

Support for Mine Action

In April 2009, Colombia reported that it would cost an estimated \$78 million to cover mine action needs for the period 2009–2012, with \$66.3 million projected to come from national funding sources—42% of the total requirement from the Ministry of Defense, and 23% from the Ministry of Welfare—and \$11.7 million from other sources, including international assistance.¹⁹⁹

National support for mine action

In official budget reporting, Colombia reported contributing COP1.884 billion (\$942,000) to national mine action programs in 2008, as reported by the National System for Evaluation of Public Sector Performance (Sistema Nacional de Evaluación de Resultados de la Gestión Pública), the Department of Planning's monitoring and evaluation division.²⁰⁰ PAICMA reported contributions of COP2.771 billion (\$1,385,500) in national funds for mine action in 2008, but did not provide details to compare to Department of Planning figures.²⁰¹ National funds are allocated under the project entitled "Implantación del Programa Nacional de Prevención de Accidentes por Minas Antipersonales y Atención a Víctimas" ("Implementation of the National

¹⁹³ Information from Pastoral Social, 20 March 2009.

¹⁹⁹ Article 7 Report, Form A, 30 April 2009.

²⁰⁰ SINERGIA, "Programas de prevención de accidentes por minas antipersonal y atención a víctimas" ("Program for the prevention of antipersonnel mine accidents and victim assistance"), www.sigob.gov.co.

²⁰¹ PAICMA, "Annual Report 2009," p. 68.

Program for the Prevention of Antipersonnel Mine Accidents and for the Care of Victims”). In its Article 7 report covering 1 January 2007 to 31 March 2008, Colombia reported a government commitment of COP2.665 billion (about \$1,327,500) for the national mine action program for July 2007–June 2008.²⁰² As of August 2009, the Department of Planning reported a national commitment of COP2.937 billion (\$1,468,500) for 2009.²⁰³

For the implementation of VA between 2009 and 2012, some COP63.991 million (\$31,996) in national resources was budgeted, mostly coming from the Ministry of Social Protection.²⁰⁴ In its 2009–2019 strategy, PAICMA mentioned that from 2008 to 2019, Colombia would spend COP155.110 million (\$77,555) on 1,682 civilian survivors (this equals less than \$50 per person). Additionally, COP258.194 million (\$129,097) was allocated to psychosocial and economic support for 2,799 military and civilian survivors during the same period.²⁰⁵

National funding as reported by the Department of Planning evidently does not include funds directed through other budget sources such as the ministries of defense and foreign affairs. As a result, it is not possible to assess national funding levels against the levels called for in Colombia’s Article 7 report for 2008. These average \$16.6 million per year based on a total requirement of \$66.3 million for the four-year period. In its Article 7 report for 2007, Colombia reported a commitment of \$41 million in national funding over four years. It has not since reported on further contributions to make up shortfalls in reported national funding.²⁰⁶

International cooperation and assistance

In 2008, nine countries and the EC reported providing \$9,139,472 (€6,206,351) to mine action in Colombia. Reported mine action funding in 2008 was 4% more than reported in 2007.²⁰⁷ Past statements by Colombia have suggested that the lack of effective control of mine-affected areas, rather than international funding levels, is the main hindrance to meeting its Article 5 deadline.

Funding to Colombia at 2008 levels appears adequate for supporting clearance of areas under military control. No estimates have been provided on what is needed to clear the other mined areas where incidents occur. Funding to RE and VA appear insufficient to meet needs in these areas.

2008 International Mine Action Support to Colombia: In-Kind²⁰⁸

Donor	Form of In-Kind Support	Monetary Value (where available)

DEMOCRATIC REPUBLIC OF THE CONGO

2008 Key Data

State Party since	1 November 2002
Contamination	Antipersonnel and antivehicle mines, submunitions, other ERW
Estimated area of contamination	Unquantified
Casualties in 2008	14 (2007: 28)
Estimated mine/ERW survivors	Unknown but at least 1,247
Article 5 (clearance of mined areas)	Deadline: 1 November 2012
Demining in 2008	Mined and battle area clearance: 0.55km ²
Risk education recipients in 2008	575,723
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$12.4 million (2007: \$5.9 million)

Ten-Year Summary

The Democratic Republic of the Congo (DRC) became a State Party to the Mine Ban Treaty on 1 November 2002. National implementation legislation is under consideration in the Parliament. In May 2006, the DRC reported that it had completed its stockpile destruction. It continues to find and destroy additional stockpiled mines each year. There were credible allegations of use of antipersonnel mines in the DRC by non-state armed groups at least until 2004, and by Ugandan and Rwandan government forces in 2000.

The DRC has made limited progress in identifying and clearing mined areas from its territory since becoming a State Party. The extent of contamination remains unclear, and the UN has noted the lack of significant progress in treaty implementation.

The UN Mine Action Coordination Centre recorded 1,696 mine/explosive remnants of war (ERW) casualties (705 killed and 991 injured) in the DRC between 1999 and 2008, although data collection remained limited and many more casualties are thought to exist. Risk education has been conducted by international and national NGOs working in partnership since 2002, and has increased each year.

Despite having developed objectives to increase victim assistance by 2009, as part of its commitment to achieve the aims of the Nairobi Action Plan, mine/ERW survivors have received little assistance since 2004. Due to ongoing conflict, poor healthcare services, an under-resourced rehabilitation sector, and few opportunities for psychological assistance or economic reintegration, survivors received limited or no support services.

Mine Ban Policy

The DRC acceded to the Mine Ban Treaty on 2 May 2002, becoming a State Party on 1 November 2002. The National Commission to Fight Antipersonnel Mines was created in 2002.¹

The DRC submitted its latest Article 7 transparency report on 22 May 2009, covering calendar year 2008. It has submitted six previous reports.²

¹ Article 7 Report, Form A, 30 April 2003; and see also *Landmine Monitor Report 2006*, p. 325.

² Previous Article 7 reports were submitted on 20 May 2008, 30 April 2007, 18 April 2006, 2 May 2005, 21 June 2004, and 30 April 2003.

The DRC has not enacted domestic legislation to implement the Mine Ban Treaty. In its May 2009 Article 7 report, it stated that the process of developing legislation had been “paralyzed” by internal political problems, which have had “grave repercussions” on the functioning of national institutions.³ However, it also said the legislation was still under consideration by the Lower House of Parliament, before being sent to the Senate and then the President for promulgation, noting that it hoped to complete the process in 2009.⁴

The DRC attended the Ninth Meeting of States Parties in Geneva in November 2008, where it made statements on stockpile destruction, mine clearance, and victim assistance. It did not attend the intersessional Standing Committee meetings in May 2009.

The DRC has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

The DRC is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 18 March 2009 during a special event at the UN in New York. It had not ratified the convention as of 1 July 2009.⁵

Production, use, stockpiling, destruction, and retention

The DRC is not known to have produced or exported antipersonnel mines. While government forces used antipersonnel mines in the past, Landmine Monitor has not received any allegations of use of antipersonnel mines by government forces since the DRC acceded to the treaty. There were credible allegations of use of antipersonnel mines in the DRC by non-state armed groups at least until 2004, and by Ugandan and Rwandan government forces in 2000.⁶

In May 2006, at the Standing Committee meetings, the DRC informed States Parties that it had completed the destruction of all 2,864 stockpiled antipersonnel mines it had been able to identify, thus fulfilling its treaty obligation to destroy stocks by 1 November 2006. It stated that if more stockpiled mines were discovered later they would be destroyed in a timely fashion.⁷

Since May 2006, the DRC has destroyed newly discovered or seized antipersonnel mines on many occasions. In its May 2009 Article 7 report, the DRC listed 631 additional mines destroyed during 2008, all of them reportedly turned over by national armed forces (Forces Armées de la République Démocratique du Congo, FARDC) personnel at Kabinda, Lubao, and Lufalanga, as well as the Kamina military base. The report does not explain whether the mines were discovered among FARDC arsenals or were discovered or seized from other sources. The stockpiles consisted of the following mines: 267 M35, 110 NR413, 100 TM-500, 78 Z1, 72 No. 4, one M18, one AUPS, one No. 2, and one TS-50.⁸ The DRC also reported destruction of more than 1,000 additional mines in 2007 and 2006.⁹

³ Article 7 Report, Form J, 22 May 2009. In its May 2008 Article 7 report, the DRC had reported “new momentum” in development of national implementation laws, and stated that in 2007 a bill on the prohibition of mines was presented to parliament for “assessment.” Article 7 Report, Forms A and J, 20 May 2008. In its April 2007 Article 7 report, the DRC stated that the government had restarted the process of adopting the basic texts relevant to application of the treaty. Article 7 Report, Form J, 30 April 2007.

⁴ Article 7 Report, Forms A and J, 22 May 2009.

⁵ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 60–61.

⁶ See Uganda and Rwanda chapters in this edition of Landmine Monitor. In earlier years, there were also credible allegations of use of antipersonnel mines in the DRC by the armed forces of Burundi and Zimbabwe.

⁷ See *Landmine Monitor Report 2006*, pp. 326–327. The DRC representative in May 2006 did not indicate the date on which the DRC considered the program completed. The 2,864 mines destroyed included mines held in the military regions, mines recovered from non-state armed groups, and mines abandoned across the country. Apparently, it only included seven mines (Claymore type) held by the armed forces. The DRC’s Article 7 reports seem to indicate that 2,662 stockpiled antipersonnel mines were destroyed from 2002 until the end of 2005. The mines were destroyed by HI, Mechem, and MAG.

⁸ Article 7 Report, Form G, 22 May 2009.

⁹ For details see *Landmine Monitor Report 2008*, p. 280.

In its May 2009 Article 7 report, as in its previous report, the DRC stated that information on retained mines was “not yet available.”¹⁰ It is still not clear if this indicates the DRC is considering retaining or has already retained an unspecified number of mines for training and research purposes.

Non-State Armed Groups

Non-state armed groups (NSAGs), both Congolese and foreign, remain active in the country.¹¹ Landmine Monitor found no allegations of new use of antipersonnel mines by any group in 2008 or the first half of 2009. Disarmament and demobilization of former NSAG combatants continued.¹² As noted above, the DRC reported additional mines destroyed during 2008, but did not report specifically on mines surrendered by or seized from NSAGs.

Scope of the Problem

Contamination

The DRC is affected by mines—both antivehicle and antipersonnel—and ERW. Contamination is from UXO, possibly still including unexploded submunitions,¹³ as well as from significant quantities of abandoned explosive ordnance. The precise extent of contamination is unknown due to the lack of a nationwide general survey¹⁴ although, as of November 2008, a total of 2,004 suspected hazardous areas (SHAs) had been identified.¹⁵

Contamination is said by the government to exist across the territory, but is predominantly found in the east, north, and part of the south of the country.¹⁶ In November 2008, the UN declared that the provinces of Equateur, Katanga, North Kivu, Province Orientale, and South Kivu were the most affected. The DRC’s latest Article 7 report also includes Maniema in a list of the most affected provinces.¹⁷ The UN also stated that, “more and more dangerous areas are being reported in Kasai Oriental and Occidental.”¹⁸

Casualties

In 2008, the UN Mine Action Coordination Centre (UNMACC) reported 14 mine/ERW casualties (three killed and 11 injured). The casualties were seven men, one woman, five children (four boys and one girl), and no details were provided for one casualty. At least six were civilian casualties and details for the others were not recorded. At least three incidents were caused by ERW; for the others the device was unknown. Three incidents occurred in South Kivu province and one incident each in the provinces of Kasai Occidental, Katanga, North Kivu, and Oriental. This was a decrease compared to 2007 when 28 new mine/ERW casualties (four killed and 24 injured) were reported in 11 incidents in the DRC.¹⁹

Due to delays in data collection, however, it is possible that the 2008 casualty figure will increase in future reporting, as in previous years, including 2007, for which UNMACC had reported 22 casualties.²⁰ Casualty reporting remained inconsistent. In 2008, UNMACC informed Landmine Monitor of three people killed in April while tampering with a hand grenade, but

¹⁰ Article 7 Report, Form D, 22 May 2009.

¹¹ Foreign armed groups reported to be active or present in DRC as of June 2009 included the Forces Démocratiques de Libération du Rwanda (FDLR), the Interahamwe (Rwanda), and the Lord’s Resistance Army (Uganda). For details of the disarmament process, see *Landmine Monitor Report 2006*, pp. 328–330.

¹² See, for example, “MONUC hands over weapons to the FARDC,” MONUC, 15 May 2009, monuc.unmissions.org.

¹³ DCA deminers have documented the presence of cluster munition remnants in the villages of Kasu, Katelwa, and Est Agrico in Kabalo territory. See, for example, Human Rights Watch, “Africa and the Oslo Process to Ban Cluster Munitions,” Cluster Munitions Coalition Fact Sheet, September 2008, p. 2. In 2008, HI cleared unexploded submunitions in the east of the DRC.

¹⁴ See, for example, Article 7 Report, Form C, 22 May 2009.

¹⁵ Statement of the DRC, Ninth Meeting of States Parties, Geneva, 27 November 2008.

¹⁶ *Ibid.*

¹⁷ Article 7 Report, Form C, 22 May 2009.

¹⁹ UNMACC IMSMA database query in email from Madieng Ndiaye, Roving Operation Officer, UNMACC, 22 April 2009; and IMSMA analysis in email from Salim Raad, Deputy Program Manager, UNMACC, 15 June 2009.

²⁰ Landmine Monitor identified 28 casualties in 2007, 22 of which were recorded by UNMACC. See *Landmine Monitor Report 2008*, p. 285.

these casualties were not included in the UNMACC total for 2008. No further explanation was provided.²¹ UNICEF reported that there were 10 mine incidents during October 2008 to January 2009: this does not correspond with UNMACC records.²²

Casualties continued to be reported in 2009: at least one boy was injured while playing with ERW in North Kivu, as of 15 June.²³

As of June 2009, the total number of casualties recorded by UNMACC in the Information Management System for Mine Action (IMSMA) from 1964 to the end of 2008, was 2,184 (931 killed and 1,247 injured; six people who were neither killed nor physically injured were also included in the database).²⁴ Reflecting the inconsistencies in data and reporting for the DRC, it was also reported that the 2,184 UNMACC-recorded casualties occurred between 1996 and 2008.²⁵ The UN reported that the current records underestimate the extent of the problem. Total casualty figures for the DRC are expected to “rise dramatically” when information can be collected in areas currently inaccessible due to ongoing conflict.²⁶

From 1999 to 2008, UNMACC recorded 1,696 casualties (705 killed and 991 injured).²⁷ The majority of casualties were men (782 including four deminers), followed by women (311), boys (205), and girls (88), while the age and/or gender of 315 casualties was unknown. Most casualties were civilian (1,213), while 67 were military and another 421 unknown. ERW caused most casualties (571) followed by antipersonnel mines (554), antivehicle mines (66), cluster submunitions (142), other victim-activated improvised explosive devices (IEDs)—booby traps—(10), and unknown devices (358).

The main activities at the time of the incident were farming (319), passing by/standing near (245), collecting food/wood/water (221), and hunting and fishing (108). Deliberate tampering caused 68 casualties, traveling (60), household work (31), and tending animals (19). One civilian casualty occurred during a demining accident and 175 casualty activities were recorded as “other” and 322 as unknown. Four deminer casualties and 57 military casualties were reported. The casualty peak occurred between 2000 and 2003 when at least 1,316 casualties were recorded. Most casualties occurred in the provinces of Equateur (381), South Kivu (359), Katanga (170), and North Kivu (168).²⁸

Risk profile

People are mainly at risk from UXO, although mines also pose a threat. The highest level of contamination is found from the north of Equateur province to the south of Katanga province, via the two Kasai provinces. Most incidents reported were caused through farming, herding, attempting to transform hazardous items into agricultural, hunting, or fishing tools, collecting water and firewood, and children playing with suspected items.²⁹ The state of ammunition stockpiles also poses a significant risk to civilians and explosions have occurred in a number of ammunition storage areas.³⁰

³⁰ Response to Landmine Monitor questionnaire by Matthew Willner-Rei, MAG, 6 May 2009.

Conflict in the Eastern provinces (North Kivu, Maniema, Oriental, and South Kivu) has increased the level of UXO contamination, as well as creating large numbers of internally displaced persons (IDPs). In other areas relative stability is an incentive for refugees based in Zambia, Tanzania, and the Republic of the Congo to return to Katanga and Equateur, two of the most contaminated provinces.³¹ According to the Office of the UN High Commissioner for Refugees (UNHCR), 39,543 refugees returned to the DRC in 2008.³²

Socio-economic impact

According to the UN, the growing number of victims and dangerous areas being reported suggests that the impact of contamination is considerable.³³ The DRC has stated that contamination impedes access to water points, renders agricultural land unusable, endangers the return of refugees and IDPs, and blocks the reconstruction of roads. The existence of antivehicle mines has, for example, prevented Médecins sans Frontières Suisse from accessing the health point at Dungu; the health center at Ikela in Equator province is said to be similarly blocked.³⁴

Program Management and Coordination

Mine action

In March 2008, the government created two new structures: an interministerial National Mine Action Commission to serve as the national mine action authority and a “Focal Point” in the Ministry of Interior and Security. Both will lead to the establishment of the Congolese Centre for Mine Action, a “technical, operational, and permanent” structure charged with implementing the policies and decisions of the Commission.³⁵ In the absence of a formal governmental regulatory body, the UN Mine Action Service (UNMAS) manages UNMACC, established in 2002, which is part of the UN Mission in the DRC (MONUC) peacekeeping mission. UNMACC maintains de facto responsibility for planning, managing and monitoring all mine action activities on behalf of the government.³⁶

Risk education

Risk Education (RE) is managed by UNMACC. UNICEF funded a position for a Congolese national on UNMACC’s staff to coordinate RE issues beginning in August 2007. From August to December 2008, there was a gap in the contract and no one was responsible for managing RE. As of January 2009, the post was filled again.³⁷ The RE officer receives training from the deputy program manager.³⁸

An accreditation process exists for international NGOs and is to be extended to national NGOs, but this had not happened as of May 2009.³⁹ The RE officer is in charge of quality assurance of the operators.⁴⁰ The national standards for mine action that are being developed by UNMACC include RE, but had not been approved as of June 2009.⁴¹

RE is included in the monthly mine action coordination meeting organized by UNMACC.⁴²

⁴¹ Ibid; and telephone interview with Raphael Debotte, MAG, 23 June 2009.

⁴² Response to Landmine Monitor questionnaire by Micheline Magwambo, UNICEF/UNMACC, 7 May 2009.

UNMACC's operational plan includes RE and was developed through consultation with key stakeholders. The goal is a reduction by 50% of new mine/UXO incidents by 2012. The specific RE objectives are: to coordinate RE activities, build capacity, monitor and evaluate RE programs, and the financial management of RE projects.⁴³ An evaluation is planned for September 2009.⁴⁴

Victim assistance

A focal point for victim assistance (VA) at the Ministry of Health (MoH) was appointed in late 2007.⁴⁵ UNMACC's VA role has been limited, other than data collection. There was some limited collaboration between UNMACC and the MoH on logistics and data management issues.⁴⁶ In early 2009, UNMACC was preparing to fill a position for a VA coordinator which would include roles of casualty data management, VA planning and coordination, and liaison on VA issues with the ministries of health and social affairs. Funding for the position was secured by April 2009.⁴⁷ As of 17 June 2009, the position had not been filled.⁴⁸

Data collection and management

An evaluation of the UNMAS program in 2008 found that "greater efforts" were needed to ensure reliable data is available to assist mid- to long-term planning.⁴⁹ UNMACC has been administering the Information Management System for Mine Action (IMSMA) database for the DRC.⁵⁰ RE activities are entered into IMSMA.⁵¹

There is no complete nationwide data collection mechanism in the DRC and casualties are believed to be under-reported. Some areas remain inaccessible because of the lack of infrastructure or security constraints.⁵²

UNMACC began collecting data on mine/ERW casualties in the DRC in 2002. It collects casualty information through partner organizations, mostly local NGOs and international organizations. The capacity of the organizations involved is variable, and quality assurance from UNMACC is inadequate.⁵³ No changes were reported in data collection organizations. However, the detail in reporting forms was reduced to match the level of information that could be entered into IMSMA.⁵⁴ The 2008 UNMAS evaluation recommended that UNMACC improve distribution of casualty data to VA providers.⁵⁵ Health system data does not differentiate mine/ERW casualties from other injured people, although the distinction may sometimes take place in the records of local services.⁵⁶

From January to May 2008, Handicap International (HI) carried out a Preliminary Opinion Collection and Community Impact Survey in Equateur, Maniema, North Kivu, and Orientale provinces. The survey identified previously unrecorded casualties; 54 in North Kivu and six

Plans

Strategic mine action plans

No strategic mine action plan exists for the DRC. In May 2008, the evaluation of the UN mine action program recommended that UNMACC develop a four- to five-year mine action operational strategy concentrating on the following areas:

- identification of contaminated areas;
- establishment of an action plan for effective prioritization of clearance operations;
- definition of the needs for RE and development of an action plan; and
- development of a meaningful VA policy.⁵⁹

⁵⁷ HI, "Report: Preliminary Opinion Collection in DRC, 1 January–31 May 2008," undated, provided by email from Philippe Houliat, Head Office Senior Technical Clearance Ordnance Manager, HI, 25 March 2009. Previously Landmine Monitor had reported 121 casualties identified in the HI survey. See *Landmine Monitor Report 2008*, p. 287.

⁵⁸ Response to Landmine Monitor questionnaire by Madieng Ndiaye, UNMACC, 20 April 2009.

⁵⁹ Anne Capelle and Chris Lang, "Evaluation," undated but May 2008, p. 9.

The UN reported that in 2009, mine action would “emphasize surveying, due to the continuous lack of information, and pay more attention to the overlooked provinces of Kasai Oriental and Kasai Occidental.”⁶⁰ As of April 2009, an operational action plan was reportedly being drafted, due to be ready by June.⁶¹ No further progress was reported as of late July 2009.

The DRC has not presented a national VA strategy. In its 2009 Article 7 report the DRC stated that drafting of a VA strategy was ongoing.⁶² Yet, in 2007, it was reported that “a plan of action based on the Nairobi Action Plan has been developed.”⁶³ In 2008, the VA focal point in the MoH declined to provide a copy of the draft plan, and explained that further developments were pending.⁶⁴ The UNMACC position for a VA coordinator includes the task of preparing a VA strategy.⁶⁵ A recommendation of the 2008 evaluation was for the program to develop “a meaningful victim assistance policy.”⁶⁶

Integration of mine action with reconstruction and development

The national strategy for growth and poverty reduction was published in July 2006, but it does not refer specifically to the problem of mines or ERW.⁶⁷ According to the poverty reduction strategy, the government’s priority activities take account of persons with disabilities. Possible activities include the establishment of a national program for persons with disabilities, improving economic and social circumstances, promotion of education and training, and improving health and mobility of persons with disabilities.⁶⁸

National ownership

Commitment to mine action and victim assistance

In November 2007, the UN stated that although the government “continues to demonstrate commitment to the treaty, there has been no significant progress on implementation. The adoption of national legislation and the establishment of a national mine action authority are still pending.”⁶⁹ It repeated this statement in 2008.⁷⁰ In November 2008, the DRC declared its firm commitment to implementing the Mine Ban Treaty and claimed that its recent progress had been far more significant, notably through its efforts to set up national mine action structures.⁷¹

VA, to the extent that it has been included in broader health and disability services in the DRC, has been primarily the responsibility of the MoH, which coordinates the rehabilitation sector through the National Community-Based Rehabilitation Program (Programme National de Réadaptation à Base Communautaire, PNRBC). However, the centers which provide rehabilitation services to persons with disabilities, including mine/ERW survivors, are managed by NGOs, religious organizations, or private companies and receive support from the ICRC.⁷²

National mine action legislation

Two ministerial decrees were issued in 2008, establishing a National Mine Action Authority and a focal point for mine action. A national law, including a legal basis for the mine action program, was planned to be adopted before the end of 2008.⁷³ This had not occurred as of March 2009.⁷⁴

National management

The demining program in the DRC continues to be managed by the UN, although in 2008 the government appeared to be taking a greater interest in asserting its responsibilities for the program. The focal point system is seen as a positive step but is still at an early stage of development.⁷⁵

National budget

In 2008, a budget of US\$2.9 million was proposed by the Ministry of Interior and Security to support the Focal Point for Mine Action, but this was not approved by the National Assembly. It was planned to reintroduce the budget for the 2010 fiscal year.⁷⁶

National mine action standards/Standing operating procedures

National mine action standards (NMAS) were drafted in 2008 with the assistance of the Geneva International Centre for Humanitarian Demining.⁷⁷ In November 2008, the DRC stated that the standards would be adopted by February 2009.⁷⁸ As of March 2009, 21 of the 27 planned NMAS had been drafted and a review had started within technical working groups.⁷⁹ The NMAS were expected to be adopted by the end of 2009.⁸⁰

Program evaluations

In 2008, UNMAS commissioned an external evaluation of the UN mine action program in the DRC. The purpose of the evaluation, conducted in March–April, was to help define the future course of the program.⁸¹ The evaluation concluded that there was a need to “reactivate and reorient the program,” on the one hand, by continuing to encourage the government to establish the necessary capacity to deal with the mine/ERW problem, and, on the other hand, to improve the efficiency of mine action. This implied gaining a better understanding of the extent of contamination as well as being more responsive to the needs of the NGOs and proactively supporting their operations.⁸²

The evaluation report included only a brief review of data collection and VA issues, highlighting the need for increased data collection and sharing of information as well as a severe lack of VA services. The evaluation concluded that establishing specific VA projects for mine/ERW survivors in the DRC was not warranted and that mine action actors should help to ensure that mine/ERW survivors’ needs are met through appropriate programs in the existing health, education, social, and employment sectors.⁸³

⁸³ *Ibid.*, p. 33; and interview with Anne Capelle, Independent Consultant, Geneva, 26 May 2009.

Demining and Battle Area Clearance

In 2008, demining and battle area clearance continued to be carried out by three international NGOs: DanChurchAid (DCA), Handicap International (HI), and Mines Advisory Group (MAG). A new international demining operator, TDI (The Development Initiative Ltd.), a commercial company, arrived in the DRC in December 2008. As of May 2009, it was deploying to Katanga province to carry out general survey and spot explosive ordnance disposal tasks.⁸⁴ Swedish Rescue Services Agency (SRSA) joined DCA in a partnership in February 2009, using a Mini MineWolf machine in Kabalo on DCA tasks.⁸⁵

Demining and battle area clearance in 2008⁸⁶

Operator	Area cleared (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	Unexploded submunitions destroyed	Other ERW destroyed
DCA	323,125	11	2	0	4,563
HI	9,796	12	2	10	388
MAG	204,749	0	0	0	44,184
Mechem	16,492	0	0	0	8
Totals	554,162	23*	4	10	49,143

* The DRC reported the destruction of only 19 antipersonnel mines during 2008.⁸⁷

The 2008 UNMAS evaluation identified UNMACC's quality management as a serious weakness of the demining program. Only the subcontracting agency Mechem seemed to be correctly monitored,⁸⁸ although UNMACC conducted six quality management missions in 2008 and a further three in the first quarter of 2009 on DCA projects.⁸⁹ Neither HI nor MAG had a quality assurance or quality control visit during 2008,⁹⁰ although in 2009, HI received one visit per month in the first four months of the year.⁹¹ HI noted that the lack of quality management capacity impeded the appropriate handover of cleared land.⁹² In April 2009, UNMACC stated that a new concept of operations would include a "total quality management process."⁹³

Demining and battle area clearance: 2004–2008

Year	Area cleared (km ²)
2008	0.55
2007	0.41
2006	0.78
2005	0.45
2004	0.01
Total	2.20

Progress since becoming a State Party

Under Article 5 of the treaty, the DRC is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 November 2012.

⁹³ Response to Landmine Monitor questionnaire by Madieng Ndiaye, UNMACC, 20 April 2009.

In five years of clearance, DRC has cleared only 2.2km² of suspected hazardous areas and has no credible estimate for the extent of contamination. On 27 November 2008, at the Ninth Meeting of States Parties, the DRC declared that it was “superfluous” to consider the need for an extension at this stage but noted the “major obstacles” facing the country in its efforts to implement the Mine Ban Treaty.⁹⁴

Risk Education

In 2008, mine/ERW RE was implemented by national NGOs and accredited international NGOs working in partnership.⁹⁵ Other national NGOs expanded their spheres of activity to include RE and survey.⁹⁶ In 2008, the number of beneficiaries recorded in IMSMA was 549,457,⁹⁷ but the total reported to Landmine Monitor by operators was 575,723. This continues a trend of increasing RE activity over the last five years.⁹⁸

RE activities include emergency RE, direct RE, training of trainers, and community liaison (CL). Reaching remote and isolated communities has continued to be a major challenge for RE.⁹⁹

MAG and Humanitas Hubangui, a national NGO, have a network of community volunteers in most of the affected areas, which they provide with notebooks and T-shirts to gather information. When MAG passes through communities, their CL officers collect the information and where necessary, produce dangerous area reports.¹⁰⁰ MAG conducts organizational capacity-building for Humanitas Hubangui on both implementing and managing RE with a view to the organization being able to access funding on its own.¹⁰¹ They also conduct RE through the community volunteers, including refugees in transit camps, in Katanga, North Equateur, and South Equateur provinces to a total of 170,600 beneficiaries.¹⁰²

HI worked in partnership with the national NGOs SYLAM and Tosalisana in Kisangani and Goma to deliver emergency RE, training of trainers to mine committees, local authorities, child-to-child training, and community liaison to a total of 31,462 beneficiaries.¹⁰³

DCA worked in partnership with ECC-Meru, the national church umbrella organization, Badu and ADIC to conduct RE and community liaison in Katanga, South Kivu and Manjema to a total of 373,661 beneficiaries.¹⁰⁴

An RE workshop was held in Bukavu with all operators (except HI, as a fatal accident prevented their participation) in September 2008 to develop a common set of RE materials, including school booklets, leaflets for use in communities during RE sessions and at refugee transit camps, and training aids. They were produced in Swahili, Lingala, and French.¹⁰⁵ They were printed and distributed by UNICEF in early 2009.¹⁰⁶

The international NGOs report monitoring the activities of their national partners.¹⁰⁷

The 2008 external evaluation of the UN mine action program recommended defining the needs for RE, developing an action plan, revising and harmonizing messages, setting up an accreditation procedure for national organizations, and developing national coordination capacity.¹⁰⁸

There was little RE in the DRC until July 2002. Since then international and national NGOs have conducted RE through a mix of emergency and community-based activities (including setting up community committees, and child-to-child RE), mass media, and CL. Target groups have included at-risk communities, IDPs, and refugees. RE has been conducted in Kisangani and the surrounding areas, north Katanga, North and South Kivu, Equateur, and Orientale provinces.¹⁰⁹

HI started to conduct RE in the DRC in 2002, and was joined by UNICEF, DCA, and Mines Awareness Trust in 2003 and MAG in 2005.¹¹⁰ National NGOs called for capacity-building to create a sustainable RE capacity, and UNICEF and international NGOs responded by providing several training courses and working in partnership with national NGOs.¹¹¹ In 2006, the number of RE beneficiaries doubled from the previous year, as a result of the doubling number of national NGOs and training by international operators.¹¹² It continued to increase in 2007 with international NGOs increasing the scope of the programs and more national NGOs becoming involved. Yet geographic coverage remained inadequate.¹¹³

In 2004, Mines Awareness Trust seconded an RE advisor to UNICEF who designed a national RE curriculum and materials.¹¹⁴ From 1999–2008, UNMACC recorded 1,423,862 beneficiaries.¹¹⁵

On the occasion of International Day for Mine Action, 4 April 2009, a famous singer in the DRC, Miss Mbongo, was appointed as Ambassador of the struggle against landmines.¹¹⁶

Victim Assistance

The total number of survivors is unknown, but is estimated to be at least 1,247.¹¹⁷ In 2008, VA efforts were stalled by political discord and the consequences of internal conflict on the operation of relevant institutions.¹¹⁸ No specific VA programs exist in the DRC. All assistance has been provided through broader programs for health and persons with disabilities. Accessing rehabilitation services remained challenging. Few other services have been reported by international organizations or local authorities.¹¹⁹

A lack of resources, combined with looting of medical equipment, has eroded the healthcare system.¹²⁰ Emergency healthcare in the DRC remained inadequate in mine-affected areas in 2008, and in many places public health services had collapsed. International organizations continued to supplement healthcare, but faced funding shortages. Ongoing conflict hampered

¹²⁰ USAID, "Democratic Republic of the Congo: Complex Emergency Situation Report #2 (FY 2009)," 4 June 2009, www.usaid.gov.

relief efforts and simultaneously increased demand for services.¹²¹ The government reportedly provided limited assistance through healthcare facilities and some surgical assistance in coordination with the national community-based rehabilitation program. Government services in areas with mine casualties faced limited finances and lacked technical capacity.¹²²

Improvement of physical rehabilitation services remained a serious challenge.¹²³ PNRBC services remained weak and lacked funding. No expansion of the program, as had been planned, was reported for 2008.¹²⁴ PNRBC has struggled to implement activities since its launch in 2002. The PNRBC community-based rehabilitation (CBR) network attempted to integrate data on persons with disabilities in 2008. It faced challenges in equipping and standardizing services at centers.¹²⁵

Limited psychological support services exist in the DRC, despite the needs of people suffering trauma from conflict, particularly sexual violence.¹²⁶ Psychological care within the health system is only provided by physiotherapists and social workers with some basic training.¹²⁷ Persons with disabilities often found it difficult to obtain economic reintegration assistance including through employment, education, and government services. Limited private and public funds were allocated to schools providing specialized or vocational training for persons with disabilities.¹²⁸ No specific economic reintegration services were reported for survivors.¹²⁹

The DRC has no specific legislation for persons with disabilities, including mine/ERW survivors. The 2006 constitution contains a general provision protecting the rights of persons with disabilities.¹³⁰ But the government has not effectively enforced existing legal provisions. Accessibility of buildings or government services is not mandated by law.¹³¹ Supported by HI, in 2008, local associations for persons with disabilities in Kinshasa worked to develop draft legislation to protect the rights of persons with disabilities, based on the provision in the constitution.¹³²

As of 1 July 2009, the DRC had not signed the UN Convention on the Rights of Persons with Disabilities. The DRC stated it had started the accession process in late 2007.¹³³ In 2008, the treaty text was reportedly translated and distributed nationally to provincial parliaments. Workshops on the convention were held in provinces including Kisangani, and North and South Kivu, with a view to adoption by the national parliament in 2009.¹³⁴

¹³⁴ Statement by Masuga Musafiri, MoH, Ninth Meeting of States Parties, Geneva, 27 November 2008.

Progress in meeting VA26 victim assistance objectives

The DRC is one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors.¹³⁵ As part of its commitment to the Nairobi Action Plan, the DRC presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005; they were subsequently revised in 2006, but no plans to fulfill the objectives were added. Objectives remained largely non-specific.¹³⁶ As noted above, the creation of a strategic plan to implement the objectives was announced twice in 2007, but was being revised and had not been formally presented as of May 2009.

Landmine Monitor was unable to identify significant progress on any of the DRC’s VA objectives since 2004, other than partial improvement in data collection, the deadline for which elapsed in 2007. In 2008 and 2009, no notable developments were reported on objectives, which were scheduled to be realized by 2009. Challenges appeared to be a lack of coordination, capacity, technical support, and funding. No progress in implementing objectives was reported in 2008, and the only concrete activities reported by the DRC were consultations regarding a VA strategy.¹³⁷

In 2008, a process support visit was undertaken by the Mine Ban Treaty’s Implementation Support Unit on the behalf of the co-chairs of the Standing Committee on Victim Assistance and Socio-Economic Reintegration. The DRC participated in the Nairobi workshop on advancing VA in Africa in 2005. The DRC included a VA or disability expert on its delegation to the intersessional Standing Committee meetings in 2006 and 2007, and at each meeting of States Parties from 2006 to 2009. The DRC used the voluntary Form J attachment to its annual Article 7 report to provide some information on the state of VA in all years from 2005 to 2009.¹³⁸

Victim assistance activities

ICRC-supported hospitals reported admitting 502 weapon-wounded patients, among them one mine/ERW casualty (0.02% of the total in 2008).¹³⁹ During the year, ICRC-supported physical rehabilitation centers provided 93 prostheses for mine/ERW survivors (16% of the total) and 11 orthoses for mine survivors (9% of the total).¹⁴⁰ The ICRC increased its support from one rehabilitation center in 1999 to five in 2009: Kasai Occidental, North Kivu, South Kivu, and two centers in the capital, Kinshasa.¹⁴¹

HI continued to support the reintegration of persons with disabilities in Kinshasa through its CBR project in cooperation with the urban division of social affairs. The HI CBR project did not operate in coordination with the national CBR program run by the MoH. The HI program identifies persons with disabilities and provides referrals to appropriate medical, rehabilitation, and educational services. Based on its recent data collection activities, HI intends to work with local NGOs to build VA capacity as part of an exit strategy from VA in the DRC by 2011. Through the HI program, one mine/ERW survivor received a referral for prosthetics assistance in 2008.¹⁴²

No data from the MoH on beneficiaries of the PNRBC was available due to a lack of adequate data collection.¹⁴³

¹⁴³ Response to Landmine Monitor questionnaire by Masuga Musafiri, MoH, 22 April 2009.

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates for meeting mine action needs (including RE and VA) in the DRC. There is no long-term strategic plan for mine action, including resource mobilization strategies. In November 2007, the DRC stated that development of a strategic plan through to 2012 was one of two national priorities for mine action.¹⁴⁴ UNMAS reported that such a strategy was planned for 2008, along with capacity development for a transition away from UNMACC management.¹⁴⁵ No such plan was reported complete as of July 2009.

National support for mine action

The DRC did not report national funding to mine action in 2008, as in 2007.¹⁴⁶

International cooperation and assistance

In 2008, six countries reported providing \$12,407,357 (€8,425,476) to mine action in the DRC. Reported mine action funding in 2008 was roughly 110% more than reported in 2007. In US dollar terms, funding to the DRC has risen every year since 2003. However, as in previous years, given that the full extent of the landmine problem is not known, it is not possible to assess the adequacy of overall funding for mine action.

2008 International Mine Action Funding to the DRC: Monetary¹⁴⁷

Donor	Implementing agencies/ organizations	Project details	Amount
Netherlands	MAG, UNMAS	Unspecified mine action	\$4,196,640
Sweden	MAG, SRSA	Unspecified mine action	\$3,569,346 (SEK23,497,996)
Denmark	DCA	Integrated mine action	\$1,719,375 (DKK8,750,000)
Belgium	MAG	Integrated mine action	\$1,193,142 (€810,228)
United Kingdom	DCA	Data collection, RE, mine action coordination	\$911,561 (£491,540)
Spain	DCA	Mine clearance	\$817,293 (€555,000)
Total			\$12,407,357 (€8,425,476)

In March 2009, Japan made a contribution of ¥762 million (\$7,391,400) to the UN Voluntary Trust Fund for Assistance in Mine Action for mine action in the DRC and Chad.¹⁴⁸ It did not differentiate the amounts dedicated to Chad and the DRC, but in May 2009, Chad reported that at least \$5,586,000 of Japan's contribution would be allocated to technical survey and clearance programs in Chad.¹⁴⁹ This would leave not more than about \$1.9 million in funding to the DRC, to be applied to survey, rapid response capacity, and VA programs.¹⁵⁰

REPUBLIC OF THE CONGO

Ten-Year Summary

The Republic of the Congo (Congo) became a State Party to the Mine Ban Treaty on 1 November 2001. It has not enacted national legal measures to implement the treaty. Congo reported completion of destruction of its stockpile of 5,136 antipersonnel mines in September 2003, but 4,000 additional mines were found in 2009 and destroyed.

Congo is contaminated with explosive remnants of war (ERW), including cluster munition remnants, but the presence of emplaced mines has not been confirmed. In May 2009, Congo announced that it was seeking international assistance to conduct technical survey of its mine-suspected region, close to its border with Angola, in order to meet its Article 5 deadline of November 2011.

Landmine Monitor has identified 25 ERW casualties (14 killed, one injured, and 10 unknown) and no mine casualties between 1999 and 2008, though under-reporting is likely. There are no specific victim assistance programs and limited services for persons with disabilities.

Mine Ban Policy

Congo acceded to the Mine Ban Treaty on 4 May 2001, becoming a State Party on 1 November 2001. It indicated as early as September 2002 that legislation had been drafted to implement the treaty domestically, but this still had not occurred as of mid-2009.¹

Congo submitted an undated Article 7 report in 2009 covering calendar year 2008. It submitted four previous reports, the most recent in April 2007.²

Congo attended the Ninth Meeting of States Parties in Geneva in November 2008, but did not make any statements. It also attended the intersessional Standing Committee meetings in May 2009, where it intervened on mine clearance. It has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

No mine use has been reported in Congo since 1997, when mines were used during its civil war.³ Congo is not known to have produced or exported antipersonnel mines. In September 2003, Congo reported the destruction of its stockpile of 5,136 antipersonnel mines.⁴

In its Article 7 report submitted in 2009, Congo reported that it had discovered 4,000 antipersonnel mines (2,500 PPM-2 and 1,500 PMN) in an abandoned warehouse and destroyed them on 3 April 2009 in Mongo-Tandou. Congo reported that an additional 508 POMZ-2 mines were awaiting destruction.⁵

¹ Article 7 Report, Form A, 12 September 2002. In November 2007, Congo stated that it required assistance from the Geneva International Centre for Humanitarian Demining (GICHD) in order to draft national legislation. In August 2008, the GICHD reported that support had been provided. See *Landmine Monitor Report 2008*, p. 294. No further progress on national legislation has been reported, including in Congo's Article 7 report submitted in 2009.

² It submitted previous reports on 12 September 2002, 4 May 2004, 30 June 2005, and 20 April 2007. The 2005 and 2007 reports consisted solely of the cover page indicating no new information since the previous report.

³ See *Landmine Monitor Report 1999*, pp. 189–191.

⁴ Statement by Col. Léonce Nkabi, Project Coordinator, Ministry of National Defense, Fifth Meeting of States Parties, Bangkok, 19 September 2003. Copies of the destruction records were attached to the statement. The details of types and numbers of mines destroyed were not reported in Congo's subsequent Article 7 report. See *Landmine Monitor Report 2004*, p. 357. At the Eighth Meeting of States Parties, Congo reported destroying 4,718 stockpiled mines. Statement of Congo, Eighth Meeting of States Parties, Dead Sea, 18 November 2007.

⁵ Article 7 Report (for calendar year 2008), Form G. See also Statement of Congo, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 28 May 2009.

Mines Advisory Group (MAG) oversaw the destruction of the 4,000 mines along with a local explosive ordnance disposal (EOD) team. It said that the mines came from the Pointe-Noire regional stockpile and that the destruction was witnessed by the Minister of Defense, 100 international representatives, and members of the press. MAG stated that a further 509 POMZ mines would be destroyed in the coming days at the Pointe-Noire Foundry.⁶ Previously, in June 2008, MAG told Landmine Monitor that between December 2007 and the end of May 2008 its teams destroyed 83 antipersonnel mines among other items of ordnance and ammunition from storage areas in Brazzaville and Pointe-Noire.⁷

In its Article 7 report submitted in 2009, Congo stated that it retained 322 antipersonnel mines for training purposes, after it used 50 mines (30 PPM-2 and 20 POMZ-2) in the April 2009 destruction of the newly discovered stockpile.⁸ Previously, in November 2007, Congo had cited a figure of 372 mines retained.⁹ It has not provided details on the intended purposes of its remaining retained mines.

Congo is not party to the Convention on Conventional Weapons. Congo signed the Convention on Cluster Munitions in Oslo on 3 December 2008, but had not ratified it as of 1 July 2009.¹⁰

Scope of the Problem

Contamination

Congo is significantly contaminated with explosive remnants of war (ERW), both abandoned explosive ordnance and UXO. The problem results from civil conflict in 1993–1999.¹¹ There are many areas of ERW contamination, and even the capital, Brazzaville, is reported to have an area of 260,000m² still contaminated with UXO.¹² The threat includes cluster munition remnants.¹³ Unsafe explosive ordnance storage conditions also increase the likelihood of fires or explosions at ammunition storage areas; these have already occurred several times.¹⁴

MAG, the only international demining operator in Congo, has conducted surveys in Brazzaville and Dolisie, on sites where civilian incidents have occurred as a result of ERW. Preliminary findings indicated that incidents continued to occur due to the encroachment of communities onto contaminated land for housing, agriculture, and other livelihood activities. At one of the sites, items of UXO, including unexploded submunitions, were scattered on open ground being cultivated. MAG expects that battle area clearance (BAC), and possibly demining, will be required.¹⁵

Yet the exact extent to which Congo is affected by antipersonnel mines remains unknown. According to its Article 7 report covering April 2003 to April 2004, “the border zone with Angola in the southwest of the country is mine suspected.”¹⁶ Its latest Article 7 report, covering calendar year 2008, indicated “no change” in the situation on the cover page.¹⁷ As previously reported by Landmine Monitor, the UN Mine Action Service (UNMAS) believes that the mine problem—to

⁶ Mines Advisory Group, “4,000 anti-personnel landmines destroyed,” 6 April 2009, www.alertnet.org. MAG said the explosive charges from the POMZ mines were used as priming charges to destroy the 4,000 mines, and that the bodies of the POMZs would be melted at the foundry.

⁷ Email from Anna Kilkenny, Programme Manager, MAG, 27 June 2008.

⁸ Article 7 Report (for calendar year 2008), Form D. The mines are: 66 German PPM-2, 50 Soviet PMN-58, 156 Soviet POMZ-2, and 50 Soviet PMD-6.

¹⁷ Article 7 Report (for calendar year 2008), Form C.

the extent one exists—is limited to an area 60km in diameter between the unclearly marked borders of the Cabinda enclave (Angola), the Democratic Republic of the Congo, and Congo.¹⁸

In February 2008, MAG carried out a survey in Kimongo district suspected to be contaminated, along the border with Cabinda. The findings of the survey “did not confirm a current mine threat on the Republic of Congo side of the border,” but MAG hoped to carry out additional spot verification to validate the results.¹⁹ This did not subsequently occur.²⁰ In May 2009, Congo informed the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies that surveys had not identified any new victims since the 1970s, although the indigenous populations had claimed “without much evidence” that mines were present.²¹ In 2006, it was reported that civilians in the suspected areas were reluctant to return to their communities to carry out forestry and farming as “they have not received any guarantees for their security from the authorities.”²²

Casualties

A representative of the Ministry of National Defense told Landmine Monitor that there had not been any mine or ERW casualties in Congo in 2008 or 2009, as of 27 May.²³

The total number of mine/ERW casualties in Congo is not known. Landmine Monitor has identified 25 ERW casualties (14 killed, one injured, and 10 unknown) between 1999 and 2008. No mine casualties were identified. The last incident was in May 2006, when a person was killed by ERW.²⁴ In 2003, approximately 10 UXO casualties were reported; all were treated at the ICRC-supported military hospital in Bangui.²⁵ In 2001, a man and boy were killed and a woman injured in an ERW explosion. In 2000, 11 children were killed while playing with a shell in a school playground.²⁶ However, it is possible that there is significant under-reporting, given the lack of an effective data collection system.

In October 2008, MAG stated that it was conducting surveys in Brazzaville and Dolisie, in areas where ERW incidents have occurred. However, no further details were available regarding what information they had gathered.²⁷

Program Management and Coordination

There is no national mine action authority or mine action center, although a colonel serves as the mine action focal point within the Ministry of National Defense.

National ownership

Congo has demonstrated some commitment to mine action, but so far progress in meeting its Article 5 obligations has been slow. Some surveys of the suspected region have been conducted by the Ministry of Defense at its own cost. Otherwise, clearance operations have been conducted through MAG with international funding.

National mine action legislation and standards/Standing operating procedures

National mine action legislation has not been adopted.²⁸ MAG has its own standing operating procedures for BAC and EOD.²⁹

²⁸ Statement of Congo, Eighth Meeting of States Parties, Dead Sea, 18 November 2007.

²⁹ Interview with Adam Komorowski, Regional Head of Operations, MAG, Manchester, 28 April 2009.

Demining and Battle Area Clearance

MAG is the only operator conducting BAC and EOD in Congo. In the capital, Brazzaville, and in the country's second largest city, Pointe-Noire, MAG trained and supervised two teams of technicians from the armed forces in the use of techniques to destroy small arms and light weapons, including man-portable air-defense systems, air-to-air missiles, rockets, and landmines.³⁰ Between December 2007 and May 2008, MAG destroyed 18 cluster munitions, containing submunitions, during stockpile destruction activities.³¹

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Congo is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 November 2011. In May 2009, at the Standing Committee meetings, Congo stated that it had "not even considered the possibility" of seeking an extension, but noted that its deadline was fast approaching.³² It has requested the assistance of the Geneva International Centre for Humanitarian Demining in applying land release principles to the suspected region, therefore seeking to avoid the conduct of expensive clearance operations in areas which are not actually contaminated.³³

Victim Assistance

The total number of survivors is unknown. There are no specific victim assistance (VA) policies or activities in Congo. Survivors receive the same limited services as other persons with disabilities. However, the Ministry of Health is responsible for mine/ERW survivors,³⁴ and the Ministry of Social Affairs is the lead agency for disability issues.³⁵ The Ministry of Labor, Employment and Social Security and the National Social Security Fund are responsible for disability pensions.³⁶

Emergency and continuing medical care is poor, with only two doctors and nine nurses per 10,000 people in 2004.³⁷ The ICRC continued to provide medicines, supplies, supervision, and training to eight health centers in Pool, which are gradually transferring to government responsibility.³⁸

There is a National Prosthesis Center in Brazzaville, but this is difficult to access for persons outside of the capital.³⁹

In 2009, the National Union of Congolese Disabled (Union Nationale des Handicapés congolais, UNHACO), which works with persons with disabilities in Congo, said that "the situation of disabled people in Congo has made significant advances," citing increased recruitment of persons with disabilities in the public sector and greater public funds.⁴⁰ However,

they called on government to improve its rehabilitation and accessibility policies.⁴¹ In May 2009, the Chinese Ambassador donated equipment to UNHACO as a gesture to facilitate friendship between the organization and the Federation of the Disabled in China.⁴² Other organizations that have assisted persons with disabilities include the Congolese Federation of People with Disabilities (Fédération Congolaise des Personnes Handicapées) and the Federation of Disabled Women (Fédération des Femmes handicapées).⁴³

There are few socio-economic reintegration services for persons with disabilities. With 50% unemployment among the active population,⁴⁴ economic prospects for persons with disabilities are difficult. There is a limited disability pension for those with “a loss of at least 2/3 of capacity for work.”⁴⁵

Congolese law prohibits discrimination against persons with disabilities, but these provisions were rarely enforced. There were no laws requiring accessibility.⁴⁶ Congo signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol in 2007, but neither had been ratified as of 1 July 2009.

Support for Mine Action

International cooperation and assistance

No international funding was reported for Congo in 2008. In 2007 and 2008, the United States funded MAG technical survey and destruction of disused military stockpiles, consisting of obsolete and surplus weapons and munitions. The US contributed US\$675,000 to the program in 2008 and \$445,000 in 2007.⁴⁷ As the MAG survey and destruction program focuses on small arms and light weapons other than antipersonnel mine stockpiles, US support in 2007 and 2008 is not included in reported mine action funding for Congo. As of December 2008, MAG listed the US and the United Kingdom (via the Conflict Prevention Pool) as “current donors” to its program in Congo.⁴⁸

France reported contributing mine clearance training for Congolese personnel in 2007, valued at \$12,829 (€9,357).⁴⁹

CÔTE D'IVOIRE

Ten-Year Summary

The Republic of Côte d'Ivoire became a State Party to the Mine Ban Treaty on 1 December 2000. It submitted its initial Article 7 report in May 2004, three years late. It has not enacted national legal measures to implement the treaty. Côte d'Ivoire has stated that it has never used, produced, or stockpiled antipersonnel mines, even for training purposes.

Côte d'Ivoire is not believed to be affected by mines but may have a residual problem with explosive remnants of war (ERW). From 1999–March 2009, 23 ERW casualties were identified (nine killed and 14 injured) in five incidents. No formal risk education activities have been recorded since 1999. Access to health and disability services is problematic and has deteriorated since the 2002 coup.

Mine Ban Policy

Côte d'Ivoire signed the Mine Ban Treaty on 3 December 1997 and ratified it on 30 June 2000, becoming a State Party on 1 December 2000. Côte d'Ivoire has not enacted national legal measures to implement the treaty.¹ In July 2009, Côte d'Ivoire submitted its updated annual Article 7 report for the period 1 May 2008 to 30 April 2009.²

Côte d'Ivoire attended the Ninth Meeting of States Parties in Geneva in November 2008, but did not make any statements. It did not participate in the intersessional Standing Committee meetings in Geneva in May 2009. It last attended the Standing Committee meetings in 2006.

Côte d'Ivoire has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Côte d'Ivoire has reported that it has never used, produced, or exported antipersonnel mines and has no stockpile, even for training purposes.³ In 2006, a commander with the former non-state armed group, New Forces, stated they had not used mines either.⁴

Côte d'Ivoire is not party to the Convention on Conventional Weapons. Côte d'Ivoire signed the Convention on Cluster Munitions in December 2008, but had not ratified it as of 1 July 2009.⁵

¹ In its Article 7 reports submitted in 2005 and 2006, Côte d'Ivoire stated, "Legislation for domestication of Land Mine Ban Treaty to follow." An official stated in March 2006 that a draft bill was being reviewed by the office of the Prime Minister and was expected to be submitted to the National Assembly. In its Article 7 report submitted in 2007, Côte d'Ivoire stated that the status of national implementation legislation had remained unchanged since 2006.

² Côte d'Ivoire has submitted five previous reports: in 2008 (for the period 1 May 2007 to 30 April 2008); in 2007 (an undated cover page, for the period 9 August 2006 to 30 April 2007, indicating that all areas of reporting were unchanged); 25 April 2006; 27 April 2005; and 27 May 2004. Its initial report was three years late.

³ Article 7 Report, Forms B, D, and E, 27 May 2004; and interview with Capt. Patrick-Alexandre M'Bahia, National Gendarmerie, Abidjan, 22 March 2006.

⁴ Interview with Cmr. Koffi Ferdinand, Communications Director, Armed Forces of the New Forces, Bouaké, 28 March 2006.

⁵ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 64.

Scope of the Problem

There is no evidence that Côte d'Ivoire is affected by landmines.⁶ In its Article 7 reports, Côte d'Ivoire has reported no areas in which antipersonnel mines were confirmed or suspected.⁷ There is, however, a sporadic threat from ERW, as evidenced by several incidents in 2008 involving civilians, particularly children.⁸

In 2008, at least 18 new ERW casualties were reported in two incidents, including seven people killed and 11 injured, in Bondoukou town (eastern Côte d'Ivoire) and in Yamoussoukro city (central Côte d'Ivoire). All casualties were civilians, mostly children (15) tampering with the devices. Compared to 2007, when two military personnel were injured, the increase is due to one incident causing 14 casualties.⁹

Two other ERW incidents have been recorded since 1999: one in 2005 when two children were killed by ERW¹⁰ and one in 2003 when a soldier was injured.¹¹ No new ERW casualties were reported from January–March 2009.¹²

In addition, on 29 September 2008, an ammunition storage area belonging to the Armed Forces of the New Forces exploded near the commercial center in Bouaké, injuring seven soldiers.¹³ It is not known whether this created a UXO problem in the vicinity.

Program Management and Coordination

The situation in Côte d'Ivoire does not warrant a specific mine action strategy or authority. Disability issues are under the responsibility of the Ministry of Family, Women and Social Affairs and the Federation of the Disabled.¹⁴ Casualty data is reported by national media, Handicap International (HI), and the police (gendarmerie), with HI noting that data collection is not a priority for the health sector.¹⁵

Risk Education

As of 2009, mine/ERW risk education was not considered needed in Côte d'Ivoire because officially there was no contamination.¹⁶ In all Article 7 reports submitted by Côte d'Ivoire from 2004–2009, Form I was marked as “not applicable.”¹⁷ Landmine Monitor reported some informal risk education activities provided by the UN Operation in Côte d'Ivoire (UNOCI) and Force Licorne in Bouaflé (in 2005), by the Club Union Africaine, the ICRC, and the Canadian Embassy (in 2002), and general awareness campaigns from 1999–2001.¹⁸

Victim Assistance

The estimated number of survivors is 21. ERW survivors receive the same services as other persons with disabilities, but the overall health and humanitarian situation is fragile and access to services continued to be limited in 2008. Existing disability legislation was not enforced.¹⁹ In September 2008, the governmental National Institute for the Training of Health Workers (Institut National de Formation des Agents de la Santé) launched a four-year program to train specialized rehabilitation personnel—the first program of this kind.²⁰ After nine years of presence, HI phased out its operations in Côte d'Ivoire in February 2009 because of lack of funding. As a result, no international organizations working on disability remain present in the country.²¹

As of 1 July 2009, Côte d'Ivoire had not ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol, which it signed on 7 June 2007.

CROATIA

2008 Key Data

State Party since	1 March 1999
Contamination	Landmines and ERW, including submunitions
Estimated area of contamination	954.5km ² (1 January 2009)
Casualties in 2008	Nine (2007: eight)
Estimated mine/ERW survivors	At least 1,421
Article 5 (clearance of mined areas)	Deadline: 1 March 2019 Original deadline: 1 March 2009
Demining in 2008	Mined area clearance: 12.23km ² Area released by survey: 29.78km ²
Risk education recipients in 2008	Approximately 14,475
Progress towards victim assistance aims	Limited
Support for mine action in 2008	International: \$6,574,631(2007: \$5,928,565) National: \$45.3 million (2007: \$45.6 million)

Ten-Year Summary

The Republic of Croatia became a State Party to the Mine Ban Treaty on 1 March 1999. It completed destruction of its stockpile of 199,003 antipersonnel mines in October 2002. It initially indicated it would retain 17,500 mines for training and research purposes, but reduced this number to 7,000 in 2000, and has since consumed more than 900 mines. Antipersonnel mines were occasionally used in criminal activities in Croatia up to 2003. National implementation legislation, including penal sanctions, was enacted in October 2004. Croatia served as co-rapporteur and then co-chair of the Standing Committee on Stockpile Destruction from 2000–2002, and co-rapporteur and then co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration from 2002–2004. Croatia hosted regional mine action conferences in 1999 and 2002 and served as President of the Sixth Meeting of States Parties in November–December 2005.

Croatia is affected by mines and explosive remnants of war (ERW). Contamination includes a significant problem of cluster munition remnants. Croatia has made steady progress in demining 239km² in the decade to 2008 and releasing another 613km² through technical survey and other methods of land release. Croatia was unable to meet its Article 5 clearance deadline, however, and in 2008 requested and was granted a 10-year extension through March 2019.

Between 1999 and 2008, Landmine Monitor identified 214 mine/ERW casualties (75 killed, 137 injured, and two unknown). The main provider of risk education over the last 10 years has been the Croatian Red Cross, but there has also been strong input from local communities with numerous NGOs, associations and theaters involved. The Croatian Mine Action Centre has been responsible for coordinating risk education since 2003.

Over the last decade there has been an improvement in emergency medical care, an increase in psychosocial counseling services, and the adoption of the National Strategy of Equalization of Opportunities for Persons with Disabilities 2007–2015. In May 2009, however, despite being one of the VA26 countries with significant numbers of mine survivors, Croatia admitted that victim assistance progress since 2005 had been largely “cosmetic,” lacked follow-up and, so far, had not made any “real changes” in the lives of survivors.

Mine Ban Policy

Croatia signed the Mine Ban Treaty on 4 December 1997 and ratified on 20 May 1998, becoming a State Party on 1 March 1999. It enacted national implementation legislation, including penal sanctions, in October 2004.¹ The law created a National Commission for the Coordination of Monitoring the Implementation of the Law.²

Croatia attended the Ninth Meeting of States Parties in Geneva in November 2008 and made several statements on mine clearance. It also participated in the intersessional Standing Committee meetings in Geneva in May 2009, where it made a statement on mine clearance and another detailing how it has used its retained mines.

Croatia submitted its annual Article 7 transparency report on 10 April 2009, covering calendar year 2008. It included voluntary Form J, reporting on casualties, victim assistance, and risk education. Croatia has submitted 10 previous Article 7 reports.³

With respect to interpretation and implementation of the treaty, Croatia has said that the transit of antipersonnel mines across Croatian territory by other states will not be tolerated.⁴ With respect to antivehicle mines with sensitive fuzes, Croatia informed States Parties in May 2006 that it had removed the tilt rods from its TMRP-6 antivehicle mines.⁵ It said that it “fully subscribes” to the statement in a Landmine Monitor Fact Sheet that “a mine that relies on a tripwire, breakwire, or tilt rod as its sole firing mechanism should be considered an antipersonnel mine.”⁶ Croatia has not yet made known its view on the issue of joint military operations with states not party.

Croatia is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It submitted an annual report as required by Article 13 on 30 September 2008. Croatia is party to CCW Protocol V on Explosive Remnants of War.

Croatia signed the Convention on Cluster Munitions on 3 December 2008 and ratified on 17 August 2009.⁷

Production, transfer, stockpiling, and destruction

Croatia has regularly stated that it has never produced antipersonnel mines.⁸ It inherited stocks from the former Yugoslavia. There have been no reports of Croatia ever importing or exporting antipersonnel mines.

¹ The Law on Prohibition of the Use, Stockpiling, Production and Transfer of Anti-personnel Mines and on Their Destruction was approved by parliament on 1 October 2004 and by the president on 6 October 2004. Article 9, Section IV of the law provides penal sanctions. Article 7 Report, Form A, 8 June 2005.

² Article 7 Report, Form A, 8 June 2005. It consists of representatives from the ministries of defense, foreign affairs, interior, and justice, as well as CROMAC.

³ Previous reports were submitted on 30 April 2008, 30 April 2007, 28 April 2006, 8 June 2005, 18 June 2004, 30 April 2003, 26 April 2002, 30 May 2001, 26 January 2001, and 3 September 1999.

⁴ See *Landmine Monitor Report 2006*, p. 354.

⁵ Statement of Croatia, Standing Committee on the General Status and Operation of the Convention, Geneva, 12 May 2006; and email from Dijana Pleština, Advisor on Mine Action, Ministry of Foreign Affairs and European Integration, 22 March 2006.

⁶ Statement of Croatia, Standing Committee on the General Status and Operation of the Convention, Geneva, 12 May 2006. It said, “Moreover, in order to make the agreement on this issue even stronger, we would like to point out that, although TMRP-6 mines do not rely on tilt rod as its sole firing mechanism, and in that sense do not constitute antipersonnel mines, we decided to take a step further and remove tilt rods from these mines so as to exclude every possibility for these mines to be activated by persons. This means that now all TMRP-6 mines in Croatia can be used exclusively as anti-vehicle mines which can only be detonated by pressure force of 250–300 kilos.” In addition, in February 2006, a Ministry of Defense official stated that the Croatian company Agencija Alan had removed TMRP-6 mines from its website and all of their sales catalogues. The ICBL had expressed the view that the sale of TMRP-6 mines with tilt rods would constitute a violation of the Mine Ban Treaty. For more details, see *Landmine Monitor Report 2006*, p. 354.

⁷ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 64–66.

⁸ See, for example, Article 7 Report, Form E, 10 April 2009.

Croatia completed the destruction of its stockpile of 199,003 antipersonnel mines on 23 October 2002, in advance of its treaty deadline of 1 March 2003. Six types of mines were destroyed in three phases.⁹ An additional 45,579 mine fuzes were destroyed during the stockpile destruction program.¹⁰

Croatia also possesses 19,076 MRUD Claymore-type directional fragmentation mines, which it does not classify as antipersonnel mines. It has repeatedly said these mines cannot be activated by accidental contact, but has not reported on what steps it has taken to ensure that these mines can only be used in command-detonated mode.¹¹

Mines retained for research and training

Initially, Croatia announced that it would retain 17,500 antipersonnel mines for training and development purposes, but in December 2000 decided to reduce this number to 7,000.¹² Croatia reported that it retained 6,038 antipersonnel mines at the end of 2008.¹³ The mines are stored at the Croatian Armed Forces storage site, Jamadol, near Karlovac, and “are used or going to be used by the Croatian Mine Action Centre.”¹⁴ In 2008, a total of 65 mines were destroyed in the testing of demining machines by the Croatian Centre for Testing, Development and Training.¹⁵ Croatia destroyed 76 retained mines in 2007, 57 in 2006, 164 in 2005, 78 in 2004, and 268 in 2003.¹⁶

In its Article 7 report for calendar year 2008, Croatia used expanded Form D on retained mines to state that, “Based on the current needs for testing of demining machines in year 2008, we estimate that the following amount [175] of anti-personnel mines will be used (and consequently destroyed) in year 2009.”¹⁷ This was the same amount estimated for 2006, 2007, and 2008.

Scope of the Problem

Contamination

Croatia is affected by landmines and—to a much lesser extent—ERW, a legacy of four years of armed conflict associated with the breakup of the former Yugoslavia during the early 1990s. Mines were laid mainly to protect defensive positions on lines of confrontation, which changed frequently, but also in areas of strategic importance such as railway lines, power stations, and pipelines.¹⁸

At the end of 2008, the Croatian Mine Action Centre (CROMAC) estimated the total suspected hazardous area (SHA) at 954.5km², affecting 111 towns and municipalities.¹⁹ Mined areas are still present in 12 of Croatia’s 21 counties, including the agriculturally fertile region of Slavonia,

⁹ Article 7 Report, Form F, 28 April 2006. The mines destroyed included: PMA-1 (14,280); PMA-2 (44,876); PMA-3 (59,701); PMR-2A/2AS (74,040); PMR-3 (4); and PROM-1 (6,102).

¹⁰ Article 7 Report, Form F, 28 April 2006.

¹¹ Email from Capt. Vlado Funaric, Ministry of Defense, 22 February 2006; and Statement of Croatia, “Claymore-Type Mines,” Standing Committee on the General Status and Operation of the Convention, Geneva, 16 May 2003. Claymore-type mines used in command-detonated mode are permissible under the Mine Ban Treaty, but are prohibited if used with tripwires.

¹² Article 7 Report, Form D, 30 May 2001.

¹³ Statement of Croatia, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 May 2009; and Article 7 Report, Form D, 10 April 2009. The mines included: 763 PMA-1; 1,238 PMA-2; 1,255 PMA-3; 893 PMR-2A; 70 PMR-3; and 1,819 PROM-1.

¹⁴ Article 7 Report, Form D, 10 April 2009.

¹⁵ Ibid. The mines destroyed included: 30 PMA-1A; 15 PMA-2; 10 PMA-3; 4 PMR-2A; and 6 PROM-1. Croatia provided details on how many of which types of mines were used for each of the four demining machines tested (Casper SMT-01, Mini MineWolf, MV-4, and MV-10) and for training exercises in detection and removal of UXO.

¹⁷ Article 7 Report, Form D, 10 April 2009.

¹⁸ See *Landmine Monitor Report 2008*, p. 302; and *Landmine Monitor Report 2007*, p. 316.

¹⁹ Interview with Natasa Matesa-Matekovic, Head of Department for Planning and Analysis, CROMAC, Sisak, 9 February 2009.

which also has oil and natural gas reserves.²⁰ CROMAC included in its overall estimate some 4.6km² contaminated with KB-1, MK-1, and BL-755 unexploded submunitions left from the conflict in 1991–1995 and affecting 16 towns and municipalities in eight counties.²¹

In 2008, Croatia reported that 82 military facilities covering 2.8km² are contaminated with a further 65,521 antipersonnel mines and 1,697 antivehicle mines.²² There is also a problem with UXO found around military storage facilities and the public occasionally reports items of abandoned explosive ordnance.²³

Casualties

In 2008, Landmine Monitor identified nine landmine casualties (three killed and six injured); all were adult men, including three deminers. CROMAC reported seven of these casualties, in six incidents resulting in the death of one civilian and one deminer and causing injuries to three civilians and two deminers.²⁴ From media reports Landmine Monitor identified two additional landmine casualties, one death and one injury, both men. Both incidents happened while the men were grazing their animals.²⁵ This is a slight increase from the eight casualties identified in 2007, but a decrease compared to 2006 (13) and 2005 (20).²⁶

Landmine casualties continued in 2009 with two reported (one death, one injury) as of 14 July. On 31 January, a man was killed in Sisak-Moslavina county while hunting. On 17 February, a man was injured in Osijek-Baranja county while collecting wood.²⁷

Between 1999 and 2008, Landmine Monitor identified 214 mine/ERW casualties (75 killed, 137 injured, and two unknown), including a Dutch tourist injured in 2005 and an Italian tourist killed in 2007. During the same period, CROMAC reported 201 casualties (71 killed, 128 injured, and two unknown). Information on an additional 17 casualties (two killed, four injured, and 11 unknown) was gathered from the Croatian Mine Victim Association (CMVA) and media reports.²⁸

Recent casualty figures have been consistently lower than the 59 casualties reported in 1999. CROMAC stated the fewer casualties were reported in 2008 than any previous year.²⁹

The total number of mine/ERW casualties in Croatia is not known.³⁰ CROMAC recorded 1,908 casualties between 1991 and July 2009,³¹ a decrease from the 1,951 registered casualties held by CROMAC for the period from 1991 to 2007, as reported in 2008.³² The discrepancy is probably the result of a review in 2008 of casualty data for incidents prior to 1998.³³ CMVA, prior to ceasing operations in 2007, had collected data on 2,244 mine/ERW casualties between 1990 and January 2007.³⁴

Risk profile

Men are most at risk, accounting for the majority of casualties.³⁵ Recent casualties have occurred while grazing, hunting, and collecting wood. Refugees and internally displaced persons (IDPs) are also at risk.³⁶ The PROM-1 mine caused 42.8% of incidents. All recent incidents occurred in clearly marked areas.³⁷ All SHAs are marked.³⁸

Socio-economic impact

Around 800,000 people—18% of the population—live in 111 towns and municipalities (out of a total of 556) that are affected by mines and ERW.³⁹ Up to 22,000 people remain refugees or internally displaced and the return of many of these individuals to their homes is hampered by the presence or suspected presence of mines.⁴⁰

Of the total SHA, forest accounts for 566km² (57%), arable land for 140.7km² (14%), meadows and pastures 108.2km² (11%), and underbrush and karst (limestone areas characteristic of a certain region of the former Yugoslavia) 108.7km² (11%).⁴¹ Mine-affected agricultural and forest areas are a major economic problem. The total loss to agriculture is estimated at €44 million a year (approximately US\$65 million) and Croatian Forest Ltd. assesses the value of wood resources that cannot be used because of mines at €178 million (\$262 million). Additional losses flow from the inability to maintain and renew forests. Croatia has made safety for tourism a priority, but some subsectors continue to be affected, particularly “hunting tourism.” Suspected mined areas account for more than 100km² of national park land or nature reserves.⁴²

Program Management and Coordination

Mine action

CROMAC was established by the Croatian government on 19 February 1998 as the umbrella organization for mine action, responsible directly to the government for coordinating mine action.⁴³ The CROMAC council, appointed by the government, is the governing and advising body for CROMAC. The council consists of a president, appointed by the prime minister, and 10 members, appointed from the concerned ministries. The council meets at least quarterly.⁴⁴

Risk education

CROMAC is responsible for overall coordination, monitoring, and reporting of risk education (RE) activities as mandated by the Law on Humanitarian Demining of 2006.⁴⁵ The National Mine Action Strategy 2009–2011, including RE, awaited adoption by the Croatian Parliament as of September 2009.⁴⁶

⁴⁶ Email from Miljenko Vahtarić, CROMAC, 14 August 2009.

CROMAC holds coordination meetings with representatives of institutions and associations performing RE where they present their plans and reports.⁴⁷ However, stakeholders have identified a need for improved coordination between government organizations and NGOs to facilitate planning, monitoring, and mobilization of resources.⁴⁸

Victim assistance

Since 2006, CROMAC has been responsible for coordinating victim assistance (VA), in cooperation with other government ministries and NGOs.⁴⁹ This role mainly consisted of semi-annual coordination meetings to exchange information, which few stakeholders attended. The CROMAC staff person responsible for VA had limited expertise in VA or disability-related matters.⁵⁰

The Ministry of Foreign Affairs has a Special Advisor for Mine Action who provided updates on VA implementation at international meetings.⁵¹

The Commission for Persons with Disabilities, located in the Ministry of Family, Veteran's Affairs and Intergenerational Solidarity, is the focal point for monitoring implementation of the National Strategy of Equalization of Possibilities for Persons with Disabilities 2007–2015.⁵² An Ombudsperson for Persons with Disabilities was appointed on 9 June 2008, although the office did not start functioning until October 2008.⁵³

Data collection and management

CROMAC plays a leading role in collecting data on contaminated areas and manages the database on suspected mined areas, which includes the results of general and technical surveys.⁵⁴ CROMAC sends updated maps of suspected mined areas to more than 50 local government departments and to organizations that require them. In 2008, CROMAC sent 877 maps of mine-affected counties and towns, 533 mine situation maps in response to specific requests, and 1,808 maps with data on newly identified and released SHAs. CROMAC has also developed maps marking the location of areas affected by cluster munition remnants.⁵⁵

Despite plans to “completely update the CROMAC database, incorporating information from other databases as required by the end of 2006,”⁵⁶ in May 2009 Croatia stated that it still lacked a consolidated disability database and that data spread among “7–8” databases was only partially complete and “only partially useful.”⁵⁷

⁵⁷ Statement of Croatia, Standing Committee on Victim Assistance and Socio-Economic Reintegration, Geneva, 29 May 2009.

In 2008 and 2009, CROMAC was the main entity collecting data on new mine/ERW casualties although its mandate was restricted to those incidents that occurred within the boundaries of suspected mined areas. CROMAC reported that casualty data was collected primarily to define mined areas as well as for VA purposes,⁵⁸ although no further information was provided about these purposes, and a representative from the Ministry of Foreign Affairs and European Integration was unable to identify them.⁵⁹ In March 2009, the lack of a clear definition of a mine casualty was raised as an obstacle preventing the consolidation of casualty data, and plans were made to approve a definition at CROMAC's next VA coordination meeting.⁶⁰

As of May 2009, the Ministry of Health and Social Welfare had information on 343 civilian mine casualties, as part of its efforts to register trauma casualties in the Croatian Trauma Register. It was reported that the information for registered casualties was complete, but that information on past casualties not already in the database was not actively being sought.⁶¹

CMVA recorded casualties in every part of the country, including outside the CROMAC monitoring areas, until it ceased to operate in early 2007. In 2008, Landmine Monitor reported that most of the CMVA data had been lost and that existing data was incomplete.⁶²

In October 2007, the local NGO MineAid requested funding support to undertake a survivor needs assessment as part of a larger VA program, but no funding was provided in 2008.⁶³

Plans

Strategic mine action plan

Croatia has conducted mine action in accordance with a 10-year National Mine Action Strategy approved by Parliament in 2000. CROMAC prepared a new strategy for 2009–2019 as part of Croatia's request for an extension of its Article 5 deadline, which was submitted in June 2008 and approved by the Ninth Meeting of States Parties.⁶⁴

In July 2009, the government approved a three-year plan for 2009–2011 that aims to reduce the SHA by 219.5km² through demining and general survey. Nearly one-quarter of the area will consist of tasks that are safety priorities and more than one-half will be linked to socio-economic development plans. The plan projects that demining costs will amount to about HRK1 billion (\$207 million) and will be financed by the state budget, World Bank loans, public companies, and donations.⁶⁵

CROMAC planned in 2007 to create a new VA strategy, but as of May 2009 had made no progress.⁶⁶ In June 2007, Croatia passed the National Strategy of Equalization of Opportunities for Persons with Disabilities 2007–2015, which coordinates all programs that relate to persons with disabilities, including landmine survivors, and seeks to raise standards to an international level.⁶⁷ In May 2009, Croatia reported that there was a lack of political will to implement the strategy.⁶⁸

Integration of mine action with reconstruction and development

Planning and prioritization of mine action is undertaken at the municipal and county levels, based on maps and data of confirmed and suspected mined areas sent by CROMAC twice a year. Municipalities submit their demining priorities to county authorities who take account of development plans in setting regional demining priorities. From these, CROMAC drafts annual plans for approval by ministries and then by the government. Public companies with projects in suspected mined areas are obliged to include mine action in their budgets.⁶⁹

CROMAC gives priority to tasks that promote public safety, contribute to socio-economic development, as well as “ecological priorities,” notably protection and preservation of forests and natural parks where the presence of mines can prevent effective firefighting. With this system, Croatia has almost completely removed the danger to transport infrastructure and major tourist destinations, as well as removing the threat to housing and areas immediately surrounding communities.⁷⁰

National ownership

Commitment to mine action and victim assistance

Croatia's national budget has been the most important source of financing for its demining. Together with national investors, Croatia provides more than 80% of funds for clearance operations from national sources.⁷¹ Yet the pace of demining has been slower than planned and in 2008 Croatia requested the maximum extension period allowed by the treaty.

⁷¹ Interview with Natasa Matesa-Matekovic, CROMAC, Sisak, 9 February 2009.

VA has been coordinated through CROMAC without international technical or financial support. Most VA services, especially medical care and physical rehabilitation, were carried out using national technical capacity and funds.⁷² However, there was no national educational capacity to train prosthetic technicians to internationally recognized standards.⁷³

National mine action legislation

The Law on Humanitarian Demining was adopted in 2005 and entered into force on 5 January 2006.⁷⁴ It has been amended twice: a 2007 amendment more clearly defined mine action staff roles and responsibilities and a second amendment in 2008 clarified responsibilities for quality control (QC).⁷⁵ According to the law, the Croatian army is responsible for clearance of all military areas.⁷⁶

National mine action standards/Standing operating procedures

Croatia does not have national mine action standards, but under the auspices of its national legislation Croatia has adopted Rules and Regulations on Methods of Demining to guide the demining program.⁷⁷ CROMAC's standing operating procedures (SOPs) are said to be in line with the International Mine Action Standards, and cover: survey and marking of mined areas and/or buildings; project planning; eligibility assessment for demining operators; and quality assurance (QA) and QC of demining.⁷⁸

Demining and Battle Area Clearance

In 2008, 27 commercial companies and one international NGO, Norwegian People's Aid (NPA), carried out demining. These organizations used a total of 617 deminers (46 more than in 2007) and 70 support staff, 50 demining machines, and 44 mine detection dogs (MDDs).⁷⁹ The Croatian army cleared 152,956m² of contaminated land on some of the 82 affected military sites, which include military bases, training and storage sites, radar stations, and an airport.⁸⁰

Throughout 2008, an average of 257 deminers, 13 demining machines, and four MDD teams were involved in demining operations.⁸¹ The cost of demining in 2008 (i.e. clearance and survey) averaged HRK7.78 per m² (\$1.59), without value-added tax. This represented a cost reduction of 8.1% compared with 2007, a result of working on bigger tasks in agricultural areas where demining machines could be used.⁸²

Identification of hazardous areas

CROMAC survey teams continued in 2008 with the project started in 2006 to resurvey the entire suspected mined area in Croatia.⁸³ General survey by CROMAC in 2008 reduced the suspected mined area by 9.4km².⁸⁴ Technical survey in Croatia is not conducted in accordance

with international standards. Demining operators conduct technical survey in a procedure called “mine search.” CROMAC still issues clearance certificates for those tasks.⁸⁵

CROMAC plans to use technical survey to reduce the SHA in protected forest areas such as national parks and nature reserves. These are the areas for which there are no records of minefields or mine emplacement but which were identified as suspect as a result of general survey. CROMAC expects to start in 2010, after amending legislation to make technical survey of these areas possible and after preparing specific SOPs. CROMAC expects technical survey will reduce the total suspected mined area by a further 377km².⁸⁶

CROMAC is responsible for marking and fencing mined areas. Croatia’s Article 5 deadline extension request states that it has marked all SHAs,⁸⁷ making it one of the few countries in the world to have done so. CROMAC reported that as of December 2008, it had placed a total of 14,986 mine signs around SHAs, having added 461 mine signs during the year.⁸⁸

Mine clearance in 2008

In 2008, operators released a total of 33.11km², including 20.88km² that was released by technical survey, up from 12.75km² in 2007, and 12.23km² that was manually demined. In the process they destroyed 1,808 antipersonnel mines, 2,627 antivehicle mines, and 3,617 items of UXO.⁸⁹

Demining in Croatia in 2008⁹⁰

Demining operators	Mine clearance (km2)	Antipersonnel mines destroyed	Antivehicle mines destroyed	UXO destroyed	Area reduced by technical survey (km2)
27 Commercial companies	11.98	1,787	2,617	2,139	20.38
NPA	0.10	18	0	1,263*	0.50
Croatian army	0.15	3	10	215	0
Total	12.23	1,808	2,627	3,617	20.88

* NPA’s UXO clearance results included 25 unexploded submunitions.⁹¹

Quality Assurance/Quality Control

Under the 2006 Law on Humanitarian Demining (as amended), CROMAC was obliged from 5 January 2008 to ensure the presence of a demining monitor at all worksites on a daily basis. CROMAC had a problem allocating sufficient staff, but eventually managed to organize daily visits by the monitor, and weekly visits by the QA inspector to every open task.⁹²

⁸⁵ See *Landmine Monitor Report 2008*, p. 305; and telephone interview with Natasa Matesa-Matekovic and Miljenko Vahtarić, CROMAC, 6 August 2008.

⁹⁰ Email from Natasa Matesa-Matekovic, CROMAC, 18 February 2009. Results reported by NPA differ from those reported by CROMAC. NPA reported to Landmine Monitor that during 2008 it released 101,835m² of suspected mined areas through mine and battle area clearance and a further 531,754m² through technical survey. Email from Vanja Sikirica, Deputy Program Manager, NPA, 22 May 2009; and email from Kristina Ikić Baniček, Advisor for International Cooperation and Donations, CROMAC, 24 August 2009.

⁹¹ Email from Vanja Sikirica, NPA, 22 May 2009.

⁹² Interview with Zeljko Piscenec, Deputy Manager for Quality Control, CROMAC, Sisak, 29 February 2008; and interview with Natasa Matesa-Matekovic, CROMAC, Sisak, 9 February 2009.

Quality assurance of demining operations in 2008 was conducted by 12 QC officers, who checked 338 completed tasks, and by 23 QA monitors, who made 3,778 sample checks on 587,939m² during 918 QA visits.⁹³

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Croatia was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. On 2 June 2008, however, Croatia submitted a request for a 10-year extension.⁹⁴

The request estimated that at the beginning of the extension period, in March 2009, Croatia would have 944km² of suspect land, meaning that it would reduce its total SHA through clearance and technical survey by 53km² in 2008.⁹⁵ Croatia missed the target by 10.5km² as CROMAC and operators released a total of 42.5km² in 2008 and bringing the total SHA area down to 954.5km².⁹⁶

The request projects that Croatia will release 410km² of land through clearance and the rest through general (210km²) and technical (377km²) survey. This calls for clearance that peaks at 56km² in 2010, and will average 41km² a year for the coming decade, levels well in excess of anything achieved so far.⁹⁷

The request also foresees a substantial rise in mine action demands on national financial resources. Croatia projects total costs for completion at €740 million (\$1 billion), of which €490 million (\$722 million) or 66% of the total is to come from the state budget.⁹⁸ The request envisaged a rise in the state's annual contribution from €22.5 million in 2008 to an amount variously reported as €33 million and €53 million in 2010.⁹⁹

The Ninth Meeting of States Parties approved the request but the Analyzing Group noted that, while the plan presented is workable and ambitious, its success was contingent on Croatia doubling its average annual financial contribution to demining and on the development of a methodology to address forested areas suspected to contain mines. The Analyzing Group considered the plans contained in the request to be comprehensive and complete, but said additional clarity could result from defining some key terms, using them consistently, and incorporating (into the goals for the extension period) clearance of the 3.24km² around military barracks¹⁰⁰, training grounds, technical warehouses, radar stations, and airfields.¹⁰¹ An ICBL critique of the application noted Croatia in the past has set realistic targets and largely achieved them but found the extension request "optimistic."¹⁰²

⁹⁷ See *Landmine Monitor Report 2008*, p. 306; and Article 5 deadline Extension Request, 2 June 2008, pp. 35–36.

⁹⁸ Article 5 deadline Extension Request, 2 June 2008, pp. 7, 37. However, the request also presents figures (Table 5, p. 53) which project total costs at €683 million and the contribution from the state budget at €458 million.

⁹⁹ See *Landmine Monitor Report 2008*, p. 306; and Article 5 deadline Extension Request, 2 June 2008, pp. 7, 33, 53.

¹⁰⁰ This is the area requiring clearance at the time the Extension Request was drafted. Clearance operations in 2007 and 2008 reduced it to 2.81km².

¹⁰¹ Analysis of Croatia's Article 5 deadline Extension Request, submitted by the President of the Eighth Meeting of States Parties on behalf of the States Parties mandated to analyze requests for extensions, 22 October 2008, p. 4.

¹⁰² See *Landmine Monitor Report 2008*, p. 306; and ICBL, "ICBL Critique on Croatia Extension Request," June 2008.

Demining from 1999–2008¹⁰³

Year	Mine clearance (km ²)*	Area released by survey (km ²)*
2008	12.23	30.27
2007	27.12	19.9
2006	24.77	78
2005	27.18	0
2004	33.68	142.3
2003	31.83	252.2
2002	30.85	29.6
2001	12.69	28.7
2000	9.81	23.2
1999	14.33	9.3
Total	224.49	613.47

**Figures prior to 2008 are taken from Croatia's Article 5 deadline Extension Request and differ significantly from figures previously provided to Landmine Monitor.¹⁰⁴*

Demining operations in the last 10 years resulted in the destruction of 46,430 mines, including 26,570 antipersonnel mines and 19,860 antivehicle mines, as well as 202,166 ERW. In addition, the Croatian army destroyed 1,826 antipersonnel mines, 2,473 antivehicle mines, and 44,406 ERW in areas around military barracks, training grounds, and facilities.¹⁰⁵

Risk Education

In 2008, RE was mainly conducted by the Croatian Red Cross (CRC), but also by NGOs, theater groups, the police, and CROMAC.

Information on mine casualties and previous RE activities is used to prioritize RE activities and to ensure even coverage.¹⁰⁶

A joint initiative by the Croatian Ministry of Internal Affairs and UNDP called “Less weapons-fewer tragedies,” which combined gathering “war materials” from homes and delivering RE messages through lectures and the media, was reported to have achieved good results.¹⁰⁷

In August 2008, CROMAC piloted a unique web-based system called the Mine-Information System portal (MISportal), that provides information on suspected mined areas and detailed maps showing the location of mine warning signs. This enables CROMAC to provide updated information and distribute searchable maps widely to the general public.¹⁰⁸ Information from MISportal is available to all Internet users and mine-suspected areas can be searched by county,

municipality, town, or community.¹⁰⁹ It is intended that this would be used to inform people planning tourism.¹¹⁰ The site has received a high number of hits, particularly during the tourist season.¹¹¹

Risk Education Activities in 2008¹¹²

Organization	Type of activity	Geographical area	No. of beneficiaries
CRC	Lectures, public events and school-based RE to high risk groups (forest workers, hunters, fishermen, and returnees); 12 safe-play areas in Darla, Solin, and Vinkovci; RE provided along side other community events	12 counties: Brod-Posavina, Dubrovnik-Neretva, Karlovac, Lika-Senj, Osijek-Baranja, Pozega-Slavonija, Split-Dalmacija, Sisak-Moslavina, Šibenik-Knin, Virovitica-Podravina, Vukovar-Srijem, and Zadar; 49 municipal areas	42 instructors; 688 lectures for 8,775 attendants (1,052 men, 747 women, and 6,976 children)
Association of Civil Victims of Homeland War, CRC, CROMAC, and County Police Administration anti-explosive units	Six "Children in a mine environment" lectures in elementary schools	Osijek-Baranja, Sisak-Moslavina, and Vukovar-Srijem	1,000 estimated
CROMAC with police, and the Association of Civil Victims of Homeland War	Lectures in elementary schools, distribution of books, plays, and display of panel "Children in a mine environment"	Osijek-Baranja, Karlovac, and Zadar	Unknown
Theater Bembo, Theatre Daska, Scena MM Puppet Theatre, and Pinokio Theater	"Bembo and Friends" project: July 2007–July 2008; six short films, 10,000 picture books, and DVD to elementary schools; 22 theater shows		4,700 audience for the theater shows
Center for Neohumanist Studies	Distribution of books		Unknown

Mine awareness activities were regularly promoted and broadcast through the media.¹¹³ A new poster was designed, and 2,000 copies were printed and distributed through the CRC. A total of 10,000 "Beware of mines!" picture books were distributed to elementary school students by the Centre for Neohumanist Studies from Karlovac.¹¹⁴

¹¹⁴ Ibid.

The main RE provider over the last 10 years has been the CRC with ICRC support.¹¹⁵ The Ministry of Education also provided RE with UNICEF support until 2000, when it was integrated into the school curriculum, although it was not implemented systematically.¹¹⁶ RE has had strong input from local communities, and, by 2006, more than 15 national NGOs, associations and theaters were involved, and four state institutions.¹¹⁷ By 2003, CROMAC was responsible for coordinating RE.¹¹⁸ Since 1999, RE has been conducted in all affected counties through training of instructors, presentations, plays, in schools and through mass media and the distribution of materials.¹¹⁹ By 2007, 54 safe-play areas had been built.¹²⁰ From 2006, however, activities had reduced significantly due to decreased donor support.¹²¹

RE initially focused on children, but by 2003 adults were increasingly targeted as the highest casualty group before swinging back to children by 2007, when they were again the largest number of beneficiaries. Adult target groups included male workers, particularly railway and forestry workers, hunters, farmers, and returning refugees and IDPs.¹²²

The CRC reported that traditional presentations were of limited value, and that it was difficult to change behavior.¹²³ RE activities were combined with efforts to raise funds for demining.¹²⁴ RE was also combined with marking during the general survey.¹²⁵ Although CROMAC stated that RE should be integrated with clearance operations, NPA was the only organization to do this, through its community liaison activities¹²⁶. In 2007, the continued decrease in mine casualties annually since 2005 was attributed in part to sustained RE efforts, although there was no evaluation to confirm this¹²⁷.

Victim Assistance

The total number of survivors is unknown, but is at least 1,421.¹²⁸ In 2008, Croatia stated that survivors were “entitled to health care and orthopedic prosthesis” up to the amount covered by the Croatian Institute for Health Insurance but psychosocial rehabilitation programs and employment opportunities were limited.¹²⁹

By law, healthcare for survivors (as for all Croatian citizens) was free through the country’s well-developed healthcare system¹³⁰. But quality and coverage varied around the country with less access in rural areas and reports of corruption.¹³¹ There was a need to strengthen health

workforce monitoring and management, improve emergency response, and reform health financing to reduce chronic deficits.¹³² A 2008 study by Health Consumer Powerhouse found Croatia's healthcare system to be "among the worst in Europe," although the study lacked information for several indicators.¹³³ Aside from the development of SOPs in 2007 for the evacuation of clearance casualties, as of May 2009 no progress had been made in providing emergency response training to doctors or increasing the number of emergency response medical teams.¹³⁴

The Institute for Rehabilitation and Orthopedic Devices and specialized hospitals provide physical rehabilitation services, which by law are free to survivors.¹³⁵ In May 2009, Croatia reported that bureaucratic obstacles to services had been reduced, but were not fully removed. Survivors' ability to access services thus depended on "where one goes for rehabilitation, connections and sheer luck."¹³⁶ As with healthcare generally, quality and access of rehabilitation remained inconsistent, with fewer services available in rural areas.¹³⁷ Croatia lacked the capacity to train prosthetic technicians to internationally recognized standards, although plans were underway to open a government-hosted prosthetics and orthotics school that would seek certification from the International Society for Prosthetics and Orthotics by 2011.¹³⁸

The Ministry of Family, Veterans Affairs and Intergenerational Solidarity operates psychosocial counseling centers that survivors can access in every county.¹³⁹ The government acknowledged, however, that there were "problems detected in the programs of psycho-social rehabilitation of victims."¹⁴⁰ Few survivors visited centers, because they were not aware they existed and there were stigmas associated with visiting a mental health center.¹⁴¹ No progress was announced on the national strategy on mental health for vulnerable groups, including landmine survivors, which was proposed in 2007. The CMVA, prior to its closure in 2007, was the main psychosocial support network for mine/ERW survivors.¹⁴²

While Croatia stated that, in 2008, "various projects of financial assistance and education were enforced with the aim to help mine victims,"¹⁴³ it also recognized that there were "problems" in employment for survivors.¹⁴⁴ In 2008, a separate department for persons with disabilities was established within the national employment agency, but just 22% of registered persons with disabilities found employment, a slight decrease from previous years. There was a lack of progress in employing persons with disabilities outside Zagreb.¹⁴⁵ Despite special training for employment agency staff members in 2007, Croatia stated that these staff members lacked

training to properly match survivors with jobs, causing some survivors to lose their jobs after government incentives ended.¹⁴⁶

Registered mine/ERW survivors are entitled to a pension according to their level of disability. In some cases, however, this disability status must be verified annually, a serious challenge to survivors for whom travel is difficult.¹⁴⁷ Mine/ERW survivors with a “100% physical impairment” are entitled to a disability pension, a monthly orthopedic allowance, and a pension for a person who cares for the survivor which averaged HRK8,714 (\$1,776) a month in 2008. A family disability allowance of 2,694 HRK (\$549) a month is provided to survivors’ family members following fatal mine/ERW incidents, although just 74 people were collecting this allowance. Children of people killed in mine/ERW incidents, of landmine/ERW survivors with 100% physical impairment, and child survivors with 100% physical impairment receive affirmative action when applying to educational institutions, student housing, and for scholarships, and are entitled to a grant while enrolled in primary and secondary school.¹⁴⁸

Croatia has a highly-developed legal framework related to persons with disabilities, including survivors, with some 200 different laws designed to promote their rights and prevent discrimination.¹⁴⁹ Because of a lack of implementation,¹⁵⁰ however, discrimination occurred and access to public facilities remained limited.¹⁵¹ Croatia ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol on 15 August 2007.

Progress in meeting VA26 victim assistance objectives

As one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate attention to survivors,¹⁵² Croatia presented its 2005–2009 VA objectives at the Sixth Meeting of States Parties in 2005 and presented revised objectives in April 2007.¹⁵³ In May 2009, Croatia acknowledged that there had been little progress towards achieving its VA objectives, blaming a lack of political will,¹⁵⁴ a sentiment echoed by the leader of a VA organization, who stated that, by the end of 2008, there had been “no fulfilment of Croatia’s 17 objectives.”¹⁵⁵

Some limited progress has been seen towards three of the 17 objectives, although none was noted in 2008: develop a strategy for better and stronger cooperation between all interested parties in mine victim assistance by mid-2007; develop SOPs, by 2008, for the evacuation of mine casualties from mined areas; and fully implement the National Strategy of Unique Policy for the Disabled 2003–2006, and develop a new strategy for the period after. Lack of progress in establishing a comprehensive database made it impossible to determine whether or not specific

targets had been reached in providing psychosocial support, vocational training, and income-generation opportunities.¹⁵⁶

Croatia included a disability expert on its delegation to the Meeting of States Parties in 2007 and included a mine survivor in its delegation to the intersessional Standing Committee meetings from 2006–2007 and meetings of States Parties from 2005–2008. It reported on progress in achieving VA aims at intersessional meetings in 2005 and 2006 and meetings of States Parties from 2005–2007. Croatia used the voluntary Form J attachment in every Article 7 report since 2005 to provide details on VA activities.

Victim assistance activities

In 2008, MineAid implemented two projects to improve access to education for more than 27 landmine survivors and their children.¹⁵⁷ A regional psychosocial support and rehabilitation center for survivors in Rovinj, originally planned to open by mid-2006, was not yet operational by May 2009. The center, previously referred to as the Duga Center, had been renamed to Model of Active Rehabilitation and Education, and planned to expand its target population to include a broader category of traumatized and vulnerable population, along with mine/ERW survivors.¹⁵⁸ No other survivor-specific activities were identified.

Support for Mine Action

Croatia's Article 5 deadline extension request includes a cost estimate for completion of mine clearance between 2009–2018 totaling €740 million (\$1 billion) but it identified sources of funding for only €715 million. Of the total required, the state budget is projected to cover €490 million or 66%, with national investors covering 18%, European Union funds covering approximately 5%, and national and other donors and financial institutions (including the World Bank) covering the remaining 7%.¹⁵⁹

National support for mine action

In its Article 7 report for 2008, Croatia reported that the state budget accounted for 56% of overall mine action funding in 2008, compared to 56.5% in 2007.¹⁶⁰ As reported by CROMAC, however, total annual funding for 2008 was HRK320,137,524 (\$65,276,041/€44,327,069), of which HRK158,086,839 (\$32,233,906) was provided from the state budget, with state administered bodies such as forestry, highway, utility and water authorities covering a further HRK64,230,612 (\$13,096,622). National sources of funding thus totaled HRK222,317,451 (\$45,330,528), or 70% of overall funding.¹⁶¹ National funding from the state budget and legal entities totaled \$45,655,863 in 2007.¹⁶²

The 2009 mine action plan reported that funds totaling HRK289,666,001 (\$59,062,898) had been allocated from the Croatian state budget for mine action in 2009. National funds included loans of HRK42,100,000 (\$8,604,580) taken by Croatia to support socio-economic recovery of mine-affected areas. Funds were allocated to management and administration, clearance, medical services, salaries, training and equipment, facilities, and socio-economic recovery.¹⁶³

¹⁵⁶ Statement of Croatia, Standing Committee on Victim Assistance and Socio-Economic Reintegration, Geneva, 29 May 2009; and statement by Marija Breber, MineAid, "Minutes from the 19 March 2009 MRE/VA coordination meeting," provided by email from Natasa Matesa-Matekovic, CROMAC, 18 February 2009.

¹⁵⁸ Interview with Dijana Pleština, Zagreb, 25 April 2009.

¹⁵⁹ Article 5 deadline Extension Request, 2 June 2008, p. 37. The request also presents figures (Table 5, p. 53) which project total costs at €683 million and the contribution from the state budget at €458 million.

¹⁶⁰ Article 7 Reports, Form C, 10 April 2009; and Form C, 30 April 2008.

¹⁶¹ CROMAC, "The Report on Implementation of Humanitarian Demining Plan and Spent Financial Means Allocated for 2008: Summary," Sisak, 30 March 2009, p. 4.

¹⁶² CROMAC, "26th Session of the Council of the Croatian Mine Action Centre Held in Sisak," 22 February 2008, www.hcr.hr.

¹⁶³ CROMAC, "Humanitarian Demining Plan 2009: Summary," Sisak, 29 April 2008, p. 3.

According to the 2009 plan, HRK318,157,000 (\$64,872,212) was secured for mine clearance operations in 2009, of which the state budget accounted for 55.3% (HRK175,977,000/\$35,881,710), compared to 50.1% in 2008. State administrative bodies accounted for 17.7% of funds, donations for 13.7%, and loans for 13.2%.¹⁶⁴

International cooperation and assistance

In 2008, seven countries reported providing \$6,574,631 (€4,464,641) to mine action in Croatia, approximately 11% more than international funding reported in 2007. CROMAC reported international donations in 2008 totaling HRK51,910,070 (\$10,584,463) against a projection of HRK63,800,000 (\$13,008,820). Thus, in US dollar terms, donations were roughly 19% less than projected.¹⁶⁵ In May 2009, Croatia reported that “in order to fulfill the plan to remove the mine threat” by 2019, it was necessary for Croatia to access more funding via EU pre-accession and structural funding mechanisms.¹⁶⁶

2008 International Mine Action Funding to Croatia: Monetary¹⁶⁷

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Norway	NPA	Integrated mine action	\$2,490,519 (NOK 14,039,000)
United States	ITF	Mine clearance, survey, RE, VA	\$2,027,496
Germany	Arbeiter Samriter Bund	Mine clearance	\$1,178,080 (€800,000)
Japan	CROMAC	Mine clearance	\$517,749 (¥53,376,202)
Czech Republic	ITF	Mine clearance	\$147,260 (€100,000)
Luxembourg	Unspecified	Mine clearance	\$108,972 (€74,000)
Slovenia	ITF	Unspecified mine action	\$104,555 (€71,000)
Total			\$6,574,631 (€4,464,641)

In 2008, the International Trust Fund for Demining and Mine Victim Assistance (ITF) allocated \$5,627,109 (18%) of its funds to Croatia.¹⁶⁸ In 2007, the ITF allocated \$3,189,527 (13.81%) of its funds to Croatia.¹⁶⁹

In February 2009, Croatia signed a cooperative agreement with Yemen, under which Croatia will provide equipment to support clearance operations in Yemen, and the two countries will exchange technical expertise in areas related to treaty implementation. The types of equipment and value of in-kind support were not reported.¹⁷⁰

CYPRUS

2008 Key Data

State Party since	1 July 2003
Contamination	Antipersonnel and antivehicle mines, UXO
Estimated area of contamination	Up to 5km ² (November 2008 UN estimate)
Casualties in 2008	Six (2007: 0)
Estimated mine/ERW survivors	Unknown but at least seven
Article 5 (clearance of mined areas)	1 July 2013
Demining in 2008	Twenty SHAs in buffer zone; two National Guard minefields in government-controlled areas; no demining in Turkish-controlled areas
Risk education recipients in 2008	1,645
Support for mine action in 2008	International: None (2007: \$485,000) National: \$147,260 (2007: Not reported)

Ten-Year Summary

The Republic of Cyprus became a State Party to the Mine Ban Treaty on 1 July 2003. It completed destruction of its stockpiled antipersonnel mines on its deadline of 1 July 2007. It retained 1,000 mines for training and research purposes but has yet to consume any of them. Cyprus has stated that domestic implementation of the treaty is achieved through the ratification legislation and other law non-specific to antipersonnel mines.

Cyprus has made steady progress in clearing mined areas since becoming a State Party to the Mine Ban Treaty. The UN has continued to conduct clearance of contamination in the buffer zone between the government-controlled areas and territory controlled by Turkish Forces, although funding shortfalls in early 2009 have restricted progress. There has been no evidence of clearance on territory controlled by Turkish Forces.

From 1999 to 2009, Landmine Monitor identified at least eight landmine casualties (one killed and seven injured) in Cyprus. Risk education has been provided to civilians since 2006. Mine/explosive remnants of war (ERW) survivors, including non-Cypriot nationals, receive adequate assistance.

Mine Ban Policy

Cyprus signed the Mine Ban Treaty on 4 December 1997 and ratified it on 17 January 2003, becoming a State Party on 1 July 2003. Cyprus states that domestic implementation of the treaty is achieved through the legislation adopted for ratification.¹ In addition, the “Law Concerning Explosive Materials of 2005” makes it a crime to use, produce, stockpile, or transfer any explosive material without the necessary authority.² The National Committee for the Implementation of the Ottawa Convention and the Cyprus Mine Action Centre (CYMAC) are responsible for implementation of treaty obligations.

¹ “Law Ratifying the Convention on the Prohibition of the Use, Stockpiling, Production and Transfer of Anti-Personnel Mines and on Their Destruction,” Law No. 37 (III), 2002.

² “Law Concerning Explosive Materials of 2005,” Law No. 19 (I) 2005, Article 4. The law includes penal sanctions.

Cyprus attended the Ninth Meeting of States Parties in November 2008 and the intersessional Standing Committee meetings in Geneva in May 2009, making statements on mine clearance at both meetings.

Cyprus submitted its updated annual Article 7 report covering calendar year 2008. It had previously submitted five Article 7 reports.³

With respect to matters of interpretation and implementation related to Articles 1, 2, and 3 of the Mine Ban Treaty, Cyprus has stated its view that the treaty prohibits foreign stockpiling and transshipment of antipersonnel mines, and, in the case of Article 1(c) of the treaty, “prohibits common military exercises of states parties to the Convention with the armed forces of states that have not ratified the Convention.”⁴

Cyprus is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. As of July 2009, it had not yet submitted its national annual report for 2007 or 2008 in accordance with Article 13. Cyprus is not yet party to CCW Protocol V on Explosive Remnants of War.

As of 1 July 2009, Cyprus had not signed the Convention on Cluster Munitions.

Production, stockpiling, and retention

Cyprus maintains that it has never produced or exported antipersonnel mines.⁵ In its initial Article 7 report, Cyprus declared a total of 48,475 stockpiled antipersonnel mines before the destruction program started in December 2003.⁶ Cyprus completed stockpile destruction on its treaty-mandated deadline of 1 July 2007.⁷

Cyprus retained 1,000 antipersonnel mines for training and development purposes under Article 3 of the treaty.⁸ This number has not changed since 2003, indicating that none of the mines are being consumed in training activities. An official from the Ministry of Foreign Affairs told Landmine Monitor in April 2009 that a limited number of these mines would be consumed during training in May 2009.⁹ Previously, in June 2008, officials told Landmine Monitor that Cyprus has no plans to destroy any of its retained mines.¹⁰ Cyprus has yet to provide details of the intended purposes and actual uses of its retained mines. Cyprus has not used the expanded Form D on retained mines agreed by States Parties in December 2005.

³ Previous reports were submitted for calendar year 2007, in April 2007, 28 April 2006, 24 April 2005, for the period 1 July–31 December 2003, and on 28 September 2005 (non-standard form).

⁴ Fax PD-MA/24.11.12.142 from Panayiotis Papadopoulos, Counselor, on behalf of the Permanent Secretary, Ministry of Foreign Affairs, 8 May 2006. For additional details, see *Landmine Monitor Report 2006*, p. 374.

⁵ The United States government identified Cyprus as a past producer, but Cyprus denied it. See *Landmine Monitor Report 1999*, p. 704.

⁶ Article 7 Report (for the period 1 July–31 December 2003), Form B. Cyprus has at times reported other numbers, but officials have stated this is the correct total. See *Landmine Monitor Report 2006*, pp. 374–375 for details. The stockpile initially declared consisted of eight types or variants of mines from China, Singapore, Taiwan, and the US: M2A1 (474), M2A3 (179), M16 (4,086), M16A1 (16,440), M16A2 (20,146), M16E3 (278), VS-50 (4,450), and GLD-112 (2,422).

⁷ Article 7 Report (for calendar year 2007), Form G. The destroyed mines were M2A1/A4, M16A1/A2, M16E3, VS-50, and GLD-112. The report does not provide the number of each type.

⁸ Article 7 Report, (for calendar year 2008) Form D. The form states “Unchanged from last reporting.” The mines are stored at the National Guard warehouse at Palodia village near Limassol and are used by CYMAC. The total retained is made up of 100 each of types M2A1, M2A3, M16A1, and M16A2, as well as 200 each of M16, VS-50, and GLD-112 types. While the 1,000 figure has remained the same since 2003, Cyprus changed the composition in the 2006 report to 200 M16 mines and zero M16E3 instead of 100 M16 and 100 M16E3.

⁹ Email from Panayiotis Papadopoulos, Ministry of Foreign Affairs, 30 April 2009.

¹⁰ Interview with delegation of Cyprus, intersessional Standing Committee meetings, Geneva, 5 June 2008. The delegation also noted Cyprus can retrieve mines from its minefields and use these for training purposes.

Scope of the Problem

Contamination

Cyprus is contaminated by antipersonnel and antivehicle mines and ERW. The island has been divided geographically and politically by a heavily mined, 180km-long buffer zone since 1974 when Turkish Armed Forces took control of the north. Minefields were laid within and outside the buffer zone by both the Greek Cypriot National Guard and Turkish Armed Forces. The UN has estimated that up to 5km² of land on the island may be contaminated with mines and UXO.¹¹

By early 2009, 10 mined areas containing 3,224 antipersonnel mines remained to be cleared outside the buffer zone in territory controlled by the Republic of Cyprus:¹² confirmed minefields remained in or around the villages of Dali, Geri, Potamia, and Trouloi.¹³ As of May 2009, a military firing range near Paphos was close to being completely cleared. According to the Ministry of Foreign Affairs, there are no other areas affected with ERW in the territories under the effective control of the Republic of Cyprus.¹⁴ A further 18 suspected hazardous areas (SHAs) remained to be cleared within the buffer zone.¹⁵ The extent of contamination in areas controlled by the Turkish Armed Forces was not known.

Casualties

In 2008, Landmine Monitor identified at least six new landmine casualties (all injured) in four incidents.¹⁶ Four casualties were civilians and two were deminers. On 28 March 2008, a Mozambican demining team leader was injured by an antipersonnel mine in the buffer zone.¹⁷ On 5 December 2008, three members of the same Iraqi family (one man, one woman, and one child) were injured by an antipersonnel mine in the buffer zone while seeking asylum.¹⁸ On 20 December 2008, in a similar incident another Iraqi man was injured by an antipersonnel mine in the buffer zone while seeking asylum.¹⁹ On 10 December 2008, a deminer was injured by an antipersonnel mine during clearance activities.²⁰ Prior to 2008, the last identified mine casualty in Cyprus occurred in 2003.²¹ No new landmine casualties were reported in 2009, as of 31 May.²²

The total number of mine casualties in Cyprus is not known. From 1999 to 2008, Landmine Monitor identified at least eight mine casualties (one killed and seven injured).²³ Five casualties were civilians (three men, one woman, and one child) and the remaining three casualties were deminers. Among the civilian casualties, four were Iraqi immigrants trying to cross the North-

²³ See *Landmine Monitor Report 2004*, p. 383; and *Landmine Monitor Report 2000*, p. 765.

South border illegally and one was a farmer. Antipersonnel mines caused six casualties and antivehicle mines caused two casualties. In addition, in August 2003, a Cypriot refugee from the Turkish-occupied north committed suicide by walking into a clearly signposted minefield.²⁴

Before 1999, at least four casualties were identified: three peacekeepers of the UN Force in Cyprus (UNFICYP) were killed by mines between 1974 and 1998, and a 37-year-old man was killed by a mine when he followed his dog into a minefield in the buffer zone in 1997.²⁵

Risk profile

In 2008, the increase in casualty numbers was a result of asylum seekers trying to cross the North-South border illegally. People living along the buffer zone, particularly farmers, are also believed to be at risk.

Socio-economic impact

The impact of contamination across the island appears to be primarily a blockage to agricultural activities.²⁶ Farmers are said to be using the land adjacent to the mined areas and in most cases have cultivated land to within two meters of minefield perimeter fences.²⁷ Demining in the buffer zone is said, however, to have a significant economic impact: by enabling the opening of new crossing points, clearance has facilitated increased trade and population movement.²⁸

Program Management and Coordination

Mine action

An interministerial National Committee, established in May 2003, serves nominally as the National Mine Action Authority for Cyprus, but since adopting a National Plan for the Implementation of the Ottawa Convention (see below) it has not met.²⁹ Cyprus has two mine action centers. The Cyprus Mine Action Centre (CYMAC), under the command of the Engineers Corps Command of the National Guard, is responsible for implementation of the Mine Ban Treaty and CCW Amended Protocol II. The UN Mine Action Centre in Cyprus (MAC-C), established in 2004, supports coordination between UNFICYP, the Republic of Cyprus, Turkish Armed Forces, and the European Union. MAC-C is responsible for supervising demining operations in the buffer zone.³⁰

Victim assistance

The situation in Cyprus does not warrant specific victim assistance (VA) programs. There is no legislation concerning the coverage for mine incidents, but survivors and families of casualties receive assistance through the Ministry of Defence and the Ministry of Labour and Social Insurance.³¹ Cyprus included information on VA activities in voluntary Form J to its Article 7 report only once.³²

Disability issues fall under the responsibility of the Ministry of Labour and Social Insurance.³³ The Pancyprrian Council for Persons with Disabilities, chaired by the Ministry of Labour and Social Insurance, monitors disability issues and allows persons with disabilities to contribute

²⁴ See *Landmine Monitor Report 2004*, p. 383. As this was a suicide, it does not fit within the Landmine Monitor definition of a mine/ERW casualty, and was thus not counted in the 1999–2008 total.

³³ Ministry of Labour and Social Insurance, “Social Welfare Services,” www.mlsi.gov.cy.

to public policy. Government representatives, organizations of persons with disabilities, employers, and employee organizations participate in the Council.³⁴

Data collection and management

MAC-C uses the Information Management System for Mine Action (IMSMA) for operations in the buffer zone, and makes data available on request. The latest version of IMSMA was installed in 2006 but, due to technical problems relating to the migration of data, has not become fully operational.³⁵ MAC-C has reported that recent casualty data is inserted into the IMSMA database.³⁶ In 2009, the Ministry of Foreign Affairs reported that data is collected by the National Guard and police forces, and that data collection has become faster and more efficient.³⁷

Plans

Strategic mine action plan

Cyprus's strategic plan for fulfillment of its Article 5 obligations remains based on the National Plan, which was first issued in September 2004. The plan included an annual timetable for the clearance of the 18 minefields in Cyprus-controlled areas. No plan for clearance of areas controlled by Turkish Armed Forces has been made public. Clearance of the 18 remaining SHAs in the buffer zone was planned to be completed by 2011, although funding constraints in early 2009 had temporarily threatened that deadline.³⁸ UNFICYP was seeking access to 12 SHAs from the relevant parties; access to six had already been granted. For 2009, MAC-C planned to clear four large minefields containing a substantial number of mines.³⁹

Integration of mine action with reconstruction and development

There is no evidence that Cyprus has formally integrated mine action into development efforts.

National ownership

Commitment to mine action and victim assistance

Cyprus has made steady progress in removing emplaced antipersonnel mines from mined areas. According to the UN, the major constraint to demining operations is the country's sensitive political climate. Mine clearance operations face delays and changing priorities due to political considerations.⁴⁰

National management

Cyprus has conducted and managed demining of its National Guard minefields outside the buffer zone and in territory under its control. All demining inside the buffer zone has been coordinated and implemented by the UN.

National mine action legislation and standards/Standing operating procedures

No national mine action legislation has been adopted in Cyprus. National Guard operations are only to remove antipersonnel mines—antivehicle mines are left in the areas cleared. Demining in the buffer zone is said to be carried out according to the International Mine Action Standards, which were developed into safety guidelines by the UN, creating a basis for standing operating procedures for contractors.⁴¹

Demining and Battle Area Clearance

The Engineers Corps Command of the National Guard is tasked with clearing emplaced minefields in government-controlled areas.⁴² In the buffer zone, MAC-C manages demining with two demining operators: ArmorGroup Services carries out clearance and Mines Advisory Group carries out quality management. Mine detection dogs are no longer used in the buffer zone and MAC-C had planned to hire a mini-flail for a short period in late 2008 to speed up clearance but this did not happen.⁴³

Within the buffer zone, 20 minefields were cleared in 2008, with the destruction of 5,090 antipersonnel mines, 2,497 antivehicle mines, and five ERW.⁴⁴ The National Guard cleared two minefields of antipersonnel mines only, with the destruction of 392 mines.⁴⁵ In addition, clearance of a military firing range in the vicinity of Paphos was due to be completed by the end of May 2009. Clearance activities as of 22 May 2009 had led to the destruction of 16 items of UXO. The land that was cleared as of that date amounted to 64,564m², with 5,850m² remaining to be cleared. No decision had been taken on the future ownership or use of the land.⁴⁶

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Cyprus is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 July 2013. The clearance of National Guard minefields in areas controlled by Cyprus outside the buffer zone began in 2005 with a demining team from the National Guard.

Demining of minefields within the buffer zone started in November 2004, and by late 2008 demining operations had released more than 6km², with the destruction of more than 9,000 landmines.⁴⁷ Clearance of the buffer zone was due to be completed by 2011, although funding constraints in early 2009 had temporarily called into question that deadline.

There has been no progress in clearance of mined areas under the control of the Turkish Armed Forces. This involves the legal responsibility of Turkey under the Mine Ban Treaty as a State Party to the Mine Ban Treaty. However, should Turkey fail to fulfill its legal obligations, in accordance with Article 5 of the treaty, Cyprus will be obliged to seek an extension to its deadline by virtue of its assertion of jurisdiction over the areas occupied by the Turkish Armed Forces.⁴⁸ This is not the understanding of Cyprus “simply because the Ottawa Convention

makes the occupying power solely responsible for mine clearance in the occupied part of the Republic, Ankara's disagreements notwithstanding.⁴⁹

Risk Education

In 2008, risk education (RE) activities increased, reaching some 1,645 civilians working in the buffer zone, particularly farmers.⁵⁰ The number of mine incidents also increased.

The UN Police in Cyprus (UNPOL) continued providing mine/ERW risk education to 1,145 farmers working in the buffer zone (500 in 2007).⁵¹ RE briefings were organized in coffee shops.⁵² Farmers in Cyprus must receive RE each year as a condition for renewing their farming licenses.⁵³ UNPOL staff continued to be trained by MAC-C.⁵⁴ The National Guard Demining Unit (Engineer Corps Command) carried out four RE seminars for some 500 people, including local families, farmers, and workers in the buffer zone.⁵⁵ MAC-C also provided safety briefings for some 1,600 UNFICYP personnel.⁵⁶ Cyprus reported that "All National Guard minefields under the Republic of Cyprus jurisdiction and control are fenced, marked with warning signs and monitored by troops in full compliance with the Convention."⁵⁷

It is unknown whether, in 2008, Turkish forces organized RE. Cyprus' Ministry of Foreign Affairs has reported that "the government of the Republic does not conduct risk education within occupied areas."⁵⁸

Cyprus' national mine action plan does not include RE⁵⁹ but UNPOL has been providing RE to civilians, with no interruption, since 2006.⁶⁰ Previously, a UN Mine Action Service mission saw no need for RE as the mine threat to the civilian population in Cyprus is minimal.⁶¹ In its Article 7 reports for 2007 and 2008, Cyprus noted in Form I that the situation remained "Unchanged from last reporting."⁶² In the previous Article 7 report for 2006, it did not report RE activities, but stated that mined areas are fenced and marked.⁶³

Victim Assistance

The total number of survivors is unknown, but is at least seven. The health sector in Cyprus has adequate means to treat new mine casualties,⁶⁴ and survivors receive free medical assistance, rehabilitation, *ex gratia* monetary compensation, and a monthly disability allowance.⁶⁵

Civilian survivors and families are entitled to free medical services at government hospitals and institutions, as well as to compensation and allowances. Military personnel dealing with demining activities receive the same benefits but, in case of fatal accident, the relatives are

eligible for a compensation payment. In addition, the Ministry of Defence or the Ministry of Finance can recommend *ex gratia* allowances for mine survivors and families of mine casualties, subject to approval by the Council of Ministers.⁶⁶

Non-Cypriot mine survivors, including illegal immigrants, receive free medical care at the same standards as Cypriot citizens.⁶⁷ Post-treatment issues for illegal immigrants are, however, examined by the government on a case-by-case basis.⁶⁸

The two deminers injured in 2008 received initial medical care in Cyprus and were then transferred abroad; both were covered by their employer's insurance.⁶⁹ Civilian survivors injured in 2008 received free medical treatment and were granted permission to remain legally in Cyprus.⁷⁰ In 2008, in the Turkish-controlled areas, authorities reportedly employed 423 persons with disabilities and provided financial aid to another 3,155 of the approximately 3,928 known persons with disabilities.⁷¹

Cyprus has legislation protecting the rights of persons with disabilities, in employment, education, access to healthcare, and other forms of social assistance.⁷² These provisions are enforced, although physical accessibility of buildings continues to be a problem.⁷³ On 30 March 2007, Cyprus signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol, but it had not ratified them as of 1 July 2009.

Support for Mine Action

In April 2006, the UN Secretary-General's representative provided a cost estimate of €11 million (US\$16.2 million) to achieve a "mine-free Cyprus." Mine clearance in the buffer zone was estimated to cost €6 million, with an additional €5 million required for unspecified mine action to achieve "mine free" status.⁷⁴ In December 2008, MAC-C reported that it would cost \$7 million to complete mine clearance operations in the buffer zone.⁷⁵

According to the National Plan for the Implementation of the Ottawa Convention for 2005–2013, the total estimated cost for the "destruction of antipersonnel mines" outside the buffer zone, including emplaced mines under Cyprus's control, was CYP475,350 (\$1.2 million/€811,510).⁷⁶ Landmine Monitor is not aware of cost estimates since 2005 for completion of mine action programs outside the buffer zone.

National support for mine action

In June 2008, the Defence Policy Directorate reported that the annual budget of the Cyprus National Guard included a budget item for implementation of the Mine Ban Treaty. The Directorate reported allocations for mine action in 2008 totaling €100,000 (\$147,260) and planned allocations in 2009 totaling €50,000 (\$73,630).⁷⁷

⁷⁷ Email from Lt. Gennaris Andreas, Defence Policy Directorate, 24 June 2009.

The National Plan states that the required costs for destruction of antipersonnel mines outside the buffer zone will be met from the national budget.⁷⁸ In November 2008, Cyprus reported that “the destruction process of AP mines laid in minefields” was “not impeded by any circumstances,” and that demining teams were supported “technically and financially.”⁷⁹ In May 2009 Cyprus reported that it did not require “external assistance” for either mine clearance or destruction activities.⁸⁰

International cooperation and assistance

No international funding was reported for mine action in Cyprus in 2008. In 2007, the European Commission (EC) reported providing €4 million (\$5,484,400), via the Partnership for the Future program to UNDP, to support clearance of mined areas under Turkish control in the north of the buffer zone.⁸¹ The duration of the funding was originally reported as from September 2007 to September 2009.⁸² However, as of December 2008, MAC-C reported that EC funding would end in January 2009, and that mine clearance in the buffer zone could shut down in the absence of additional funds.⁸³ In January 2009, the United Kingdom provided £46,700 (\$86,605) to cover MAC-C clearance costs through February and March 2009.⁸⁴ Cyprus did not report continuing funding shortfalls in its statements to the May 2009 Standing Committee meetings, nor did it report having secured additional funding to cover costs for the remainder of 2009.

DENMARK

2008 Key Data

State Party since	1 March 1999
Estimated area of contamination	1.246km ² of mined areas as of May 2009
Article 5 (clearance of mined areas)	Deadline: 1 January 2011 Original deadline: 1 March 2009
Demining in 2008	Clearance of 0.47km ² of mined areas (May 2007–April 2008)

Ten-Year Summary

The Kingdom of Denmark became a State Party to the Mine Ban Treaty on 1 March 1999. No additional legal or administrative measures were deemed necessary for national implementation of the treaty beyond ratification. Stockpile destruction of 266,517 mines was completed in December 1999, well in advance of the treaty deadline of 1 March 2003. Denmark initially retained 4,991 mines for training and research, but this number was reduced to 2,091 in August 2000. By the end of 2008, Denmark retained 2,009 mines, which was one more than it had reported the previous two years.

Denmark was slow to begin clearance of its only mined area on the Jutland peninsula after becoming a State Party. In November 2008, at the Ninth Meeting of States Parties, Denmark requested, and was granted, an initial 22-month extension to its Article 5 deadline in order to determine the period needed to complete demining operations.

Scope of the Problem

Contamination

In 1944, the whole area of the Skallingen Peninsula in Jutland on the Danish west coast was mined with antipersonnel and antitank mines.¹ One minefield remains on the peninsula. In 1946, large parts of the minefield were cleared, but due to significant difficulties with the clearance and quality control of mainly dune and salt marsh areas, a part of the mined area was fenced and left uncleared.²

The affected area of the Skallingen Peninsula, as of entry into force of the Mine Ban Treaty for Denmark, comprised a total of 1.86km², initially identified from German mine records as well as markings established by mine clearance teams in 1947. For operational purposes the suspected mined area was divided into three sub-areas: 1, 2, and 3. Area 1 was cleared by a British contractor, European Landmine Solutions, in 2006, releasing 0.19km² of beach and dunes.³ Area 2 was cleared by the Danish consortium Minegruppen between May 2007 and April 2008.⁴ Area 3 remains to be demined.

As a result of these demining operations, the suspected hazardous area of Area 3 was 1.2km² as of November 2008.⁵ Subsequent “terrain analysis” resulted in the size of the suspected area rising slightly to 1.246km² as of May 2009.⁶ However, it is not known to what extent the area

¹ Statement of Denmark, Ninth Meeting of States Parties, Geneva, 25 November 2008.

³ *Ibid.*, p. 2.

⁴ *Ibid.*

⁵ *Ibid.*

⁶ Statement of Denmark, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009.

still contains functioning mines. Based on findings in Areas 1 and 2, Denmark's original Article 5 deadline extension request asserts that, "Most or all remaining mines are ineffective because of the salty, wet environment in the area."⁷

Casualties

No incidents from mines on Skallingen have been reported since 1946. No casualties were reported in the clearance operations in 2006–2008. The entire area—almost 3km²—was surrounded by a new fence in 2005.⁸

Socio-economic impact

The socio-economic impact of the remaining minefield on Skallingen is said to be insignificant.⁹ "Although tourists can not walk to the south end of Skallingen, small boats from Esbjerg cannot land there and hunters cannot hunt in the area concerned, none of this has any economic implication on the local community."¹⁰ According to Denmark, the environmental impact of the minefield is mainly positive due to restricted human access, while it expects mine clearance to have significant detrimental impacts, especially for the rare birds that have colonized the peninsula.¹¹ The salt meadows are said to still show signs and scars of the mine clearance carried out in the 1940s.¹²

Program Management and Coordination

The Ministry of Transport is responsible for clearance activities on Skallingen. The project is organized under the Danish Coastal Authority, which has the power to task and coordinate civil contractors and manage projects.¹³

Plans

In May 2009, Denmark announced that the next steps in the demining of Area 3 were the conduct of an Environmental Impact Assessment, the specification of clearance standards and methods, and the development of a clearance plan. Also, as the area "is designated as a specially protected nature and wildlife area under both the Ramsar Convention on Wetlands and the EU's Birds and Habitats Directives," Denmark stated that, "... a public consultation process of relevant interested parties has to be carried out."¹⁴ Previously, Denmark had noted that the release of Area 3 would be based on technical survey of the area, the condition of the mines, and the environmental implications.¹⁵ It has claimed that it may be impossible to demine the salt meadows without causing serious deterioration, which "is probably not compatible with the rules of the Habitats Directive and RAMSAR Convention."¹⁶

National Ownership

Denmark has asserted full national ownership of its demining program, including responsibility for all its costs. It developed standards for clearance on Skallingen based on the International Mine Action Standards (IMAS). Denmark has stated that, prior to the clearance of Area 3, these standards will be "reviewed and reformulated so they address the situation in the new

area of operation while remaining IMAS compliant.¹⁷ Clearance operations are subject to an “extensive quality management system,” which includes samples of cleared areas as a final quality control.¹⁸

Demining

Demining on Skallingen has been carried out by commercial contractors selected from a process of internationally competitive bidding. In 2008, all demining was carried out by the Danish consortium Minegruppen.

Area 2 was cleared between May 2007 and April 2008, releasing 0.47km² of “sensitive and highly protected nature,” destroying in the process 13 antipersonnel mines, five antivehicle mines, and 131 other items (detonators, explosives, or UXO).¹⁹ In May 2009, Denmark stated that “should any States Parties have an interest in the experiences Denmark has gained in terms of mine clearance in dynamic beach and dune areas as well as marsh areas, we will be happy to share information.”²⁰

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Denmark was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. On 27 March 2008, Denmark presented a first request for an extension to its Article 5 deadline but did not specify the period it was seeking, a treaty requirement.²¹ On 28 August 2008, Denmark presented a revised request seeking an initial extension of 22 months until 1 January 2011.²² This period will primarily be used to determine the period needed to complete clearance operations.²³ Thus, Denmark will probably need a second extension period to fulfill its Article 5 obligations.

The Analysing Group of States Parties, chaired by the President of the Eighth Meeting of States Parties, noted that, “presumably the delay in proceeding with implementation as soon as possible after entry into force hampered Denmark in fulfilling its obligations under Article 5 of the Convention by its deadline.”²⁴ At the Ninth Meeting of States Parties, Denmark stated it had “taken note of this assessment, which we do not wish to challenge.”²⁵

In granting Denmark’s extension request, the Ninth Meeting of States Parties noted that, “while it may be unfortunate that after almost ten years since entry into force a State Party is unable to specify how remaining work will be carried out, it is positive that Denmark will, within the extension period of 22 months, garner an understanding of the true remaining extent of the challenge and develop plans accordingly that precisely project the amount of time that will be required to complete Article 5 implementation.”²⁶ In October 2008, Denmark declared its plan to submit an additional request in mid-2010 for consideration at the Tenth Meeting of States Parties.²⁷ In May 2009, Denmark stated that a “final time schedule and a complete

release plan shall be prepared, and presented, before the deadline of January 1, 2011.” Denmark remained “fully committed to fulfill our obligations in accordance with Article 5 of the Ottawa Convention.”²⁸

Support for Mine Action

National support for mine action

In 2005, the government of Denmark committed DKK86 million (US\$14,344,569), and in 2006 it allocated an additional DKK32 million (\$5,385,211) for completion of mine clearance operations on the Skallingen peninsula, to support clearance activities under its Article 5 deadline extension.²⁹ In referring to these allocations in its update on mine clearance activities at the Ninth Meeting of States Parties, Denmark did not report any new funding since 2006, implying that clearance during 2008 had been paid for via funds contributed in 2005 and 2006, and that no new funds were needed to cover costs.³⁰

International support for mine action

Denmark reported making donations for mine action totaling DKK74,630,000 (\$14,664,795) in 2008, an increase of approximately 14% compared to 2007.³¹ In US dollar terms, Denmark’s 2008 contributions represent the highest annual funding reported by Denmark since at least 1999. (In DKK terms, Denmark’s funding surpassed 2008 levels throughout the period 2000–2004 and in 2006).

In 2008, Denmark ceased funding to Chechnya, Jordan, and Nepal, all of which received funds in 2007. In 2007, Denmark contributed DKK6,798,000 (\$1,249,333) to Nepal. Funding to Afghanistan increased from DKK8 million (\$1,470,236) in 2007 to DKK18 million (\$3,537,388) in 2008.

DJIBOUTI

Ten-Year Summary

The Republic of Djibouti completed destruction of its stockpile of 1,188 mines on 2 March 2003, one day after its treaty-mandated deadline, but has retained 2,996 mines for training purposes. It enacted national implementation legislation in March 2006. It has not submitted an Article 7 report since January 2005.

It is not known whether Djibouti is still affected by landmines, but it has a small residual problem from explosive remnants of war (ERW). Its Article 5 deadline for clearance of emplaced antipersonnel mines expired on 1 March 2009, and clearance by France of its ammunition storage area at La Doudah in May 2008 ostensibly removed the last known mined areas from the territory of Djibouti. All other known mined areas were cleared during the demining program that formally ended in 2003.

Between 1999 and May 2009, at least 84 casualties were recorded (23 killed, 54 injured, and seven whose status is unknown), but there may have been up to 160 casualties in Djibouti. No formal mine/ERW risk education activities have been recorded since 2002. Healthcare, disability services, and disability legislation remain inadequate.

Mine Ban Policy

Djibouti signed the Mine Ban Treaty on 3 December 1997 and ratified it on 18 May 1998, becoming a State Party on 1 March 1999. The president signed national implementation legislation on 11 March 2006.¹ The law also created a national commission responsible for application of the law.

As of July 2009, Djibouti had not submitted its annual updated Article 7 report, due 30 April 2009. Djibouti has not submitted an Article 7 report since January 2005.²

Djibouti did not attend the Ninth Meeting of States Parties in Geneva in November 2008 or the intersessional Standing Committee meetings in May 2009. Djibouti has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Djibouti has reported that it has not produced antipersonnel mines. It is not known to have ever exported mines.³ Both the government and the Front for the Restoration of Unity and Democracy used landmines around military positions and on access roads during the 1991–1994 civil war.⁴

On 2 March 2003, one day after its treaty-mandated deadline, the country destroyed its stockpile of 1,188 antipersonnel mines.⁵ In 2005, Djibouti reported that it retained 2,996 antipersonnel mines for training purposes, the same number it first declared in January 2003.⁶ It has not provided an update since that time and has never reported in any detail on the intended

⁴ See *Landmine Monitor Report 1999*, pp. 33–34.

⁵ Article 7 Report, Form G, Tableau Explicatif, 6 February 2004; and Article 7 Report, Form G, 16 January 2003.

⁶ Mines retained include: 650 M12; 307 M412; 621 PPM2; 665 T72; 521 MB; 16 DV; 30 M961; 10 AV; 128 PPMISR; 12 MLE421; 18 M59; and 18 of unknown type and origin. Article 7 Reports, Form D, 25 January 2005; and Form D, 16 January 2003.

purposes and actual uses of its retained mines—a step agreed to by States Parties in the Nairobi Action Plan that emerged from the First Review Conference in November–December 2004.

Djibouti is party to the Convention on Conventional Weapons, but not Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. It had not signed the Convention on Cluster Munitions as of 1 July 2009.

Scope of the Problem

Contamination

Djibouti has a small residual problem with explosive remnants of war (ERW), primarily UXO, and possibly mines.⁷ With the completion of mine clearance by France in May 2008 around its ammunition storage area at La Doudah,⁸ there were no known mined areas.⁹ Indeed, at a regional seminar for French-speaking countries in October 2008, Djibouti reported that it was “mine free since the completion of demining at La Doudah.”¹⁰ In June 2008, however, a border conflict between Djibouti and Eritrea at Ras Doumeira¹¹ raised fears of new contamination.

Casualties

There were no reports of new mine/ERW casualties in Djibouti 2008 or in 2009 to 31 May.¹² The last confirmed mine casualties occurred in September 2004 when three girls were injured.¹³ In June 2008, France declared that there have never been casualties at its base at La Doudah.¹⁴

The total number of mine/ERW casualties in Djibouti is not known as there is no systematic casualty data collection mechanism. In 2003, Djibouti reported that there had been more than 160 casualties, including some 40 people killed.¹⁵ In October 2008, at the Seminar of African Francophone Actors of Mine and ERW Action in Benin, it was reported that from 1997 to 2000 there were 30 people killed and 89 injured in Djibouti.¹⁶ Between 1999 and May 2009, Landmine Monitor identified 84 mine casualties, including 23 people killed and 54 injured, with the status of seven unknown. The majority of casualties (81) were registered between 1999 and 2001.¹⁷

According to military sources, between 1997 and 2000, 31 people were killed and 90 injured in mine incidents: most casualties were military personnel.¹⁸ In May 2003, Djibouti declared that “no casualties were registered since 2001.” However, media reported one mine incident occurred in September 2004.¹⁹ The incident was confirmed by the Djibouti Mine Action Center.²⁰

Demining and Battle Area Clearance

Progress in implementing Article 5

Under Article 5 of the treaty, Djibouti was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. Mine clearance operations ended in 2003, and Djibouti has been listed by the Mine Ban Treaty Implementation Support Unit as having indicated that it fulfilled its Article 5 obligations; but Landmine Monitor knows of no formal declaration of completion to date. In November 2005, Djibouti acknowledged that even though it had declared itself “mine-safe” in January 2004, “nevertheless, we should continue our efforts especially with France to clear completely La Doudah...and only once those demining operations are completed, we will be able to declare Djibouti ‘mine-free’.”²¹ Djibouti did not request an extension to its Article 5 deadline at the Ninth Meeting of States Parties in November 2008.

Risk Education

The level of the threat does not warrant a formal mine/ERW risk education (RE) program in the country, and no RE activities have been recorded in Djibouti since 2002.

In 2001 and 2002, activities included school-based RE and public information dissemination by the ICRC, the Red Crescent Society of Djibouti, the Association of Support to Mine Victims (Association de Soutien aux Victimes de Mines), and the Djibouti Mine Action Center.²² Djibouti made use of Article 7 Form I only once to report on RE activities, stating that awareness and information campaigns were organized up to October 2002, but it did not state when they started.²³

Victim Assistance

The total number of survivors is unknown but is estimated to be at least 54. In 2004, when Djibouti declared itself “mine-safe,” government officials stressed the need to assist mine survivors.²⁴ However, there is no specific victim assistance plan for Djibouti, and mine/ERW survivors receive the same inadequate services as other persons with disabilities.²⁵ The capacity to provide adequate healthcare continued to be hampered by a lack of qualified medical staff and limited infrastructure and supplies.²⁶ The Peltier Hospital, in the capital, is the only structure able to treat trauma injuries.²⁷

There is no specific agency responsible for disability issues in Djibouti.²⁸ Djibouti does not have specific legislation to protect the rights of persons with disabilities, but the Labor Code prohibits discrimination in employment. In 2008, NGOs continued to advocate for improved legal protection and employment conditions for persons with disabilities.²⁹ Nonetheless, persons with disabilities still reportedly faced discrimination.³⁰

²⁸ US Department of State, “2008 Country Reports on Human Rights Practices: Djibouti,” Washington, DC, 25 February 2009.

²⁹ *Ibid.*

³⁰ *Ibid.*

Djibouti has not made official statements on victim assistance, either in meetings of States Parties or in its annual Article 7 reports, since 2003. As of 1 July 2009, Djibouti had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

Support for Mine Action

International cooperation and assistance

No international funding was reported for Djibouti in 2008. In 2007, France reported contributing US\$3,300 (€2,407) of in-kind funding to Djibouti, in the form of mine clearance training.³¹ France also reported funding mine clearance at La Doudah, but did not report a value for the contribution.

³¹ Email from Anne Villeneuve, Advocacy Officer, Handicap International, 6 June 2008; with information from Béatrice Ravel, Ministry of Foreign Affairs, and Henry Zipper de Fabiani, National Commission for the Elimination of the Antipersonnel Mines (Commission nationale pour l'élimination des mines antipersonnel).

Support for mine action in 2008	International: \$1,285,195 (2007: \$110,000) National: Unknown (2007: \$500,000)

Ten-Year Summary

The Republic of Ecuador became a State Party to the Mine Ban Treaty on 1 October 1999. In January 2002, it completed the destruction of its stockpile of 260,302 antipersonnel mines. Ecuador retained 1,000 antipersonnel mines for training purposes at the end of 2008, having destroyed 2,971 mines previously retained. Ecuador began a process to enact domestic implementation measures in 2008. Ecuador became co-rapporteur of the Standing Committee on the General Status and Operation of the Convention in November 2008.

The mine problem in Ecuador originates from the 1995 border conflict with Peru. During the conflict, six provinces were mined, particularly in the Condor Mountain Range (Cordillera del Cóndor). Ecuador has since made slow progress in clearance, with average annual output since 1999 only slightly more than 12,000m². At the Ninth Meeting of States Parties, Ecuador requested, and was granted, an eight-year extension of its Article 5 deadline to 1 October 2017; remaining suspected mined areas totaled about 500,000m² as of mid-2009.

Between 1999 and 2008, Landmine Monitor identified 13 mine/explosive remnants of war (ERW) casualties (five killed and eight injured) in Ecuador. Limited risk education (RE) has been conducted since 2002 by the Organization of American States (OAS), the Ecuadorian Red Cross and the army in El Oro, Loja, and Morona Santiago provinces. Between 2005 and 2008, two RE campaigns were conducted, training members of Shuar communities to deliver RE messages.

Prior to 2003, there was no mine/ERW casualty data collection or any specific services provided to mine/ERW survivors. Civilian survivors received inadequate services and there was a general lack of government attention to persons with disabilities. Starting in 2003, the Ecuadorian National Demining Center and the OAS worked together to provide comprehensive services to the 14 registered, living civilian mine survivors. Military survivors receive comprehensive care through the government, though many veterans find it difficult to find work because of their advanced age and limited education.

Mine Ban Policy

Ecuador signed the Mine Ban Treaty on 4 December 1997 and ratified it on 29 April 1999, becoming a State Party on 1 October 1999. Ecuador initiated a process in 2008 to adopt national implementation measures, including penal sanctions as required by Article 9.¹ The Ecuadorian National Demining Center expected progress after the April 2009 elections.²

Ecuador submitted its eleventh Article 7 report on 30 April 2009, covering calendar year 2008.³

At the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008, Ecuador made statements on its Article 5 deadline extension request and refuted a media report cited in *Landmine Monitor Report 2008* that Colombian rebel leader Raúl Reyes was killed by a landmine laid around a FARC camp in Ecuador (see below). At this meeting, Ecuador became co-rapporteur of the Standing Committee on the General Status and Operation of the Convention.

In February 2009, Ecuador participated in a regional Mine Ban Treaty meeting held in Managua, Nicaragua, to prepare for the treaty's Second Review Conference. Ecuador also attended the intersessional Standing Committee meetings in Geneva in May 2009, where it gave an update on its mine clearance program.

With respect to matters of interpretation and implementation related to Articles 1, 2, and 3, Ecuador has stated that it has never participated in a joint military operation with states not party to the treaty and that its foreign policy does not allow it to participate in joint military operations with other states. Ecuador has also stated that it has never received a request for the transit of antipersonnel mines, it has not produced antivehicle mines with sensitive fuzes or antihandling devices, and it views 1,000 as the acceptable limit for the number of mines retained for training.⁴

Ecuador is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It submitted its first Article 13 report on 1 October 2008. Ecuador ratified CCW Protocol V on Explosive Remnants of War on 10 March 2009.

Ecuador signed the Convention on Cluster Munitions on 3 December 2008, but had not yet ratified it as of 1 July 2009.⁵

Production, transfer, stockpile destruction, retention, and use

Ecuador has not produced or exported antipersonnel mines in the past. Ecuador completed destruction of its stockpile of antipersonnel mines in January 2002, destroying a total of 260,302 mines.⁶

According to its April 2009 Article 7 report, Ecuador has a total of 1,000 mines retained for training, a number that is unchanged from the previous year's report.⁷ Since completing its stockpile destruction, Ecuador has destroyed a total of 2,971 mines previously retained for training.⁸ Yet it still has not yet reported in any detail on the intended purposes and actual uses of its retained mines, a step agreed to by States Parties at the First Review Conference in December 2004.

¹ In April and May 2008, Ecuador stated that CENDESMI, the National Commission for Human Rights, the National Congress Parliamentary Commission for Human Rights, and the ICRC had prepared a reform of the penal code for antipersonnel mines. Article 7 Report, Form A, 25 April 2008; and response to Landmine Monitor questionnaire by Bolívar Torres Cevallos, President, CENDESMI, 6 May 2008, p. 1.

² Article 7 Report, Form A, 30 April 2009.

³ Previously, Ecuador submitted Article 7 reports on 25 April 2008, 30 April 2007, 3 May 2006, 24 January 2006, 23 June 2004, 30 April 2003, 31 May 2002, 5 March 2001, 23 August 2000, and 29 March 2000. Landmine Monitor obtained an advance copy of the 30 April 2003 report, but it was never posted on the UN website.

⁴ See *Landmine Monitor Report 2007*, p. 351.

⁵ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 71–72.

⁶ Article 7 Report, Form G, 30 April 2009. Ecuador revised this total several times. See *Landmine Monitor Report 2004*, p. 402.

⁷ Article 7 Report, Form D, 30 April 2009. This includes 800 TAB-1, 158 VS-50, 25 P-4B, 11 PRB-M35, and six PMD-6M mines.

⁸ Ecuador said in 2000 it would retain 16,000 mines, then said in 2001 it would only keep 4,000, a number later revised to 3,970. It then destroyed 1,970 retained mines on 11 August 2004 and another 1,001 on 4 August 2007. Article 7 Report, Form G, 30 April 2009; *Landmine Monitor Report 2008*, p. 333; and *Landmine Monitor Report 2004*, pp. 402–403.

Landmine Monitor knows of no government use of antipersonnel mines in Ecuador since the Cenepa border war with Peru concluded in 1998.⁹ A March 2008 media report cited by *Landmine Monitor Report 2008* claimed that the Revolutionary Armed Forces of Colombia (Fuerzas Armadas Revolucionarias de Colombia, FARC) had emplaced landmines around a camp in Ecuadorian territory and that FARC deputy leader Raúl Reyes was killed by one of these mines.¹⁰ Ecuador strongly denied that the area surrounding the FARC camp was mined and cited “sufficient documentation by media and global public opinion” that Reyes was killed as a result of bombardment by the Colombian Armed Forces in Ecuadorian territory.¹¹ Landmine Monitor acknowledges that it appears that the media report regarding the death of Reyes by a landmine was not correct. In a March 2009 letter to Ecuador, Landmine Monitor said the inclusion of the information in the 2008 report was “in no way intended to imply any wrongdoing on the part of the government of Ecuador” or “indicate that the government was in any respect failing to live up to its obligations.”¹²

Scope of the Problem

Contamination

Five provinces in southern Ecuador remain contaminated with antipersonnel mines and, to a much smaller extent, antivehicle mines and UXO, resulting from the 1995 conflict with Peru.¹³ The most heavily mined section of the border is the Condor Mountain Range, which was at the center of the conflict.¹⁴

In its Article 5 deadline extension request, Ecuador provided a detailed history of its mine problem and progress in clearance. It reported that the original number of suspected hazardous areas (SHAs) was 128, covering an estimated 0.6km². A total of 10,910 mines were said to have been laid between 1995 and 1998, of which 10,843 were antipersonnel mines and the remaining 67 were antivehicle mines, in the provinces of El Oro, Loja, Morona Santiago, Orellana, Pastaza, and Zamora Chinchipe.¹⁵ Orellana province has since been declared free from mines. Morona Santiago is the most mine-affected province, in terms both of the numbers of SHAs and the number of mines.¹⁶

As of end April 2009, Ecuador reported that its mine problem was more extensive than that described in its Article 5 deadline extension request. Between April 2008 and April 2009, Ecuador identified nine new SHAs covering 21,200m² in Morona Santiago although the number of mines reported to be in the ground did not change.¹⁷ As of 31 December 2008, 61 SHAs remained containing 6,113 mines over an area of 517,312m² (see table below). The demining teams have found 69 antivehicle mines in comparison to the 67 Ecuador reported had been used

⁹ Ecuador’s reporting on mined areas laid from 1995–1998 indicates that the country used antipersonnel mines after signing the Mine Ban Treaty in 1997, but prior to entry into force in 1999. See *Landmine Monitor Report 2004*, p. 401.

and needed to be removed. Ongoing surveys may determine that much of the suspected area is in fact free of contamination.¹⁸ Ecuador reported no SHAs along the border with Colombia.¹⁹

Summary of the mine problem in Ecuador as of 31 December 2008²⁰

Status	Provinces	No. of SHAs	Mined area (m ²)	No. of antipersonnel mines	No. of antivehicle mines
Baseline	El Oro, Loja, Morona Santiago, Pastaza, Zamora Chinchipe	137	642,234	10,910	67
Completed	El Oro, Loja, Morona Santiago, Pastaza, Zamora Chinchipe	76	124,922	4,797	69
Remaining	El Oro, Loja, Morona Santiago, Pastaza, Zamora Chinchipe	61	517,312	6,113	0
Total		274	1,284,468	21,820	136

Casualties

No new mine/ERW casualties were recorded in Ecuador in 2008 or in 2009 as of 26 February. There were no demining accidents in the same period.²¹

The total number of mine/ERW casualties in Ecuador is not known. Prior to mid-2001, there was no systematic data collection mechanism for mine incidents. Between 1999 and 2008, Landmine Monitor identified 13 mine/ERW casualties (five killed and eight injured) in Ecuador. The last recorded incident was reported in 2004, when a mine incident caused seven casualties (two killed and five injured); the incident occurred when an adult male was handling an antipersonnel mine.²² By the end of 2008, the OAS Program for Integrated Action against Antipersonnel Mines (Programa de Asistencia a la Acción Integral Contra las Minas Antipersonal, AICMA) database had information on 69 landmine casualties in Ecuador, of which 19 were civilian and 50 were military.²³

Socio-economic impact

According to Ecuador, although the socio-economic impact of mines on a national basis impacts less than 5% of the population, mine/ERW contamination restricts and endangers subsistence livelihoods and access to water. Particularly affected are the indigenous Shuar and Achuar tribes, who are prevented from accessing large tracts of their traditional farming and hunting land.²⁴

¹⁸ The Article 7 reports in 2008 and 2009, Ecuador's Statement to the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009, and the presentation by Ecuador at the Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas, 25 February 2009 are inconsistent. The data they cite do not match or calculate correctly.

¹⁹ Response to Landmine Monitor questionnaire by Bolívar Torres Cevallos, CENDESMI, 7 May 2008.

²⁰ The Article 7 reports in 2008 and 2009, Ecuador's Statement to the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009 and the presentation by Ecuador at the Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas, 25–27 February 2009 are inconsistent. They do not match or calculate correctly. The baseline figures in the table are taken from the Article 7 report of 30 April 2009 and the Article 5 deadline Extension Request, and the "remaining" figures are the difference between the "baseline" and the "completed" numbers.

²⁴ Article 5 deadline Extension Request, 31 March 2008, pp. 21–25.

Perhaps the major benefit of the mine action program has been the impetus it has created to improve relations between Ecuador and Peru.²⁵ Since May 2007, Ecuador and Peru have met three times to discuss progress towards meeting Mine Ban Treaty obligations within the extension periods approved in November 2008. These meetings have taken place within the “2+2” framework, which entails formal cooperation between the Foreign and Defense Ministers of both countries. At their meeting in October 2008, the presidents of Peru and Ecuador agreed to use the Andean Development Corporation as a funding mechanism for mine action and each country committed US\$2 million as seed money. Other issues raised in the meetings included the role of the OAS, the medical evacuation of Peruvian deminers to Ecuador, and an agreement on mine clearance operations from July 2009 to June 2010.²⁶

Program Management and Coordination

Mine action

The Ecuadorian National Demining Center (Centro Nacional de Desminado Humanitario, CENDESMI), under the Ministry of Foreign Affairs and in collaboration with the Ministry of Defense, is responsible for coordinating mine action operations, mine/ERW RE (which is conducted by OAS AICMA and CGD), and the victim assistance (VA) program (implemented by OAS AICMA).²⁷ CENDESMI is chaired by the Ministry of Foreign Affairs and is composed of the Ministry of National Defense, Ministry of Public Health, the Ecuadorian Institute for International Cooperation, and the Demining General Command (Comando General de Desminado, CGD) of the Army Engineering Corps.²⁸

Data collection and management

Ecuadorian army mine action survey teams conduct surveys and the data is entered into the database at the OAS using the Information Management System for Mine Action (IMSMA) software.²⁹

Casualty data is collected through impact studies, during landmine/ERW RE campaigns, and from the Association of Former Military Combatants (Asociación de Excombatientes del Ejército).³⁰ As of April 2009, impact studies, through which most civilian casualties have been identified in the past, were ongoing and expected to be completed in 2010.³¹ OAS AICMA maintains a registry of casualties and the services received by survivors.³²

Plans

Strategic mine action plans

CENDESMI's board of directors, in coordination with the CGD and the OAS AICMA office in Quito, establish annual clearance priorities.³³ Ecuador's Article 5 deadline extension request contains a workplan for each year of the extension period and, according to CENDESMI, the order in which the mined areas will be cleared each year will be reviewed and revised if needed.³⁴

The National Mine Action Plan, approved in 2000, includes RE and VA. There is no separate VA plan nor is one needed, given Ecuador's relatively small number of survivors. CENDESMI is a national body and military survivors are assisted with national funds. Services for civilian survivors are paid for with international funds channeled through the OAS.³⁵ As of April 2009, there were no plans in place to transfer responsibility for the VA program from the OAS to a national body.³⁶

The National Council on Disabilities (Consejo Nacional de Discapacidades, CONADIS) is responsible for the development and monitoring of disability policy.³⁷ Ecuador has a national disability plan; implementation is monitored by CONADIS.³⁸ In June 2008, Ecuador developed a plan for implementation of the UN Convention on the Rights of Persons with Disabilities.³⁹

Integration of mine action with reconstruction and development

Ecuador has never reported any strong links between mine clearance and development, although agricultural production, mining, and tourism are affected, and each sector could expand if the areas were free from landmines. Demining in the provinces of El Oro, Loja, and Morona Santiago and in Amazonas department in Peru, is said to contribute to the development of border areas, including the construction of three major roads and an international bridge between the two countries, expected to directly benefit 500,000 inhabitants.⁴⁰

National ownership

Commitment to mine action and victim assistance

Despite its slow progress in clearing mined areas, Ecuador has stated that it is committed to mine action. In an interview with Landmine Monitor in Quito, Bolívar Torres, CENDESMI's president, said that demining is considered one of the most successful confidence-building measures with Peru, after almost two centuries of hostilities and mistrust.⁴¹ It has provided significant in-kind support to the program since 1999 (see Support to Mine Action section below).

National management

CENDESMI is responsible for coordinating mine action operations. As a coordinating body CENDESMI does not manage any of the national or international funds received for mine action. The OAS has this responsibility.⁴²

⁴¹ Interview with Bolívar Torres Cevallos, CENDESMI, Quito, 12 September 2008.

⁴² Ibid.

Since 2001, OAS AICMA has assisted Ecuador in executing and managing its national demining plan. The Assistance Mission for Mine Clearance in South America (Misión de Asistencia a la Remoción de Minas en Suramérica, MARMINAS), established by the Inter-American Defense Board in May 2003 to support mine clearance in Ecuador and Peru, provides technical advice to the OAS and monitors demining operations. CENDESMI reported that in 2007 seven international monitors from MARMINAS supported demining operations.⁴³

National mine action legislation and standards

CENDESMI and the National Demining School were established by Executive Decree 1297 on 22 September 1999.⁴⁴ Ecuador uses national standards and procedures, based on the International Mine Action Standards and established with OAS technical assistance.⁴⁵

Program evaluations

In January 2008, the Geneva International Centre for Humanitarian Demining (GICHD) conducted an evaluation of the European Commission (EC) 2002–2007 mine action strategy in Latin America. The objective was to generate lessons for the EC that could be applied to improve planning and management of existing and future mine action projects, programs, and policies.⁴⁶ The evaluation concluded that the Ecuador border had only minor contamination and was located in a mostly remote border region which had some impact on cross-border transit and trade. The most important consequence of the demining to date has been to reinforce and consolidate the peace process between the two countries. The analysis conducted during the evaluation concluded that in terms of mine clearance the best approach would have been rapid clearance with limited long-term capacity development. The evaluation also noted that because, in earlier years, consolidation of the peace process was the primary strategic goal, limitations in effectiveness and efficiency in mine clearance were more acceptable. With the political situation now more stable, the report recommended that future efforts insist on greater efficiency and effectiveness.⁴⁷

Demining and Battle Area Clearance

The CGD of the Ecuadorian army, CENDESMI's operational unit, is responsible for carrying out demining operations through its Army Engineering Corps.⁴⁸

CENDESMI operates two regional commands. One is the Tarqui regional command covering El Oro and Loja provinces and the other is the Amazonas regional command in Morona Santiago province.⁴⁹ The missions assigned to these units include mine clearance, technical survey, minefield marking, RE, and VA.⁵⁰ In 2008, the Army Engineering Corps consisted of 60 deminers with plans to increase the number of deminers to 100 in October 2009.⁵¹

In 2008, the Army Engineering Corps cleared 6,215m² (approximately the size of one football field) in two mined areas in Morona Santiago, destroying 176 antipersonnel mines and four antivehicle mines. In the first four months of 2009, mine clearance continued at a reduced pace as the survey teams were able to conduct clearance on only 34 of 80 working days because of rain.⁵²

⁵¹ Article 5 deadline Extension Request, 31 March 2008, p. 16; and presentation by Ecuador, Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas, 25 February 2009.

⁵² Article 7 Report, Form C, 30 April 2009; and statement of Ecuador, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009. The 2008 clearance figure is derived from subtracting the cumulative area cleared at the end of 2007 as reported in the Article 5 deadline extension request from the cumulative area cleared at the end of 2008 as stated in the 30 April 2009 Article 7 report. Ecuador did not report a clearance figure for only 2008.

In July 2007, the US Department of Defense provided Ecuador with a piece of remote controlled vegetation clearing equipment called the Tempest system, which has been used since September 2007 to clear vegetation for paths to mined areas in Morona Santiago, where approximately one-half of the total remaining mined areas is located.⁵³ In July 2008, the Department of Defense agreed that Ecuador could use the Tempest for an additional year.⁵⁴

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Ecuador was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 October 2009. Since 2005, Ecuador has declared its commitment to meeting its Article 5 obligations on a number of occasions. In 2005, the OAS-EC agreement for the joint Ecuador-Peru project stated the funded activities should enable Ecuador to “achieve the objective of declaring its national territory free from antipersonnel mines in 2010.” In 2006, CENDESMI indicated that Ecuador “would make all the necessary efforts to conclude operations in 2009, and therefore achieve the deadline mandated by the Treaty.”⁵⁵ A 2006 planning document for the OAS mine action project in Ecuador stated that the goals of the national mine action authorities were to meet its Article 5 obligations. A key goal was to achieve “mine-safe” status by 2010.⁵⁶ On 31 March 2008, however, Ecuador submitted a formal request for an extension of eight years to its Article 5 deadline, to 30 September 2017.⁵⁷ A revised “Executive Summary,” submitted in August 2008, did not change the requested extension period.⁵⁸

Since the beginning of the program, progress in clearing mined areas in Ecuador has been slow, with a rainy climate in the mined areas said to be the major hindrance to not meeting its original 10-year treaty deadline. In granting Ecuador an extension to 2017, the States Parties noted that technical surveys still needed to be carried out to know the full extent of the problem and raised the concern that the 333,390m² (the remaining 80% planned to be cleared in the last two years of the extension period) far exceeded any previous outputs. States Parties requested that Ecuador provide a detailed accounting of the remaining mined areas at the Second Review Conference.⁵⁹

States Parties also noted the request indicated a more than 100% increase in future funding as well as a significant increase in demining capacity, which suggests that Ecuador could clear all remaining mined areas in less time than requested.⁶⁰ Ecuador has pointed out that technical surveys are likely to reduce the contaminated area to a size that matches the personnel and proposed budget and that the amount of land to clear will not greatly exceed what has been achieved on an annual basis since 1999.⁶¹ The ICBL has recommended on a number of occasions that Ecuador should carry out the technical surveys as soon as possible rather than wait six more years until 2015, as planned under the extension request.

According to CENDESMI’s president, the extension request sets out a realistic plan based on the limitations in financial and human resources and the logistical problems posed by transporting personnel, equipment, and supplies to the area of operations. He also said that

⁶⁰ Decision on Ecuador’s Article 5 deadline Extension Request, Ninth Meeting of the States Parties, Geneva, 28 November 2008.

⁶¹ Analysis of Ecuador’s Article 5 deadline Extension Request, submitted by the President of the Eighth Meeting of the States Parties on behalf of the States Parties mandated to analyze requests for extensions, 10 November 2008, p. 1.

Ecuador was committed to meeting its Mine Ban Treaty obligations and was “not going to cross its arms and wait for the deadline to expire.”⁶²

The Article 5 deadline extension request did not include a timeframe to clear nine mined areas in El Oro and Loja provinces in which manual clearance was said to be not applicable because there was a need to first secure mechanical equipment with the capability to act like a sieve.⁶³ Ecuador reported in May 2009 that the OAS has been in discussion with the US Department of State to obtain the necessary equipment.⁶⁴

Demining from 1999–2008⁶⁵

Year	Mine clearance (m ²)
2008	6,215
2007	2,586
2006	12,219
2005	7,681
2004	12,431
2003	24,971
2002	3,841
2001	11,021
1999–2000	43,957
Total	124,922
Average per year	12,492

Risk Education

During 2008 mine/ERW RE was conducted by OAS AICMA and the CGD.⁶⁶ They reached 1,820 people in three of the five mine-affected provinces: 43 people in El Oro, 658 in Loja, and 1,119 in Morona Santiago provinces.⁶⁷ The number is similar to 2007 when 1,875 received RE. In 2008, two teachers and two community leaders were trained to spread RE messages in their communities.⁶⁸

RE was provided through multi-day participatory campaigns and follow-up visits were made to at-risk communities. Campaigns targeted adults (mainly farmers or hunters) and children, as well as teachers and local leaders. Activities aimed to provide alternatives to risk-

⁶⁸ Response to Landmine Monitor questionnaire by Sergio Ugarte Argüello, OAS AICMA, 29 April 2009.

taking behaviors in affected communities.⁶⁹ Methods used included house-to-house visits and distribution of materials including posters. The key message disseminated was “Mines Kill.”⁷⁰

The RE campaign focusing on Shuar communities in Tiwinza canton, Morona Santiago province, which began in 2007 and continued into 2008. Mayors and teachers were trained to deliver RE messages in their communities and were provided with materials in Spanish and the Shuar language. This appeared to resolve the language barrier previously reported to reduce the effectiveness of RE in Shuar communities. In 2008, monitoring of the beneficiaries’ knowledge about mine risk took place while continuing to spread RE messages.⁷¹ It was found that 100% of beneficiaries surveyed were able to correctly answer the question, “What is an antipersonnel mine?” while 76% indicated that they knew what to do if they encountered a mine.⁷²

Quarterly monitoring visits to marked sites are carried out by OAS AICMA in conjunction with RE activities.⁷³ In May 2008, two new warning signs were placed in Loja province and subsequently, inspection carried out in nine areas in Loja province and one in El Oro province showed that marking/fences were in good condition, although one sign in Loja province was dislodged by a river.⁷⁴

OAS AICMA maintains a telephone line which allows the public to access information about mines and report mine contamination. In the first quarter of 2008, OAS AICMA received two reports of antivehicle mines in Loja province which were followed up on by CENDESMI and the CDG.⁷⁵

According to OAS AICMA, the achievements of RE programs are reflected in the fact that there have been zero mine accidents and that members of the population of three provinces knew about safe behavior in the presence of mines.⁷⁶

Since 1999, RE has been provided in El Oro, Loja, and Morona Santiago provinces. Until 2002, only very limited RE was provided by the military with help from the US military, and in 2002 a Landmine Monitor field visit found there was little awareness of mine risk in El Oro. From 2002, RE also began to be conducted by the OAS and the Ecuadorian Red Cross (ERC), as well as the army, in El Oro, Loja, and Morona Santiago. A toll-free number was provided to report mine/ERW contamination and listen to RE messages. RE was reportedly limited by poor means of communication, long distances, and poor weather. At the Eighth Meeting of States Parties, Ecuador stated that some 37,000 people had benefitted from RE, including 21,060 people reached by radio in El Oro province.⁷⁷

Victim Assistance

The estimated number of casualties is 69; there are 14 civilian survivors in Ecuador and the number of military survivors is unknown.⁷⁸

Mine survivors in Ecuador receive comprehensive VA services on an ongoing basis. However, care for civilian survivors is dependent on international assistance channeled through the OAS. Of the 15 registered civilian survivors, as of the end of 2008, 12 had received comprehensive assistance, including physical rehabilitation, psychological support, and economic reintegration, with support from the OAS. Of the remaining three, one was no longer living and the other two did not need assistance.⁷⁹

⁷⁷ Statement of Ecuador, Eighth Meeting of States Parties, Dead Sea, 19 November 2007.

⁷⁸ Response to Landmine Monitor questionnaire by Sergio Ugarte Argüello, OAS AICMA, 29 April 2009.

⁷⁹ Statement of Ecuador, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009.

Military survivors who were injured during the 1995 war are entitled to free medical, psychological, and physical rehabilitative care, including mobility devices, housing support, and scholarships for their children. The armed forces provide transportation to assist military survivors in accessing services. Active military survivors are given administrative assignments and inactive military survivors can receive job placement assistance through the National Disabled Federation's Labor Insertion project.⁸⁰

In 2008, no improvements had been made to the poor road conditions in some mine-affected provinces, necessitating evacuation of casualties by helicopter.⁸¹ The Center for Comprehensive Disability Assistance (Centro de Atención Integral al Discapacitado, CAID), one of the main rehabilitation centers in Ecuador, is well equipped, with six staff who work to international standards. Because of the expensive materials used, the cost of devices limits access for persons with disabilities.⁸²

While survivors have access to economic reintegration services, military survivors have problems finding jobs because of their age (the average age of survivors is 43) and their limited levels of education.⁸³

In 2006, a law established benefits for a select group of disabled veterans from the 1995 conflict. The law was later reformed to include deminers injured in post-war demining activities. As of February 2009, 272 people had benefited from the law.⁸⁴ In addition, Ecuador has enacted various laws protecting the rights of persons with disabilities. This legal framework was strengthened in September 2008 with the approval of a new article to the constitution, prohibiting discrimination on the basis of disability.⁸⁵ However, some aspects of laws protecting persons with disabilities were not enforced.⁸⁶ On 3 April 2008, Ecuador ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol.

Victim assistance activities

In 2008, three landmine survivors received medical and physical rehabilitative care through the OAS program. Two survivors had existing prostheses maintained and one received a replacement prosthetic.⁸⁷ No other services were provided specifically to mine survivors, although various government institutions provided medical, physical rehabilitation, and economic integration services to persons with disabilities.⁸⁸

In 2008, the Ministry of Defense provided 383 scholarships to children of persons with disabilities from the military.⁸⁹ An initiative of the Office of the Vice President, "Ecuador without Barriers," helped create approximately 2,800 jobs for persons with disabilities by 17 December 2008.⁹⁰

In 2008, the ICRC Special Fund for the Disabled (SFD) donated to CAID equipment and materials to fit 50 people with prostheses and provided training in the production of lower-limb prostheses.⁹¹

⁹¹ ICRC SFD, "Annual Report 2008," Geneva, April 2009, p. 32.

Support for Mine Action

In March 2008, Ecuador provided a cost estimate totaling \$10,560,040 (€7,701,874) for fulfilling its Article 5 obligations during the period from 2010 to 2017.⁹² In July 2008, Ecuador revised downward its total cost estimate for meeting its Article 5 obligations to \$9,321,940 (€6,798,877) for the same period.⁹³ Then, in September 2008, Ecuador submitted another revised budget for its extension request, but this time totaling \$16,671,040 (€11,320,820). The substantial increase in overall costs is accounted for by both increases to existing budget items and the addition of new budget items not included in the July 2008 estimate. Annual costs within the latest budget are roughly \$2.33 million in 2010, \$2.15 million in 2011 and 2012, \$2 million in 2013, and \$2.01 million annually from 2014 to 2017. The government of Ecuador is projected to provide \$1,080,000 annually during the extension period, totaling \$8.64 million or 52% of the total projected costs.⁹⁴ Ecuador has not provided a total cost estimate for fulfilling VA or RE obligations.

International support for Ecuador's mine action programming to date has occurred mainly through the framework cooperation agreement signed between Ecuador and OAS AICMA in 2001. OAS AICMA is responsible for the management of funds allocated to Ecuador through the agreement.⁹⁵ The Ministry of Foreign Affairs mobilizes international resources from sources outside the OAS.⁹⁶ In 2008, Ecuador and Peru continued to coordinate resource mobilization as part of their overall cooperative efforts in mine action. Ecuador and Peru held a joint meeting in Quito in September 2008 with mine action NGOs and representatives from diplomatic missions of donor countries to develop coordinated funding for clearance operations in both countries.⁹⁷ Ecuador has not reported on the results of this meeting or subsequent resource mobilization efforts.

National support for mine action

Ecuador did not report national funding to mine action in 2008. In its Article 5 deadline extension request, Ecuador reported on annual national funding during the period 1999–2007, with national support in 2007 roughly \$500,000 (€364,671), as well as \$326,836 (€238,375) in additional funding from national agencies.⁹⁸ In its extension budget revised in September 2008, Ecuador reported on national funding for the period 2010–2017, but did not confirm whether the amounts committed had been obligated.

International cooperation and assistance

In 2008, the OAS reported funding to Ecuador/Peru mine action projects via OAS AICMA totaling \$1,285,195 (€872,739), with contributors consisting of Canada (\$318,773), Norway (\$300,000), the EC (\$280,259), Spain (\$280,092), and Italy (\$106,071). The OAS did not specify how much was allocated to each country. Reporting to Landmine Monitor by Spain and Italy for 2008 included contributions to OAS AICMA for projects in the Americas, including mine action in Ecuador and Peru, but the donors did not specify the amounts directed to projects in each country.⁹⁹ In 2007, Spain reported providing \$109,688 (€80,000) through OAS AICMA for unspecified mine action in Ecuador.¹⁰⁰

⁹⁸ Article 5 deadline Extension Request, 31 March 2008, p. 52.

⁹⁹ Spain Article 7 report, Form J, 30 April 2009; and email from Manfredo Capozza, Humanitarian Demining Advisor, Ministry of Foreign Affairs, 2 March 2009.

¹⁰⁰ Article 7 Report, Form J, 25 April 2008. The OAS reported contributions to Ecuador of \$107,736 from Spain in 2007. Email from Adriana C. Frenchia, OAS, 26 August 2008.

Based on the budget revised as of September 2008, the amount of international funding needed to fulfill Ecuador's Article 5 obligations ranges from roughly \$915,000 to \$1.2 million per year.¹⁰¹ It is uncertain, given that OAS funds for Ecuador and Peru are undifferentiated, whether international funds directed in 2008 to Ecuador's national mine action efforts meet the financial targets in its extension plan. National funding as last reported is less than the annual amount required in the plan. International funding does not appear to fully address Ecuador's VA needs.

¹⁰¹ Article 5 deadline Extension Request (Budget Revision), 13 September 2008.

EL SALVADOR

2008 Key Data

State Party since	1 July 1999
Contamination	Residual antipersonnel mines and ERW
Estimated area of contamination	Unquantified
Casualties in 2008	14 (2007: four)
Estimated mine/ERW survivors	Unknown but estimated 3,158
Risk education recipients in 2008	4,774
Progress towards victim assistance aims	Slow
Support for mine action in 2008	\$195,000 (2007: \$195,000)

Ten-Year Summary

The Republic of El Salvador became a State Party to the Mine Ban Treaty on 1 July 1999. It completed destruction of its stockpiled antipersonnel mines in February 2003. In 2004, El Salvador reformed its penal code to enforce the treaty domestically. El Salvador last submitted an Article 7 transparency report in December 2006.

El Salvador was mine-affected but major clearance operations were completed in 1993. There is a residual problem with explosive remnants of war. Between 1999 and 2008, Landmine Monitor identified 63 casualties (12 killed, 26 injured, and 25 unknown). During the same period, risk education activities were carried out by the National Civilian Police's Division of Arms and Explosives, as part of a permanent education program on the risks of mines, explosives, and guns.

While some progress was made in decentralizing access to healthcare and community-based rehabilitation and raising awareness about the rights of persons with disabilities, limited progress has been observed in the implementation of El Salvador's victim assistance objectives that were established in 2005. In 2009, El Salvador called on the international community to assist with physical rehabilitation and economic reintegration.

Mine Ban Policy

El Salvador signed the Mine Ban Treaty on 4 December 1997, ratified on 27 January 1999, and became a State Party on 1 July 1999. The treaty is enforced domestically through Article 346-C of Decree 471 (Reform of the Penal Code), which entered into force on 30 November 2004.¹

El Salvador attended the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings in May 2009. In February 2009, it attended a regional Mine Ban Treaty meeting held in Managua, Nicaragua, to prepare for the Second Review Conference of the Mine Ban Treaty. El Salvador made statements on victim assistance at all of these meetings.

¹ The law includes penal sanctions of five to 10 years imprisonment for using, developing, producing, purchasing, stockpiling, or transferring one or more antipersonnel mines. Any individual that in any way assists with these activities can be prosecuted with a two to four year prison sentence. Diario Oficial, Vol. 365, No. 217, 22 November 2004. The text of the decree, which amends the Penal Code, is included in Article 7 Report, Section II.B, 29 April 2005.

As of 1 July 2009, El Salvador had not yet provided its annual Article 7 report covering calendar year 2008, due 30 April 2009. It also failed to submit a report covering calendar year 2007.² El Salvador has prepared a total of seven Article 7 reports, the most recent dated 31 December 2006, covering calendar year 2006.³

El Salvador has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

El Salvador is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It has never submitted an annual Article 13 report. El Salvador is also party to CCW Protocol V on Explosive Remnants of War, but has not yet submitted an annual Article 10 report. El Salvador signed the Convention on Cluster Munitions on 3 December 2008, but had not yet ratified as of 1 July 2009.⁴

Production, transfer, use, stockpile destruction, and retention

El Salvador has reported that it has not produced antipersonnel mines.⁵ It is not known to have exported antipersonnel mines in the past. There have been no reports or allegations of landmine use since the early 1990s.⁶

El Salvador completed destruction of its stockpile of 7,549 antipersonnel mines on 20 February 2003.⁷ In its initial Article 7 report submitted in 2001, El Salvador stated that it would not retain any mines for training.⁸ However, in subsequent reporting, El Salvador stated that the armed forces retained a total of 96 antipersonnel mines (50 M14 and 46 M26) for the purposes of training and development.⁹ In its most recent Article 7 report, it indicated that 24 mines had been consumed in training activities, leaving a total of 72.¹⁰ In March 2008, the Ministry of Foreign Affairs told Landmine Monitor that El Salvador was considering destroying all of the mines retained for training.¹¹

Scope of the Problem

Contamination

El Salvador has a problem with explosive remnants of war (ERW), and may have a small residual mine threat, although no mined areas have been identified in recent years.

² In March 2008, a government official told Landmine Monitor that reports had not been submitted because there had been no change, but the Article 7 reporting template allows for the submission of a cover sheet “no change” report. Telephone interview with José Francisco Cortez González, Ministry of Foreign Affairs, San Salvador, 25 March 2008.

³ Other Article 7 reports were submitted on: 3 August 2006, 29 April 2005, 25 March 2004, 4 March 2003 (received by Landmine Monitor; not recorded by the UN), 29 April 2002, and 31 August 2001. The last four reports do not use the standard forms.

⁴ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 73.

⁵ Article 7 Report, Forms E and H, 4 March 2003.

⁶ See *Landmine Monitor Report 2004*, p. 410. Both the Salvadoran government and the Farabundo Martí National Liberation Front (FMLN) made extensive use of antipersonnel mines during the 1980–1992 conflict.

⁷ Article 7 Report, Section III.C, 25 March 2004; Article 7 Report, Forms A, D and F, 4 March 2003; and statement of El Salvador, Standing Committee on Stockpile Destruction, Geneva, 15 May 2003.

⁸ Article 7 Report, Form D, 31 August 2001.

⁹ Article 7 Report, Forms B and D, 29 April 2002, and subsequent reports. As El Salvador has not submitted an Article 7 report since 31 December 2006, it has not reported on the intended purposes and actual uses of its retained mines, and has not used the expanded Form D for reporting on retained mines agreed by States Parties.

¹⁰ Article 7 Report, Section 2.c, 31 December 2006.

¹¹ Telephone interview with José Francisco Cortez González, Ministry of Foreign Affairs, 25 March 2008. He also indicated that he believed that the retained mines were inert and contained no explosives.

Casualties

El Salvador reported 14 ERW casualties (two killed and 12 injured) in four incidents in 2008. No landmine casualties were reported in 2008. Four of the casualties were boys, followed by men (three), girls (three), and women (two); the gender of two children was unknown.¹² This represents a significant increase from the four ERW casualties (all injured) recorded in 2007. Government representatives offered no explanation for the increase except to say that there was an increase of explosive incidents involving ERW during the year, particularly in June, July, and August, including incidents with no casualties.¹³ The increase is likely due to better reporting through increased awareness of the issue.¹⁴

Incidents occurred in the departments of Chalatenango, Cuscatlán, and La Libertad, and in San Miguel, a large city in the eastern part of the country. Three of the four incidents occurred when children were playing with abandoned explosives. The fourth incident occurred when two adult men attempted to extract metal from an explosive. In all four cases, the Division of Arms and Explosives (DAE) within the National Civilian Police determined that the explosives were from the civil war in the 1980s.¹⁵

In 2009, four ERW casualties (all injured) were identified, as of 31 May. On 26 January, in the department of La Unión, three men and one boy were injured when they detonated an explosive device they found in the yard of their home.¹⁶

Between 1999 and 2008, Landmine Monitor identified 63 mine/ERW casualties (12 killed, 26 injured and 25 unknown).¹⁷ Because there is no detailed mechanism to collect information about mine/ERW casualties, it is likely that there were other casualties; in 2004, for example, there were “several” casualties, but the precise figure is not known.¹⁸ Between 1999 and 2008, casualties were identified through media reports, the National Civilian Police and the Council for Integrated Attention for Persons with Disabilities (Consejo Nacional de Atención Integral a las Personas con Discapacidad Nacional, CONAIPD). The last officially confirmed report of a mine casualty was in 1994. At the end of 2007, El Salvador reported that “at least 3,142” casualties were in the database of the Protection Fund for the Disabled and Injured as a Result of the Armed Conflict (Fondo de Protección de Lisiados y Discapacitados a Consecuencia del Conflicto Armado).¹⁹ By 28 November 2008, a total of 14,068 war-injured individuals had been registered, which included mine/ERW survivors.²⁰

Risk profile

In 2008 and 2009, incidents happened in rural areas in five different departments. In two cases, the activity at the time of the incident seems to have been intentional risk taking behavior. However, in the other three cases, young children (aged 5, 7, and 9) found explosives and began to play with them in the company of other children.²¹

Program Management and Coordination

Mine action

There is no national mine action program. The Ministry of Defense and the DAE are the authorized national institutions responsible for clearance of mines and ERW. Since 1994, El Salvador has managed, implemented, and funded national risk education (RE) activities with 100% national funds from the DAE's general budget.²²

Victim assistance

CONAIPD coordinates victim assistance (VA) through its Sub-Committee on Victim Assistance. The Sub-Committee includes representatives from various government ministries, survivors' organizations, organizations for persons with disabilities, and other civil society actors.²³ It met in November 2008 to review progress in achieving the country's VA objectives.²⁴ According to a representative of a survivors' network, the Sub-Committee was unbalanced, with many more government representatives than survivors or other persons with disabilities, and government delegates to the Sub-Committee lacked the authority to make decisions.²⁵

El Salvador coordinates VA through CONAIPD without international technical or financial assistance. Despite being a developing country, it has significant national capacity, especially in healthcare and physical rehabilitation, and most VA services are provided by national public and private entities.²⁶ In 2005, the government estimated that 98% of VA services were provided with national funds.²⁷ In 2009, El Salvador reported that all VA services were supported by national funds.²⁸ However, at nearly every meeting of States Parties and the intersessional Standing Committee meetings,²⁹ El Salvador has called on the international community to support economic reintegration services and the cost of materials for prosthetics and other mobility devices, to "extend its reach."³⁰ El Salvador has national legislation to protect the rights of persons with disabilities, including landmine/ERW survivors, but it is poorly enforced.³¹

RE activities are included as part of an ongoing, permanent safety campaign.³² In September 2007, El Salvador developed a VA action plan for the implementation of its revised "VA26" objectives (see Progress in meeting VA26 victim assistance objectives section below).

El Salvador has an action plan for the implementation of the 2001 National Policy for the Regulation of the Equality of Opportunities for Persons with Disabilities.³³ In 2008, El Salvador developed a plan of action for the implementation of and compliance with the Convention

on the Rights of Persons with Disabilities.³⁴ The National Development Plan “Safe Country: Government Plan 2004–2009” includes the aim of social inclusion for all persons with disabilities within the objective of combating extreme poverty in the poorest regions of the country.³⁵ Funds dedicated to the implementation of this plan have supported the development of a community-based rehabilitation network in rural communities, for the benefit of all persons with disabilities, including mine/ERW survivors.³⁶

Data collection and management

Data on all mine/ERW casualties occurring since the end of the war is collected by the DAE, where it is recorded in a database for casualties caused by all “industrial and homemade explosive artifacts.”³⁷ The Protection Fund collects data on war-injured individuals, including some mine/ERW survivors injured after the war, who were determined to have been “injured by war in times of peace.”³⁸ CONAIPD tracks the number of survivors from both databases.³⁹

As there is no single consolidated database, it is possible that some survivors are in both the DAE and the Protection Fund databases, since casualties occurring after the end of the war can apply to be included in the Protection Fund. Data managed by the Protection Fund does not differentiate between survivors injured by mines and those injured by ERW. Data held by the DAE lacks details, only noting the type of explosive that caused the casualty. While Protection Fund data was said to be under revision in April 2008, no further details of this revision were available as of 31 May 2009.

A 2007 national census, which included a question on disability for the first time in El Salvador’s history, identified 235,302 persons with disabilities, making up 4.1% of the population. However, these results have been disputed by CONAIPD, the Permanent Table of the Office of the Ombudsperson for Human Rights, and many individual NGOs for having significantly undercounted this population.⁴⁰ In 2008, CONAIPD received technical assistance from Spain to design plans for a national disability census and, as of May 2009, was seeking funding to carry out the census.⁴¹

Risk Education

Mine/ERW RE in El Salvador is part of a broader, permanent education campaign carried out in schools by the National Civilian Police to explain the dangers of weapons, including explosives, arms, and landmines. The target population for this program is schools with high rates of juvenile delinquency.⁴² Previously, the police targeted areas where the conflict had been most intense.

In 2008, the DAE held 153 sessions in 10 different schools, reaching 4,792 people, including 4,653 students and 139 teachers.⁴³ This was a decrease from the 6,819 beneficiaries in 2007. Schools were based in the departments of Chalatenango, La Paz, La Libertad, and San Salvador.⁴⁴ The DAE has two staff members who carry out all RE sessions. Included in the presentations is information about the criminal penalties for being found in possession of illegal weapons.⁴⁵

⁴⁵ Email from Walter Alvarado, DAE, 25 June 2009.

In July 2008, following an ERW incident involving four children in Chalatenango, a police officer stated that there were not enough RE programs in the department. He had participated in an RE program in the area that ended in 1999 and believed that the adult population was aware of the risks but children lacked awareness, causing them to become “the new victims.”⁴⁶

The DAE has provided education to schools regarding the risks of mines, explosives, and arms since at least 1999. In 2001, the International Demining Group carried out RE alongside clearance and survey work. In 2003, a government representative acknowledged that the local population was not informed or qualified to take action when coming into contact with UXO.⁴⁷ In 2005, the DAE program targeted schools in areas that had previously been impacted by conflict. By 2008, RE activities were focused on eliminating the use of arms and explosives by youth involved in criminal activity.⁴⁸

Victim Assistance

The total number of mine/ERW survivors is unknown, but is estimated to be 3,158.⁴⁹ While some progress was made in decentralizing access to healthcare and community-based rehabilitation and raising awareness about the rights of persons with disabilities, limited progress has been observed in the implementation of El Salvador’s victim assistance objectives that were established in 2005. In February 2009, in reviewing overall progress in VA, El Salvador described mobility devices, professional training, and income-generating projects for survivors as ongoing needs and underscored the importance of international assistance to continue providing “effective attention” for mine/ERW survivors and other persons with disabilities.⁵⁰

Landmine/ERW survivors are treated within the general healthcare system and services directly related to their disability are free of charge. Most specialized health services are located in the capital, however, they are out of reach for most civilian survivors, due to lack of transportation. In 2008, military survivors could receive free transportation to the Central Military Hospital in San Salvador and the Regional Military Hospital in San Miguel; mobile health services were organized to benefit people living in rural communities, including survivors, but their reach was limited by a shortage of fuel for vehicles.⁵¹

In 2008, CONAIPD reported that the national healthcare system could handle any kind of emergency.⁵² However, following an ERW incident in June 2008, the evacuation of four wounded children to an appropriate medical facility took more than five hours because of a lack of emergency vehicles, impassable roads, and the lack of necessary equipment and materials in the nearest health center.⁵³

While there is a range of public, private, and NGO providers of rehabilitation services in El Salvador, survivors complained that their mobility devices were not of good quality and that waiting periods for repairs and replacements were long.⁵⁴ In November 2008, a multi-stakeholder review of VA noted that there were just two institutions to provide physical rehabilitation services

⁵⁴ *Landmine Monitor*, “El Salvador Mission Report, 30 March–4 April 2008.”

to survivors, one of which was restricted to military survivors. These were a rehabilitation center run by the Protection Fund in San Salvador (serving both former combatants and civilians) and the Centro de Rehabilitación Profesional de la Fuerza Armada de El Salvador (Center for the Professional Rehabilitation of the Armed Forces of El Salvador) in San Salvador (serving former and active military personnel). The review recommended that rehabilitation services be decentralized. The cost of materials for the production of prosthetics was another challenge. In 2008, the government began a project to establish standards for prosthetic/orthotic production.⁵⁵

By May 2009, community-based rehabilitation (CBR) networks had been established in 64 municipalities “in extreme poverty,” to improve social integration of persons with disabilities. Through a joint government-NGO project, local authorities were trained to help persons with disabilities become involved in developing themselves and their communities.⁵⁶ However, the 2008 national VA review found that the country lacked a national policy for psychological support and social integration.⁵⁷

Despite a 4% employment quota for persons with disabilities, and NGO projects to increase economic opportunities for survivors, unemployment remained a problem for survivors in 2008. The 2008 VA review cited challenges such as the age of survivors (most are in their 40s while employers prefer to hire younger candidates) and the high unemployment rate.⁵⁸ Pensions for all survivors classified as “war victims,” both civilian and military, were raised by 20% in January 2009.⁵⁹

El Salvador has legislation to protect the rights of persons with disabilities but, despite government awareness campaigns to prevent discrimination and promote compliance with employment quotas, implementation remained ineffective.⁶⁰ El Salvador ratified the Convention on the Rights of Persons with Disabilities and its Optional Protocol on 14 December 2007. In 2008, El Salvador developed an action plan and established a commission to monitor implementation of this convention.⁶¹

El Salvador’s VA situation has improved over the last 10 years. In 1999, only NGOs were providing survivor-specific services, although the government had requested international assistance to develop a comprehensive landmine victim assistance program.⁶² In that same year, El Salvador began receiving assistance from the Pan American Health Organization through a five-year project for the rehabilitation of mine victims in Central America. By 2003, the project had provided CBR training for socio-economic reintegration, as well as training for physiotherapists and prosthetic technicians. In 2004, several factors limited effective socio-economic reintegration initiatives, including: the lack of access to basic education; lack of appropriate transportation to facilities; lack of financial support; discrimination; lack of awareness of the needs of persons with disabilities; lack of access due to centralization of services; and limited support for income-generating activities for persons with disabilities. In 2005, El Salvador presented objectives for improving victim assistance but, as of May 2009, limited progress had been identified.

Progress in meeting VA26 victim assistance objectives

As one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate attention to survivors,⁶³ El Salvador presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005. It then presented revised objectives and a plan to implement them in 2007 at the Eighth Meeting of States Parties. The revised objectives were developed by the CONAIPD Sub-Committee on Victim Assistance (see Program Management and Coordination section above).⁶⁴ The Sub-Committee met in November 2008 to review progress made towards achieving the revised objectives.

El Salvador’s revised objectives lack specific targets for the number of beneficiaries or deadlines. There has been some progress towards some objectives: such as the implementation of CBR networks in targeted communities; an increase in pensions for mine/ERW survivors; awareness raised about the rights of survivors; and the implementation of projects to increase healthcare access in rural communities. But there is no data available on the number of survivors receiving services as a result of these advances.⁶⁵ One critical objective that has not been achieved is the verification and consolidation of survivor data; without this, it is not possible to monitor progress. A government official explained that they were still monitoring the implementation of the program developed as part of the Nairobi Action Plan, but that the Convention on the Rights of Persons with Disabilities action plan had, in part, taken its place since available data includes services provided to all persons with disabilities.⁶⁶

El Salvador has provided information on advances and challenges in VA at all meetings of States Parties since 2005 and at all intersessional Standing Committee meetings except in 2006. A VA expert from CONAIPD has attended all international meetings since 2005 (except in 2006). El Salvador has never used voluntary Form J in its Article 7 report to provide information on VA.

Victim assistance activities

In 2008, 1,759 of the 14,068 war-injured individuals (approximately 25% of which are mine/ERW survivors) registered with the Protection Fund benefited from the socio-economic reintegration program; 5,216 received assistance through the continuing health program. Through the Salvadoran armed forces, 15,031 veterans received physical and mental health benefits; 3,097 received economic assistance.⁶⁷ It is not known how many of these beneficiaries were mine/ERW survivors as data is not collected on the cause of disability for beneficiaries with disabilities.⁶⁸

In 2008, Survivor Corps (formerly Landmine Survivors Network) in El Salvador completed the nationalization process and, by the start of 2009, was officially registered in El Salvador as the Fundación Red de Sobrevivientes y Personas con Discapacidades (Foundation Network of Survivors and Persons with Disabilities, RSPD). In 2008, it continued to receive funding support from Survivor Corps in Washington, DC, but began to cover 25% of its operating expenses through direct donations. The RSPD expanded its mandate of working with landmine/ERW survivors to include all those wounded by war and other persons with disabilities. This change was designed to make the organization more inclusive and, as the only organization in Central America dedicated to providing peer support, to allow a larger group of persons with disabilities

to benefit from this methodology.⁶⁹ In 2008, the RSPD provided a range of services, including peer support, physical rehabilitation and small business support to 267 persons with disabilities, of which 139 were mine/ERW survivors. Some survivors received multiple services.⁷⁰ Through a special project funded by Canada, a further 700 persons with disabilities, including mine/ERW survivors, participated in a course in business administration and human rights.⁷¹ In 2009, the RSPD had begun to diversify its peer support outreach workers to include persons with a range of disabilities.⁷²

In 2008, the ICRC Special Fund for the Disabled (SFD) continued to collaborate with the Universidad Don Bosco (UDB) School of Prosthetics and Orthotics, an International Society for Prosthetics and Orthotics Level II regional school based in San Salvador. The SFD provided equipment and materials for training purposes, material and components to fit 60 people, and supported the participation of two UDB teachers in a one-month tutorial on the use of polypropylene technology for lower-limb prostheses, held at the SFD training center in Addis Ababa, Ethiopia. The SFD also assessed a rehabilitation center in Santa Ana, the second largest city in El Salvador.⁷³

Support for Mine Action

Landmine Monitor is not aware of comprehensive long-term cost estimates for meeting mine action needs, including RE and VA.

National support for mine action

The Ministry of Health is in charge of coordinating and allocating funds for rehabilitation programs, including those allocated through the Protection Fund, as well as other services for persons with disabilities, including war-injured.⁷⁴ The government of El Salvador has not reported to Landmine Monitor whether the Protection Fund receives any international monetary assistance, nor has it reported the amount of funds directed from the Protection Fund to landmine survivors.

International cooperation and assistance

In 2008, the United States reported providing US\$195,000 from the US Centers for Disease Control and Prevention (CDC) for VA in El Salvador.⁷⁵ The US was the sole reported contributor to El Salvador in 2007, providing the same amount via the CDC.

ERITREA

2008 Key Data

State Party since	1 February 2002
Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	Approximately 100km ² of mined areas (as of May 2009)
Casualties in 2008	64 (2007: 70)
Estimated mine/ERW survivors	Unknown but could be more than 84,000
Article 5 (clearance of mined areas)	Deadline: 1 February 2012
Demining in 2008	Clearance of 0.06km ² of mined areas Clearance of 1.5m ² of battle areas
Risk Education Recipients in 2008	Approximately 106,500
Progress towards victim assistance aims	Slow

Ten-Year Summary

Eritrea became a State Party to the Mine Ban Treaty on 1 February 2002. Eritrea has not enacted national implementation legislation. Since becoming a State Party, Eritrea has consistently reported that it has no stockpile of antipersonnel mines, other than 100 live and nine inert mines retained for training purposes. Both Eritrea and Ethiopia used antipersonnel mines in their 1998–2000 border war. Eritrea strongly denied a report by the UN Monitoring Group on Somalia that Eritrea provided antipersonnel mines to “militant fundamentalists” in Somalia in 2006.

Conflicts dating back to World War II have left Eritrea with a severe mine and explosive remnants of war (ERW) problem. Following the signing of a peace agreement with Ethiopia in December 2000, the UN Mission in Ethiopia and Eritrea (UNMEE) was deployed and established a Mine Action Coordination Center (MACC). The Eritrean Demining Authority (EDA) was created as the national mine action authority, with clearance entrusted to the Eritrean Demining Operations (EDO). The EDO was subsequently absorbed into the EDA.

A Landmine Impact Survey completed in 2004 is the basis for describing the landmine problem and the National Mine Action Strategic Plan. Eritrea ordered all international mine action organizations to cease operations and leave the country in July 2002 and then again in 2005, when the government impounded vehicles and clearance operations were suspended. A lack of funds since 2007 has further reduced the EDA’s capacity to conduct clearance and the amount of land cleared in 2008 was the lowest since 2000. On 30 July 2008, the UN Security Council terminated UNMEE and all mine action activities ceased in the Temporary Security Zone (TSZ) separating Eritrea and Ethiopia.

Between 1999 and 2008, Landmine Monitor identified 653 mine/ERW casualties (159 killed, 445 injured, and 49 unknown), which, due to limited and overlapping data collection mechanisms, is likely to be less than the actual total for the period. Data collection by the EDA has improved over the past decade, but data remained incomplete and lacked detail.

Risk education (RE) has primarily been conducted by the EDA, working with the ministries of education and information, and increasingly integrated with demining, with the support of UNICEF. A 2008 knowledge, attitudes, and practice survey recommended significant changes to the RE program, including the development of a more targeted approach and more of a focus on behavior change as opposed to conventional information dissemination.

Healthcare improved but serious shortages in staff and supplies remained. Rehabilitation and prosthetics services were available through state-run centers, supported by the ICRC until mid-2009. The community-based rehabilitation (CBR) program expanded to all areas of the country by 2009, providing rehabilitation, prosthetic and counseling services and access to inclusive education for persons with disabilities, yet it lacked sufficient coordination and monitoring capacity. Economic reintegration activities were mostly provided by the government and a disabled war veterans' NGO. Although opportunities for vocational training and income-generation were limited, the government committed significant resources to the training war-injured persons with disabilities. Psychological support services lacked qualified staff. Eritrea lacked adequate legislation to protect the rights of persons with disabilities. Government restrictions have significantly reduced the number of international operators providing victim assistance in Eritrea.

Mine Ban Policy

Eritrea acceded to the Mine Ban Treaty on 27 August 2001, becoming a State Party on 1 February 2002. Eritrea has not enacted domestic legislation or reported any new national measures to implement the Mine Ban Treaty, as required by Article 9.¹

Eritrea submitted its sixth annual Article 7 report on 25 March 2009, covering the period from 30 December 2007 to 30 December 2008.²

Eritrea did not attend the Ninth Meeting of States Parties in November 2008 or the intersessional Standing Committee meetings in May 2009. It attended both meetings the previous year.

Eritrea has not made known its views on key issues of interpretation and implementation of Articles 1, 2, and 3 of the treaty (joint military operations with states not party, foreign stockpiling and transit, mines with sensitive fuzes or antihandling devices, and mines retained for training).

Eritrea is not party to the Convention on Conventional Weapons. It has not signed the Convention on Cluster Munitions.³

Transfer of antipersonnel mines

In its May 2006 and November 2006 reports, the UN Monitoring Group on Somalia alleged the transfer of antipersonnel mines from Eritrea to non-state actors in Somalia in March and July 2006.⁴ In July 2007, the Monitoring Group provided clarification and further details on the alleged July 2006 transfers, including details of the air transport and background information on the plane used.⁵

¹ At a March 2004 regional landmine workshop, Eritrea said it planned to "take all the necessary measures to adopt implementing legislation." However, in May 2005, the deputy general manager of the EDA told Landmine Monitor that he did not know if national legislation was being pursued. No progress on national legislation has been reported in Eritrea's recent Article 7 reports.

² Previous reports were submitted on 10 March 2008, 3 January 2007, 15 September 2005, 4 December 2004 (report received by Landmine Monitor), and 3 September 2003.

³ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 199.

⁴ The May 2006 report of the UN Monitoring Group stated that the government of Eritrea transferred 1,000 antipersonnel mines to "militant fundamentalists" in Somalia on or around 5 March 2006. The November 2006 report stated that the government of Eritrea transported antipersonnel mines and other weapons by cargo aircraft from Assab, Eritrea to Mogadishu, Somalia in July 2006. In addition, an October 2005 report alleged two shipments of unspecified mines (either antipersonnel or antivehicle) from Eritrea to Somalia. See "Report of the Monitoring Group on Somalia pursuant to Security Council Resolution 1630 (2005)," S/2006/229, 4 May 2006, p. 12; "Report of the Monitoring Group on Somalia pursuant to Security Council resolution 1676 (2006)," S/2006/913, 22 November 2006, pp. 11–16; "Report of the Monitoring Group on Somalia pursuant to Security Council resolution 1587 (2005)," S/2005/625, 4 October 2005, p. 16; *Landmine Monitor Report 2006*, pp. 411–412; and *Landmine Monitor Report 2007*, pp. 369–370.

⁵ "Report of the Monitoring Group on Somalia pursuant to Security Council resolution 751 (1992)," S/2007/436, 18 July 2007, p. 9. For more details, see *Landmine Monitor Report 2008*, pp. 355–356.

Eritrea has stated that the information in the Monitoring Group reports is “groundless” and “fictitious.”⁶ In July 2007, Eritrea stated that allegations by the Monitoring Group of antipersonnel mine transfers were “baseless and unfounded...Eritrea has never provided landmines or any other military support to any of the factions in Somalia.”⁷

Attempts by two Presidents of meetings of States Parties to the Mine Ban Treaty to clarify and seek further information from the Monitoring Group about its reports of mine transfers had not received a reply as of August 2009.⁸

Production, stockpiling, and use

Eritrea has stated that it never produced antipersonnel mines, and that all the mines used in past conflicts were obtained from Ethiopian forces (either from minefields or storage facilities) during the 1962–1991 war of independence.⁹

In each of its Article 7 reports, Eritrea has indicated that it no longer has a stockpile of antipersonnel mines.¹⁰ Eritrea’s treaty-mandated deadline for destroying any stocks of antipersonnel mines was 1 February 2006.

According to its most recent Article 7 report, as in previous reports, Eritrea retains 100 live and nine inert antipersonnel mines for training purposes.¹¹ The number has not changed, indicating no mines have been consumed during training activities. Eritrea has not reported on the precise intended purposes and actual uses of its retained mines, as agreed by States Parties in 2004, and has not used the expanded reporting form for retained mines agreed by States Parties in 2005.

There have been no reports of new use of antipersonnel mines since the end of the 1998–2000 border war with Ethiopia. Between 2003 and 2008 there were incidents caused by newly laid antivehicle mines in the TSZ, according to news reports and UNMEE MACC. In October 2008 an antivehicle mine killed three civilians traveling by car on the road connecting the contested town of Badme with Ethiopia. Reportedly the road is checked by the Ethiopian army regularly for new mine use.¹²

Scope of the Problem

Contamination

Eritrea is affected by mines and ERW dating back to World War II, but largely as the result of the country’s struggle for independence from 1962–1991 and its border war with Ethiopia in 1998–2000.¹³

The remaining extent of contamination is not known with any precision. A Landmine Impact Survey (LIS), conducted from 2002–2004, indicated that 481 of 4,176 communities in Eritrea (11.5%) were seriously affected by mines and/or ERW. The LIS also found that more

⁶ “Report of the Monitoring Group on Somalia pursuant to Security Council resolution 1676 (2006),” S/2006/913, 22 November 2006, Annexes V and VI, pp. 53–54.

⁷ Letter A1/212/07 from Elsa Haile, Director, UN and Multilateral Organizations Division, Ministry of Foreign Affairs, to Stephen Goose, HRW, Landmine Monitor Ban Policy Coordinator, 6 July 2007.

⁸ For details of statements and actions by the two Presidents relating to the Monitoring Group reports, see *Landmine Monitor Report 2008*, p. 356.

⁹ Article 7 Report, Form B, 10 March 2008.

¹⁰ See Form B of each Article 7 report. Eritrea maintains that all of the approximately 450,000 mines it obtained from Ethiopia during the 1962–1991 war were subsequently laid during the 1998–2000 border conflict, except for those that were unusable, which were disposed of or destroyed. In 2002, Eritrea claimed that 40,000 mines had been destroyed by the Eritrean Defense Force following the end of the liberation war. UNMEE MACC could not confirm this. See *Landmine Monitor Report 2002*, p. 249. UNMEE MACC estimated that Eritrea laid about 240,000 mines during the 1998–2000 conflict. Interview with Phil Lewis, Programme Manager, UNMEE MACC, Asmara, 18 January 2002.

¹¹ Article 7 Report, Form D, 25 March 2009. It retains 40 PMN, 40 POMZ-2, and 20 PMD6 live mines, as well as one inert mine of each of the following types: PMN, PMD-6, POMZ-2, M16, PPM-2, MON 100, M14, PRB M35 and MON 50.

¹² “An Ethiopian-Eritrean war looms again,” *France 24*, 13 November 2008, www.france24.com.

¹³ See *Landmine Monitor Report 2007*, p. 371.

than 650,000 people lived in the impacted communities across all six regions of the country. Contamination in 914 suspected hazardous areas (SHAs) was estimated to cover a total of 129km² of land, including the surveyed areas in the TSZ. An additional 113 UXO-contaminated sites required spot clearance.¹⁴

The LIS was not granted access to some 30 communities in the TSZ, as well as to a further 140 communities across Eritrea.¹⁵ In its last report on its operations in Eritrea issued January 2008, UNMEE MACC stated that while the LIS data and RE teams contributed to the knowledge of the mine problem, the full extent of contamination in the TSZ cannot be known without a thorough survey.¹⁶ UNMEE has estimated that mined areas cover 78km² in the TSZ and that SHAs cover a further 21.8km². Some of these areas were identified as potentially contaminated during the LIS.¹⁷ In May 2009, the EDA estimated that 702 SHAs remained from the 914 SHAs identified by the LIS, covering approximately 100km².¹⁸

The Eritrean Armed Forces have reported laying more than 200,000 mines in the TSZ.¹⁹ In January 2008, they claimed only 10,472 antipersonnel mines and 34 antivehicle mines remained in the ground²⁰ and Eritrea's most recent Article 7 report stated that 10,619 mines had been found and destroyed during clearance operations from 2000–2008.²¹ Based on the reported figures, UNMEE concluded that, although there are many minefields, the quantity of mines emplaced may, in fact, be significantly lower than expected.²²

The majority of the UXO contamination is in the TSZ, where UNMEE found munitions primarily along the trench lines.²³ UNMEE reported in 2007 that PTAB 2.5 and BL755 unexploded submunitions have been encountered in Eritrea; ERW have also been found in artillery and mortar ammunition storage areas used in the 1998–2000 war. ERW have been located at Tio and Idi, in Sub-Sector East, and more recently, outside Massawa.²⁴ ERW in Eritrea may also include items left over from the Italian invasion prior to World War II.²⁵

Casualties

In 2008, the EDA identified 64 new mine/ERW casualties, including 22 killed and 42 injured. Almost half of all casualties (30) were children (11 boys, two girls, and 17 unknown gender), four were adults (two men and two of unknown gender), and another 30 casualties were of unknown age and gender. Three casualties were caused by antipersonnel mines, 28 by antivehicle mines, 29 by ERW, and four by an unknown device. Most casualties occurred in Gash Barka region (29), followed by Anseba (16), Debub (15), Semenawi Keyih Bahri/Northern Red Sea (three), and Maekel (one). In three incidents, which caused 28 casualties, buses reportedly activated newly laid mines. Another 16 casualties occurred while herding, 15 while playing; the activities of five casualties at the time of the incident were unknown.²⁶

This was a slight decrease from 2007, when the EDA identified at least 70 new mine/ERW casualties (17 killed and 53 injured).²⁷ It was, however, an increase from 2006, when 32 casualties were identified (nine killed and 23 injured).²⁸

²⁸ See *Landmine Monitor Report 2006*, p. 418.

Casualties continued to be reported in 2009: the EDA reported 14 casualties (four killed and 10 injured) as of June, including five men, six boys, and three girls.²⁹

Between 1999 and 2008, Landmine Monitor identified 653 casualties (159 killed, 445 injured, and 49 unknown).³⁰ Landmine Monitor data was gathered from reporting by the EDA, UNMEE MACC, Ministry of Labor and Human Welfare (MoLHW), and the Ministry of Health (MoH).³¹ The EDA recorded 677 casualties between 2000 and 2008, including 184 killed and 493 injured.³² It is unknown if all these casualties actually occurred in this timeframe. The LIS remains the most reliable source of cumulative casualty data, identifying 4,934 reported mine casualties (2,436 killed and 2,498 injured) through June 2004.³³

A MoLHW national survey on disability completed in 2005 reportedly identified approximately 84,000 landmine survivors in Eritrea, of a total 150,000 persons with disabilities.³⁴ However, this figure was not issued again and does not appear to correlate with other reporting on the numbers of persons with disabilities or war-injured persons in Eritrea, including reporting by the MoLHW.³⁵ According to UNICEF the exact number of mine survivors was not determined by this study,³⁶ which runs contrary to earlier information received by Landmine Monitor.³⁷

Risk profile

According to UNICEF, “The suspension of the UN Mine Action Coordination Center’s demining and explosive ordnance disposal [EOD] activities, in April 2008, and lack of donor and technical support to the EDA is increasing the risk of mine and UXO accidents.”³⁸ People are at risk from mines, UXO and IEDs.³⁹

The proportion of incidents attributed to mines is decreasing, while those involving ERW have remained relatively static. Since 2006, just under half of recorded incidents were attributed to intentional handling of UXO, and two of every three of these incidents involved young males under 18 years of age.⁴⁰

According to the EDA/UNICEF knowledge, attitudes, and practice (KAP) survey in 2008, “[a]lthough the findings of the survey describe considerable residual contamination, overall respondent ratings for threat were generally low, suggesting the perceptions of threat have moderated as people have adapted to living in contaminated environments. Despite this, perception of risk remains high, and for a majority of respondents, well above reported levels of knowledge and practice.”⁴¹

²⁹ Email from Habtom Seghid, EDA, 26 June 2009.

³⁰ See *Landmine Monitor Report 2001*, p. 254 (MoLHW data for 2000); *Landmine Monitor Report 2004*, p. 429 (UNMEE MACC data for 2001, 2002, and 2003); *Landmine Monitor Report 2005*, p. 346 (UNMEE MAC data for 2004); *Landmine Monitor Report 2006*, p. 418 (UNMEE MAC data for 2005); *Landmine Monitor Report 2007*, p. 375 (UNMEE MACC data and Landmine Monitor media monitoring for calendar year 2006); and *Landmine Monitor Report 2008*, pp. 363–364 (EDA data).

³¹ The LIS identified 295 casualties from incidents in 2001–2003, compared to the 340 casualties identified by the UNMEE MACC in the TSZ only, in the same years. While there is likely significant overlap between UNMEE MACC and LIS data, inadequate details on casualties prevent comparisons from being made.

³² See *Landmine Monitor Report 2008*, p. 365; and email from Habtom Seghid, EDA, 13 March 2009. In 2008, the EDA reported 613 casualties (162 killed and 451 injured) between 2000 and 2007, to which the casualties reported by EDA for 2008 have been added. Email from Habtom Seghid, EDA, 13 March 2009.

³³ See *Landmine Monitor Report 2005*, p. 347.

³⁴ See *Landmine Monitor Report 2006*, p. 419.

³⁵ For example, in 2008 the MoLHW reported a total of 80,000 persons with disabilities in Eritrea and the ICRC reported 58,000. See *Landmine Monitor Report 2008*, p. 365.

⁴¹ Ibid.

Socio-economic impact

Those most affected by mines in Eritrea are the rural population in all regions, nomadic people, internally displaced persons (IDP), and refugees. Key humanitarian challenges were to make land safe for the return and resettlement of IDPs in Debu and Gash Barka, and freeing land for agricultural use.⁴² The government reported that in 2007 all Eritrean IDPs successfully returned home.⁴³ According to UNMEE, mines and ERW remain a major threat to people living and working in the TSZ.⁴⁴

Program Management and Coordination

Mine action

The Eritrean Demining Authority was established in July 2002, reporting directly to the Office of the President and responsible for coordinating mine action in Eritrea, and ensuring that mine action would support rehabilitation and development projects and be integrated into the national development strategy.⁴⁵ It was not responsible for mine action in direct support of the UNMEE peacekeeping mission and the Eritrean-Ethiopian Border Commission.⁴⁶

UNMEE MACC was established in August 2000, following the cessation of hostilities between Eritrea and Ethiopia, with a mandate to provide demining support to the UNMEE peacekeeping mission within the 25km-wide TSZ and for 15km on either side.⁴⁷ It was responsible for all mine action activities within the TSZ.⁴⁸ In July 2008, its mandate was not renewed and UNMEE left Eritrea.⁴⁹

Risk education

The EDA is responsible for managing and implementing RE, but coordination meetings did not take place in 2008. In March 2009, with UNICEF support, a Technical Working Group on the Mine Action Program was established, and is open to UN agencies, government ministries, the ICRC, and the Red Cross Society of Eritrea (RCSE), and all other mine action actors remaining in the country.⁵⁰

UNICEF supported capacity-building of the EDA, including a study visit to Kenya, and advocated on gender mainstreaming in the mine action program, in particular in demining and EOD operations.⁵¹

Victim assistance

The MoLHW, through its Department of Social Affairs, is responsible for issues regarding persons with disabilities, including mine/ERW survivors. MoLHW victim assistance (VA) activities are conducted in cooperation with the EDA. UNDP is designated to support capacity development for both the EDA and the MoLHW. In late 2008, however, the UN reported that communication between mine action stakeholders was “in limbo.”⁵²

Data collection and management

There is no comprehensive casualty data collection mechanism in Eritrea. The EDA collects casualty data through mine/ERW RE field teams and community volunteers and provides monthly mine/ERW casualty reports to UNICEF. The EDA also said that the MoLHW is

ultimately responsible for nationwide reporting on mine/ERW survivors.⁵³ In 2008, UNMEE noted a lack of effort in data collection by national authorities and the need for a standard reporting format.⁵⁴ The UNMEE MACC stopped collecting mine/ERW casualty data in early 2008, before the formal end of its mandate in July 2008.

In 2008, UNMEE MACC entered into discussions with the EDA and the Ethiopian Mine Action Office to develop plans to transfer segregated national data from its Information Management System for Mine Action database to other organizations. The final outcome of the discussions was not reported.⁵⁵ According to UN reporting on the National Mine Action Strategic Plan for 2009, the EDA and MoLHW are responsible for coordinating management of mine/ERW casualty and relevant disability survey data.⁵⁶

Plans

Strategic mine action plans

The National Mine Action Strategic Plan for 2005–2010 aims to support poverty reduction initiatives and achieve zero victims from mines and UXO.⁵⁷ The plan calls for technical surveys, clearance and marking, reactivation of demining teams, and RE refresher courses as well as RE to assist the return of IDPs.⁵⁸ The UNDP 2007–2011 country plan set a target of clearing half of all mined areas by 2011.⁵⁹

There is no specific VA plan. However, the National Mine Action Strategic Plan includes provisions for the implementation of VA. According to the plan, the MoLHW had developed a “directions paper” for VA. No further details were available.⁶⁰ In 2008, the MoLHW reported that a National Policy on Disability, developed in 2000 to ensure that persons with disabilities had access to services and assistance, was being implemented.⁶¹

National ownership

Commitment to mine action and victim assistance

In June 2008, Eritrea declared that, “to enable our objectives and achieve our vision by completing landmine clearance within the initially planned time frame our demand for financial and logistical support is crucial.”⁶² However, actions by Eritrea, such as expelling international demining NGOs and confiscating mine action program vehicles, has made the international provision of funds and logistical support almost impossible. As a result, Eritrea is managing the mine action program on its own with no external advisors since UNDP support ended in 2006.

VA is primarily provided through government structures, particularly those of the MoLHW.⁶³ At the beginning of 2008, nine international humanitarian organizations were operational in Eritrea. International NGOs faced considerable restrictions from the government. The ICRC was given the most room to operate, but even its field of operations was strictly limited by the government. Restricted access to fuel supplies led the ICRC to suspend a series of programs in 2008. The number of international NGOs working in Eritrea (on other issues, not merely VA) was reduced to five in 2009, down from 37 in early 2005. International NGOs operating in Eritrea are reportedly not allowed to be implementing partners of UN agencies.⁶⁴

National mine action legislation and standards/Standing operating procedures

The EDA was established in July 2002 through Proclamation 123/2002 to coordinate mine action in Eritrea, and to ensure that mine action would support rehabilitation and development within the national development strategy.⁶⁵ The EDA has developed standing operating procedures for demining operations, said to be in accordance with the International Mine Action Standards.⁶⁶

Program evaluations

In July 2004, UNDP commissioned a technical appraisal of its 2002–2006 Mine Action Capacity Building Programme (MACBP) that recommended the programme monitor not only the short-term outputs (such as the results of mine clearance), but also the lasting impact of the program for people living in mine-affected communities. The review also recommended that a mechanism be incorporated to measure the contribution of mine action to Eritrea in achieving the Millennium Development Goals.⁶⁷ The EDA stated in 2007 and again in 2008 that it was not in a position to implement the recommendations because of lack of funding.⁶⁸

Demining and Battle Area Clearance

In 2008, the EDA had six 60-person and two 30-person manual clearance teams, one technical survey team of seven people, two quality assurance teams of three persons each, and two EOD teams of five persons each. Four of the demining teams were deployed on an emergency response basis to facilitate the return of IDPs.⁶⁹ According to Eritrea’s Article 7 reports no technical surveys to reduce the overall estimate of contamination have been conducted since 2005 due to a shortage of funds.⁷⁰

⁷⁰ Article 7 Reports, Form C, submitted from 2006–2009.

UNMEE MACC closed its mine clearance operations in February 2008 and did not conduct any clearance in 2008.⁷¹ Over the course of its 2001–2008 mission, which operated under restrictions imposed by the government, UNMEE and cleared and handed over 350,000m² of agricultural land, cleared 950km of roads and assessed and verified another 2,485km, and released 35km² of land through surveys. During the clearance operations, 473 items of UXO, two antivehicle mines, and 379 antipersonnel mines were destroyed.⁷²

As a result of the closure of UNMACC and the limited resources of the EDA a total of only 57,014m² of mined areas and another 1.5km² of battle areas were cleared in 2008, compared to 1.31km² of mined areas and 6.08km² of battle areas cleared in 2007.⁷³ Clearance operations in 2008 resulted in the destruction of 35 antipersonnel mines, nine antivehicle mines, and 611 items of UXO.⁷⁴ EDA teams also conducted road verification in Gash Barka and Debub regions, approved demining projects to assist the government and the private sector in development projects, and carried out EOD.⁷⁵

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Eritrea is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 February 2012. The EDA has stated that it remains committed to this goal, although limited funding presents a major challenge.⁷⁶ As the table below indicates, output from clearance operations has decreased significantly in the last years.

Demining from 2003–2008⁷⁷

Year	Mine clearance (km ²)	Area released by survey (km ²)
2008	0.06	0
2007	1.31	0
2006	10.70	35.91*
2005	13.30	N/R
2004	3.58	N/R
2003	7.21	N/R
Total	35.16	35.91

* Reflects cumulative total, not annual figure.

Since the LIS was completed in 2004, Eritrea has released more than 25km² of land, leaving approximately 100km² remaining. The EDA considers the 100km² only an estimate.⁷⁸ Until the EDA conducts technical surveys on the remaining SHA, the actual remaining area to clear will

be unknown.⁷⁹ With a low annual clearance rate and insufficient funds to conduct surveys to release land by means other than clearance Eritrea is unlikely to meet its 2012 Article 5 deadline and will have to request an extension from a Meeting of States Parties.

Risk Education

In 2008, the EDA implemented RE with UNICEF financial and technical support through 10 RE teams in five of the country's six regions (Anseba, Debub, Gash Barka, Maekel, and Semenawi Keyih Bahri/Northern Red Sea).⁸⁰ The teams developed a network of more than 100 community volunteers to deliver RE.⁸¹ Approximately 106,500 people, including 75,500 children in 225 villages, were reached through the EDA teams in 2008 and through community-based RE outreach to all IDP resettlement villages.⁸² The RE teams became more closely integrated with EOD teams, on the recommendation of the EDA/UNICEF KAP survey.⁸³

RE activities in schools, in collaboration with the Ministry of Education, increased in 2008, and training was conducted for curriculum developers and school teachers.⁸⁴ As of September 2008, it was estimated that the RE program had established coverage in 334 elementary and middle schools serving a population of some 226,000 students.⁸⁵

RE kits were provided to IDP families. Activities took place on 4 April 2009 in support of the International Day for Mine Awareness and Mine Action Assistance. RE messages were disseminated through radio, newspaper and television by UNICEF and the Ministry of Information.⁸⁶ UNMEE MACC also conducted community-based RE in the TSZ for communities and IDPs until March 2008.⁸⁷

The 2008 KAP survey was used for RE planning, and improved targeting so that highest priority was given to children and young people.⁸⁸ The report noted that RE programming remained mine-focused although casualties were increasingly from intentional handling of ERW, and that interventions were still largely "whole of community" focused and relied on conventional dissemination approaches. The report concluded, "...there is a need to modify current approaches, focusing more on behaviour change and less on conventional information dissemination. This will require re-thinking how MRE can best engage vulnerable populations and involve targeted groups in the design of behaviour change communication (BCC) interventions and materials."⁸⁹

UNICEF conducted monitoring and evaluation, but noted that the system needed strengthening, that materials specifically targeting boys needed to be developed, and that outreach was needed to both school-children in remote areas and the nomadic population.⁹⁰

⁹⁰ Email from Gbemi Akinboyo, UNICEF, 14 August 2009.

UNICEF reported that a lack continuity of funding remained a major threat to sustaining gains made in RE.⁹¹

RE has been conducted over the last 10 years with the involvement of the EDA (and until 2005 the EDO), UNMEE MACC, Ministry of Education, Ministry of Information, the RCSE (with support from the ICRC), and NGOs, with technical and financial support from UNICEF. RE has primarily consisted of presentations in communities, school-based RE, training of trainers (including school teachers and community volunteers), radio broadcasts, distribution of materials, and displaying of billboards.⁹²

By 2002, most school teachers in highly affected areas had been trained through a program by UNMEE/UNICEF.⁹³ RE was integrated into the primary school curriculum in 2006.⁹⁴

The RCSE started an RE program in 2006, but this was suspended in 2007 due to a court case.⁹⁵ RE resumed in mid-2008 and was ongoing as of September 2009 with the financial support of the ICRC.⁹⁶

Victim Assistance

The number of mine/ERW survivors in Eritrea remains unknown. The 2004 LIS identified 2,498 people injured by mines/ERW in Eritrea while other estimates have indicated there may be from 40,000 to more than 84,000 mine/ERW survivors.⁹⁷

Eritrea continued to face a shortage of qualified medical personnel, leaving the country short of surgical and physical rehabilitation services. Outside of the capital Asmara, general practitioners rather than specialist surgeons reportedly performed surgery in hospitals. In 2008, the Ministry of Health chose the Barentu Referral Hospital in the heavily mine-affected Gash Barka region as a training center for graduate medical staff. Although hospitals in the Gash Barka region continued to lack necessary resources in 2008, the range and quality of surgery, and pre- and post-operative care had reportedly improved.⁹⁸

The MoLHW Division of Orthopedics is responsible for rehabilitation services and runs three centers: the main Adi Guadad center in Asmara and two satellite centers in Assab and Keren. There is also a small prosthetics and device workshop at the Denden Camp for IDPs in Asmara serving the camp and its surrounds.⁹⁹ Rehabilitation services are also provided through the CBR program, under the MoLHW Division of Rehabilitation.¹⁰⁰ In January 2009, the MoLHW reported that the CBR program had been introduced in all the administrative regions of Eritrea, covering more than 68,000 beneficiaries.¹⁰¹ This was accomplished in advance of the plan to establish nationwide coverage by 2012.¹⁰² However, in 2008, there continued to be shortages of qualified physical rehabilitation staff in Eritrea.¹⁰³

Following the closure of UNMEE activities in 2008, UNDP re-established support to VA.¹⁰⁴ In January 2009, UNDP began modest support to the MoLHW, including assistance in developing nationwide rehabilitation services for persons with disabilities through both the CBR

program and institution-based rehabilitation, with emphasis on enabling the MoLHW to plan, coordinate and monitor its activities.¹⁰⁵ Increased coordination and monitoring were reportedly much needed in existing CBR facilities, as these mechanisms had not kept pace with the rapid expansion of the CBR program.¹⁰⁶

The CBR network provides psychosocial support through some 5,000 volunteers throughout Eritrea.¹⁰⁷ Due to widespread conflict trauma, there is a significant and increasing need for mental health services. The number of mental health professionals is reportedly extremely limited. The NGOs HealthNet TPO and Dutch Interchurch Aid, operating from January 2005–January 2009, assisted the Ministry of Health in establishing psychosocial support services and community-based mental health structures in the mine-affected Gash Barka and Debub regions. From 2005–2008, the project trained community counselors, psychiatric nurses, and primary care workers in mental health.¹⁰⁸ In October 2008, UNICEF provided training on psychosocial support to teachers and community workers in Debub region.¹⁰⁹

The government, particularly through the MoLHW, continued to provide programs and funding to increase economic opportunities for persons with disabilities, including veterans, as well as running schemes for broadening access to vocational training, loans, and allotments of farming land.¹¹⁰ The government reportedly committed “substantial resources” to support and train persons with physical disabilities caused by armed conflict.¹¹¹ The Ministry of Education has an inclusive education policy to integrate children with disabilities and other vulnerable children into public schools. The CBR program has reportedly also assisted children with disabilities access mainstream education.¹¹²

Eritrea has no specific legislation to protect the rights of people with disabilities. However, Eritrea’s draft constitution prohibits discrimination against persons with disabilities, in employment, education, or other state service provision. There is no legislation prescribing access to public thoroughfares or public or private buildings.¹¹³ Discrimination against persons with disabilities remained problematic. Women with disabilities faced particular discrimination in accessing social and economic rights.¹¹⁴

As of 1 August 2009, Eritrea had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

Progress in meeting VA26 victim assistance objectives

As a member of the so-called VA26, a group of 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate attention to survivors,¹¹⁵ Eritrea presented its 2005–2009

¹¹⁵ “Final Report, First Review Conference,” Nairobi, 29 November–3 December 2004, APLC/CONF/2004/5, 9 February 2005, p. 3.

VA objectives at the Sixth Meeting of States Parties in 2005.¹¹⁶ The objectives were not SMART (specific, measurable, achievable, relevant, and time-bound) and had no set time-frames for completion. Eritrea did not report on progress against its objectives and has not revised the objectives or presented plans on how they were to be achieved, or by which institutions.¹¹⁷

Eritrea participated in the workshop on advancing landmine VA in Africa, in Nairobi in May–June 2005. Eritrea did not send a VA expert to participate in the meetings of the Standing Committee on Victim Assistance and Socio-Economic Reintegration or to meetings of States Parties. However, Eritrea reported on its VA activities at the Standing Committee meetings in 2008. Eritrea has not included the voluntary Form J in its annual Article 7 report to provide information on VA.¹¹⁸

From 2005–2008, progress was reported on several of Eritrea’s 2005–2009 non-specific VA objectives including: increased data collection by the EDA; training of health workers; increased employment through access to land and seed money loans; and improved accessibility of buildings and disability awareness. No progress was reported against the few more measurable objectives, such as providing rehabilitation services for 80% of known recent landmine survivors. Eritrea’s restricted collaboration with international organizations appears to have hampered progress in reaching its VA objectives. These include training surgeons in saving limbs and amputation surgery; procuring sufficient raw materials for prostheses production; and formulating and implementing national disability legislation in line with the UN Convention on the Rights of Persons with Disabilities.¹¹⁹

Victim assistance activities

As noted above, the most significant VA provider is the MoLHW, through the CBR program and Division of Orthopedics rehabilitation centers.¹²⁰ The Norwegian Association for the Disabled (NAD) disability program, which had provided support to the disability sector, including the MoLHW CBR program, was phased out in 2008.¹²¹

The ICRC planned cooperation with the MoLHW to support physical rehabilitation services, including physiotherapy, did not proceed as planned during 2008, since the project proposal and Memorandum of Understanding were not signed until late October.¹²² ICRC activities included refresher courses for physiotherapists and support to the Ministry of Health for developing and implementing a national, diploma-level training course for physiotherapists. The ICRC provided technical support to a training course in wheelchair production, in collaboration with NAD and the Association for the Physically Disabled of Kenya. ICRC technicians and physiotherapists also provided ongoing support to the main Adi Guadad center in Asmara.¹²³ The ICRC provided training at the Barentu Referral Hospital and Agordat and Tessenay hospitals in Gash Barka region; these hospitals received supplies on an *ad hoc* basis, as well as equipment and logistics support. Barentu Referral Hospital had a four-person ICRC surgical team, which assisted the other two hospitals. Due to fuel supply restrictions, the ICRC’s surgical training program was suspended in August 2008; the problem was not resolved at the end of 2008. The ICRC supported three hospitals in Gash Barka region, which treated five people injured by mines/

¹²³ *Ibid.*

ERW in 2008. With relevant ministries, the ICRC co-organized courses on trauma management, war surgery and physiotherapy for 220 civilian and military medical personnel.¹²⁴

The Eritrean National War-Disabled Veterans Association (ENWDVA) provides support to war veterans with disabilities through services including mobility devices, loans and small business opportunities, counseling and workshops. ENWDVA also sent some members abroad for appropriate medical treatment. Specific ENWDVA programs provide economic reintegration support for female veterans with disabilities. ENWDVA receives considerable financial contributions from Eritrean communities in Europe.¹²⁵

Support for Mine Action

Eritrea's original National Plan to Implement Article 5, published in 2004 for the period 2005–2009, included a budget estimate totaling \$63,350,000 (€43,019,149) to fulfill strategic objectives in survey, clearance, RE, and VA, and to support the return of IDPs.¹²⁶ In March 2007, Eritrea reported a revised plan, with updated strategic objectives and a revised budget of \$38.2 million for the period 2006–2009.¹²⁷ In March 2008, EDA further revised the budget downward to \$19.7 million for remaining work.¹²⁸

National support for mine action

No national mine action funding was reported for Eritrea in 2008 or 2007. In June 2008, Eritrea reported that the government paid for costs associated with EDA mine clearance teams, including operational and logistical costs, aside from two teams funded by UNDP.¹²⁹ It did not report the value of these contributions.

The original National Mine Action Strategic Plan projected that the government of Eritrea would contribute \$800,000 (€543,257) annually to mine action in 2008 and 2009. The plan also stated that the government paid the salaries of national mine action staff, excluding RE teams.¹³⁰ In updating its mine action cost estimates in 2008, Eritrea did not report if funds required from national sources had been revised downward along with the overall budget, or whether the government of Eritrea had fulfilled its financial obligations to the plan to date.

International cooperation and assistance

In 2008, Italy reported contributing €230,000 (\$338,698) through UNICEF to RE activities in Eritrea.¹³¹ In addition, the United Kingdom reported contributing £50,000 (\$92,725) through the UN Mine Action Service to support capacity-building, mine clearance and emergency response in Eritrea and Ethiopia, but did not differentiate funds to Eritrea.¹³² No international monetary or in-kind support was reported for Eritrea in 2007. Technical surveys originally planned for 2006 had not begun as of March 2009, due to a lack of financial support, and were postponed until the second (post-2009) phase of Eritrea's strategic plan.¹³³

ETHIOPIA

2008 Key Data

State Party since	1 June 2005
Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	Unquantified
Casualties in 2008	18 (2007: 84)
Estimated mine/ERW survivors	At least 7,275
Article 5 (clearance of mined areas)	Deadline: 1 June 2015
Demining in 2008	Not formally reported, but believed to be 4.46km ² of mined areas
Risk Education Recipients in 2008	88,000
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$18.9 million (2007: \$5.8 million)

Ten-Year Summary

The Federal Democratic Republic of Ethiopia became a State Party to the Mine Ban Treaty on 1 June 2005. Ethiopia has not enacted national implementation legislation. Ethiopia completed destruction of its stockpile of antipersonnel mines on 2 April 2009. The government strongly denied a report by the UN Monitoring Group on Somalia that Ethiopia provided antipersonnel mines to forces in Somalia in 2006. Both Ethiopia and Eritrea used antipersonnel mines in their 1998–2000 border war.

Ethiopia's mine and explosive remnants of war (ERW) problem is the result of armed conflicts dating back 60 years. The Landmine Impact Survey, completed in 2004, significantly overstated the extent of contamination. The Ethiopian Mine Action Office (EMAO) was established in February 2001 to formulate policy, allocate resources, and approve mine action strategies and workplans. With support from Norwegian People's Aid, EMAO has been using land release principles to identify the remaining threat.

Between 1999 and 2008, Landmine Monitor identified 1,947 mine/ERW casualties in Ethiopia (786 killed, 1,129 injured, and 32 unknown). Ethiopia lacks a national casualty data collection mechanism and accurate casualty data was not available so it was not possible to analyze trends effectively or accurately represent the total numbers of casualties. Since 1999, risk education (RE) in Ethiopia has been provided by EMAO, NGOs, and local government, mainly in the regions of Tigray, Afar, and Somali, with UNICEF financial and technical support. By 2008, the provision of RE was limited.

Ethiopia lacks sufficient emergency medical care. Despite some improvements in healthcare coverage by 2009, some mine-affected regions had made the least progress in healthcare development. Physical rehabilitation services increased significantly since 1999, but remained inadequate to meet the needs of persons with disabilities—including mine survivors—despite significant international support, particularly from the ICRC. Psychosocial support and economic reintegration were inadequate throughout the past decade. Surveys indicated that only about half of mine/ERW survivors received emergency medical care, very few received rehabilitation, and almost none accessed psychological or economic assistance. Limited progress was made in introducing public policies to address the needs of persons with disabilities: existing laws were not adequately implemented, which perpetuated discrimination.

Mine Ban Policy

Ethiopia signed the Mine Ban Treaty on 3 December 1997 and ratified it on 17 December 2004, becoming a State Party on 1 June 2005. Ethiopia has not reported the enactment of national implementation legislation. In its Article 7 report submitted in 2009, however, Ethiopia included reference to several items of legislation that it stated were “consistent with Article 9” of the Mine Ban Treaty. These included: certain sub-articles of the Ethiopian constitution; the Council of Ministers’ Regulation No. 70/2001 establishing the EMAO; and articles 500, 499, 497, and 481 of Ethiopia’s penal code.¹

Ethiopia submitted its initial Article 7 report—due by 28 November 2005—in June 2007.²

Ethiopia attended the Ninth Meeting of States Parties in Geneva in November 2008, where it made statements on stockpile destruction and mine clearance. Ethiopia did not attend the intersessional Standing Committee meetings in May 2009.

Ethiopia has not engaged in States Parties’ discussions on matters of interpretation and implementation related to Articles 1, 2, and 3 and thus has not made known its views on issues related to joint military operations with states not party to the treaty, foreign stockpiling and transit, mines with sensitive fuzes or antihandling devices, and mines retained for training. Ethiopia’s silence is particularly notable in light of its military support for, and joint military operations with, the Transitional Federal Government (TFG) of Somalia, known as the Government of National Unity after February 2009, which is not party to the Mine Ban Treaty.

Ethiopia is not party to the Convention on Conventional Weapons and has not signed the Convention on Cluster Munitions.³

Transfer of antipersonnel mines

The UN Monitoring Group on Somalia has alleged transfer of antipersonnel mines from Ethiopia to Somalia. In November 2006, the Monitoring Group reported that in September 2006 the Ethiopian military transferred 180 antipersonnel mines and other unspecified mines to Puntland and Qeybdiid militias.⁴ The Monitoring Group had alleged earlier transfers of mines from Ethiopia to Somalia, but did not specify whether the mines were antipersonnel or antivehicle.⁵ In response to Landmine Monitor’s inquiries about the alleged November 2006 transfer of antipersonnel mines, Ethiopia described the allegations as “without foundation... unsubstantiated...[and] false.” It stated that “Ethiopia is in full compliance of its obligations under the Convention...[T]here has never been any transfer of antipersonnel mines to any third party including in Somalia.”⁶

¹ Article 7 Report, Form A, 30 April 2009. No further details of the penal code articles were reported.

² The initial report did not include Form A (national implementation measures) or Form B (stockpiled antipersonnel mines), and did not note what period it covered. The date ranges of several forms were left blank. Form C referred to locations of mined areas as of June 2007; Form G stated the period from 2004 to 2007.

³ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 201–202.

⁴ “Report of the Monitoring Group on Somalia pursuant to Security Council resolution 1676 (2006),” S/2006/913, 22 November 2006, pp. 19–22. It also reported transfers of antivehicle mines and unspecified mines to other Somali entities. It cited the provision of 100 antivehicle mines to Baadi’ade and Ujejeen clans on 17 July 2006, 200 unspecified mines to Mohammed Qanyare, warlord and former TFG minister between July and mid-October 2006, and an unknown quantity of unspecified mines to the Islamic Courts on 25 July 2006.

⁵ In May 2006, the UN Monitoring Group reported a January 2006 transfer of unspecified mines from Ethiopia to Somali warlord Mohamed Dheere. An October 2005 report from the Monitoring Group stated that Mohamed Dheere had bartered mines and small arms for ZU-23 anti-aircraft guns from Ethiopia. “Report of the Monitoring Group on Somalia pursuant to Security Council resolution 1630 (2005),” S/2006/229, 4 May 2006, p. 13; and “Report of the Monitoring Group on Somalia pursuant to Security Council resolution 1587 (2005),” S/2005/625, 4 October 2005, p. 46.

⁶ Letter from Amb. Samuel Assefa, Embassy of Ethiopia to the US, to Stephen Goose, HRW, Landmine Monitor Ban Policy Coordinator, 11 July 2007. He also wrote, “Terrorists and extremist groups, however, have routinely used antipersonnel landmines. These mines are channeled to these by, among others, the Government of Eritrea and its collaborators.”

No new allegations of antipersonnel mine transfers have been made by the Monitoring Group since 2006. Attempts by two Presidents of Meetings of States Parties of the Mine Ban Treaty to clarify and seek further information from the Monitoring Group about its reports of mine transfers have not received a reply as of August 2009.⁷

Production, stockpiling, and use

Ethiopia has stated that it does not produce antipersonnel mines, and has not imported antipersonnel mines since the overthrow of the Mengistu regime in 1991.⁸

The Mine Ban Treaty required that Ethiopia destroy all of its stockpiled antipersonnel mines by 1 June 2009. In its June 2007 Article 7 report, Ethiopia reported that 39,759 items described as stockpiled antipersonnel mines were destroyed between 2004 and 2007. Of the declared items, only 5,867 appear to be antipersonnel mines.⁹

At the Ninth Meeting of States Parties, Ethiopia reported that, as a result of inventories carried out by the Ministry of Defense during 2008, it concluded its original stockpile to be 55,569 antipersonnel mines, of which 40,189 had already been destroyed. Ethiopia stated its intention of destroying a further 14,266 mines (54,455 in total) before its June 2009 deadline, with the remaining 1,114 mines to be retained for training purposes.¹⁰

In its April 2009 Article 7 report, Ethiopia stated that 54,455 antipersonnel mines had been destroyed, fulfilling the Article 4 stockpile destruction obligation on 2 April 2009. It said the mines were destroyed at various locations by “electrical method” according to Ministry of Defense safety and environmental procedures. It indicated that 40,189 mines had been destroyed in 2008 and another 14,266 mines in 2009—again providing a list which included many items that do not appear to be antipersonnel mines. Of the 54,455 items, it appears that 32,650 were antipersonnel mines.¹¹

In one part of the April 2009 Article 7 report, Ethiopia stated it retained 303 mines for training purposes, the same number as reported in the initial Article 7 report in 2008. It said the mines were used for mine detection dog (MDD) training at Entoto, Gemhalo, and Tegochale.¹²

However, in another part of the report, Ethiopia indicated 1,114 mines are retained, the same number cited at the Ninth Meeting of States Parties.¹³

There have been no reports of new use of antipersonnel mines since the end of the 1998–2000 war with Eritrea.¹⁴ Between 2003 and 2008 there were incidents caused by newly laid antivehicle mines in the Temporary Security Zone (TSZ) separating Eritrea and Ethiopia, according to news reports and the UN Mission in Ethiopia and Eritrea (UNMEE) Mine Action

⁷ For details of statements and actions by the two Presidents relating to the Monitoring Group reports, see *Landmine Monitor Report 2008*, p. 373.

⁸ Ethiopia first made this statement in 1997. Statement by Amb. Dr. Fecadu Gadarmu, Embassy of Ethiopia to Canada, Mine Ban Treaty Signing Ceremony, Ottawa, 3 December 1997, p. 2.

⁹ Article 7 Report, Form G, June 2007. Antipersonnel mines declared destroyed are as follows: PMD-6M (111), PMN (4,227), TS-50 (1), M2A3B (2), M3 (620), M14 (306), M16 (21), POMZ-2M (361), V-5 (2), M69 (151), M35 (10), M21 (14), GOYYATA (29), “Egypt antipersonnel mine” (2), and antipersonnel mines of unknown type (10). The remaining items included detonators, blocks of explosives, practice mines, signal mines, fuzes, and booby-traps.

¹⁰ Statement of Ethiopia, Ninth Meeting of States Parties, Geneva, 26 November 2008.

¹¹ Article 7 Report, Form F, 30 April 2009. The 32,650 mines include: PMN (14,318), M16 (7,023), PMD-6M (6,178), POMZ-2M (3,471), M3 (503), M14 (390), M69 (318), MD-9 (182), Goyyatta (132), MK-1 (30), PPMI (29), V5 (23), M2A3 (17), GOYTA (13), M-35 (9), unknown (8), NR490 (3), and MON-50 (3). The other items include detonators, fuzes, strikers, detonating cord, blasting caps, TNT, and plastic explosives.

¹² Article 7 Report, Form D, 30 April 2009. This included PMD (76), PMN (60), M14 (58), POMZ (43), M16 (43), M3 (13), and Type 69 (10).

¹³ Article 7 Report, Form G, 30 April 2009. This included PMN (508), POMZ-2M (200), PMD-6M (150), M-3 (100), M16 (60), Goyyatta (60), MK-1 (10), M14 (5), V-3 (4), PPMI (3), GOYTA (2), and one each MON-50, MON-100, M-59, M-69, M-2A1, M-2A1 (practice), NR490, MK-161, PPM-2, and unknown. The number of individual mines listed totals 1,112.

¹⁴ While not openly acknowledging the use of antipersonnel mines during the border conflict with Eritrea from 1998–2000, in April 2002 Ethiopia provided the UN with detailed maps of mines laid by Ethiopian forces in Eritrea during the conflict. Email from Phil Lewis, Chief Technical Advisor, UNMEE MACC, 23 April 2002.

Coordination Center (MACC). UNMEE has had no access to the TSZ since March 2008.¹⁵ In October 2008 an antivehicle mine killed three civilians traveling by car on the road connecting the contested town of Badme with the rest of Ethiopia. Reportedly the road is checked by the Ethiopian army regularly for new mine use.¹⁶

Scope of the Problem

Contamination

Ethiopia is contaminated by mines and ERW, primarily UXO, resulting from internal and international armed conflicts dating back to 1935.¹⁷ It is not known if this includes a residual threat from cluster munition remnants. The 2004 Landmine Impact Survey (LIS) identified 1,492 communities as impacted by mines and UXO in 1,916 suspected hazardous areas (SHAs). Afar, Tigray, and Somali regions accounted for more than 80% of the impacted communities in the country.¹⁸

EMAO, however, considered the results of the LIS unreliable,¹⁹ and in 2007 began to conduct general and/or technical surveys in all of the communities deemed affected by the LIS. In its initial Article 7 report submitted in 2007, Ethiopia declared 4,097 suspected mined areas; the date of emplacement of the mines ranges from 1935 to 2000.²⁰ EMAO, however, believed the actual number was much lower than even the 1,916 SHAs identified by the LIS and did not know the source of the Article 7 data on SHAs.²¹

In August 2009, EMAO reported it had re-surveyed 1,047 communities and had confirmed 164 mined areas and SHAs in nine regions covering approximately 36km² (see table in Identification of hazardous areas section below). A total of 925 SHAs had been cancelled totaling more than 597km² of estimated area, and 738 communities of the 1,047 communities visited were declared unaffected.²²

Casualties

Landmine Monitor identified 18 mine/ERW casualties in Ethiopia in 2008 (three killed and 15 injured). Casualties included eight men, one woman, one girl, and two people of unknown gender. Due to a lack of consistent information and limited casualty data collection, not all casualties could be cross-referenced and current casualty data probably under-represents the extent of the problem in Ethiopia.²³ The available casualty figures for 2008 are inadequate for meaningful comparison to the 84 mine/ERW casualties (31 people killed, 49 injured, and four unknown) identified by Landmine Monitor in 2007.²⁴ No confirmed mine/ERW incidents were recorded in 2009 as of June.

In 2008, Ethiopian troops in Somalia were frequently involved in explosive device incidents, although most appear to have been caused by remote-detonated devices as opposed to victim-activated devices.²⁵

¹⁹ Letter from EMAO to UNMAS recommending that the UN certify the LIS, 22 June 2006.

²⁰ Article 7 Report, Form C, 5 July 2008.

²¹ Interviews with Gebriel Lager, Deputy Director, EMAO, in Ljubljana, 14 April 2008; and in Geneva, 4 June 2008.

²² Email from Rune Andresen, Programme Manager, NPA, 20 August 2009.

²³ See *Landmine Monitor Report 2008*, pp. 379–380; and US Department of State, "2008 Country Reports on Human Rights Practices: Ethiopia," Washington, DC, 25 February 2009. In 2008, the Tigray BoLSA had reported 52 casualties including 44 casualties in one incident involving a bus. This incident has since been identified as a bombing, not a mine incident, and has not been included in the total for 2008. The 44 casualties were previously included in *Landmine Monitor Report 2008*. The POC in Addis Ababa reported assisting 23 people injured by mines/ERW in 2008 but details are not known. Email from Ambachew Negus, National Mine Coordinator, RaDO, 17 June 2009.

²⁴ See *Landmine Monitor Report 2008*, p. 379.

²⁵ Landmine Monitor media monitoring, January–December 2008; and see *Landmine Monitor Report 2008*, p. 380.

Between 1999 and 2008, Landmine Monitor identified 1,947 mine/ERW casualties in Ethiopia (786 killed, 1,129 injured, and 32 unknown). Landmine Monitor data in the period was gathered from various sources, including UNMEE MACC, EMAO, the national NGO Rehabilitation and Development Organization (RaDO), and the LIS. Due to the lack of comprehensive or systematic data collection, these cumulative casualty figures should not be considered comprehensive or representative of trends or the actual numbers of casualties.²⁶

Casualties from 1999–2008

Year	Killed	Injured	Unknown	Totals
2008	3	15	0	18
2007	31	49	4	84
2006	17	17	0	34
2005	13	5	13	31
2004	24	37	0	61
2003	148	209	0	357
2002	426	509	0	935
2001	13	69	0	82
2000	51	119	15	185
1999	60	100	0	160
Total	786	1,129	32	1,947

The most complete data source remains the LIS completed in 2004, which recorded 16,616 mine/ERW casualties (9,341 people killed and 7,275 injured).²⁷

Risk profile

A high proportion of recent casualties were children, and many incidents were caused by antivehicle or antipersonnel mines. Common activities at the time of incident include traveling and tampering, followed by shepherding.²⁸

There is no permanent marking of mine/UXO contaminated areas, although a Geneva International Centre for Humanitarian Demining (GICHD)/UNICEF RE needs assessment report of May 2008 for Somali region found that communities there used tree branches to fence off some minefields.²⁹

²⁶ See *Landmine Monitor Report 2008*, p. 379; *Landmine Monitor Report 2007*, p. 391; *Landmine Monitor Report 2006*, pp. 436–437; *Landmine Monitor Report 2005*, pp. 360–361; *Landmine Monitor Report 2004*, pp. 895–896; *Landmine Monitor Report 2003*, p. 519; *Landmine Monitor Report 2002*, p. 553; and *Landmine Monitor Report 2001*, p. 216. For 2004, this report counted RaDO, deminer casualties, and UNMEE MACC data reported in *Landmine Monitor Report 2004*. For 2003, this report counted both the LIS and UNMEE MACC IMSMA reporting for the TSZ, both reported in *Landmine Monitor Report 2004*. For 2002, this report added the data from the TSZ in *Landmine Monitor Report 2003* to the LIS data reported in *Landmine Monitor Report 2004*. For 2001, this report added the data from the TSZ in *Landmine Monitor Report 2002* to the LIS data in *Landmine Monitor Report 2004*. For 2000, the LIS data from *Landmine Monitor Report 2004* was added to RaDO-recorded casualties in Somali National Region reported in *Landmine Monitor Report 2001*. For 1999, the LIS data from *Landmine Monitor Report 2004* was counted.

²⁷ See *Landmine Monitor Report 2004*, p. 895.

²⁸ See *Landmine Monitor Report 2008*, p. 375.

²⁹ *Ibid.*, p. 378.

Socio-economic impact

An RE assessment conducted by GICHD/UNICEF in Somali region in December 2007 and January 2008 found that while the mine/ERW problem was considerable, most of the people interviewed stated that clearance was not their first priority. Drought, food and water shortages, as well as health, were considered more serious problems.³⁰

Program Management and Coordination

Mine action

EMAO was created as an autonomous statutory body by the Council of Ministers in February 2001.³¹ Initially, EMAO reported to the Office of the Prime Minister but, following public-sector reorganization in 2005, responsibility was transferred to the Ministry of Federal Affairs.³² EMAO formulates policy, allocates resources, and approves mine action strategies and workplans.³³ EMAO also conducts mine surveys, marking, clearance, and RE activities based on priorities determined by regional and local authorities.³⁴

In 2007, following a recommendation by a 2006 UNDP evaluation, the Ethiopian mine action program changed from being directly executed by UNDP to a nationally executed program with one international mine action project officer based at EMAO.³⁵

Victim assistance

The Ministry of Labor and Social Affairs (MoLSA) is responsible for disability issues and coordinating rehabilitation. The Head of MoLSA's Rehabilitation Affairs Department represented Ethiopia internationally as the victim assistance (VA) focal point. The Ministry of Health (MoH) has also claimed to have responsibility for VA coordination. EMAO does not coordinate VA activities.³⁶

Data collection and management

The LIS conducted in 2002–2004 was not certified by the UN until July 2006. EMAO believes that if the survey teams had included one person with a demining background for the community interviews, the results would have been more accurate.³⁷ In 2007, at EMAO's request, Norwegian People's Aid (NPA) trained their survey teams to conduct technical and general survey in the SHAs identified by the LIS.³⁸ As of April 2009, these surveys were continuing.³⁹

There is no nationwide or systematic mine/ERW casualty data collection for Ethiopia and data is not readily shared between mine action actors. The extent to which EMAO collects casualty data was not clear.⁴⁰ There was no standard format or mechanism for collecting or storing data. Limited mine/ERW casualty or survivor data was collected separately by the Ministry of Health, Landmine Survivors Network Ethiopia (LSN Ethiopia), and RaDO. The Central Statistics Agency of Ethiopia collects data on persons with disabilities. There is only limited sharing of data between stakeholders in the disability sector.⁴¹

³⁹ Article 7 Report, Form C, 30 April 2009.

⁴⁰ Telephone interview with Helena Ruud, UNICEF, 13 August 2009.

⁴¹ Government of Ethiopia "Draft Victim Assistance Status Report," provided by email from Assefa Ashengo, Head, Rehabilitation Affairs Department, MoLSA, 15 August 2009.

The MoH, in cooperation with the World Health Organization (WHO), has operated an injury surveillance system in six hospitals in Addis Ababa since 2004. The project was expanded to Afar, Benishangul-Gumuz, Gambella, and Somali regions and Dire Dawa city by 2009 and was planned to be implemented nationwide by 2010. MoLSA and LSN Ethiopia were involved in designing a census questionnaire component on disability for the Third National Population and Housing Census 2007: the census included questions on cause of disability, including war injury. As of August 2009, MoLSA had not reported the results. In early 2008, a RaDO survey of 135 mine-affected villages in the Tigray region found 343 mine/ERW casualties, including 14 recorded in the past year. As of June 2009, LSN Ethiopia had registered 2,084 amputees, including some who were not mine survivors.⁴² LSN Ethiopia did not collect recent mine/ERW casualty data for 2008–2009.⁴³

The GICHD/UNICEF needs assessment for the Somali region reported that only half of all survivors interviewed had received medical care and just 1% had received physical rehabilitation.⁴⁴ The assessment was not endorsed by the government and thus could not be used subsequently for program implementation purposes.⁴⁵

Plans

Strategic mine action plans

Even though the decree that established EMAO did not explicitly require a strategic plan, in August 2005 EMAO completed a strategic plan for 2006–2011. The draft strategy reportedly sets the following goals:⁴⁶

- elimination of the socio-economic impact of mines and UXO in affected communities;
- provision of RE to affected communities to reduce the number of victims;
- building of a competent mine action program; and
- creation of a mine information system capacity to assist planning of demining and RE, and to provide full information to other developmental actors.

EMAO stated that it would revise its strategic plan after completion of the technical surveys, scheduled for before the end of 2009.⁴⁷

UNDP mine action project objectives include: to return and promote long-term reintegration of internally displaced people; to stabilize peace in war-affected areas of Afar and Tigray; and to improve food security through creating access to land for affected communities.⁴⁸

Disability action plan

A National Program of Action for Rehabilitation of Persons with Disabilities (1996–ongoing) was under revision in 2008. Reportedly, VA will be addressed in the revised plan to be created by 2010.⁴⁹ Ethiopia has not presented a strategic VA plan. It did report, however, that the Ministry of Foreign Affairs, MoLSA, Ministry of Education, MoH, EMAO, LSN Ethiopia, and other relevant partners “exert coordinated efforts to implement the plan of action.”⁵⁰

Integration of mine action with reconstruction and development

Cleared land in Afar and Tigray regions is said to be made available for common use by community farmers and herders, and in most cases plowing and grazing begins immediately after the handover of cleared land to the community.⁵¹ According to UNDP, the released land was used for farming and grazing and contributed to improved food security in the regions. As a result, UNDP believes mine clearance contributed directly to one of the Millennium Development Goals: the eradication of extreme poverty and hunger.⁵²

Ethiopia’s Plan for Accelerated and Sustained Development to End Poverty (PASDEP) includes provisions for food security for people in highly vulnerable situations, specifically including persons with disabilities. Ethiopia also reportedly adheres to the Continental Plan of Action for the African Decade of Persons with Disabilities (1999–2009).⁵³

National ownership

Commitment to mine action and victim assistance

Ethiopia has demonstrated commitment to mine action through the establishment of a mine action center and the use of national resources to address contamination. A UNDP evaluation of mine action in 2006 found that “a high degree of national management, planning and operational

capacity had been developed,” and recommended that the national mine action program should transition to national execution in early 2007,⁵⁴ which occurred the same year.⁵⁵

Ethiopia has stated it is committed to its “obligations to meet the aims of the Nairobi Action Plan and to assist landmine survivors and other persons with disabilities” by giving special consideration to survivors and other persons with disabilities living in mine-affected areas.⁵⁶ However, disability is not considered a priority issue in Ethiopia. Disability organizations have stated that MoLSA was not capable of planning and coordinating VA due to a lack of government commitment.⁵⁷ Ethiopia has acknowledged that the disability sector is uncoordinated and lacks direction, funding, and capacity at the regional level.⁵⁸ In 2009, the work of civil society organizations was hampered by a new law setting categories of activities that can be undertaken by NGOs in accordance with their funding sources (national or international).⁵⁹

National efforts in VA for landmine survivors, and assistance for people with disabilities more generally, focus on revision of existing laws and policy frameworks.⁶⁰ MoLSA has a mandate to address issues relating to persons with disabilities, including landmine survivors. Other relevant ministries reportedly also have disability departments. Each region of the country and the two separate city administrations have a Bureau for Labor and Social Affairs (BoLSA) responsible for employment and social issues in addition to coordinating both public and private services for persons with disabilities. Many VA services were supported by international organizations or provided by NGOs or the ICRC.⁶¹

National management

Many EMAO personnel are former Ethiopian army personnel and constitute the core group of technical experts at EMAO.⁶² NPA initiated a project in 2005 with EMAO to enhance EMAO’s MDD and technical survey/task impact assessment capacities.⁶³ In 2008, the project was extended until 2011⁶⁴ and its office relocated to EMAO’s headquarters.⁶⁵ In May 2009, UNDP reported that it continued to provide support for technical capacity development, project quality assurance, program advice, strategic partnering, and resource mobilization.⁶⁶

During a workshop in 2008, MoLSA, the disability and VA coordination focal point, proposed the creation of an interministerial Disability Council under the Office of the Prime Minister to implement the UN Convention on the Rights of Persons with Disabilities, and the Developmental Social Welfare Policy.⁶⁷ In 2009, this policy, issued in 1996, was being reviewed in order to more adequately address disability and rehabilitation issues, including mine/ERW VA provisions. An *ad hoc* national committee was established to coordinate community-based rehabilitation (CBR) programs.⁶⁸

National mine action legislation and standards/Standing operating procedures

As noted above, EMAO was established through a Council of Ministers' decision in 2001.⁶⁹ National standards for mine clearance operations were adopted in 2001 and revised in 2006.⁷⁰ NPA drafted standing operating procedures (SOPs) for technical survey, which EMAO accepted in October 2006.⁷¹ The SOPs foresee two phases: first, information gathering and analysis through general survey without entering the SHA; and then technical survey to further reduce the polygons by defining the perimeters of the SHA.⁷²

Program evaluations

A GICHD evaluation published in 2007 concluded that EMAO "has performed increasingly well since its establishment. Its demining operations have made a substantial contribution to resettlement and rehabilitation efforts in the war-affected districts ("woredas") of Tigray and Afar regions, delivering significant socio-economic benefits for those regions and promoting Ethiopia's post-war recovery."⁷³

Demining and Battle Area Clearance

EMAO and NPA are the only demining operators in Ethiopia. As of November 2008, the demining capacity was comprised of six manual demining companies, 12 MDD teams, five technical survey teams, and six mechanical demining teams.⁷⁴

In 2006, NPA completed a MDD training facility at Entoto Mountain in Oromia region near Addis Ababa as part of a larger EMAO training center that was under construction. The full training center was scheduled to officially open in late 2009.⁷⁵ From 2007–2008, NPA trained and accredited 38 MDD teams with a capacity of approximately 1,000m² of clearance or verification per day per dog. Three teams have been "retired" leaving 35 active MDD teams.⁷⁶

Identification of hazardous areas

In 2007, five technical survey teams were deployed to the regions of Amhara, Dire Dawa, Oromia, Somali, and Tigray to re-survey SHAs identified by the LIS.⁷⁷ As of August 2009, EMAO had surveyed 1,047 SHAs from the LIS and confirmed 164 as mined areas. They also identified 40 new SHAs. The technical surveys applied NPA/EMAO land release concepts which break SHAs into smaller demining tasks and polygon sets.⁷⁸ As of August 2009, 925 SHAs had been cancelled totaling more than 597km² of estimated area.⁷⁹

Preliminary survey results as of August 2009⁸⁰

Region	No. of SHAs surveyed	Land released (m ²)	Confirmed mined area (m ²)
Somali	361	511,197,341	29,983,755
Tigray	234	40,750,015	5,461,701
Afar	214	38,226,465	355,667
Oromia	118	5,242,661	209,661
Amhara	114	1,933,202	13,475
Benishangul-Gumuz	19	223,994	13,175
Dire Dawa	14	30,043	413,449
Gambela	9	0	0
Harer	3	0	200,000
Addis Ababa	3	0	29,054
Total	1,089	597,603,721	36,679,937

Demining and battle area clearance in 2007 and 2008

Ethiopia did not formally report clearance results for 2008, although Landmine Monitor extrapolation from available data suggests clearance of 4.46km². According to NPA, in 2008 MDD teams cleared 1,630,342m² and found 13 antipersonnel mines, four antivehicle mines, and 129 items of UXO in Gemhalo, Tigray region, and Togochale, Somali region.⁸¹ In the first quarter of 2009, NPA MDD teams cleared a further 500,000m², during which 19 items of UXO were found.⁸²

In 2007, Ethiopia reported it cleared 7.54km² of mined areas and that the total SHA for the country had been reduced by 122.11km².⁸³ In June 2008, Ethiopia reported it had released 375km² through technical surveys and rapid response teams since 2002.⁸⁴ During clearance operations since 2003, 5,713 antipersonnel mines, 722 antivehicle mines, and 97,148 items of ERW have been destroyed.⁸⁵

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Ethiopia is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 June 2015. In April 2007, Ethiopia informed States Parties that high-priority mined areas would be cleared by 2010 and the remaining areas by its Article 5 deadline.⁸⁶ In June 2008, Ethiopia reiterated that it “firmly hopes to fulfill its Article 5 obligations by 1 June 2015.”⁸⁷ In November

⁸⁶ Statement of Ethiopia, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 25 April 2007.

⁸⁷ *Ibid*, 5 June 2008.

2008, however, Ethiopia cited security problems in the regions as a possible impediment to mine clearance operations and meeting its Article 5 obligations by the June 2015 deadline.⁸⁸

Demining from 2003–2008⁸⁹

Year	Mine clearance (km ²)	Battle area clearance (km ²)	Area released by survey (km ²)
2008	4.46	0.00	475.49
2007	7.54	4.74	122.11
2006	11.42	0.00	Unknown
2005	11.00	0.00	7.06
2004	7.00	2.00	1.70
1999–2003	Unknown	Unknown	Unknown
Total	41.42	6.74	606.36

Risk Education

RE remained very limited in 2008. RE was delivered by EMAO, alongside clearance, and by RaDO. UNICEF support to the Tigray BoLSA ended in 2007.⁹⁰

RaDO conducted RE for Sudanese refugees in four camps in collaboration with the Administration for Refugees and Returnees Affairs and the Office of the UN High Commissioner for Refugees (UNHCR). RE was delivered through community meetings, house-to-house visits, and the media. Training of trainers was conducted through existing community networks: women's associations, youth associations, schools, clubs, churches, social workers. A total of 1,227 trainers were trained, and 87,958 beneficiaries reached.⁹¹

RaDO's RE materials were developed to be language appropriate and culturally sensitive to southern Sudanese communities. The materials were cloth banners, posters, leaflets, carry bags, and wall murals. They were distributed to the trainers for use as aids, and to community leaders during repatriation for use in education sessions at screening points, assembly points, and way stations by already-trained members of repatriation teams.⁹² Monitoring was conducted regularly by RaDO and partners.⁹³

The GICHD/UNICEF needs assessment concluded that RE was needed in Somali region due to the high number of casualties and ongoing conflict. The communities surveyed had little knowledge of the danger posed by mines/ERW, particularly to children and herders. The assessment recommended the adoption of a participatory community-based approach using local resources, supported by external actors, and taking into consideration lessons learned from RE in Tigray and Afar regions. RE should also support data collection efforts.⁹⁴

Since 1999, RE in Ethiopia has been provided by EMAO, NGOs, and local governments, mainly in Tigray, Afar, and Somali regions, with UNICEF financial and technical support.⁹⁵

Victim Assistance

The total number of mine/ERW survivors in Ethiopia is unknown, but is at least 7,275, according to the LIS.⁹⁶ Little concrete progress in providing services to mine/ERW survivors was reported for 2008. Challenges in providing adequate services for persons with disabilities, including mine/ERW survivors, in Ethiopia included a lack of resources, a lack of trained personnel, and inadequate enforcement of existing legislation. Communication between national and international organizations was also poor.⁹⁷

The emergency medical care system in Ethiopia remained inadequate to meet the needs of people with traumatic injuries, including mine/ERW survivors. There was insufficient medical staff, including a lack of doctors trained in emergency care. Some progress in national emergency response coordination was reported with the establishment of an emergency unit at the MoH and the completion of new blood banks in all regions of the country.⁹⁸

Ethiopia continued to improve coverage in the health sector and build the capacity of health services through the Health Sector Development Program (Phase III 2005–2010).⁹⁹ Yet shortages in medicine, supplies, and staff persisted. In part, this was due to a focus on quantity rather than quality in the program. The MoH was reportedly aware of these challenges and constraints, including an acute lack of adequate funding to fulfill plans. Reporting in mid-2008 indicated that overall national use of the health system had decreased slightly since 2004. Although no conclusive data was available, explanations for this decrease included the introduction of user fees deterring poor people from accessing the system and a lack of understanding or implementation of the fee waiver, as well as an increased number of private sector health providers.¹⁰⁰ Healthcare coverage in some areas was hampered by the volatile security situation. This prevented expansion, upgrades, and maintenance of health services in the Somali region, which fell behind national targets. In Oromia, the most densely inhabited region, healthcare services fell behind other large regions, leaving serious gaps in coverage.¹⁰¹

Access to physical rehabilitation services remained difficult due to the limited number of centers. Many persons with disabilities could not afford transportation or accommodation during treatment.¹⁰² Particularly in eastern Ethiopia, including in Dire Dawa and Somali regions, there was a lack of physical rehabilitation services, combined with inadequate awareness about physiotherapy and rehabilitation in general.¹⁰³ The Social Welfare Development Directorate of MoLSA is responsible for coordinating rehabilitation services for persons with disabilities.

Ethiopia had 13 centers run by the government and NGOs providing physical rehabilitation and prosthetic-orthopedic devices. Regional BoLSAs supervised six centers in different parts of the country. Some NGO-run outreach programs existed to assist people without access to centers. A sustainability study in early 2007 recommended the development of a national physical rehabilitation strategy, which MoLSA planned to complete by 2010, for distribution to relevant government offices, including BoLSAs, in 2011. The strategy is being drafted in collaboration with the ICRC.¹⁰⁴ Throughout 2008, the ICRC provided support to MoLSA in developing the strategy.¹⁰⁵ WHO was working with relevant disability and rehabilitation stakeholders to expand CBR implementation in Ethiopia.¹⁰⁶

Psychological support services are limited in Ethiopia and are mostly provided by NGOs, including peer support services. Some psychiatric services are provided by the MoH, but these were largely confined to Addis Ababa. There are no clinical psychologists in Ethiopia. Reportedly psychiatric nurses are distributed throughout the country and other health workers receive some mental health support training.¹⁰⁷

No concrete improvement was reported in economic reintegration for persons with disabilities, including mine/ERW survivors. Limited economic reintegration activities have been exacerbated by extreme poverty, conflict, and geographic obstacles. Access to vocational training and micro-credit institutions is limited by strict eligibility criteria and interest rates.¹⁰⁸

Government-run centers under BoLSAs provide some vocational training to persons with disabilities, including mine/ERW survivors. Vocational training and income-generation opportunities were also provided by NGOs and the Ethiopian Red Cross. Some economic reintegration opportunities for persons with disabilities were supported by the International Labor Organization and international donors. Employment quotas reportedly existed, but were not implemented. The government reportedly tried to raise awareness among employers and civil service institutes for the increased employment of persons with disabilities.¹⁰⁹

Ethiopian law does not mandate equal rights for persons with disabilities. Reportedly the government devoted few resources to rehabilitate or assist persons with disabilities or provide services for them. Persons with disabilities sometimes reported discrimination in work and wages. Women with disabilities were more disadvantaged than men in education and employment.¹¹⁰ Furthermore, inadequate enforcement of existing legislation sustained negative attitudes to persons with disabilities. In 2008, a proclamation was passed to provide equal employment opportunities for persons with disabilities, prohibit discrimination, and require employers to adapt to the needs of employees with disabilities, with recourse to legal action and penalties.¹¹¹

Ethiopia signed the UN Convention on the Rights of Persons with Disabilities on 30 March 2007, but as of 1 July 2009 had not ratified it, nor had it signed the Optional Protocol.

Progress in meeting VA26 victim assistance objectives

Ethiopia is one the 26 States Parties which are members of the VA26 group of States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors. As part of its commitment to the Nairobi Action Plan, Ethiopia developed 2005–2009 VA objectives which were presented at the Sixth Meeting of States Parties in 2005.¹¹² Objectives for 2005–2009 have not been formally revised and failed to meet the SMART criteria (specific, measurable, achievable, relevant, and time-bound). No plans to achieve the objectives were reported and Ethiopia did not formally report on progress related to the objectives in 2008–2009.¹¹³ A revised draft status report provided to Landmine Monitor indicated that although progress in VA has been noted by Ethiopia, it did not correlate with the objectives presented in 2005. Ethiopia was developing new or revised objectives for the period 2009–2010.¹¹⁴

¹¹⁴ “Draft Victim Assistance Status Report,” provided by email from Assefa Ashengo, MoLSA, 15 August 2009.

Ethiopia did not make statements regarding VA progress and challenges at the Ninth Meeting of States Parties in 2008 or the intersessional Standing Committee meetings in May 2009. Ethiopia participated in the workshop on advancing landmine VA in Africa, held in Nairobi from May–June 2005. In November 2006, MoLSA co-hosted a workshop to discuss mine VA in Ethiopia. In August 2007, a VA-focused roundtable was convened by MoLSA to discuss future measures.

Ethiopia included a VA/disability expert on its delegation to the intersessional Standing Committee meetings in 2008 and the Seventh Meeting of States Parties. Ethiopia reported on challenges in achieving the aims of the Nairobi Action Plan, and on its VA activities more generally, at the Standing Committee on Victim Assistance and Socio-Economic Reintegration in 2008 and at the meetings of States Parties in 2007 and 2008.

In June 2008, Ethiopia presented a report on the Status of Victim Assistance to the Standing Committee on Victim Assistance and Socio-Economic Reintegration. In 2007, Ethiopia used Form J in its initial Article 7 report and in its Article 7 report submitted in 2009, to provide details on VA.

Victim assistance activities

The National Orthopedic Center (NOC) at the Black Lion Hospital in Addis Ababa, inaugurated in October 2007, was not fully operational as of July 2009, although the physiotherapy unit was operational. The Prosthetic Orthotic Center (POC) of Addis Ababa remains the largest prosthetic center and the national referral center, pending the NOC becoming fully operational. In 2009, the organizational structure of the POC was being revised and would probably result in its merger with the NOC, under coordination of the Medical Faculty of Addis Ababa University. ICRC support to the POC had been phased out and by 2008 the center was using local products for manufacture. In 2008, the POC assisted 130 mine/ERW survivors, of whom 116 received prostheses (among the 528 prostheses produced).¹¹⁵

The ICRC and regional authorities held a seminar for health professionals on treating weapon-wounded patients in Tigray. The ICRC faced restrictions in carrying out its mandate in Ethiopia and reduced its set-up and program, concentrating activities in Tigray. In 2008, the ICRC was not granted permission to resume work in the Somali region after having been expelled in July 2007.¹¹⁶ In 2008, the ICRC supported six rehabilitation centers (Assela, Arabaminch, Bahirdar, Cheshire Services Ethiopia, Dessie, and Mekelle) with materials and components, technical support, and on-the-job training. In 2006–2007 it supported eight centers. The ICRC covered transportation, accommodation, and other costs for mine/ERW survivors and other war amputees. ICRC support to the Harar center ended in October 2007 and the center has not been operational since. The ICRC-supported centers delivered 520 prostheses to mine/ERW survivors (of 1,959 total prostheses delivered) and 65 orthoses to survivors (of 2,874 in total). This total was a decrease from 2007, due to the termination of support to the POC and Harar centers. Yet the six ICRC-assisted centers increased service provision by about 25%.¹¹⁷

Ethiopia views the peer support services by LSN Ethiopia through trained peer counselors as an integral part of national capacity for providing psychological support to mine/ERW survivors.¹¹⁸ LSN Ethiopia assisted a total of 644 mine/ERW survivors in 2008. It supported 339 people through its peer-to-peer support program, 139 through social reintegration, 66 through loans/micro-credit, 15 through income-generating activities and eight received educational support. In addition, five survivors were referred for emergency medical care and eight received continuing

¹¹⁵ Data from interview with Yohanes Berhanu, Manager, POC, Addis Ababa, March 2009, provided by email from Ambachew Negus, RaDO, 17 June 2009; and telephone interview with Yohanes Berhanu, POC, 5 August 2009.

¹¹⁷ Data from interview with Marc Zlot, Head of Orthopedic Programme, ICRC, Addis Ababa, March 2009, provided by email from Ambachew Negus, RaDO, 17 June 2009; and ICRC, “Physical Rehabilitation Programme: Annual Report 2008,” Geneva, May 2009, pp. 25–26.

¹¹⁸ “Draft Victim Assistance Status Report,” provided by email from Assefa Ashengo, MoLSA, 15 August 2009.

medical care, 35 received prosthetics, and 20 survivors received other services.¹¹⁹ In 2008, LSN Ethiopia held a workshop for health experts on including psychological support in hospitals and workplaces to raise awareness of the possibility of employing mine/ERW survivors; this led to some beneficiaries gaining employment.¹²⁰

In 2008, RaDO provided physical and social rehabilitation services in six refugee camps in west and east Ethiopia for Sudanese and Somali refugees and the surrounding local population, in collaboration with the Administration for Refugees and Returnees Affairs and the Office of the UN High Commissioner for Refugees. RaDO provided various mobility devices and offered vocational training and income-generating activities.¹²¹

Cheshire Services Ethiopia provided rehabilitation services and orthopedic appliances to persons with disabilities, mainly children, in 2008. It provided rehabilitation services through its center just outside Addis Ababa as well as outreach and CBR programs in Dire Dawa and Addis Ababa. The appliances it provided were included in ICRC reporting. Outreach by Cheshire Services Ethiopia reaches eight regions of Ethiopia, in collaboration with MoLSA and MoH.¹²²

The Tigray Disabled Veterans Association (TDVA) continued to support the service capacity of the Mekelle Orthopedics and Physiotherapy Center, which provided vocational training and access to credit, self-employment, and income-generation opportunities. TDVA carried out several projects specifically supporting war veterans with disabilities and their families in 2008, including developing cooperatives in rural and semi-urban areas of Tigray region, supporting entrepreneurship for women with disabilities and sponsoring education for persons with disabilities and their children.¹²³

In October 2008, Handicap International (HI) began a two-year project to increase and improve physical rehabilitation services in Dire Dawa and Somali regions. Physiotherapy units of public hospitals in Dire Dawa and Jijiga receive equipment and HI provides technical support and training to four graduate physiotherapists. The project did not have data on the number of mine/ERW survivors among beneficiaries for 2008, but intended to collect such data for 2009.¹²⁴

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates for meeting mine action needs (including RE and VA) in Ethiopia. The national mine action program was established using a combination of national funds and a World Bank loan.¹²⁵ Authority for mine action strategy and implementation, aside from VA activities, rests with EMAO.

National support for mine action

Ethiopia did not report national mine action funding in 2008. In 2007, the GICHD evaluation of Ethiopia's mine action program reported an annual contingency budget of ETB17 million to 20 million (\$1,941,400–\$2,284,000) for mine action, most of which had not been spent.¹²⁶

International cooperation and assistance

In 2008, 10 countries and the EC reported providing \$18,942,638 (€12,863,397) to mine action in Ethiopia. This represents more than double what was reported in 2007. The EC continued its ongoing support to UNDP in Ethiopia with a €9,750,000 (\$14,357,850) contribution in 2008. Funding at 2008 levels appears sufficient to meet Ethiopia's mine action needs.

2008 International Mine Action Funding to Ethiopia: Monetary¹²⁷

Donor	Implementing Agencies/ Organizations	Project Details	Amount
EC	UNDP, TRANSTEC, ICRC	Mine clearance, VA	\$15,940,415 (€10,824,674)
Norway	NPA	Mine clearance	\$1,405,008 (NOK7,920,000)
Netherlands	UN Mine Action Service (UNMAS), NPA	Unspecified mine action	\$576,780
Finland	NPA	Survey, mine clearance	\$294,520 (€200,000)
Japan	Fund for Barrier-free Mobility	VA	\$232,956 (¥24,016,060)
United States	Via the Centers for Disease Control	Unspecified mine action	\$173,000
United Kingdom	UNDP	Capacity-building, mine clearance	\$83,453 (£45,000)
Austria	LSN	VA	\$4,374 (€2,970)
Total			\$18,710,505 (€12,705,762)

2008 International Mine Action Support to Ethiopia: In-Kind¹²⁸

Donor	Form of In-Kind Support	Monetary Value (where available)
Germany	Mine clearance equipment	\$232,133 (€157,635)
Total		\$232,133 (€157,635)

In addition to the above, the UK reported contributing £50,000 (\$92,725) via the UN Mine Action Service (UNMAS) to support capacity-building, mine clearance, and emergency response in Eritrea and Ethiopia, but did not differentiate funds to Ethiopia.¹²⁹

GAMBIA

Ten-Year Summary

The Republic of the Gambia became a State Party to the Mine Ban Treaty on 1 March 2003. It has not enacted national legal measures to implement the treaty. The Gambia has never submitted its initial Article 7 report, due in August 2003. It submitted a voluntary report in August 2002, declaring that it did not possess a stockpile of antipersonnel mines.

It is not known to what extent the Gambia is contaminated with landmines. It has not formally reported a problem, although a mine blast was reported by the media in December 2007 close to the border with the mine-affected Casamance region of Senegal. Its Article 5 deadline for clearance of antipersonnel mines in mined areas is 1 March 2013.

Landmine Monitor has identified three mine casualties (two killed and one injured) occurring in the Gambia between 1999 and 2008. In response to the influx of refugees crossing from Senegal, risk education was provided in 2007 and 2008 to border communities in the Gambia. Services for persons with disabilities remain limited. Access to healthcare in some rural areas is difficult.

Mine Ban Policy

The Gambia signed the Mine Ban Treaty on 4 December 1997. While it completed domestic ratification of the treaty on 2 November 1999, the instrument of ratification was not deposited until 23 September 2002. The Gambia became a State Party on 1 March 2003. In 2002, the Gambia reported its intent to incorporate the Mine Ban Treaty into its domestic laws, but no progress on national implementation legislation has since been reported.¹

The Gambia did not attend the Ninth Meeting of States Parties in Geneva in November 2008, or the intersessional Standing Committee meetings in May 2009. The Gambia has not made known its views on key matters of interpretation and implementation related to Articles 1, 2, and 3 of the Mine Ban Treaty (joint military operations with states not party to the treaty, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

As of 1 July 2009, the Gambia had not submitted its initial treaty-mandated Article 7 transparency report, due 27 August 2003. It is one of only three of the 156 States Parties that have not submitted an official Article 7 report. Prior to ratifying the Mine Ban Treaty, the Gambia submitted a voluntary report on 28 August 2002, in which it declared that it has never possessed antipersonnel mines.²

The Gambia is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions in December 2008, but had not ratified it as of 1 July 2009.³

Scope of the Problem

Contamination

The Gambia has seemingly been contaminated by mines as a result of spillover from ongoing violence in the Casamance region of Senegal,⁴ as evidenced by the 2007 mine blast in the Gambia's Western division (see Casualties section below).⁵ Villagers subsequently claimed

⁴ See, for example, Overseas Security Advisory Council, "The Gambia 2009 Crime & Safety Report," 31 March 2009, www.osac.gov. For details on the conflict in Casamance, see the report on Senegal in this edition of Landmine Monitor; and see also *Landmine Monitor Report 2007*, pp. 596–597.

⁵ Modou Jonga, "Gambia: 3 Months After Gilanfari Landmine Explosion, No Sign Of De-Mining," *Foroyaa Newspaper* (Serrekunda), 7 April 2008, allafrica.com.

that it was no longer safe to graze cattle in the area and that the incident had sent “a wave of fear” through their communities.⁶ No explosions have since been reported, however, and the government has not formally declared the area contaminated.

Casualties

There were no reports of new mine or explosive remnants of war (ERW) casualties in the Gambia in 2008 or to 31 May 2009.⁷ The only mine incident ever reported in the Gambia occurred in December 2007, when two children were killed and one injured in Gilanfari, a village on the border with Senegal’s Casamance region.⁸ Also in December 2007, there was an unconfirmed media report of another incident in which a mine killed one man and injured another. Landmine Monitor could not verify this information and did not include the incident in casualty figures.

In May 2008, at least one Gambian was injured in Casamance when a Gambian-registered bus drove over a mine; in total there were 21 casualties in this incident.⁹ In March 2002, one Gambian was killed in a mine explosion in Casamance.¹⁰

In February 2009, at least 10 Gambian mine casualties (seven killed and three seriously injured) occurred in Libya when the vehicle in which they were traveling detonated a landmine in a remote area near the Niger-Libya border. The group of illegal migrants was trying to reach Europe.¹¹

Results of a Voluntary Services Overseas report published in June 2009 estimated there were approximately 33,000 persons with disabilities in the Gambia (or 1.8% of the population).¹²

Program Management and Coordination

There is no formal mine action structure in the Gambia. The army has responsibility for demining. The situation in the Gambia does not warrant specific victim assistance programs. Disability issues do not fall under any government agency, although the Department of State for Health and Social Welfare is responsible for supplying wheelchairs received from donors.¹³

Demining

There is no formal mine action program in the Gambia. In late December 2007, the Gambian Armed Forces (GAF) Public Relations Officer, Lieutenant Alagie Sanneh, noted that sufficient time was needed to study the patterns of mines laid. While noting that the army had enough trained personnel, Lt. Sanneh said that landmine incidents were uncommon in the Gambia and that the army was not readily equipped to deal promptly with them.¹⁴ In 2007, 30 deminers from the Gambia received training in mine clearance at the International Mine Action Training Centre in Nairobi, Kenya.¹⁵

¹⁵ Email from Ben Remfrey, Global Operations Director, Mines Awareness Trust, 23 June 2008.

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, the Gambia is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2013. As a first step, the Gambia should report formally on the extent of the problem to other States Parties and, if necessary, request assistance to initiate a demining program.

Risk Education

In 2008, the Nova Scotia Gambia Association (NSGA) continued the mine/ERW risk education (RE) program started in 2007 in Foni, Western division. They worked in cooperation with village committees, showing educational films and giving interactive presentations.¹⁶ Some 13,950 people in 34 border communities were reached in 2008.¹⁷ Target groups included Senegalese refugees and border communities, mainly children and women, farmers, and traders.¹⁸

NSGA and UNICEF installed 43 mine/ERW RE billboards warning members of local communities as well as people crossing the border; 1,280 RE posters and 2,000 leaflets were also distributed.¹⁹

NSGA received technical and financial support from UNICEF and worked in close cooperation with the GAF.²⁰ While no evaluation of the effort has been conducted, NSGA believes that RE played a crucial role in preventing casualties in 2008–2009.²¹

Victim Assistance

The estimated number of survivors is unknown but is at least five (one injured inside Gambia, four outside Gambia). Mine/ERW survivors receive the same services as other persons with disabilities, but services are limited.²² Persons with disabilities mostly have to rely on the support of their families, some disability organizations or charity. The National Rehabilitation Center is not able to cope with the demand, and disabled people's organizations often have resource challenges. Additionally, there is a lack of disability awareness and knowledge about service providers.²³

Begging is said to be one of the main sources of income for most persons with disabilities.²⁴ Some social discrimination was reported against severely disabled persons, but "persons with less severe disabilities were accepted fully in society and they encountered very little discrimination in employment for which they were physically capable," according to the United States Department of State.²⁵

Access to basic health services remained problematic in some rural areas, and a lack of adequate human resources was a concern.²⁶ The government reported that every year, 50% of the trained Gambian medical personnel left the public sector for the private sector or to work abroad. This trend particularly impacted rural health posts.²⁷

Media reported that two casualties occurring in Libya were treated in the hospital of Sabha, Libya; the third received first-aid in Niger and was then transported to Dakar, Senegal.²⁸

The constitution protects the rights of persons with disabilities.²⁹ As of 1 July 2009, the Gambia had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

GREECE

Ten-Year Summary

The Hellenic Republic (Greece) became a State Party to the Mine Ban Treaty on 1 March 2004. It relies on existing legal measures to implement the treaty. Greece failed to destroy its stockpile of 1.58 million antipersonnel mines by its deadline of 1 March 2008. It did not begin the destruction process until November 2008; had destroyed only 225,962 mines as of May 2009; and hoped to complete stockpile destruction by the end of 2009. Greece retains 7,224 mines for training purposes, but has yet to consume any of them.

Greece has made significant progress in clearing antipersonnel mines from its border with Turkey and expected to complete operations before the end of 2009, well in advance of its 2014 Article 5 deadline for clearance of mined areas.

Between 1999 and 2008, Landmine Monitor identified at least 108 landmine casualties (66 killed and 42 injured); the majority of casualties were non-Greek citizens. There has been no formal risk education program in Greece but minefields are marked and fenced.

Mine survivors received some services, particularly in terms of emergency medical care, but assistance in rehabilitation, psychological support, and socio-economic reintegration are limited. Greece has legislation protecting the rights of persons with disabilities in employment, education, access to health care, and in the provision of other government services. Accessibility legislation was poorly enforced.

Mine Ban Policy

Greece signed the Mine Ban Treaty on 3 December 1997 and ratified it on 25 September 2003, becoming a State Party on 1 March 2004. Ratification makes the Mine Ban Treaty part of Greek domestic law.¹ In 2006, Greece for the first time provided details about its national implementation measures, and specified which parts of existing criminal codes provide penal sanctions for treaty violations.²

Greece attended the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings in May 2009. On each occasion it made statements on its missed stockpile destruction deadline (see Production, trade, stockpiling, and destruction section below) and mine clearance. At the Ninth Meeting, it was named co-rapporteur of the Standing Committee on Mine Clearance, Mine Risk Education, and Mine Action Technologies.

Greece submitted its sixth Article 7 report on 30 April 2009, covering calendar year 2008.³

Greece has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling or transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Greece is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It submitted its annual report required by Article 13 on 3 November 2008. Greece is not party to CCW Protocol V on Explosive Remnants of War.

Greece had not signed the Convention on Cluster Munitions as of 1 July 2009.⁴

¹ Interview with Lt.-Col. Vassilis Makris, Defense Policy Directorate, International Law Section, Hellenic Defense General Staff, MoD, Athens, 13 May 2005.

² Article 7 Report, Form A, April 2006. The information was repeated in the Article 7 reports submitted on 30 April 2009 and 30 April 2008. See *Landmine Monitor Report 2006*, p. 446.

³ Greece previously submitted Article 7 reports on 30 April 2008, 30 April 2007, April 2006, 6 May 2005, and 7 July 2004.

⁴ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 207–208.

Production, trade, stockpiling, and destruction

Greece is a former producer of antipersonnel mines, and also imported them from Germany and the United States.⁵ Prior to becoming a State Party, Greece had a moratorium on the production and export of antipersonnel mines for a number of years.

In its Article 7 reports, Greece has declared a stockpile of 1,566,532 antipersonnel mines composed of five types: M2 (214,374), DM31 (794,400), M16 (553,359), M14 (3,895), and Area Denial Antipersonnel Mine (ADAM) artillery shells (504).⁶ Each ADAM 155mm projectile contains 36 antipersonnel mines thus the 504 shells reported by Greece contain 18,144 mines, bringing the stockpile total to 1,584,172. An army official told Landmine Monitor that ADAM mines, which contain traces of depleted uranium, pose a problem because they must be frozen before destruction.⁷

Greece did not meet its 1 March 2008 deadline for destruction of its stockpile of antipersonnel mines, and remains in violation of the treaty. It gave repeated assurances throughout 2007 that it would meet the deadline.⁸ In November 2007, Greece informed States Parties that it had “contracted a specialized private company” to destroy the mines, and said, “Our goal is to complete the destruction within the set deadline. You will be kept informed on the progress.”⁹ The deadline came and went without further communication to States Parties from the government.

In its 30 April 2008 Article 7 report, Greece stated: “The stockpiled Antipersonnel Mines (APM) have already been gathered and transferred in 26 final sites, from which they will be collected by the tendered private company, in order to be destructed.”¹⁰

In June 2008, at the intersessional Standing Committee meetings, Greece informed States Parties that it had missed the deadline, but did not provide an explanation, citing only “complex and time consuming procedures, which were further delayed by changes intervened [sic].” Greece stated that the contract with Hellenic Defense Systems SA had still not been finalized, but was undergoing an audit and legal review.¹¹

In June 2008, officials told Landmine Monitor that the delays had been caused by “legal parameters,” as well as environmental concerns that required special destruction facilities. They said that the facilities and legislation needed for the destruction were in place and that no further delays were expected.¹² The official military order for the destruction of the mines had been signed earlier in June,¹³ and the contract was finally signed on 25 June 2008.¹⁴

On 1 August 2008, Landmine Monitor was informed that preparations were underway to initiate the transfer of the mines to Bulgaria, where the Videx company would destroy the mines.¹⁵ Greece also wrote to the President of the Eighth Meeting of States Parties, stating that it would complete the destruction of all stockpiled antipersonnel mines no later than 28 May 2009.¹⁶

⁵ Greece has stated, “Upon ratification of the Ottawa Convention, there were not any anti-personnel mine production facilities whatsoever in Greece.” Article 7 Report, Form E, 30 April 2007.

⁶ Most recently, Article 7 Report, Form B, 30 April 2009. The report submitted in July 2004 listed a stockpile total of 1,565,532.

⁷ Interview with Lt.-Col. Vassilis Makris, MoD, Athens, 29 March 2006.

⁸ See *Landmine Monitor Report 2007*, p. 401; and statement of Greece, Eighth Meeting of States Parties, Dead Sea, 19 November 2007.

⁹ Statement of Greece, Eighth Meeting of States Parties, Dead Sea, 19 November 2007. In June 2007, Greece confirmed to Landmine Monitor that the tender still was open.

¹⁰ Article 7 Report, Form F, 30 April 2008.

¹¹ Statement of Greece, Standing Committee on Stockpile Destruction, Geneva, 2 June 2008.

¹² Meeting with Greek officials, MoD, Athens, 19 June 2008. Notes by Landmine Monitor.

¹³ “Implementation of the ‘Ottawa’ Treaty,” document provided by the MoD, 19 June 2008.

¹⁴ Statement of Greece, Ninth Meeting of States Parties, Geneva, 26 November 2008.

¹⁵ Telephone interview with Lt.-Col. Pericles Diamantides, Division of Defense Policy, Department of International Organizations, MoD, 1 August 2008.

¹⁶ “Achieving the Aims of the Nairobi Action Plan: the Geneva Progress Report 2007–2008,” Draft, Geneva, 18 August 2008, para. 22.

On 26 November 2008, Greece informed States Parties that 7,488 mines had been transferred to the destruction facility in Bulgaria, and that it believed all mines would be transferred and destroyed by the summer of 2009.¹⁷ The next day, it announced that the first 20,000 antipersonnel mines had been destroyed.¹⁸

In its April 2009 Article 7 report, Greece stated that during 2008, a total of 24,868 stockpiled antipersonnel mines (all DM31) were destroyed, while a total of 107,510 had been transferred to Bulgaria for destruction.¹⁹

On 25 May 2009, Greece told States Parties, “The operation on transfer and destruction... has begun [on 24 November 2008] and will be completed by the end of 2009.” When asked by the ICBL to clarify if both transfer and destruction would be done by the end of 2009, or just transfer, Greece replied that it hoped to be able to announce the completion of destruction by the Second Review Conference in November 2009.²⁰

It went on to say that a total of 1,568,159 mines would be destroyed.²¹ That number is 1,627 more mines than Greece has reported as stockpiling.²² Greece further said a total of 225,962 mines had already been transferred and destroyed and that another 50,000 would be transferred by the end of that week.²³

Mines retained for research and training

In its April 2009 Article 7 report, as well as previous reports, Greece indicated that it will retain 7,224 antipersonnel mines for training and development purposes: M14 (3,780), M2 (1,512), DM31 (1,512), and M16 (420).²⁴ Greece did not use the expanded Form D for reporting on the intended purposes and actual uses of retained mines agreed at the First Review Conference in 2004. However, Greek officials in 2005 and 2006 provided a detailed rationale to Landmine Monitor of how Greece determined its requirement to retain 7,224 antipersonnel mines.²⁵ It claimed that the mines are needed for the army to retain its ability to conduct counter-mine operations; the army must have “the operational ability to lay or to clear a typical minefield of 100 meter width by 60 meters depth, of the minimum possible density as this technical operation is prescribed by NATO field manuals.”²⁶ Any emplacement of antipersonnel mines outside of the specific exceptions in Article 3 is outlawed under the Mine Ban Treaty.

Scope of the Problem

Contamination

Greece is affected by landmines and explosive remnants of war (ERW). The mine contamination consists primarily of 57 minefields laid by Greece in 1974 along the Evros river on the heavily militarized northeastern part of its border with Turkey, and has been maintained since then. A total of 24,751 antipersonnel mines were originally emplaced,²⁷ as well as an unknown number of antivehicle mines; Greece has been removing only the antipersonnel mines since becoming

²⁶ Response to draft Landmine Monitor report by Lt.-Col. Vassilis Makris, MoD, 10 June 2006.

²⁷ Statement of Greece, Ninth Meeting of State Parties, Geneva, 27 November 2008.

a State Party to the Mine Ban Treaty.²⁸ The extent of residual contamination along the border with Turkey has not been reported, but in May 2009 Greece reported that 23,836 emplaced antipersonnel mines had been destroyed across 55 of 57 minefields.²⁹

Contamination elsewhere in the country consists not only of mines, but also of booby-traps and ERW remaining from World War II³⁰ and the 1946–1949 civil conflict in the Western Macedonia and Epirus regions in the north of the country.³¹ The total size of contaminated areas in the north is not known. Greece has reported suspected areas covering 40,000 hectares (400km²).³² A survey in Western Macedonia in 2007, however, found a total of 786 suspected hazardous areas (SHAs), including some mined areas, of which 13 SHAs covering 310,000m² were subsequently cleared, leaving 773 areas to be demined.³³

The Ministry of Defence (MoD) also reported in 2004 that there are other suspected mine/ERW-affected areas on the mainland and various islands.³⁴ No further information has been provided on these areas and this information was contradicted by defense officials in June 2008.³⁵

Greece's Article 13 report under CCW Amended Protocol II refers to areas contaminated by mines in Western Macedonia and Epirus, although it notes that there are "no properly defined minefields in this area and no maps."³⁶ Greece has reported as "void" the section covering "areas suspected to contain mines" in its annual Article 7 reports.³⁷

Casualties

In 2008, there were at least four mine casualties in Greece. The four were Georgians who were killed in September while trying to cross a minefield near the village of Kastanies, Evros prefecture, at the border with Turkey.³⁸ Greece reported that there were "no mine victims among the Hellenic population."³⁹ The last recorded mine casualties occurred in 2006 when four people were killed and five injured (all non-Greek citizens) while attempting to cross the Evros minefields.⁴⁰ A Greek deminer was killed in 2005.⁴¹

No new mine casualties were reported in 2009, as of 31 May.⁴²

The total number of mine casualties in Greece remains unknown. Between 1999 and 2008, the MoD reported 98 mine casualties, including 52 killed and 46 injured. All casualties were non-Greek migrants attempting to cross the Evros minefields.⁴³ However, numbers might be higher: in 2007, the head of the Minefield Clearance Battalion, TENX, was reported saying that "104 illegal immigrants have been killed in Greek minefields since 1995 and another 187 have

⁴³ Ibid.

been severely injured.⁴⁴ The total number of Greek military personnel, including deminers, that were landmine casualties is unknown. However, between 1954 and 2007, at least 31 deminers were killed. From 1954 to 2002, 17 military personnel were injured in clearance operations.⁴⁵

Between 1999 and 2008, Landmine Monitor identified at least 108 landmine casualties, including 66 killed and 42 injured.⁴⁶ The vast majority (105) of casualties were non-Greek, including at least 22 Iraqi nationals, 13 Turks, seven Pakistanis, six Georgian, three Burundian, two Moldovan, two Somali, two Iranian, one Mauritanian, one Palestinian, and one Tunisian. The nationality of 45 reported non-Greek casualties remains unknown. The majority of casualties occurred at the border between Greece and Turkey (102), two at the border with Bulgaria, and the location of four remains unknown. All casualties were caused by landmines.⁴⁷

Risk profile

According to Landmine Monitor data, at-risk groups are illegal immigrants or asylum seekers trying to cross the Evros minefields and, to a lesser extent, military personnel. Greece reported that illegal migrants become casualties “because they are led to the border along the river Evros at night and then instructed to ignore any mine fences and markings and walk into the Hellenic territory. Sometimes they are even aided in cutting the wire and led into minefields.”⁴⁸

Socio-economic impact

In 2007, the ERW-affected areas were said by a defense general staff official to have “no socio-economic impact” on the local population. However, it has also been noted previously that areas cleared in the Grammos and Vitsi mountains are used for pasture and leisure. In a June 2008, meeting with the ICBL, defense officials noted that the mountains were “very beautiful areas for recreation.”⁴⁹ In 2007, forest fires in the mountains resulted in explosions, which impeded fire-fighting efforts.⁵⁰

Program Management and Coordination

There is no national mine action authority or mine action center in Greece.⁵¹ All clearance operations and their management fall under the responsibility of the MoD.⁵² The MoD and the Ministry of Health and Social Solidarity are responsible for ensuring the rights of mine survivors.⁵³ An interministerial committee in February 2007, hosted by the MoD, proposed establishing a survivor assistance committee⁵⁴ but no progress has been reported since.⁵⁵

⁴⁴ See *Landmine Monitor Report 2008*, p. 401.

⁴⁵ *Ibid.*

⁴⁶ See previous editions of Landmine Monitor. *Landmine Monitor Report 2004* reported 10 killed and four injured in 2001, however, this excluded the additional two military deminers killed in 2001, reported in *Landmine Monitor Report 2002*, p. 561. Therefore, in this report, Landmine Monitor has counted 16 mine casualties (12 killed and four injured) in 2001.

Data collection and management

Information on mine action is stored in a database accessible only to the Army General Staff and Defense General Staff.⁵⁶ Civilian and military casualty data is collected by the army.⁵⁷ In 2009, for the first time, the MoD provided details of migrant casualties to Landmine Monitor.⁵⁸ It is possible that casualties have been under-reported.⁵⁹

Plans

Strategic mine action plans

In June 2008, the MoD provided Landmine Monitor with a document in which it revealed plans to clear seven of the remaining 17 minefields in 2008, four in 2009, and six in 2010.⁶⁰ In May 2009, however, Greece reported to the Standing Committee meetings that it would complete its demining obligations by the end of year, five years in advance of its Article 5 clearance deadline.⁶¹

National ownership

Greece has been efficient in clearing antipersonnel mines along its border with Turkey in accordance with the strict requirements of the Mine Ban Treaty. National mine action legislation has not been adopted.

Greece has reported that the MoD complies with NATO standards for demining⁶² and that it takes into account international mine action standards.⁶³

Demining and Battle Area Clearance

Most clearance in Greece has been carried out by the military.⁶⁴ In September 2007 to September 2008, Greek military engineering forces cleared 3,350 antipersonnel mines along Greece's border with Turkey (the area cleared was not reported) as well as 926,575m² in the regions of Western Macedonia and Epirus in the northwest of the country.⁶⁵ In 2007, a Greek commercial company, P.A.S.S. Defence, was contracted by the Western Macedonia regional authority to survey suspected land in that region and to clear 310,127m² of land confirmed to be contaminated.⁶⁶

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Greece is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2014. Progress in meeting this obligation has been efficient, with clearance of antipersonnel mines along its border with Turkey reported to be almost completed as of May 2009, well in advance of its Article 5 deadline.

Questions remain, however, about the extent of Greece's obligation to clear containing scattered Civil War-era mines elsewhere in the country. Greece's Article 13 report under CCW Amended Protocol II refers to areas contaminated by mines in Western Macedonia and Epirus, though it notes that there are "no properly defined minefields in this area and no maps."⁶⁷

⁶⁷ Article 13 Report, Form B, 3 November 2008.

Greece has reported as “void” the section covering “areas suspected to contain mines” in its annual Article 7 reports.⁶⁸

Risk Education

There is no formal risk education (RE) program in Greece. Greece reported that “all minefields along the border with Turkey in the Evros province are clearly defined and marked, well above any standard established by Amended Protocol II and the relevant NATO STANAGs [Standardization Agreements].”⁶⁹ It also stated that “all minefields have a double fence and that “barbed wire was added to almost all the minefields of Evros.”⁷⁰ The minefields are signposted in English and Greek⁷¹ but are not always clearly visible.⁷² The Commissioner for Human Rights at the Council of Europe expressed concern that “no action has been taken to avert other deaths.”⁷³ One survivor reported that some parts of Evros minefields are not clearly signposted.⁷⁴

Victim Assistance

The total number of mine/ERW survivors in Greece is unknown. The vast majority of casualties are people trying to enter Greece illegally. The head of the clearance battalion reported that some 187 non-Greek citizens had been injured between 1995 and early 2007.⁷⁵ There are no recent or reliable figures concerning Greek mine/ERW survivors. As of July 2009, there were four known landmine amputees residing in Greece. All were foreign nationals.⁷⁶ It is not known how many other mine survivors have left the country.⁷⁷

In its Article 7 report submitted in 2009, Greece stated that it “offers, free of charge, health treatment through its National Health System to any person injured by landmines, irrespective of their legal status.”⁷⁸ Some support has been provided to survivors, particularly in terms of emergency medical care, but Landmine Monitor found no evidence of full rehabilitative assistance made available to all known survivors.⁷⁹ In 2008, during a visit to Evros prefecture, the Commissioner for Human Rights of the Council of Europe reminded Greece that “the authorities must provide a prompt and generous assistance [sic] to all mine victims, especially migrants.”⁸⁰

Mine casualties at the Evros border are evacuated and receive first-aid delivered by military personnel.⁸¹ They are treated at the hospital of Alexandroupolis or “other major hospitals” in northern Greece free of charge.⁸²

⁸² Article 13 Report, Form B, 3 November 2008; and *Landmine Monitor Report 2007*, p. 405.

Continuing medical care for mine/ERW survivors remains problematic. In 2009, Greece maintained that rehabilitation of survivors, including provision of prosthetics, is undertaken by the military hospitals following the consent of the Ministry of Health and Social Solidarity.⁸³ However, survivors reported that, in practice, they have to cover the costs of their healthcare and medicines or rely on the assistance of private citizens.⁸⁴ Negotiations for an agreement between ministries to cover the cost of prosthetic devices for mine survivors began in 2006, but no significant progress was reported as of July 2009.⁸⁵

There were no psychological support or socio-economic reintegration opportunities for survivors.⁸⁶ One survivor received a Greek language course organized for migrants and a computer class paid for by a private citizen.⁸⁷ Special education for persons with disabilities remains limited.⁸⁸ Unemployment remains a major social problem for persons with disabilities, with estimated 80% of disabled being unemployed.⁸⁹ In 2008, the deputy ombudsperson for social welfare handled complaints related to persons with disability on employment, social security, and transportation.⁹⁰

Survivors with “humanitarian refugee”⁹¹ status may be eligible for a small disability benefit.⁹² As of July 2009, two survivors with refugee status received financial support⁹³ of about €270 (US\$398) every two months.⁹⁴ Survivors without clear residency status rely on sporadic contributions from state institutions or public donations.⁹⁵

The Ministry of Interior reported that asylum applications by mine survivors are generally a top priority and deportation is excluded in such cases.⁹⁶ However, human rights activists feared in the past they might have been deported.⁹⁷ In 2008, the Council of Europe found “grave and systemic deficiencies in the Greek asylum practice” and stressed the need to improve refugee protection and access to the asylum procedure, especially in border areas, such as Evros.⁹⁸

In 2008, the Medical Center for the Rehabilitation of Torture Victims did not provide any support for mine survivors.⁹⁹ In 2007, it had channeled Ministry of Health and Social Solidarity funds for rent payments of survivors.¹⁰⁰

¹⁰⁰ See *Landmine Monitor Report 2008*, p. 403.

In 2009, the Ministry of Foreign Affairs allocated €17,000 (\$25,034) to landmine survivors in Greece through the ICBL;¹⁰¹ the funds arrived in Greece on 28 August 2009.¹⁰² Consequently, survivors did not receive any state support in the first eight months of 2009.¹⁰³

Greece has legislation that protects the rights of persons with disabilities in employment, education, access to health care, access to buildings, and in the provision of other government services; the legislation is enforced, but access to buildings for persons with disabilities is poorly enforced.¹⁰⁴ There is a general lack of physical accessibility in Greece: only 5% of public buildings are accessible.¹⁰⁵

On 30 March 2007, Greece signed the UN Convention on the Rights of Persons with Disabilities, but not its Optional Protocol. As of 1 July 2009, Greece had not ratified the convention.

GUINEA-BISSAU

2008 Key Data

State Party since	1 November 2001
Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	Unquantified; partial survey in 2007–2008 identified almost 3.2km ² of mined and battle areas
Casualties in 2008	One (2007: eight)
Estimated mine/ERW survivors	At least 798
Article 5 (clearance of mined areas)	Deadline: 1 November 2011
Demining in 2008	Clearance of 0.49m ² of mined areas Clearance of 0.76m ² of battle areas
Risk Education Recipients in 2008	1,159 (April 2008–April 2009)
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$1.7 million (2007: \$4.65 million)

Ten-Year Summary

The Republic of Guinea-Bissau became a State Party to the Mine Ban Treaty on 1 November 2001. Guinea-Bissau has not enacted national legal measures to implement the Mine Ban Treaty, but believes that existing laws are sufficient. Guinea-Bissau completed stockpile destruction in October 2005. Senegalese rebels laid antipersonnel mines in northern Guinea-Bissau in 2006.

Guinea-Bissau continues to make slow progress in clearance of mined areas; it is struggling to meet its Article 5 deadline of November 2011. A 2007–2008 “selective” impact survey identified 80 mine and explosive remnants of war (ERW)-affected communities, but it did not capture the full extent of contamination.

Between 1999 and 2008, Landmine Monitor identified 151 mine/ERW casualties in Guinea-Bissau, (60 killed, 82 injured, and nine unknown). Risk education has been implemented since 2001 but only expanded to cover areas outside the capital in 2006. A lack of funds has restricted efforts to improve and expand the program.

Over the last 10 years, capacity for the care and rehabilitation of survivors has been limited due to extreme poverty and lack of basic services in the country. Between 2004 and 2006, improvements were made to the emergency care facilities in some regional hospitals.¹ In 2004, the ICRC Special Fund for the Disabled began assisting the only physical rehabilitation center in the country.²

Mine Ban Policy

Guinea-Bissau signed the Mine Ban Treaty on 3 December 1997, ratified it on 22 May 2001, and became a State Party on 1 November 2001. In December 2004, the Minister of Foreign Affairs said Guinea-Bissau was planning to enact domestic legislation to implement the treaty.³ Yet, in July 2007 the director of the National Mine Action Coordination Center (Centro Nacional de Coordenação da Accção Anti-Minas, CAAMI) told Landmine Monitor that the government no

¹ See *Landmine Monitor Report 2006*, p. 472.

² ICRC SFD, “Annual Report 2008,” Geneva, April 2009, p. 19.

³ Statement by Soares Sambu, Minister of Foreign Affairs, First Review Conference, Nairobi, 2 December 2004.

longer plans to adopt a new law as it believes that it is sufficient that the treaty automatically became national law under the constitution, making mine-related crimes subject to existing penal sanctions.⁴

Guinea-Bissau submitted an undated Article 7 report in 2009, covering the period from 30 April 2008 to 30 April 2009. Guinea-Bissau previously provided six reports.⁵

Guinea-Bissau attended the Ninth Meeting of States Parties in Geneva in November 2008, where it made statements on mine clearance and victim assistance. It attended the intersessional Standing Committee meetings in Geneva in May 2009, where it made a statement on mine clearance.

Guinea-Bissau has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Guinea-Bissau is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 4 December 2008, but, as of 1 July 2009, had not ratified it.⁶

Production, transfer, stockpiling, and use

Guinea-Bissau has reported that it never produced or exported antipersonnel mines. On 17 October 2005, Guinea-Bissau destroyed the last of its 10,654 stockpiled antipersonnel mines, just ahead of its 1 November 2005 deadline.⁷

In its Article 7 report submitted in 2008, Guinea-Bissau reported retaining 109 mines for training purposes.⁸ However, 100 of these—50 POMZ-2 and 50 PMD-6—were listed as disarmed.⁹ In its report submitted in 2009, Guinea-Bissau listed only nine armed mines as retained for training: six PMN, one M409, and two M969 mines. It reported that the 50 POMZ-2 mines had been recycled for metal use, and the 50 PMD-6 mines had also been destroyed.¹⁰ The Article 7 report submitted in 2009 also stated that no training was currently underway.¹¹

There have been no reports of use of antipersonnel mines in Guinea-Bissau since March and April 2006, when a faction of the Senegal-based Movement of Democratic Forces of Casamance (Mouvement des Forces Démocratiques de la Casamance, MFDC), having fled Senegal into Guinea-Bissau, laid both antipersonnel and antivehicle mines in northern Guinea-Bissau.¹²

⁴ Email from César de Carvalho, General Director, CAAMI, 19 July 2007. This point has been stated in Guinea-Bissau's Article 7 reports. See, for example, Article 7 Report (for the period 30 April 2005 to 30 April 2006), Form A. The report cites Articles 85.1(h), and 68(e) of the Constitution as making the treaty national law, and Article 206 of the Penal Code, which allows sentencing of crimes. Penal Code Article 206(1) prohibits the use of explosives.

⁵ The report submitted in 2008 was also not dated, but covered the period from 30 April 2007 to 30 April 2008. Guinea-Bissau did not submit a report in 2007. The report submitted in 2006 was also not dated, but covered the period from 30 April 2005 to 30 April 2006. Other reports were submitted on 14 June 2005, 13 May 2004, 13 May 2003, and 19 June 2002.

⁶ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 86–87.

⁷ Article 7 Report (for the period 30 April 2005 to 30 April 2006), Forms F and G; and *Landmine Monitor Report 2006*, pp. 461–462. Guinea-Bissau destroyed 4,943 antipersonnel mines on 17 October 2005, 1,000 mines on 12 September 2002, and 4,711 mines in February 1998. There are differences between the numbers of stockpiled mines Guinea-Bissau declared in its previous Article 7 reports and the number destroyed in October 2005.

⁸ Article 7 Report (for the period April 2007 to April 2008), Form D. Guinea-Bissau had made inconsistent statements about its intent to retain mines for training purposes. See *Landmine Monitor Report 2005*, p. 377.

⁹ Article 7 Report (for the period 30 April 2005 to 30 April 2006), Form D. At the time of the final destruction in October 2005, Guinea-Bissau said that it would retain 67 mines. This included 58 disarmed mines (50 POMZ-2 and eight PMD-6) and nine active. Letter to Kerry Brinkert, Director, Implementation Support Unit, GICHD, from César de Carvalho, CAAMI, 20 October 2005.

¹⁰ Article 7 Report (for the period 30 April 2008 to 30 April 2009), Form D.

¹¹ *Ibid.* As in previous years, the report notes that mines retained for training purposes were to be used for “on-going training of military deminers,” and stated that the retained mines are used to “[t]rain military deminers regarding how mines work and in recognition training since these mines are likely to be found around the country.”

¹² For details, see *Landmine Monitor Report 2006*, pp. 463–464. In April 2006, Guinea-Bissau declared that it had ousted rebel forces from its territory. The ICBL condemned the antipersonnel mine use in northern Guinea-Bissau and noted that the MFDC in 1999 signed the Banjul Declaration, which among other things, committed the group to cease using landmines.

Scope of the Problem

Contamination

As a result of armed conflicts dating back to 1963, Guinea-Bissau is contaminated by landmines (both antipersonnel and antivehicle) and ERW. The last known cluster munition remnants were reportedly destroyed by Cleared Ground Demining (CGD) in August 2008,¹³ although Guinea-Bissau's latest Article 7 report refers to "some clusters" at the Paiol da Bra ammunition storage area.¹⁴

An impact survey initiated in October 2007 and completed in May 2008 confirmed 80 affected communities in seven of the country's eight regions: Bafata, Biombo, Cacheu, Gabu, Oio, Quinara, and Tombali.¹⁵ The survey estimated that 12 mined areas covered almost 2.24km² while five battle areas (not including Paiol da Bra) covered 0.93km².¹⁶ According to the survey findings, the most affected regions are Cacheu and Oio in the north, mostly as a result of mine contamination resulting from the Casamance conflict.¹⁷ The survey report states that these regions, "together with Buruntuma in Gabu region, constitute the highest priorities for clearance."¹⁸ By June 2009, however, it was reported by the United States that with its financial support, the local demining NGO Humanitarian Aid (HUMAID) had, "managed to clear the area of Buruntuma (in the northeast of Guinea Bissau on the border with Guinea Conakry) of all land mines."¹⁹

The LIS survey was not able to visit all suspected hazardous areas (SHAs) because of security or access problems: "Some communities were not surveyed due to impassable roads or pathways or due to the existence of potentially dangerous MFDC rebels in the northern region of Oio/Cacheu. Other communities were not found due to the limited information recorded on the original list and the lack of national maps of Guinea-Bissau, [*sic*] detailed questioning of local people could not locate these communities... In addition to these localities other places have been found which were not visited during the LIS...";²⁰ these included a new minefield at Gadamel Porto.²¹

A workshop convened to discuss the findings in 2008 concluded that the LIS "did not reflect the complete reality of the country's contamination by mines and UXO."²² The survey itself acknowledged that it is "not fully comprehensive" and that "further localized survey work in areas of high contamination may reveal other, as yet unsurveyed but ERW/landmine affected communities," but noted that the communities covered by the survey were preselected by national government counterparts.²³

The capital, Bissau, is believed to be clear of mines, but remains contaminated by large quantities of ERW around Paiol de Bra, an ammunition storage area that was bombed during the internal armed conflict.²⁴ Clearance by CGD was expected to be completed by the end of 2009.²⁵

Casualties

One ERW casualty (injured) was identified in 2008: on 26 April, in Paiol da Bra, the former ammunition storage site in the capital of Bissau, a 14-year-old boy was injured while “illegally tampering” with an abandoned explosive.²⁶ He had received mine/ERW risk education.²⁷ The 2008 casualty rate represents a significant decrease from the eight ERW casualties (one killed, six injured, and one unknown) recorded in 2007.²⁸ As in 2007, no landmine casualties were identified in 2008.

The LIS attempted to collect recent casualty data but there was no evidence of deaths or injuries within the prior 24 months in communities surveyed.²⁹

Casualties increased in 2009, with 12 casualties (four killed and eight injured) in two incidents, as of 31 May. On 25 March, in the Bafata region, two boys died when a grenade they were playing with exploded.³⁰ On 29 April, an incident with ERW in the Oio region killed two girls and injured five girls, one boy, and two women.³¹ One girl died on the spot and another died after being evacuated to Bissau hospital. Two other survivors were also evacuated to Bissau and were treated for serious injuries. The remaining six survivors were treated for minor injuries at the local hospital.³² Neither of the communities where the 2009 incidents occurred had been included in the recent LIS.³³

Between 1999 and 2008, Landmine Monitor identified 151 mine/ERW casualties in Guinea-Bissau: 60 killed, 82 injured, and nine unknown.³⁴ It is likely that the number is higher, given the under-reporting of incidents and the complete lack of data from the years immediately following the conflict in 1998–1999. In 2000, for example, Landmine Monitor was unable to report the number of casualties in 1999, stating that “though the number is uncertain, there continue to be mine casualties.”³⁵ Once some figures became available, starting in 2002, reported casualties ranged from 12 to 43 per year until 2007 when there was a decline to eight casualties.³⁶ The unreliability of data and the 12 reported casualties in the first six months of 2009,³⁷ make it impossible to determine a downward trend in annual casualty rates.

As of December 2008, the CAAMI casualty database had registered 1,140 casualties. There was no breakdown of people killed and injured.³⁸ Some 42% of casualties occurred in the south, 38% in the north, and 20% in the east.³⁹ It is believed that these casualties include people hurt by weapons other than mines and ERW,⁴⁰ but at least 847 of the recorded casualties are due to mines/ERW. It is believed that military and demining casualties are not included in this total as the two non-civilian casualties (one military and one deminer) identified in 2007 were not included.⁴¹

Risk profile

As in previous years, livelihood activities, including farming and scrap metal collection, have remained the main reason for risk-taking behavior. Men and adolescent boys are believed to be most at risk, as they traditionally work the land.⁴² In addition, the impact survey found that informal village demining had been conducted by civilians in 23% of communities surveyed.⁴³ HUMAID, cites examples of people entering battle areas when HUMAID personnel were not present and using hammers and chisels to remove the copper bands on unexploded artillery shells.⁴⁴

Socio-economic impact

The survey pinpointed 11 communities that were “high-priority for clearance,” 13 of which were “medium-priority,” and 56 “low-priority.”⁴⁵ More than four-fifths of the affected communities are “compact villages, relying on small-scale agriculture for survival.” Although the overall scale of contamination and impact is “limited,” the impact survey results suggest that clearance will “ameliorate currently blocked or compromised access to agricultural and pasture land for almost half of these communities.”⁴⁶

Program Management and Coordination

Mine action

Guinea-Bissau’s national mine action authority is the National Commission for Humanitarian Demining (Comissão Nacional para Desminagem Humanitária, CNDH), set up in 2001.⁴⁷ CAAMI was also established in 2001 and coordinates mine action operations.⁴⁸

Risk education

CAAMI is responsible for coordinating and monitoring the Education Program to Prevent Mine Accidents (Programa de Educação para a Prevenção de Acidentes com Minas, PEPAM), with support from UNICEF.⁴⁹ In 2008, CAAMI held 20 coordination meetings.⁵⁰

Victim assistance

Guinea Bissau’s victim assistance (VA) program is coordinated by CAAMI, but all activities are supported through international assistance. In 2008, CAAMI’s role in VA was mainly to secure international funding. Because no international funding was secured and no national funds were available or committed, none of CAAMI’s 2008 VA goals were achieved and there were no VA activities in 2008.⁵¹ In 2008, efforts to strengthen national VA capacity consisted of steps to renovate the national rehabilitation center.⁵² The Ministry of Social Solidarity and Poverty Reduction is the main government body addressing disability issues, with responsibilities to provide pensions, specialized education, promote employment, and mobilize international assistance.⁵³

Guinea-Bissau’s National Poverty Reduction Strategy Paper specifically names mine/ERW survivors as a vulnerable group that must be assisted through operational strategies and actions to reduce poverty.⁵⁴ While VA is included with the mine action plan, there is no specific VA plan

and no progress was made towards developing one in 2008.⁵⁵ Guinea-Bissau does not have a general national disability plan.

Data collection and management

The Portuguese edition of the Information Management System for Mine Action (IMSMA) has been installed in CAAMI. It is not known if data from the impact survey has been entered into the database. CAAMI stores casualty data in IMSMA. Prior to 2008, IMSMA was mainly populated using retroactive survey data and information collected by risk education (RE) promoters during community RE sessions.⁵⁶ In 2008, for the first time, details of a casualty were entered into IMSMA at or close to the time of the incident, demonstrating an improvement in the ongoing maintenance of casualty data.⁵⁷

CAAMI receives casualty data from RE promoters, the national Red Cross society, NGOs, hospitals, and through community radio.⁵⁸ It is suspected, however, that not all cases are reported because data collectors (RE promoters) only work where there is ongoing clearance, people do not report to local authorities for fear of punishment,⁵⁹ and there is a very limited presence of healthcare systems to report casualties.⁶⁰

In 2006, with support from the World Health Organization (WHO), CAAMI verified and completed information for all registered casualties using an updated IMSMA form.⁶¹ It is believed that registered casualties do not cover all existing casualties, since there is no national coverage by data collectors or other reporting mechanisms. It was expected that the LIS would increase knowledge of recent casualties that may have been previously unreported but it did not identify any casualties in the surveyed communities, nor did it cover the entire country.⁶²

Plans

Strategic mine action plan

A workshop in 2008 to discuss the LIS findings concluded that although the survey had not captured all the country's contamination, it "can be accepted as a basis for future plans during 2009–2011."⁶³ The UN reported in November 2008 that, with the impact survey data, Guinea-Bissau "is well placed to prepare a revised and focused national mine action strategy and a national mine action operational plan to ensure it addresses its Article V obligations on time."⁶⁴ In November 2008, CAAMI's director stated that an action plan for that period would be developed "later in the year."⁶⁵

UNDP informed Landmine Monitor in early August 2009 that priorities for the program were the effective integration of mine action in the reconstruction of Guinea-Bissau, government involvement in support of mine action to mobilize resources and interaction with other institutions, establishing CAAMI liaison and coordination with the armed forces, gathering reliable information on remaining contamination in the absence of technical survey, and meeting Guinea-Bissau's 2011 Article 5 deadline for mine clearance.⁶⁶

UNDP's aims for the program for 2009 were to: support institutional capacity-building of CAAMI to plan, coordinate, and monitor mine action; a revision of the program and preparation for the completion initiative (including a reduced structure of CAAMI capable of dealing with the residual ERW threat after 2011); and the preparation of a national strategic mine action plan.⁶⁷ In July 2009, a consultant for the Mine Ban Treaty Implementation Support Unit visited Guinea-Bissau to assist them in developing a clearance completion plan.⁶⁸

The goals for RE are: "educating vulnerable communities regarding ways to avoid risk of injury from mines/UXO" and "strengthening the education system to provide MRE to youth and children," along with supporting national capacity and sustainability, ensuring consistency and quality of RE messages, and providing effective coordination of activities.⁶⁹

Integration of mine action with reconstruction and development

There is no evidence of any integration of demining with reconstruction and development in Guinea-Bissau. Guinea-Bissau's National Poverty Reduction Strategy Paper specifically names mine/ERW survivors as a vulnerable group that must be assisted through operational strategies and actions to reduce poverty.⁷⁰

National ownership

Commitment to mine action and victim assistance

Government support to the mine action program has remained minimal. In November 2008, CAAMI's director declared that the program suffered from a lack of government leadership and support prior to the November elections.⁷¹ Guinea-Bissau continues to benefit from considerable international support, although a new UNDP chief technical advisor only started work in May 2009⁷² after a gap of more than one year.

National mine action legislation and standards

Apart from the 2001 decree that created the CNDH,⁷³ no national legislation governing the mine action program has been adopted. In early 2007, it was reported that new national mine action standards were being drafted. No progress has since been reported.⁷⁴ CAAMI has stated that it ensures quality control based on the International Mine Action Standards.⁷⁵

Demining and Battle Area Clearance

There were a variety of national and international demining operators in Guinea-Bissau in 2008. Their main task was to help develop the capacity of the two local NGOs that implement clearance operations. International NGO Landmine Action was partnered with HUMAID, and CGD with LUTCAM, although this situation changed as CGD ended its collaboration with LUTCAM and funded HUMAID's demining activities in Buruntuma in the second half of 2008.⁷⁶ In addition, CGD has a battle area clearance (BAC) team in Bissau and a female Roving Small Arms and Light Weapons Collection Team that works countrywide.⁷⁷ Landmine Action left Guinea-Bissau after completing the impact survey and, as of early July 2009, had not returned, although it was seeking funding for clearance, further survey, and monitoring of armed violence.⁷⁸ The US Department of Defense has contributed trainers and materials to build national explosive ordnance disposal (EOD) capacities.⁷⁹

HUMAID's demining priority in 2008 was to clear mines surrounding the town of Buruntuma. EOD priorities were to complete clearance of the ammunition storage areas at Prabis and Illonde. Work at Prabis was completed during 2008, but some work at Illonde remained to be completed in 2009.⁸⁰

Identification of hazardous areas

According to CAAMI, technical survey will supplement the impact survey results during demining/EOD operations.⁸¹ A working technical survey capacity did not formally exist as of early August 2009.⁸²

Mine clearance in 2008

Demining is primarily manual in Guinea-Bissau.⁸³ Clearance in 2008 focused on the Buruntuma minefield through HUMAID, and on the São Domingo sector of the northern border with Senegal through LUTCAM, but operations stopped in June 2008 due to lack of funding.⁸⁴

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Guinea-Bissau is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 November 2011. In 2007, Landmine Action affirmed that “with the correct investment and sensible tasking and cooperation from CAAMI, the job could feasibly be done in 2–3 years and Guinea-Bissau could become one of the few mined countries to achieve its Ottawa treaty target dates.”⁸⁹ In November 2008, however, CAAMI’s director declared that: “Due to inconsistency of funding we face a challenge in meeting the objective of having Guinea-Bissau free of mine and UXO contamination by the end of 2011.”⁹⁰ He hoped that the newly elected government would provide greater support for implementation of the Mine Ban Treaty.⁹¹

⁸⁵ Data from email from John Blacken, HUMAID, 17 April 2009. LUTCAM did not respond to requests for information on its clearance and Guinea-Bissau has not disaggregated clearance data in its formal reporting. The information on LUTCAM was provided by UNDP in an email from Reuben McCarthy, Conflict Prevention and Recovery Specialist, Sub-Regional Office for Eastern and Southern Africa, UNDP, 26 August 2009.

⁸⁶ Statement of Guinea-Bissau, Ninth Meeting of States Parties, Geneva, 27 November 2008.

⁸⁸ Email from Cassandra McKeown, CGD, 22 April 2009.

⁸⁹ See *Landmine Monitor Report 2008*, p. 413.

⁹⁰ Statement of Guinea-Bissau, Ninth Meeting of States Parties, Geneva, 27 November 2008.

⁹¹ Ibid.

In May 2009, Guinea-Bissau reported to the Standing Committee meetings that from January 2000 to April 2009, a total of 3.54km² of SHAs had been released, with the destruction of 3,039 antipersonnel mines, 157 antivehicle mines, 149 antiboat mines, and 49,009 items of UXO.⁹² This did not appear consistent with figures provided in its latest Article 7 report, which reported a total of 2.88km² of clearance in 2002–2009.⁹³

Demining from 2002–2009⁹⁴

Year	Mine clearance (km ²)	BAC (km ²)
2008	0.49	0.76
2007	0.10	0.43
2006	0.12	0
2005	0.23	0
2004	0.22	0
2003	0.28	0

Risk Education

In 2008, most RE activities took place just outside Bissau (where most clearance activities have been completed), and in Bafata, Gabu, and Oio on the northern border at São Domingo, Cacheu region.⁹⁵ They were implemented by the national mine clearance NGOs, HUMAID and LUTCAM, who conducted community liaison and delivered RE. A free telephone ERW hotline was launched by LUTCAM on 7 November 2008, which resulted in daily reports of contamination.⁹⁶

Guinea-Bissau reported that the number of beneficiaries from April 2008 to April 2009 was 1,159 individuals (478 men, 275 women, and 406 children), reached through 26 training sessions covering 46 communities or villages.⁹⁷ This was a slight increase from 908 people reached by RE in the previous reporting period.⁹⁸ LUTCAM reported that in 2008 they delivered RE to approximately 5,000 people.⁹⁹ In addition, 360 activists, representatives of youth and women's associations or religious and traditional leaders, were trained by CAAMI's 38 trainers.¹⁰⁰ It was believed that CAAMI RE activists also carried out RE in their communities but, because of a lack of financial resources, it was not possible to monitor these activities, and the number of beneficiaries was not recorded.¹⁰¹

⁹² Statement of Guinea-Bissau, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 28 May 2009.

⁹³ See Article 7 Report (for the period 30 April 2008 to 30 April 2009), Form G.

⁹⁴ The figures are taken from previous Landmine Monitor reports. Guinea-Bissau has reported different figures for clearance in recent years in its latest Article 7 report: 2008: 0.76km² of combined clearance; 2007: 0.61km²; 2006: 0.28km²; 2005: 0.12km²; 2004: 0.22km²; 2003: 0.28km²; and 2002: 0.13km². See Article 7 Report (for the period 30 April 2008 to 30 April 2009), Form G.

⁹⁵ Email from Irene Laval, CAAMI, 30 March 2009, HUMAID; response to Landmine Monitor questionnaire by John Blacken, HUMAID, 17 April 2009; and email from Cassandra McKeown, CGD, 22 April 2009.

¹⁰⁰ UN, "2009 Portfolio of Mine Action Projects," New York, November 2008, p. 193; and email from Irene Laval, CAAMI, 30 March 2009.

¹⁰¹ Interview with César de Carvalho, CAAMI, in Geneva, 28 May 2009.

CAAMI and the Senegal Mine Action Center (SMAC) met to exchange experiences and promote collaboration on delivering RE on the northern border at São Domingo.¹⁰²

Activities included in CAAMI's 2008 action plan to expand within the affected regions of Biombo, Buruntuma, Bigene (Cacheu region), and Sambuia (Gabu region) and to increase community participation were not realized because of a lack of funding.¹⁰³

All operators used standard materials and messages, which they adapted to the local context.¹⁰⁴ UNICEF produced RE materials such as books, notebooks, games, and T-shirts for use for all RE activities, targeting schoolchildren and CAAMI activists.¹⁰⁵

The impact survey noted that only 18% of surveyed communities had received RE and that the RE received by mine-affected communities was "minimal at best."¹⁰⁶ CAAMI disputes this finding on the basis that LIS researchers did not contact local authorities or CAAMI focal points in these communities.¹⁰⁷ As of June 2008, UNICEF was carrying out an assessment of the "process and impact" of the RE program, working closely with CAAMI.¹⁰⁸ Results were not available as of July 2009. They are to be used, along with the results of the LIS, to plan RE activities for 2010 and 2011.¹⁰⁹

In 2008, UNICEF provided US\$31,400 in funding and \$14,000 in-kind contributions for the RE program.

Although a need for RE was identified in 1999, outbreaks of violence prevented an RE program from being implemented until 2001.¹¹⁰ In 2006, RE activities began to move outside Bissau to other affected areas of the country, as recommended by a 2002 UNICEF evaluation.¹¹¹ The evaluation also recommended an increased coordinating role for CAAMI; carrying out impact studies; linking RE closer to other mine action activities and performing community liaison; and expanding coverage and creating a sustainable community-based network of RE activists.¹¹² An increase in armed violence in the north of the country from March–April 2006 resulted in emergency RE for the region for the rest of 2006 and 2007.¹¹³

Victim Assistance

The total number of mine/ERW survivors is unknown; there are at least 1,140 total casualties, of whom some 70% (or 798) were estimated to be survivors.¹¹⁴ In 2008, as in 2007, Guinea-Bissau made little progress in providing assistance to survivors, due to lack of funds and government support.¹¹⁵

In its statement to the Ninth Meeting of State Parties, Guinea-Bissau did not mention any ongoing VA activities and referred only to the progress made with WHO support that ended in 2006.¹¹⁶ During the WHO project, a needs assessment for survivors was carried out, casualty data

¹¹⁵ Interview with Irene Laval, CAAMI, in Geneva, 4 June 2008; responses to *Landmine Monitor* questionnaire by Irene Laval, CAAMI, 23 May 2008 and 30 March 2009.

¹¹⁶ Statement by Amália Luis Mendes, Ministry of Economy, Finance and Regional Integration, Ninth Meeting of States Parties, Geneva, 28 November 2008.

was verified, and an unspecified number of survivors received clinical assessments, prostheses, and physiotherapy.¹¹⁷ CAAMI reported that there were no VA activities in 2008, none of the year's VA goals had been achieved, and the WHO project was the only project that had really helped mine survivors.¹¹⁸

Over the last decade, capacity for the care and rehabilitation of survivors has been extremely limited. Following years of civil war and internal political instability, Guinea-Bissau remains one of the poorest countries in the world, ranked 171 out of 179 countries on the Human Development Index in 2008.¹¹⁹ Access to basic services remains severely limited for the vast majority of the population, making VA provision difficult. Political instability continued in 2009, with the assassinations of the country's president and chief of the general staff in March, leading the UN to call on the international community to "intensify its support" to the country.¹²⁰

As in previous years, in November 2008, Guinea-Bissau called on donor states to provide support for comprehensive VA.¹²¹ UNICEF cited the lack of a fundraising strategy on the part of the government and competing priorities to explain, in part, the lack of external support for both VA and RE activities.¹²²

As of May 2009, only the Bissau hospital had the capacity to attend to serious injuries resulting from mine/ERW incidents.¹²³ In its latest Article 7 report, Guinea-Bissau stated that the capacity to provide care and rehabilitation to survivors "is severely limited" as a result of the 1998–1999 conflicts that "seriously affected" the healthcare system.¹²⁴ The impact survey also found that the "healthcare systems available to treat and report casualties are extremely limited."¹²⁵

According to the government, survivors "have difficulties accessing physical rehabilitation services."¹²⁶ The only operating physical rehabilitation center in the country, the privately-run Friendly House for the Disabled (Casa Amiga do Deficiente, CAD) lacked adequate prosthetic and orthotic personnel for most of the year and saw its production decrease by nearly 50% from 2007 levels, despite increased support from the ICRC Special Fund for the Disabled (SFD). The price of prosthetic and orthotic services at the center and access to transport are an obstacle for survivors.¹²⁷ In 2008, the government began renovations on a public rehabilitation center that closed during the conflict in 1998, with the intention of rehiring previous staff and re-opening, with SFD support, in 2009. As of May 2009, the center had not yet opened.¹²⁸

Even greater challenges lie in accessing socio-economic reintegration services. There is a lack of support for professional training, small business start-up costs, or for persons with disabilities to participate in regional sporting events as they had in the past. One advancement noted in this area was the formation of an association of mine/ERW survivors, called the National Union of Physically Disabled and Mine/UXO Victims (Unión Nacional de Deficientes Motoras y Víctimas de Minas y UXOs, UNDEMOV). No further information about this organization was available.¹²⁹

¹²⁹ Statement by Amália Luis Mendes, Ministry of Economy, Finance and Regional Integration, Ninth Meeting of States Parties, Geneva, 28 November 2008.

Guinea-Bissau's constitution prohibits discrimination against persons with disabilities but no progress was made in its implementation.¹³⁰ Some military veterans with disabilities, including mine/ERW survivors, received pensions but these did not adequately address health, housing, or food needs.¹³¹ Constitutional reform to include mine/ERW survivors as "war victims" was underway as of May 2009, to give them the same rights to compensation and assistance as disabled military veterans. This reform depends, however, on the Ministry of Social Affairs securing the funds to pay the pensions.¹³²

As of 1 July 2009, Guinea-Bissau had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.¹³³

Progress in meeting VA26 victim assistance objectives

As one of the 26 States Parties with significant numbers of mine survivors and "the greatest responsibility to act, but also the greatest needs and expectations for assistance" in providing adequate attention to survivors,¹³⁴ Guinea-Bissau presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005 and has not revised them since.¹³⁵

In 2008, no progress was identified in achieving any of the 11 objectives presented. The main reasons for this lack of progress continued to be a lack of funds and national capacity. Other obstacles identified were a lack of awareness among governments (both the national government and other members of the international community) and the number of competing priorities for assistance in the country.¹³⁶

Guinea-Bissau included a VA expert on its delegation to the intersessional meetings of the Standing Committee on Victim Assistance and Socio-Economic Reintegration in 2008 and meetings of States Parties from 2006–2008. In 2007 and 2008 the expert was a survivor, who was unable to attend the meetings in 2009 due to visa problems and poor health.¹³⁷ Guinea-Bissau reported on progress and challenges in implementing VA activities at the intersessional meetings in 2005, 2006, and 2008 and at every meeting of States Parties since 2006. Because of the lack of progress achieved, much of the information provided in updates has related to the WHO project implemented from 2004–2006. Guinea-Bissau used voluntary Form J in its annual Article 7 report to provide details on VA activities in 2005, 2006, 2008, and 2009 although the annual objectives for VA included in the report have been the same since 2006.¹³⁸

Victim assistance activities

In 2008, the CAD, run by the national NGO ANDES, provided prosthetics to two landmine survivors.¹³⁹ Production overall at CAD in 2008 was 50% lower than in 2007.¹⁴⁰ The ICRC SFD, which has supported CAD since 2004, agreed in 2008 to cover the entire treatment cost for 144 war-disabled people, including the cost of prosthetics, transportation, and accommodation.

¹⁴⁰ ICRC SFD, "Annual Report 2008," Geneva, April 2009, p. 19.

It is unknown how many of these were landmine/ERW survivors. Because of “disappointing implementation rate of mutually agreed upon recommendations,” the ICRC decided to terminate its support to CAD at the end of 2008.¹⁴¹

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates for meeting mine action needs (including RE and VA) in Guinea-Bissau.

National support for mine action

No national funding for mine action was reported by Guinea-Bissau in 2008, nor was any national funding reported in 2007.

International cooperation and assistance

In 2008, four countries reported providing \$1,694,882 (€1,150,945) to mine action in Guinea-Bissau. Reported mine action funding in 2007 included allocations totaling €1.4 million (\$1,919,540 at 2007 exchange rates) for which actual disbursements took place in 2008. As a result, comparisons of 2007 and 2008 funding levels are not valid.

2008 International Mine Action Funding to Guinea-Bissau: Monetary¹⁴²

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Canada	UNDP	Unspecified mine action	\$189,000
Norway	Cleared Ground	Roving EOD team	\$345,930 (NOK1,950,000)
United Kingdom	UNDP	Mine clearance, capacity-building	\$280,957 (£151,500)
United States	HUMAID, Cleared Ground	Mine/UXO clearance, small arms and light weapons and EOD destruction and mechanical equipment field testing	\$878,995
Total			\$1,694,882 (€1,150,945)

INDONESIA

2008 Key Data

State Party since	1 August 2007
Article 4 (stockpile destruction)	Deadline: 1 August 2011 Completed: 13 November 2008
Contamination	Occasional ERW or IEDs; no mined areas
Casualties in 2008	Seven (2007: eight)
Estimated mine/ERW survivors	Unknown but at least 40

Ten-Year Summary

The Republic of Indonesia signed the Mine Ban Treaty in December 1997, but did not ratify it until February 2007, citing difficult national circumstances. It participated in Mine Ban Treaty meetings throughout the period and supported the annual pro-ban UN General Assembly resolution. Indonesia completed destruction of its stockpile of 11,603 antipersonnel mines in November 2008, far in advance of its deadline. There have been a small number of reports of the use of homemade mines and booby-traps by non-state armed groups. Indonesia has declared no known or suspected mined areas since becoming a State Party to the Mine Ban Treaty. Landmine Monitor identified at least 52 casualties due to mines, explosive remnants of war (ERW), and improvised explosive devices (IEDs) since 2001. No mine/ERW risk education has taken place in Indonesia despite ERW and IED incidents in Aceh province. Access to disability services was limited due to the centralization of services in major cities.

Mine Ban Policy

Indonesia signed the Mine Ban Treaty on 4 December 1997 and ratified it on 20 February 2007, becoming a State Party on 1 August 2007. Indonesia submitted its second Article 7 report on 17 April 2009.¹

Indonesia states that its Emergency Law No. 12/1951 on Fire Arms and Explosives provides for the imposition of penal sanctions as required by the treaty.² In March 2009, a senior Ministry of Foreign Affairs official told Landmine Monitor that the ministry has raised the possibility of new implementation legislation specifically for the Mine Ban Treaty in inter-agency meetings, but there is no progress yet in that direction.³ Other officials said they did not expect the need for such legislation to be considered until after parliamentary and presidential elections in April and June 2009.⁴

¹ On the UN website, the Article 7 report is marked as submitted on 17 April 2009. The report itself has a date of January 2008 on its cover. The report covers calendar year 2008. Indonesia's initial Article 7 report was submitted 21 January 2008.

² Article 7 Report, Form A, 17 April 2009. The law was appended to Indonesia's initial Article 7 report and provides either the death penalty, life imprisonment, or imprisonment for a maximum of 20 years for the import, transfer, receiving, acquiring, possession, ownership, transportation, hiding, bringing, use or export of firearms, munitions, or explosives, including mines.

³ Email from Andy Rachmianto, Deputy Director, Directorate for International Security and Disarmament, Department of Foreign Affairs, 23 March 2009.

⁴ Interview with Luna Amanda Fahmi, Desk Officer for Disarmament Affairs, and Riando Sembiring, Assistant to the Deputy Director, Directorate for International Security and Disarmament, Department of Foreign Affairs, Jakarta, 12 March 2009.

Indonesia participated in the Ninth Meeting of States Parties in Geneva in November 2008, where it was named co-rapporteur of the Standing Committee on Stockpile Destruction for the next year. During the session on stockpile destruction, Indonesia made a surprise announcement that it had completed the destruction of stockpiled antipersonnel mines, nearly three years ahead of its deadline.⁵ Indonesia also made a general statement regarding mine clearance extension requests, a statement in support of Thailand's extension request, and a statement during the session on Mine Ban Treaty universalization.

Indonesia participated in the Bangkok Workshop on Achieving a Mine-Free South-East Asia, from 1–3 April 2009, the second in a series of regional meetings convened in the lead-up to the treaty's Second Review Conference.

In response to questions from Landmine Monitor regarding issues of implementation and interpretation related to Articles 1 and 2 that have been under discussion by other States Parties, a senior Ministry of Foreign Affairs official stated, "Since the APL [antipersonnel landmines] Convention is banning all types of APL (total ban), transit is also an activity that is prohibited under the Convention."⁶

Indonesia is not party to the Convention on Conventional Weapons. Indonesia signed the Convention on Cluster Munitions on 3 December 2008, but had not ratified as of 1 July 2009.⁷

Production, use, transfer, stockpile destruction, and retention

Indonesia's Article 7 report confirmed that it did not have any production facilities for antipersonnel mines.⁸ Indonesia stated in the past that it has never used antipersonnel mines.⁹

On 26 November 2008, Indonesia announced to States Parties that it had finished its stockpile destruction obligation on 13 November when it destroyed the last of 11,603 stockpiled antipersonnel mines. It also stated that it was retaining 4,978 mines for training purposes.¹⁰

Indonesia reported destroying 709 PMRS, Honckin, and K-440 mines on 12 February 2008 in Garut, West Java; 758 PMA-1 and PMRS mines on 7 August 2008 in Lumajang, East Java; 539 PMA-1 mines in Madura, East Java on 7 August 2008; 80 PMA-1 and Armadila mines on 11 November 2008 in Medan, North Sumatra; 18 K-440 and MK-1 mines on 12 November 2008 in Ketawang, Central Java; and a final destruction of 9,499 PMA-1 and PMRS mines in Batujajar, West Java, on 13 November 2008.¹¹ One foreign embassy staff was reportedly present to witness the destruction process in Ketawang, Central Java.¹²

The 4,978 mines retained for training purposes are under the control of the Directorate General of Defense Strength in the Department of Defense. Indonesia reported retaining 2,531 PMA-1 mines, 1,500 PMRS mines, and 947 K-440 directional fragmentation mines.¹³

⁵ Statement of Indonesia, Ninth Meeting of States Parties, Geneva, 26 November 2008.

⁶ Email from Andy Rachmianto, Department of Foreign Affairs, 23 March 2009. Other comments did not illuminate Indonesia's views on the interpretive issues under discussion. It simply stated that Indonesia "has been and will continue to conduct joint military exercises with some friendly countries not party" to the Mine Ban Treaty, and that the treaty "only covers anti-personnel mines not any other mines."

⁷ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 91.

⁸ Article 7 Report, Form E, 17 April 2009.

⁹ Statement of Indonesia, Eighth Meeting of States Parties, Dead Sea, 18 November 2007. There have been conflicting reports about mine use by Indonesian forces in West Papua in 1961–1962 and in East Timor in the 1970s. See *Landmine Monitor Report 2000*, pp. 452–453.

¹⁰ Statement of Indonesia, Ninth Meeting of States Parties, Geneva, 26 November 2008.

¹¹ Article 7 Report, Form F, 17 April 2009. In Form G, Indonesia reports that the 11,603 destroyed mines also included 78 Kayu mines and nine BG M35 mines. In total, Indonesia reports destroying 9,828 Yugoslav PMA-1; 1,612 Yugoslav PMRS; 78 Russian Kayu; 32 Korean K-440; 26 Yugoslav Armadila; 10 Yugoslav Honckin; 9 Belgian BG M35; and 8 Indian MK I. The nomenclature for several of the mines in Indonesia's Article 7 report, such as the Kayu, Armadila, and Honckin, are not standard.

¹² Statement of Indonesia, Ninth Meeting of States Parties, Geneva, 26 November 2008.

¹³ Article 7 Report, Form D, 17 April 2009; and see *Landmine Monitor Report 2008*, p. 430. The K-440s are "Claymore" type mines that are permissible under the Mine Ban Treaty when used in command-detonated mode (usually electric detonation), but are prohibited when used in victim-activated mode (usually with tripwires). The ICBL has asked States Parties to report on steps taken to ensure Claymore-type mines cannot be used in command-detonated mode.

Indonesia did not provide specific details on how the mines will be used, but stated that they will be used as “instruction/teaching materials” to enhance the identification, detection and destruction of landmines “in general, particularly for the purpose of preparing Indonesia’s participation for UN peacekeeping operations.”¹⁴ Ministry of Foreign Affairs officials indicated that the training program was still in the planning phase.¹⁵

Scope of the Problem

Indonesia is not believed to be mine-affected but has a limited problem with ERW and victim-activated IEDs.¹⁶ It declared it had no mined areas in its initial Article 7 report.¹⁷

Casualties

In 2008, Landmine Monitor identified seven new casualties due to two ERW incidents in Aceh province, including one caused by an unexploded victim-activated IED. In February, a 10-year-old boy was injured while playing with ERW.¹⁸ On 22 April, six men were injured in Lueng village, North-Aceh district when they mistook an IED for scrap metal.¹⁹ In 2007, eight casualties were reported.²⁰ No casualties were reported in 2009 as of 31 March.

Between 2001 and 2008 Landmine Monitor identified 52 mine/ERW/IED casualties (12 killed and 40 injured) through media reports.²¹ Due to the lack of a casualty data collection mechanism and ongoing conflict, it is likely that the actual number of casualties is higher.

Victim Assistance

The estimated number of survivors is unknown but at least 40. There are no specific services for mine/ERW/IED survivors. The Ministry of Social Welfare is responsible for social and economic reintegration services for persons with disabilities. The Ministry of Health is responsible for medical treatment and physical rehabilitation.²²

Between 1999 and 2008, access to medical care, physical rehabilitation, and social and economic reintegration services for mine/ERW/IED survivors was limited due to the centralization of services in major cities and the remote locations of survivors. In 2005 and 2006, there was a small improvement in Aceh because of increased international disaster relief following the tsunami. There was no evidence of government efforts to improve services during this period.²³

In Ambon regency (Maluku province) and Aceh province, medical care for casualties is available in government centers, but decades of conflict have degraded the quality of services.²⁴ Indonesia lacks adequately trained orthotic and prosthetic technicians. Basic psychosocial services are available through primary healthcare centers and specialized centers.²⁵

Although Indonesian law prohibits discrimination and mandates accessibility, laws are not enforced and persons with disabilities face considerable discrimination.²⁶ As of 8 May 2009, Indonesia had not ratified the UN Convention on the Rights of Persons with Disabilities, which it signed on 30 March 2007, nor had it signed the Optional Protocol.

Support for Mine Action

International cooperation and assistance

No international funding to Indonesia for mine action was reported to Landmine Monitor for 2008.

The Department of Foreign Affairs disclosed in 2008 that it planned to request foreign financial assistance for building a center in Jakarta to train troops for peacekeeping and in mine detection and clearance.²⁷ Indonesia did not report on progress in mobilizing funds for the center in 2008.

²⁷ Interview with Andy Rachmianto, Department of Foreign Affairs, Jakarta, 6 March 2008.

IRAQ

2008 Key Data

State Party since	1 February 2008
Contamination	Antipersonnel and antivehicle mines, ERW including cluster munition remnants
Estimated area of contamination	No credible estimate for entire country; 1,730km ² in 13 governorates (2006 Iraq Landmine Impact Survey results)
Casualties in 2008	263 (2007: 216)
Estimated mine/ERW survivors	Unknown
Demining in 2008	15.74km ² of battle areas 9.4km ² of mined areas
Risk education recipients in 2008	At least 134,000
Support for mine action in 2008	International: \$35.9 million (2007: \$37.2 million) National: Unknown (2007: estimated \$15 million)

Ten-Year Summary

The government of Saddam Hussein did not engage in the global effort to eradicate antipersonnel mines. It used antipersonnel mines prior to the 2003 Coalition invasion, and also continued to produce mines until 2003 when its capacity was destroyed. Coalition forces did not use antipersonnel mines, but did use large numbers of cluster munitions. The Iraqi government that was subsequently formed became a State Party to the Mine Ban Treaty on 1 February 2008. Since 2003, there has been a dramatic increase in the use and sophistication of command-detonated improvised explosive devices by Iraqi insurgents, as well as some sporadic use of antipersonnel and antivehicle mines.

Since 2003, mine action in the north has continued steadily and attracted growing interest from commercial companies, but in the rest of Iraq efforts to configure an effective mine action response to extensive mine and explosive remnants of war (ERW) contamination have faltered as a result of the lack of security and a complex political environment. According to the UN, mine action activities in Iraq have not received the necessary attention and priority of the government.

Iraq has a significant number of mine/ERW casualties, but due to continuous conflict and a lack of data collection, the figures are unknown. Landmine Monitor identified more than 5,000 casualties occurring between 1999 and 2008.

Mine/ERW risk education (RE) has been conducted in the north since before 1999, and limited RE was conducted in the south by the ICRC and the Iraqi Red Crescent Society from 2001. In 2008, RE was adequate in the north, but remained inadequate in the center and south, and was implemented by NGOs and regional mine action centers with support from UNICEF.

Through its initial Article 7 report in 2008, Iraq declared being responsible for significant numbers of survivors, and therefore also having the greatest needs and expectations for assistance. It thus became the 26th State Party in the VA26 group, whose members have significant numbers of mine survivors and with “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors. Services for mine/ERW survivors and other persons with disabilities were limited in Iraq and varied regionally, with significantly more services and capacity in northern Iraq than elsewhere. Assistance to survivors was hampered

by years of conflict and sanctions, and deteriorated since 2003. No national victim assistance (VA) or disability strategies or coordination capacity existed, further exacerbating the situation.

Mine Ban Policy

The Republic of Iraq acceded to the Mine Ban Treaty on 15 August 2007, becoming a State Party on 1 February 2008. Since 2004, government representatives indicated on many occasions that Iraq was favorably inclined toward the Mine Ban Treaty.¹

Iraq has not reported any national legal measures or implementation legislation for mine action. It is not known if new national implementation legislation is being pursued or if existing laws are considered adequate.²

Iraq submitted its initial Article 7 report on 31 July 2008, covering the period until 31 July 2008. It submitted its second report on 8 May 2009, covering the period from 1 August 2008 to 31 December 2008.

Iraq attended the Ninth Meeting of States Parties in November 2008 in Geneva where it made a statement on mine clearance. Iraq also attended the intersessional Standing Committee meetings in Geneva in May 2009, where it made a statement on the status of implementation of Article 5 on mine clearance, highlighting its need for international cooperation and assistance to fulfill its obligations.

Iraq has not yet made its views known on matters of interpretation and implementation related to Articles 1, 2, and 3 of the treaty that have been widely discussed by other States Parties. These issues include joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training.

Iraq is not party to the Convention on Conventional Weapons. It attended as an observer the Oslo Signing Conference of the Convention on Cluster Munitions in December 2008, but has not yet signed the convention.³

Production, transfer, and stockpiling

Iraq produced antipersonnel mines in the past, including in the period leading up to the 2003 Coalition invasion. All mine production facilities were apparently destroyed in the Coalition bombing campaign.⁴ In its initial transparency report in 2008, Iraq reported that the Al Qaqa Factory that “produced anti-personnel mines and anti-tank mines before the 2003 war...has been completely destroyed during the 2003 war and there is no intention from the side of the Iraqi Government to reconstruct this facility.”⁵ Landmine Monitor is not aware of any mine transfers from Iraq since the 1990s.

¹ See *Landmine Monitor Report 2007*, p. 436. Iraq voted in favor of each annual UN General Assembly resolution calling for universalization of the Mine Ban Treaty since 2004, when it first became eligible to vote.

² In the report submitted in 2009, Article 7 report, Form A on national implementation measures is blank. In the report submitted in 2008, Form A only refers to the legal framework for mine action.

³ For details on cluster munition policy and practice, see Human Rights Watch (HRW) and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 211–212.

⁴ Landmine Monitor (HRW) interview with Mowafak Ayoub, Director, Disarmament Division, Ministry of Foreign Affairs, in Geneva, 10 February 2004. Iraqi and US sources requesting anonymity indicated that the Aloa’oa’a and Hutten factories in Alexandria and the Aloudisie factory in Al Yousfiz were destroyed. See *Landmine Monitor Report 1999*, pp. 886–887, for details on previous production. In 2005, Landmine Monitor removed Iraq from its list of countries producing antipersonnel mines or reserving the right to produce them, following the destruction of Iraq’s production facilities and the government’s statements in support of banning antipersonnel mines.

⁵ Article 7 Report, Form E, 31 July 2008. The report also states: “The PMN Anti-Personnel mine was produced in this factory. Shortly before the war of 2003 however, a defect in these mines resulted in restricting the use of these mines. As far as can be determined, the stocks of these mines in military ammunition dumps have been dealt with by the US Corps of Military Engineering Conventional Munitions Destruction Project. Iraq also developed the capacity to produce Valmara 69 mines but apparently this capacity was never used to physically produce Valmara mines.”

Iraq's treaty deadline for destruction of all stockpiled antipersonnel mines is 1 February 2012. Iraq did not include any information on stockpiles or destruction in its Article 7 report submitted in May 2009.⁶ In its initial Article 7 report, Iraq stated that it did not hold stockpiles of antipersonnel mines and that "this matter will be further investigated and if required, corrected in the next report."⁷ It also said, "If such stockpiled [antipersonnel mines] APMs are identified during further investigation of the matter, appropriate plans will be developed for the destruction of such and it will be reported in the next Article 7 Report."⁸ Landmine Monitor has previously noted that Iraq was believed to stockpile, at some point, mines manufactured by Belgium, Canada, Chile, China, Egypt, France, Italy, Romania, Singapore, the former Soviet Union, and the United States, in addition to Iraqi-manufactured mines.

From May 2008 to July 2009, according to Coalition press releases and local media reports, Iraqi forces recovered at least 41 antipersonnel mines in weapons caches. More than 1,800 "landmines" and "mines," type unknown, were also reported to have been recovered by Iraqi forces, as well as more than 300 antivehicle and Claymore-type mines.⁹ The Central, Northern, and Baghdad Multi-National Divisions were also reported to have recovered antipersonnel, antivehicle, Claymore, and unidentified mines.¹⁰ The jurisdiction over and arrangements for antipersonnel mines collected by multinational forces is not clear. The Iraqi government has not reported on these recovered mines or their destruction in its Article 7 reports.

In November 2008, the Coalition Munitions Clearance Program ended after destroying more than 822,980 kg of munitions from more than 100 weapons storage facilities of the Saddam Hussein regime and 10,000 smaller caches reportedly created shortly before the 2003 invasion.¹¹ An unknown number of landmines were among the weapons destroyed.¹²

According to a November 2005 American Forces Press Service (AFPS) news article, a total of 410,000 mines captured in Iraq and another 100,000 mines shipped to Iraq from the US were used to help blow up other weapons.¹³ The type of mine (antipersonnel or antivehicle) was not specified.

Mines retained for research and training

In its initial Article 7 report, Iraq indicated it was retaining 1,234 antipersonnel mines for training and development purposes.¹⁴ In its Article 7 report submitted in 2009, it appears to indicate that 297 mines are retained. The change in number is not explained.

Iraq reported that for the period from 1 August to 31 December 2008, the NGO Mines Advisory Group (MAG) retained 288 antipersonnel mines for "training and as targets during clearance operations and possible use as donor charges." Of these, the report noted that 36 PMN mines

⁶ Iraq's Article 7 report contains a blank form on stockpiled antipersonnel mines. Article 7 Report, Form B, 8 May 2009.

⁷ Article 7 Report, Form B, 31 July 2008.

⁸ Ibid, Form F. Landmine Monitor had previously noted that the size of Iraq's mine stockpile will be difficult to determine, given the dispersal of ammunition storage areas around the country. Mines and a full range of ammunition were dispersed to storage locations across the country and subsequently abandoned as the Iraq army disintegrated after the March 2003 invasion.

retained by MAG were “buried in the MDD [mine detection dog] training and accreditation area at Chamchamal.”¹⁵ UNDP also retained nine mines for training.¹⁶ The Ministry of the Environment/Regional Mine Action Center was reported to have transferred and destroyed 153 retained antipersonnel mines.¹⁷ Iraq did not report on any mines retained by the Ministry of Interior or the Iraqi Kurdistan Mine Action Agency (IKMAA), which it had previously listed as retaining antipersonnel mines in its initial Article 7 report.

Use

In the ongoing armed conflict, there have been no reports of new mine-laying by Iraqi government military forces. There have never been confirmed reports of use of antipersonnel mines by Coalition forces.¹⁸

Non-state armed groups

Despite documented cases of discoveries and seizures of antipersonnel mines between May 2008 and 1 July 2009, Landmine Monitor found no confirmed reports of new use of antipersonnel mines by the insurgency. In April 2009, a US soldier died when reportedly a mine detonated near him during combat operations near Baghdad.¹⁹ The type of mine was not known nor whether it was recently placed. Civilians continue to be killed by mines laid in previous years (see Casualties section below).

Insurgent forces have used command-detonated improvised explosive devices (IEDs) in large numbers. An IED that is victim-activated—one that explodes on contact by a person—is considered an antipersonnel mine and prohibited under the Mine Ban Treaty. An IED that is command-detonated—where the user decides when to explode it—is not prohibited by the treaty. Command-detonated bombs and IEDs have been frequently referred to in media reports as “landmines.”

Scope of the Problem

Contamination

Iraq is massively affected by landmines and ERW, the result of internal conflicts, the 1980–1988 war with Iran, the 1991 Gulf War (first Gulf War), and the conflict that has continued since the 2003 invasion by the US-led Coalition. Since then, almost daily attacks with car bombs or other IEDs on civilians, the military, and the police indicate the huge amounts of abandoned explosive ordnance (AXO) left unsecured after the overthrow of the Saddam Hussein regime. Much of this AXO has subsequently been plundered and is assisting ongoing insurgencies. A joint report by UNICEF and UNDP issued in 2009 observed that the task of clearance “might take decades to complete.”²⁰

The first phase of the Iraq Landmine Impact Survey (ILIS), implemented in 13 of Iraq’s 18 governorates in 2004–2006 and published in August 2007, found 1,622 communities affected by 3,673 suspected hazardous areas (SHAs) covering 1,730km² of land. Five governorates could not be surveyed because of insecurity. Moreover, there is substantial contamination in uninhabited areas or areas that were depopulated in the course of recent wars: this is not reported in the ILIS which was based on community interviews).²¹

¹⁵ Ibid, 8 May 2009. MAG holds 12 types (40 PMN; 2 SB 33; 2 M14; 12 V69; 1 VST; 121 VS-50; 61 Type 72; 40 TS 50; 4 PSM 1; 1 PRBM 413; 1 VAR 40; and 3 POMZ.)

¹⁶ Article 7 Report, Form D, 8 May 2009.

¹⁷ Ibid. The Ministry of Environment/Regional Center of the South transferred and destroyed 149 VS-50 and 4 M14 mines.

¹⁸ As of July 2009, only the US maintained foreign armed forces in Iraq. US forces will remain in Iraq until 2011 under a status of forces agreement between the US and Iraq. The agreement contains no references to Iraq’s obligations under the Mine Ban Treaty, for example, reporting on antipersonnel mines stockpiled or seized by the US forces, and disposition of seized mines. “Agreement Between the United States of America and the Republic of Iraq On the Withdrawal of United States Forces from Iraq and the Organization of Their Activities during Their Temporary Presence in Iraq,” ratified version, 17 November 2008.

¹⁹ “US and Coalition Casualties, Iraq,” *CNN*, www.cnn.com.

²⁰ UNICEF/UNDP, “Overview of Landmines and Explosive Remnants of War in Iraq,” June 2009.

²¹ iMMAP, “Landmine Impact Survey: The Republic of Iraq, 2004–2006,” Washington, DC, August 2007, p. 88.

Preliminary results of a second phase of the ILIS covering the remaining five governorates, which started in 2008 and was still continuing in September 2009, indicate that of nearly 3,000 communities visited, only 86 remain contaminated (see Identification of hazardous areas below). More than 1,000 communities were previously affected, but contamination has been cleared by local actors, military forces, and/or humanitarian mine action implementers.²²

Border minefields alone have been estimated by one source to total an area of 6,370km².²³ Iraq's initial Article 7 report states that Iraqi forces emplaced more than 18 million mines on the border with Iran during the Iran-Iraq war and another one million mines ahead of both the first Gulf War and the 2003 US-led invasion of Iraq.²⁴

Types of contamination and impact vary significantly between regions. The northern Kurdish governorates of Dahuk, Erbil, and Sulaymaniyah comprise one of the world's most heavily mine-contaminated areas, particularly along borders with Iran and Turkey and along the Green Line—the former frontline between Kurdish forces and former President Saddam Hussein's army. All three governorates also suffer from UXO contamination.

South-central Iraq is particularly affected by cluster munition remnants and unexploded air and ground ordnance. In the First Gulf War alone, US-led forces dropped 15 million submunitions and the failure rate of the cluster munitions used is unknown.²⁵ The 2003 invasion resulted in extensive further contamination along the routes followed in the advance on Baghdad.

Other governorates bordering Iran also have minefields dating from the 1980–1988 war and some newer mines were laid by Saddam Hussein's army on the border with Saudi Arabia before the 2003 invasion in Muthanna governorate. However, many villages in these areas are abandoned.²⁶

Casualties²⁷

In 2008, Landmine Monitor identified at least 263 new casualties due to mines, ERW, and victim-activated IEDs in Iraq, including 81 people killed, 159 injured, and 23 of unknown status.²⁸ Of these casualties, 39 were recorded by the General Directorate of Mine Action (GDMA), 42 by IKMAA, and 46 by the Kurdish Organization for Rehabilitation of the Disabled (KORD) in northern Iraq, and the rest (136) were identified through media monitoring, including by the NGO Iraq Body Count. Under-reporting is certain, as there is no systematic casualty data collection, particularly in southern and central Iraq.

At least 139 of the casualties were civilian, seven deminers, 47 security forces, and 70 unknown. Men were the largest casualty group (147, 84 civilians), 41 casualties were children (10 boys, remainder unknown), and nine were women. For the remainder, age and gender information was unknown. Some 45% of casualties were caused by ERW (118, including four cluster submunitions casualties), mines caused 106 casualties (including five due to antipersonnel mines), and victim-activated IEDs caused 39 casualties. Incidents were recorded in 12 governorates. Since there is no data collection mechanism in southern or central Iraq, most casualties were recorded in northern Iraq: 59 in Sulaymaniyah, and 42 in Erbil and Dahuk. KORD also recorded 19 casualties from

²⁵ Interview with Kent Paulsson, Senior Mine Action Advisor for Iraq, UNDP, Amman, 10 March 2008.

²⁶ See Landmine Monitor Report 2008, p. 438.

²⁷ Unless noted otherwise, Landmine Monitor analysis of casualty information (1999–2009), provided by email from Soran Majeed, Victim Assistance Officer, GDMA, 15 June 2009; Niazi Argoshi, Director General of Technical Affairs, IKMAA, 24 June 2009; Sardar Sidiq Abdulkarim, Executive Director, KORD, 17 June 2009; John Sloboda, Executive Director, Iraq Body Count/Oxford Research Group, 14 April 2009; and Landmine Monitor media monitoring, 1 January 2008–16 June 2009.

²⁸ Due to the lack of detail and standard terminology in media articles, many incidents were excluded. Unspecified landmines were only included when sufficient detail was available to exclude remote-detonated attacks; IEDs were only considered victim-activated when a person triggered the explosion, for example by stepping on it or by touching it. A common and gruesome tactic is to attach IEDs to corpses or emplace IEDs in houses which explode when a person enters the house.

Diyala and 19 additional casualties were recorded in booby-trapped houses in Diyala.²⁹ When known, the most common activities at the time of the incident were security/military (46), traveling (38) handling devices (31), and tending animals (20).

Almost all casualties of victim-activated devices identified in 2008 were Iraqi (261), while one was a US soldier and one an Israeli volunteer in the US Army. IEDs caused numerous casualties among foreign troops but most IED incidents were caused by remote-detonated devices. For example, 124 US military were killed by IEDs as reported on the US Department of Defense website in 2008.³⁰

The 2008 casualty rate is an increase compared to 2007 when 216 casualties were recorded (101 killed, 114 injured, and one unknown). This increase is partly due to improved casualty data collection in northern Iraq and the increased level of detail in records compiled by Iraq Body Count.

Casualties continued to be reported in 2009 with at least 45 casualties to 16 June 2009 (17 killed, 24 injured, and four unknown). Of these, the GDMA recorded seven, IKMAA 11, and KORD five; the others were identified through Landmine Monitor media monitoring. At least 42 of the casualties were civilian, including 23 children. Two casualties were deminers and one was a US soldier. All were Iraqis except the US soldier. ERW caused 23 casualties, mines 21, and one casualty was caused by a victim-activated IED. At least 16 casualties were caused while playing (all children). Additionally, three Iraqis were injured by an antipersonnel mine while trying to cross the buffer zone in Cyprus.³¹

Ten-year summary

According to the 2009 UNICEF/UNDP report, there are “no reliable nation-wide figures” for the number of mine/ERW casualties in Iraq.³² Landmine Monitor analysis of the five National Mine Action Authority (NMAA) databases in August 2007 showed there were approximately 21,492 records entered since 2001 (including casualties occurring before this time). These figures are incomplete, particularly since 2003, as only one database was kept updated in 2004–2005 after which data entry stopped. Most casualties were recorded in Sulaymaniyah governorate (12,573).

In its Article 7 report, Iraq noted that between 1991 and March 2008, 5,348 casualties were recorded in Sulaymaniyah (2,427 killed and 2,921 injured); 2,403 in Erbil (855 killed, 1,528 injured, and the status of the remainder is unknown); and 443 in Dahuk (209 killed and 234 injured). Nearly 60% of casualties (4,801) were caused by mines.³³ However, the UN noted that, “These figures are only indicative... and there is a rather large number of victims that remain uncounted.”³⁴ A UNICEF knowledge, attitudes, and practices study (KAP) in 2008, recorded 656 casualties since 2003 in the three northern governorates (46 killed and 610 injured).³⁵

Between 1999 and 2008, Landmine Monitor identified at least 5,184 casualties in Iraq, including 789 killed, 2,798 injured, and 1,597 unknown. A significant percentage of these were foreign troops, but the vast majority were probably Iraqi civilians. Most casualties occurred in 2003, as a result of conflict (2,192). The ILIS estimated that there were on average some 300 casualties per year.³⁶

²⁹ As noted previously, only booby-traps set off directly by a person, for example by stepping on it or by touching it, were included in this total.

³⁶ Annual totals: 1999: 807, 2000: 206, 2001: 317, 2002: 465, 2003: 2,192, 2004: 261, 2005: 358, 2006: 99, 2007: 216, and 2008: 263. See previous editions of Landmine Monitor. For 1999–2001, casualty records received by HI on 25 April 2007 were used. See *Landmine Monitor Report 2007*, p. 452 for more information. ILIS, “Executive Summary, Summary of Conclusions,” July 2007, provided by email from Dennis Hadrick, Office of Weapons Removal and Abatement, US Department of State, 30 July 2007.

Risk profile

People are at mainly at risk from landmines and UXO in the north, and mainly from cluster submunitions and UXO in the center and south. Most minefields in the north are marked, but those on the border, in areas where there is a security risk, and newly discovered minefields are not marked.³⁷ Few areas in the rest of the country are marked.³⁸ In urban areas people are at risk from AXO.³⁹

The ILIS found that the typical casualty was a male of productive age, killed or injured while tending animals or farming. The low incidence of tampering may be due to under-reporting. People are also at risk foraging for wood and plants, and fishing. Children help their families in this work. Shepherds traveling north to graze sheep are also at risk.⁴⁰

According to Danish Demining Group (DDG), in the south the risk has decreased due to behavior change, RE activities, and demining.⁴¹ In the south, common activities at the time of the incident are transferring explosives to cultivate the ground, grazing cattle, and scrap metal collection.⁴²

Socio-economic impact

Mines and UXO represent “an issue of national importance” that “endanger the overall state of Iraq’s national economy,” according to the 2009 UNICEF/UNDP report.⁴³ The report states that: “With large areas of agricultural land, numerous oil and gas fields, and hundreds of infrastructure and public facilities sown with mines, riddled with cluster bomblets or unexploded mortar and bomb shells, these would first need to be cleared before sustainable economic development and diversification could take place on a large nation-wide scale.”⁴⁴

A specific example of economic activity and development blocked by mine/UXO contamination cited by Iraq includes exploration of the Rumailah oil fields, one of Iraq’s biggest oil reserves.⁴⁵ In addition to oil and gas sector blockages, the 2009 UNICEF/UNDP report cites delays in construction of a water treatment plant in Basra which would permit the return of local communities to cultivate land as well as fishing by communities near the port of Fao. The report observes that mines and UXO prevent the return of internally displaced people (IDPs) and refugees to their communities, and “prevent the use of roads, water resources and residential areas.”⁴⁶

Affected communities are mostly rural, agricultural, and small. According to the ILIS, “The type of resource to which landmines and UXO block access are chiefly pasture and crop land, as well as in the north, scrubland used for firewood collection. In the south, irrigated farmland is an important asset type impacted by the contamination.”⁴⁷ High-impacted communities make up 4% of those affected.⁴⁸

Program Management and Coordination

Mine action

Efforts to establish a new structure for mine action management and regulation continued in 2009. The NMAA, created in 2003 under the Ministry of Planning, had become inactive by 2007 and the government shut it down in June 2007. After discussion of whether a military or a

⁴⁸ Ibid, p. 10.

civilian ministry should take the lead in mine action, the government decided at the end of 2007 to place mine action under the Ministry of Environment, which took over in April 2008 and set up the Directorate of Mine Action (DMA) in place of the NMAA.⁴⁹

The DMA is responsible for planning, accreditation, project coordination, prioritizing tasks, setting standards, quality assurance (QA), and managing a database. The DMA is supported by a Regional Mine Action Center (RMAC) in Basra, which is intended to coordinate mine action in the south. However, the DMA's development has been hampered by the lack of any regulatory framework establishing its mandate. A regulatory structure proposed by UNDP would provide for the creation of an Iraqi Higher Committee for Mine Action consisting of 20 deputy ministers from concerned ministries to act as a policy-making body, with the DMA functioning as the implementing body coordinating mine action.⁵⁰

In the meantime, Iraq's security ministries, including the ministries of defense, interior, and state security affairs have also asserted the need for security screening of organizations and personnel engaging in mine action as part of the accreditation process. As of August 2009, the DMA had forwarded documents submitted by demining organizations to the Ministry of Defense but had received no feedback.⁵¹

Mine action in the northern governorates of Dahuk, Erbil, and Sulaymaniyah continues to function semi-autonomously under the Kurdish Regional Government (KRG) and managed by the Iraqi Kurdistan Mine Action Authority and the General Directorate of Mine Action. Both organizations accredit operators in their area of responsibility. The KRG passed a law merging IKMAA and the GDMA in April 2007 but the merger had not taken place as of August 2009, although there is said to be ongoing coordination and cooperation.⁵²

Risk education

The DMA is responsible for the management of RE, and has an RE officer. However, UNICEF remained the *de facto* coordinating body in 2008, and also worked on capacity-building of the DMA with the aim of gradually handing over RE to the government by the end of 2010.⁵³ There is no coordination between the DMA and the two mine action centers in the north.⁵⁴

The RMAC in the south has one RE officer and covers Basra, Muthanna, Maysan, and Thi Qar governorates.⁵⁵ It held coordination meetings in 2008 with agriculture and civil defense directorates, DDG, the national NGO Rafidain Demining Organisation (RDO), and the Iraqi Red Crescent Societies.⁵⁶

IKMAA is responsible for RE in Erbil and Dahuk governorates.⁵⁷ The GDMA is responsible for RE in Sulaymaniyah and part of Kirkuk and Diyala governorates.⁵⁸ The KRG funds RE in northern Iraq.⁵⁹ IKMAA and the GDMA organize quarterly coordination meetings attended by representatives of the KRG's Ministry of Education, the Ministry of Environment, Ministry of Labor and Social Affairs, GDMA, MAG, ICRC, UNDP, and UNICEF.⁶⁰ In addition there are weekly mine action meetings of all sectors in the north.⁶¹

⁴⁹ Interview with Kent Paulusson, UNDP, in Geneva, 27 May 2009. As of 3 September 2009, however, this change was not reflected on the Iraq Mine Action website, www.iraqmineaction.org.

⁶¹ Email from Mohammad Tahir, GDMA, 27 March 2009.

The DMA developed an RE plan for 2008 that it shared during a UNICEF and government annual workplan meeting for 2008.⁶² However, in practice it was not implemented and all organizations worked separately, with the result that some areas were over-resourced while other areas were not covered.⁶³

UNICEF provides technical support to the DMA and partners.⁶⁴ An RE/VA study tour to Cambodia took place in September 2008, with the participation of 12 staff from the national authorities and NGOs, to learn about the roles and responsibilities of a national coordination body, working with communities, prioritization of activities, and coordination.⁶⁵

RE operators use national RE standards and curriculum (2005 version) and modify them to meet their needs.⁶⁶ The planned review of national standards did not happen in 2008, but was to take place in 2009.⁶⁷

Victim assistance

In principle, the DMA is in charge of coordinating VA at the national level and has had a VA director since 2006 but very few VA activities have originated from the national level.⁶⁸ Coordination between the DMA and relevant government bodies was limited and unsatisfactory.⁶⁹ There was also limited coordination between regional and national levels.⁷⁰

In northern Iraq, both the GDMA and IKMAA were actively involved in coordinating and monitoring VA activities. Although they have not yet merged, they coordinate regularly. VA activities are carried out in coordination with the regional Ministry of Health. Coordination and information-sharing between the KRG, GDMA, IKMAA, and NGOs was sufficient.⁷¹ At IKMAA, the VA officer position was open from October 2008 to the end of June 2009, slowing down activities.⁷² In southern Iraq, a new VA manager was recruited for the RMAC in 2009.⁷³ There was coordination with DMA and with the local health authorities, but not with other regional mine action centers or NGOs.⁷⁴

At the national level, the Ministry of Health and the Ministry of Labor and Social Affairs are responsible for disability issues. The Ministry of Health's Higher Committee for Physical Rehabilitation is responsible for the health and physical rehabilitation sectors,⁷⁵ but this committee does not meet regularly.⁷⁶ The Ministry of Labor and Social Affairs is responsible for socio-economic reintegration issues.⁷⁷

Data collection and management

The DMA operates a database using an older version of the Information Management System for Mine Action (IMSMA), which is due to be upgraded to the latest version (V.5) in 2010. The database includes all data from the ILIS and records of mine action. Clearance results in southern Iraq are recorded by RMAC and then passed to the DMA. Data from operations in the north is entered into IKMAA and GDMA databases. A Technical Advisor (TA) from Information Management and Mine Action Programs (iMMAP) has supported the DMA and IKMAA since 2007. The TA, among other activities, supervised a clean-up of DMA and IKMAA data.⁷⁸

As of 2009, no systematic data collection or unified casualty database existed in Iraq.⁷⁹ Particularly in southern and central Iraq, casualty information was lacking. The DMA collects casualty information in an *ad hoc* manner, by attempting to verify incidents when reported in the media. There is no systematic cooperation on data collection with relevant ministries,⁸⁰ although cooperation between the DMA and the Ministry of Health reportedly improved in 2009. Some information was contained in the EpiInfo database at the DMA, but it was not updated and needed more involvement from the DMA's VA department, which lacked capacity.⁸¹

RMAC started coordinating with the health directorates in Basra and Muthanna, the general hospitals in Basra and Maysan, and the Basra Prosthetics Center to collect casualty information. No NGOs in the south collected casualty information.⁸²

In northern Iraq, the regional mine action authorities and operators continued to collect reliable data and share it.⁸³

The casualty surveillance project started in 2006 in cooperation between UNDP, UNICEF, and the World Health Organization (WHO), with the Ministry of Health as implementing partner, was not fully functional as of 2009. A pilot project was completed in three areas, but the results and the project needed evaluation before continuing.⁸⁴ Verification and unification of five defunct databases handed over to the DMA was completed for clearance and contamination and mostly entered into IMSMA as of June 2009, but the casualty records remained untouched.⁸⁵

RE activities are not yet recorded in IMSMA at the DMA or RMAC as they do not have the capacity. UNICEF maintains reports of activities implemented by its partners.⁸⁶ IKMAA teams and MAG enter their activity records into the IKMAA IMSMA database,⁸⁷ while the GDMA and its partners enter data into their own database.⁸⁸

Plans

Strategic mine action plan

In June 2009, the DMA started drafting a plan for mine action in consultation with the ministries of defense and interior. The DMA expected to submit the draft to government ministries to review data and then provide input on their priorities. The plan was intended to provide the basis for mine action over the next two to three years, allowing time for the preparation of a comprehensive strategic plan in 2011.⁸⁹

⁸⁹ Interview with Kent Paulusson, UNDP, in Geneva, 27 May 2009.

A draft plan for 2010–2012 prepared by UNDP sets out a vision of “an Iraqi society free from the fear and impact of landmines and explosive remnants of war” and identifies clearance priorities as agricultural land, oil fields, power lines, roads and railway lines.⁹⁰

Victim assistance

In 2009, the DMA with support from UNDP was in the process of developing a mine action strategy. It was said that this strategy would be a general framework document, which would contain some objectives for VA but subsequent specific action plans would need developing.⁹¹

The DMA noted in May 2009 that a high-level meeting on VA involving experts, ministries, and NGOs would be held “in the near future” to discuss VA requirements under the Mine Ban Treaty, the current status of services, ways to solve gaps, and roles and responsibilities.⁹² No date or agenda for the meeting was set, and it appeared that not all stakeholders were aware of these efforts.⁹³ One main challenge was said to be that the government does not have “a strategizing culture.”⁹⁴

Integration of mine action with reconstruction and development

The 2009 UNICEF/UNDP report noted that the National Development Strategy mentioned mine action only once, and then only with the phrase “accelerating demining actions.”⁹⁵ The report also noted that mine action was not mentioned at all in the International Compact with Iraq launched in May 2007 to provide a partnership with international donors and development agencies, despite UNDP urging attention to the sector. The report concluded, “It is not surprising, therefore, that some international donors overlooked Mine Action activities altogether when making their decisions on how to best support the development of Iraq.”⁹⁶

National ownership

Commitment to mine action and victim assistance

The 2009 UNICEF/UNDP report stated that, despite the size of the challenge posed by mines and ERW to Iraq’s recovery, “little attention has been given to unexploded ordnance and mines within and outside the country. Consequently, a very limited national capacity exists to tackle the issue and the large number of injuries caused by it.”⁹⁷ The report expressed concern that mine action in Iraq had not received the necessary attention and priority of the government: “Consequently, the issue of landmines and unexploded ordnance is not fully integrated into and supported by key government strategic documents and policies. This lack of attention has resulted in limited support for a long-term and comprehensive approach to the issue.”⁹⁸

In northern Iraq, the mine action centers have sufficient capacity and have benefited from the continuous support provided by the UNDP program specialist and UNICEF.⁹⁹ The KRG has gradually increased its interest and involvement in VA since 2006 and was said to have adequate capacity to address VA/disability issues.¹⁰⁰ The KRG provided some funding to VA but this needed to be supplemented by international funding so as not to endanger service provision, which was adequate overall.¹⁰¹ The main obstacle was the lack of a strategy and disability

legislation to guide the KRG in properly assessing the resources needed.¹⁰² For RMAC, the new VA manager appeared to be active, but was dependent on guidance from the national level, which was lacking.¹⁰³

In early 2008, a component to reform Iraq's physical rehabilitation sector was added to the World Bank-funded Emergency Disability Project (EDP). The reform was to include policy development and the establishment of a multi-sectoral disability working group headed by the Ministry of Health, but the reform was shelved in November 2008 due to a lack of institutional capacity at the ministry. The EDP project is financed by a US\$16.8 million (€11.4 million) World Bank grant.¹⁰⁴ VA/mine action operators were not involved in or aware of activities under this project.¹⁰⁵

Few NGOs were active on VA/disability,¹⁰⁶ particularly in southern and central Iraq, and their capacities were weak.¹⁰⁷ NGOs working on VA in the north since the 1990s have sufficient capacity to carry out VA/disability activities, but depend on fluctuating funding.¹⁰⁸ Disabled people's organizations were often linked to political factions, had insufficient knowledge to implement activities, and did not coordinate with each other.¹⁰⁹

National management

Iraq is creating national structures for management of mine action but lacks the human resources and a regulatory framework in which to operate. The 2009 UNICEF/UNDP report concluded the DMA and the regional centers, "were unable to coordinate, plan and strategize Mine Action at the national level. They could not advocate for a prioritisation of Mine Action in the development strategies and plans of the country."¹¹⁰

External advisors

UNDP provides technical advice and capacity-building support through an advisor based in Amman, Jordan, supported by four national technical advisors in Iraq.¹¹¹ RONCO has two expatriate technical advisors with the DMA assisting accreditation and planning and any other issues by request.¹¹² iMMAP provides data management support to the DMA and other government offices as requested, working with five expatriate staff (and around 50 nationals).¹¹³

National mine action legislation

There is no national mine action legislation in place. The 2009 UNICEF/UNDP report noted that development and implementation of mine action standards had been hindered by the absence of a legal framework for mine action.¹¹⁴ According to the report, the lack of government attention to mine action has "caused a situation where a number of critical reconstruction projects are on hold due to the fact that available resources are only a fraction of what is needed. At the same time there is no regulatory framework for the possible contracting of commercial demining operators."¹¹⁵

National mine action standards/Standing operating procedures

The NMAA drafted 29 national standards based on the International Mine Action Standards in 2006, but these never received government approval. Iraq's first Article 7 report said that with the formation of a new national mine action authority the process for approving these standards would be reactivated.¹¹⁶

Demining and Battle Area Clearance

In addition to the Iraqi army and Coalition forces, demining was conducted in 2008 by three international and two Iraqi NGOs, commercial demining operators, and IKMAA. Among NGO operators, MAG and Norwegian People's Aid (NPA) were working in the north, the Iraqi Mine and UXO Clearance Organization (IMCO) worked mainly in central Iraq, and DDG and RDO worked in the south.¹¹⁷

Kurdish commercial companies coordinated by the GDMA included Ararat, Araz Mahmood Maroof, Asa, Chamy Rezan, Khabat, and the Arabian Gulf Mine Clearance Organization reportedly undertook tasks in south central Iraq.¹¹⁸

The Iraqi army had 10 divisions, each with one company that conducted mine clearance and explosive ordnance disposal (EOD). The Iraqi army and police are mainly engaged in spot EOD and IED clearance tasks.¹¹⁹ Coalition forces also conduct EOD and IED clearance for force protection purposes.¹²⁰

Identification of hazardous areas

The ILIS, implemented by iMMAP with US Department of State funding, provided the first comprehensive national survey of mine/ERW contamination but lack of security limited its completion to only 13 of Iraq's 18 governorates. Even within the 13 governorates completed, two districts and 346 other communities were omitted.¹²¹ In 2008, survey teams started survey of the other five governorates and as of mid-2009 had completed three. iMMAP expected to finish remaining areas, including areas on the border with Iran, by the end of 2009.¹²²

In the first 13 governorates, the ILIS found contamination covering an estimated 1,730km² of land (776km² in the northern region, 12km² around Kirkuk, 87.6km² in the partially surveyed south-central region, and 854.5km² in the southern region). Although the survey found mine contamination was densest in the north, which had 3,024 SHAs (82% of the total), casualties were heaviest in the southern four governorates where most of the contamination was more recent and communities were less aware of the dangers of mines and ERW.¹²³

The 2009 UNICEF/UNDP report commented that many hazardous areas and victims remained uncounted and called for "an urgent increased effort to gather information regarding the extent of land mine and explosive remnants of war contamination, as well as its implications and impact on the daily lives of the Iraqis and the country's development." According to the report, this "should include both the location of the contaminated areas and surveying the victims and their needs."¹²⁴

¹¹⁶ Article 7 Report, Annex B, 31 July 2008.

¹¹⁷ Iraq also reports "limited" and "erratic" clearance by contractors working on infrastructure projects, including work conducted by South Oil Company and Al Safsafa Company in Rumailah oil fields and by Al Khalij Al Arabi on the Basra-Al Shalamja railway line. Article 7 Report, Form F, 31 July 2008.

Demining and battle area clearance in 2008

Operators achieved higher productivity in 2008, with the amount of battle area cleared continuing at close to the same levels as in 2007 but nearly tripling the amount of mined area cleared to 9.4km² (from 3.7km² in 2007) while more than tripling the number of antipersonnel mines destroyed (to 22,000) and the number of UXO destroyed (to nearly 73,000).

Clearance rates will plunge in 2009, however, as a result of the suspension of clearance in all parts of Iraq—except the north—imposed by the Ministry of Defense with effect from 23 December 2008. The ministry halted operations on grounds of security and the need to vet personnel engaged by demining operators who would therefore have access to mines and/or explosive ordnance.¹²⁵ The suspension remained in force as of August 2009. The ban halted work on 25 projects around Basra alone, according to media reports citing a UNDP technical advisor.¹²⁶

In northern Iraq, IKMAA had a total staff of 360 (58 permanent and 302 on contract) operating in 13 demining teams, two EOD teams, two general survey teams, six preliminary technical survey (PTS) teams, eight external QA teams, and two RE teams. The PTS teams were tasked with updating and refining data on known minefields with a view to defining resource needs for full clearance.¹²⁷ The GDMA also coordinated and issued contracts for clearance to Kurdish commercial companies and similarly coordinated the work of international organizations in its area of operations.¹²⁸

MAG operated with a total of 11 expatriate and 850 national staff working in 19 mine action teams, eight small arms and light weapons teams, and 14 community liaison teams, backed by mechanical and mechanical support teams. MAG also acquired a mine detection dog (MDD) team of three dogs, which were accredited with the GDMA and assigned to work in Kirkuk governorate. It expected to expand its MDD capacity in 2009. In 2007, MAG operated in Dahuk, Erbil, Kirkuk, Ninawa (Mosul), Salah ad Din, and Sulaymaniyah governorates, and in 2008 expanded operations into areas of Diyala governorate. The teams handed over 33 former mined areas and 17 battle area clearance (BAC) tasks to local communities.¹²⁹

NPA had 80 staff working in 2008 with five multi-skilled teams conducting manual demining, BAC, EOD, and survey for land release. In addition to items cleared by its own teams, NPA destroyed 2,315 antipersonnel mines, 19 antivehicle mines, and 106 submunitions found by commercial companies. NPA reported that decisions on whether land could be cancelled, required sampling, or full clearance were taken in cooperation with a QA team from the GDMA and handover documents were signed by NPA, the GDMA, local authorities and the landowner. NPA decided to phase out its mine clearance program in 2009 and as of July had cut staff to 23.¹³⁰

IMCO was set up in 2003 with support from RONCO until it became financially independent from RONCO in August 2008 and started to receive funding direct from the US Department of State. By 2008, IMCO had 203 staff, including 88 conducting BAC and 20 for EOD. It also had seven MDDs and seven handlers. Major tasks undertaken in 2008 included clearing agricultural land in the Mukaseb and Hay Al Furat areas near Baghdad airport, the Wassit entry point on the border with Iran, and the Al Qanat nursery, also in the Baghdad area. IMCO planned to add another 40–50 staff by the end of 2009 and to use them for BAC, survey, and marking.¹³¹

¹³¹ Email from John Lytle, RONCO, 25 July 2009.

RONCO continued to provide technical support to the DMA, with two technical advisors assisting planning and accreditation and on other issues as requested. It also continued to advise IMCO on all aspects of its operation. RONCO was also working in the north undertaking survey, clearance, and infrastructure support tasks for commercial companies.¹³²

DDG, based in Basra governorate, added 63 personnel in 2008 bringing its total to 115, who worked in five BAC and five EOD teams, three RE teams, and two teams each for survey and QA. With its new staff, DDG opened a new forward operating base on the outskirts of Nasiriyah to take on clearance operations in Dhi Qar governorate.¹³³ In 2009, with the ban on clearance operations, teams were active conducting survey.¹³⁴

RDO, with a total of 82 staff, operated two BAC and two EOD teams in 2008 and in 2009 added two RE/community liaison teams that were expected to undertake post-clearance land use assessments. RDO had relied initially on DDG survey capacity but in 2009 also planned to reconfigure its resources to make up two survey teams.¹³⁵

Demining in 2008¹³⁶

Demining operators	Mine clearance (km ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	BAC (km ²)	UXO destroyed	AXO destroyed	Area released by survey (km ²)

Quality assurance/Quality control

The DMA's QA capacity is limited to desk evaluation of operators applying for accreditation. QA and quality control in field operations were undertaken internally by operators.

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Iraq is required to clear all antipersonnel mines from mined areas under its jurisdiction or control as soon as possible, but not later than 1 February 2018. Progress in mine clearance stalled, however, after the December 2008 ban by the Ministry of Defense on all clearance activities except those in the north.¹³⁷

The 2009 UNICEF/UNDP report expressed concern that mine action had not received enough attention and stated "at the current slow pace of demining operations, it is clear the goal of an 'Iraq free of the impact of mines and unexploded ordnance' will not be reached by the 2018 Mine

Ban Convention deadline.¹³⁸ UNICEF and UNDP emphasized that “it is clear that the current demining capacities in Iraq are far from meeting the requirements of the Mine Ban Convention” and called for “the urgent development of a nation-wide Mine Action Programme. This much-needed capacity increase can only be met by inviting international de-mining organizations to work in Iraq, as well as developing national Iraqi organizations and/or allocating and training more military resources for this purpose.”¹³⁹

Risk Education

RE in 2008 was conducted by national and international NGOs, IKMAA, and the GMDA. RE coverage was fairly adequate in the north, and in Basra and Thi Qar. It was inadequate in Maysan, Muthanna, Wasit, Karbala, and Qadisiyah governorates, as very few communities were reached.¹⁴⁰ In the remaining governorates no RE was reported. According to UNICEF, community engagement remained very poor, which was not realized at the national level, hence the few RE efforts in only a few areas.¹⁴¹

Risk reduction messages concentrated on informing people about the risk, threats, and safe behavior in general. Both general and tailored messages were provided in 2008.¹⁴² In IKMAA’s area of operations, activities were prioritized based on the size of the mine and ERW problem, type of behavior and number of casualties.¹⁴³ RE was also provided on request to oil and construction companies.¹⁴⁴

In the north, Handicap International (HI) conducted a KAP survey in 2008.¹⁴⁵ It found that general knowledge was good, with most people having participated in at least one RE session. As a result of the school program, children were generally found to be more knowledgeable about mine/ERW risks than adults. However, general attitude and practice was limited.¹⁴⁶ It recommended more evaluations of the impact of RE interventions, which it found had not taken into account economic and cultural factors. It also recommended targeting high-impact communities in Dahuk and Sulaymaniyah, more community-based interventions, the use of risk reduction activities (for example, the construction of wells), use of participatory rural appraisal techniques and more innovative approaches, house-to-house RE to reach women, and peer-to-peer education for children.¹⁴⁷

In central Iraq, the Iraqi Health and Social Care Organization (IHSCO) conducted a second needs assessment in an additional four governorates in central Iraq (Anbar, Baghdad, Salah ad Din, and Babil).¹⁴⁸ Bustan Association for Children’s Media and Culture (BACMA, formerly Darastan Group for Child and Media) collected information in Baghdad for its project, mainly case studies, and entered data into its own database. It found that children in Baghdad lack correct knowledge about mine/ERW risks.¹⁴⁹ With its mobile teams in the field, DDG gathered information through RE sessions on dangerous areas, livestock, and cash crops, and used this to prioritize teams’ deployment.¹⁵⁰

Activities in 2008¹⁵¹

Organization	Type of activity	Location	No. of beneficiaries
North			
GDMA	Direct RE in communities, training forest police, commemorating awareness day, posting of billboards, summer programs for children, TV broadcasts, educational materials, and sending reports to clearance teams.	Sulaymaniyah	112 villages, 900 forest police trained, summer school to 500 children
IKMAA	Mass media, direct RE, training of community members—religious leaders and teachers—and community liaison. RE teams reported discovered to EOD teams for destruction.	Dahuk and Erbil governorates	463 teachers. Direct RE 6,245 people in 196 communities. RE to 654 government and NGO staff
MAG	Direct RE to nomads, shepherds, IDPs, and children. Training of teachers (in coordination with the Ministry of Education) and religious leaders, posting of billboards, distribution of leaflets at checkpoints, contamination data collection and community assessments.	Dahuk, Diyala, Erbil, Kirkuk, Ninawa, and Sulaymaniyah.	56,947 people; 2,352 teachers trained
Center and South			
BACMA	School awareness sessions and distribution of RE materials	Baghdad and Basra governorates	4,300 students in 21 primary schools.
Civil Defense	RE in areas near fire stations	Southern governorates	Not available
DDG	Direct RE and community liaison	Basra governorate	12,439
ICRC	Emergency RE in April 2008 — distribution of materials	Baghdad and Basra governorates	3,000
IHSCO/MAG	Training and emergency RE	5 governorates in the center and south	5,314 teachers
Iraqi Red Crescent Society	Presentations, group discussions, distribution of materials.	15 governorates	39,135
UNICEF in partnership with INTERSOS, Darstan, and IHSCO	School-based and community-based RE	Baghdad, Basra, Karbala, Maysan, Muthanna, Thi Qar, Wasit, and Qadisiya.	1,500 schools, 1,000 communities, 850 teachers, 150 community volunteers, 100 local NGOs and government officials, 800 child peer trainers

¹⁵¹ Emails from Mohammad Tahir, GDMA, 27 March 2009; Jilan al-Qurainy, RMAC, 12 May 2009; Ako Aziz Hamad, IKMAA, 31 March 2009; Shanti Kaphle, UNICEF, 21 April 2009; Ahmed Zubeidi, IHSCO, 20 April 2009; Srdjan Jovanovic, Regional Mine Action Coordinator, ICRC, 6 August 2009; and Meredith Wotten, MAG, 11 August 2009.

Both print and media materials were used. Some 60,000 copies of various information, education, and communication materials on RE have been distributed to key target groups throughout Iraq.¹⁵² An RE guidebook for schoolteachers was produced by IKMAA. Special materials were produced for shepherds travelling to the north.¹⁵³

UNICEF produced two TV spots for children in 2008, which were aired three times a week for six months on Spacetoons Arabic channel and provided to other partners.¹⁵⁴

The DMA does no RE monitoring, while RMAC, IKMAA, and the GDMA monitor their own activities. UNICEF monitors its projects with partners through regular progress reports, monitoring questionnaires, and through field visits by contracted facilitators.¹⁵⁵ DDG has an internal monitoring system.¹⁵⁶ IKMAA's RE director monitored training of teachers and the work of IKMAA teams.¹⁵⁷ MAG monitored the work of the teachers and religious leaders they trained to deliver RE.¹⁵⁸

RE has been conducted in Iraq for more than 10 years by several government bodies and international and national NGOs, with the support of UNICEF, but it has been severely affected by ongoing security problems, and has been inadequate. In the north, RE has been mainly conducted by MAG¹⁵⁹ since before 1999, by the Kurdish Organization for Mines Awareness from 2000 to 2005, and then by IKMAA and the GDMA. It was conducted through direct presentations, training of teachers and religious leaders and community liaison. In the south, the ICRC and the Iraqi Red Crescent Society started conducting RE in 2001, reaching all 15 governorates in the center and south by the end of 2003, and RE activities are still carried out.

In 2003, emergency RE was implemented by several organizations, including HI with UNICEF in Baghdad, MAG in the north and south, INTERSOS in Basra, and UNICEF conducting mass media campaigns. But the security situation forced most international organizations to leave the center and south. IHSCO received support from MAG and HI to deliver direct RE and train trainers. In 2007, UNICEF started working with the ministries of education, and youth and sports to deliver RE.

The ILIS noted, "the significant number of communities whose key informants had a clear recollection of past [mine risk education] MRE and clearance events... suggests that this response has been active in many of those communities."

The DMA (until 2008 the NMAA) has been responsible for coordinating RE since 2003, with technical support from UNICEF, MAG, and RONCO. However, by 2007 the status of the NMAA was unclear, and UNICEF became the *de facto* RE coordinator. Several national RE stakeholder workshops to develop needs assessments and strategies were held. Regular coordination meetings were also held in the north and Basra, but the security situation prevented coordination meetings in Baghdad. In 2006, UNICEF conducted a review of materials, which led to some revisions.

Victim Assistance

The total number of mine/ERW survivors in Iraq is unknown, but is at least several thousand. Although conflict decreased in 2008, the number of war-disabled continued to grow as it was reported that 60% of hospital admissions were due to war-related injuries.¹⁶⁰ The improved security situation resulted in little improvement in access to basic services, and the quality

¹⁶⁰ ICRC, "Physical Rehabilitation Programme: Annual Report 2008," Geneva, 7 May 2009, p. 62.

of services continued to erode.¹⁶¹ Assistance providers continued to be the target of attacks. Government bodies were only able to provide basic services.¹⁶²

The 2009 UNICEF/UNDP report noted that, “there is little doubt that a considerable number of victims of landmines and explosive remnants of war suffer from severe disabilities, poverty, unemployment, discrimination and stigmatization, negligence and deprivation of their basic rights across Iraq.”¹⁶³ The UNICEF KAP study in three northern governorates in 2008 found that only 12% of survivors identified had received any form of assistance.¹⁶⁴ The IHSCO found that in central and southern Iraq only 4% of survivors had received assistance and that services had been in continuous decline since 2003.¹⁶⁵ Most persons with disabilities were cared for within the family network and 90% of them lived below the local poverty line.¹⁶⁶

In 2008, hospitals still often lacked medicines, equipment, suitable infrastructure, and experienced staff.¹⁶⁷ It was estimated that some 75% of medical staff have left Iraq while demand increased, particularly in rural areas where most mine/ERW casualties occur and health professionals “are almost completely absent.”¹⁶⁸

Government or NGO-operated physical rehabilitation centers are available in major cities, but in 2008, the ICRC reported that a low level of services was provided not because “the national capacity is overwhelmed” but rather because “patients are not coming to existing structures.”¹⁶⁹ This was due to the risk and cost of traveling, ethnic tensions, and a lack of information about services. In 2008, 17 centers were operating, including a newly-built center in Fallujah.¹⁷⁰ Many centers needed international support (mostly from the ICRC) and services remained more accessible in northern Iraq, where many services are operated by local NGOs with government and international funding.¹⁷¹

War and insecurity have had a major impact on mental health, but psychosocial care is stigmatized and only provided in hospitals in the main cities and by some NGOs, particularly in northern Iraq.¹⁷² Unemployment remained high in Iraq, and economic reintegration opportunities for persons with disabilities were limited and they faced discrimination. In northern Iraq, more constant support for NGOs providing economic reintegration opportunities has helped improve the living standard of program beneficiaries, resulting in a “dramatic decrease” of disabled beggars on the streets. The programs remained limited, however, and the GDMA estimated that only some 20% of those needing urgent assistance had received it during 2005–2009.¹⁷³

The Ministry of Health managed six rehabilitation centers and facilitated the procurement of equipment to eight centers in 2008. It also operated three “disability centers,” which facilitated capacity-building of rehabilitation staff (all under a World Bank Project) and provided 38,000 medical services to persons with disabilities.¹⁷⁴

The Ministry of Labor and Social Affairs operates the Social Safety Net program for vulnerable groups, including persons with disabilities, with \$8 million from the World Bank. This support contained funding for a pension survey and a beneficiary assessment, which were delayed as of

May 2009.¹⁷⁵ The government provides benefits to disabled war veterans, but many supplement it with employment.¹⁷⁶ The KRG also paid small monthly pensions.¹⁷⁷

Iraq has legislation to protect the rights of persons with disabilities, but this is reportedly only enforced in the public sector and not in the private sector.¹⁷⁸ Discrimination remained common,¹⁷⁹ and reforms to the disability sector were halted in late 2008. As of May 2009, a draft disability law remained pending in the parliament of the KRG. Disabled people's organizations and NGOs held a two-day conference in May 2009 to lobby political parties and members of parliament to approve the law after the elections in July.¹⁸⁰ As of 1 July 2009, Iraq had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

Progress in meeting VA26 victim assistance objectives

In 2008, Iraq "clarified through its initial Article 7 transparency report that it also has a responsibility for significant numbers of mine survivors."¹⁸¹ This made Iraq the 26th State Party to join the VA26, one of the States Parties with the "greatest responsibility to act, but also the greatest needs and expectations for assistance."¹⁸² However, as of July 2009, many stakeholders were not aware of the implications and possible benefits of Iraq's declaration.¹⁸³

A process was underway to identify "an appropriate in-country victim assistance/disability expert."¹⁸⁴ As of August 2009, this expert had not been identified. It was anticipated to have an expert present at the Second Review Conference of the Mine Ban Treaty in November–December 2009.¹⁸⁵ In 2008–2009, Iraq did not make statements on VA, but UNDP issued a message in July 2009 asking relevant stakeholders to start compiling information for a report to the Second Review Conference.¹⁸⁶ Additionally, the UNDP started assisting the government in mapping existing VA capacity and projecting required VA capacity, and to bring together stakeholders. It was scheduled to complete these activities by mid-2010.¹⁸⁷

Iraq reported on VA in its Article 7 reports submitted in 2008 and 2009.¹⁸⁸

Victim assistance activities

Various organizations work on VA-related issues and only those providing updated information for the reporting period have been included in this report. Information about other organizations can be found in previous editions of Landmine Monitor.

VA activities in northern Iraq were advanced by the joint UNDP/WHO project started in August 2007, channeling international funding to the main local service providers to supplement KRG funding. For the activities supported by UNDP, the first phase was concluded in February 2009.¹⁸⁹ WHO-funded projects faced some challenges and were not executed as planned. One NGO noted that the WHO did not have a clear vision and that the delays caused confusion among service providers, unlike the UNDP-supported component.¹⁹⁰ UNDP secured additional funding from Australia to continue its part of the project to the end of 2010. It was anticipated that the KRG would increase its contribution, but the government was facing budget difficulties in 2008–2009 due to the economic slowdown.¹⁹¹ The project's main challenges remained the long-term sustainability of the three implementing NGOs and securing direct bilateral funding to the KRG and NGOs.¹⁹²

Under the UNDP component, the Prosthetic Limbs and Rehabilitation Center in Dahuk, the Diana Prosthetic Limbs Center in Erbil, and KORD in Sulaymaniyah provided physical rehabilitation and socio-economic reintegration services. As of 31 December 2008, 7,784 physiotherapy sessions, 3,289 mobility aids, and 3,130 prosthetic and orthotic devices were provided. An additional 27 people completed vocational training and 110 started income-generating projects; 26 home adaptations were also made.¹⁹³

Under the WHO component, a needs assessment of the rehabilitation centers in Erbil, Sulaymaniyah, and Dahuk was conducted and two physiotherapists and two psychotherapists recruited as a result. Twelve medical staff received a four-week emergency trauma training and 18 received a multi-disciplinary training in Jordan focusing on mental health. Mental health materials were translated for use.¹⁹⁴

KORD operates two physical rehabilitation centers and three outreach posts in northern Iraq. Its strategic plan for 2009–2013 focuses on continued capacity-building and increasing its socio-economic reintegration activities. Its main challenges were: a lack of sustained financial support from the KRG; skilled staff preferring to work for the government rather than NGOs or the private sector; and a lack of coordination mechanisms with the broader disability sector. In 2008, KORD provided services to mine/ERW survivors, including 3,016 physical therapy sessions, 1,218 prosthetic-orthotic services, and economic reintegration assistance to 80 people; 28 of the survivors assisted were injured in 2008. It also provided 3,647 services to other persons with disabilities.¹⁹⁵

In 2008–2009, the GDMA provided \$800,000 support to VA/disability service implementers. Its main challenges were a lack of a nationally regulated funding mechanism and delays in funding from the KRG. The GDMA had records of 10,081 services provided to survivors in 2008, mostly physical rehabilitation, and 9,156 other persons with disabilities were also assisted (these figures include beneficiaries under the UNDP-support project and KORD beneficiaries).¹⁹⁶

The Iraqi Association of the Disabled conducted awareness raising and lobbying of the government, NGOs and other stakeholders on VA/disability issues and provided material support to persons with disabilities. It also participated in the EDP World Bank project until policy reform work was halted.¹⁹⁷

In 2008, the ICRC increased its support to the physical rehabilitation sector by adding support to the center in Fallujah which it completed in October. The center started operating in December 2008. The ICRC also supported the Prosthetics and Orthotics Training School and the al-Salam crutches production unit. The ICRC's aim was to ensure assistance to a network of centers covering most of the country so that patients would not have to travel long distances for treatment. An information leaflet on the location of the centers was produced. The centers received raw materials and components, training, and (for the Erbil center only) transport costs. The centers assisted 29,422 people, and produced 2,863 prostheses (450 for mine/ERW survivors) and 9,864 orthoses (76 for mine/ERW survivors).¹⁹⁸ The ICRC also supported 77 hospitals in all 18 governorates with supplies, equipment, and training. Some 5,438 weapon-injured people were assisted in 22 ICRC-supported hospitals and 83 medical staff attended seminars on war surgery, trauma management, and advanced first-aid.¹⁹⁹ In 2008, the ICRC started a micro-economic initiatives program for conflict-disabled heads of households in northern Iraq, benefiting some 324 persons with disabilities.²⁰⁰

Support for Mine Action

Landmine Monitor is not aware of any long-term comprehensive cost estimates for meeting mine action needs (including RE and VA) in Iraq. The DMA, within the Ministry of Environment, has official responsibility for mine action throughout Iraq, including strategic planning, budgeting, and donor relations.²⁰¹ The KRG exercises responsibility for mine action in the three northern governorates of Dahuk, Erbil, and Sulaymaniyah, including budget support to IKMAA and the GDMA, which plan mine action programming independently from the DMA.²⁰²

National support for mine action

Iraq did not report national funding for mine action in 2008. UNDP estimated Iraq's national mine action budget in 2007 to be \$15 million (€10,186,065).²⁰³ In addition, the KRG Ministry of Finance allocated funds totaling IQD4 billion (\$3.2 million) to IKMAA in 2007.²⁰⁴

In April 2008, the Iraqi government announced the creation of 2,000 new mine clearance jobs to support mine and UXO clearance throughout Iraq, with annual salaries totaling an estimated IQD4.8 billion (approximately \$4.32 million).²⁰⁵ As of May 2009, Iraq reported that fewer than 2,000 deminers were active overall, compared to an estimated need for more than 19,000 in order to complete clearance by its 2018 Article 5 clearance deadline.²⁰⁶ It did not report whether national or international funds were used to cover salaries for deminers.

The government provided a budget of \$15 million–\$20 million for the management of mine action in 2009. In addition, Iraqi ministries were expected to provide funding for mine clearance operations in 2009, but many did not have a budget for such activities.²⁰⁷

International cooperation and assistance

In 2008, nine countries reported providing \$35,886,215 (€24,369,289) to mine action in Iraq. This was approximately 4% less than reported in 2007. Reported annual international funding has decreased from a high of \$58.7 million in 2004. There is not sufficient data on the full extent

¹⁹⁸ ICRC, "Physical Rehabilitation Programme: Annual Report 2008," Geneva, 7 May 2009, p. 62; and ICRC, "Annual Report 2008," Geneva, 27 May 2009, p. 346 (contains the exact number of mine/ERW survivors treated).

JORDAN

2008 Key Data

State party since	1 May 1999
Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	9.64km ²
Casualties in 2008	18 (2007: 10)
Estimated mine/ERW survivors	654
Article 5 (clearance of mined areas)	Deadline: 1 May 2012 Original deadline: 1 May 2009
Demining in 2008	Clearance of 1.098km ² of mined areas Release of 6.1km ²
Risk education recipients in 2008	21,600
Progress towards victim assistance aims	Good

Ten-Year Summary

The Hashemite Kingdom of Jordan became a State Party to the Mine Ban Treaty on 1 May 1999. It concluded the destruction of its stockpile of 92,342 antipersonnel mines in April 2003. Jordan served as co-rapporteur and then co-chair of the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies from November 2004 to November 2006. Jordan hosted the Eighth Meeting of States Parties in November 2007, with Prince Mired Raad Zeid Al-Hussein serving as President. On 1 April 2008, Jordan enacted the National Anti-Personnel Mine Ban Law. Jordan initially retained 1,000 mines for training purposes, and only 50 mines had been consumed in training as of April 2009.

Mine action was conducted exclusively by the army's Royal Engineering Corps until 2006 when the National Committee for Demining and Rehabilitation (NCDR) signed an agreement with Norwegian People's Aid to undertake clearance of minefields on its borders with Israel and Syria in a bid to accelerate clearance and fulfillment of Jordan's Article 5 obligations. In November 2008, at the Ninth Meeting of States Parties, Jordan requested, and was granted, a three-year extension to its Article 5 clearance deadline. Also in 2008, the NCDR embarked on a nationwide survey and clearance of explosive remnants of war (ERW) to tackle what has emerged as the main source of casualties.

From 2000 to 2008, the NCDR recorded 88 mine/ERW casualties (13 killed and 75 injured) in Jordan; in total at least 778 casualties have occurred since 1949. From 1999 to 2008, risk education was conducted in Jordan primarily through public information dissemination and community liaison. After several years of reducing casualty rates, in 2008 the number increased, seemingly due to more scrap metal collection. In May 2009, Jordan completed the verification and consolidation of casualty data recorded in the National Victim Database. Since 2008, Jordan has been a focus of attention of the States Parties after reporting its responsibility for significant numbers of mine/ERW survivors. It has generally been active in providing services to persons with disabilities, including mine/ERW survivors.

Mine Ban Policy

Jordan signed the Mine Ban Treaty on 11 August 1998 and ratified it on 13 November 1998, becoming a State Party on 1 May 1999. On 1 April 2008, Jordan enacted the National Anti-Personnel Mine Ban Law, which incorporates the treaty into Jordan's domestic law.¹

Jordan submitted its twelfth Article 7 report, dated 30 March 2009, covering the period from 30 April 2008 to 30 April 2009.²

Jordan served as host of the Eighth Meeting of States Parties in November 2007. Jordan's Prince Mired Raad Zeid Al-Hussein, chair of NCDR's board, was President of the meeting. As President, he continued to play an important leadership role in promoting effective operation and implementation of the treaty, as well as its universalization, until the Ninth Meeting of States Parties in November 2008. His duties also included chairing the treaty's Coordinating Committee, which consists of all the Standing Committee co-chairs and co-rapporteurs, and chairing the Analyzing Group of states tasked with reviewing Article 5 mine clearance deadline extension requests.

At the Ninth Meeting of States Parties in Geneva, Jordan commented on several of the States Parties' Article 5 deadline extension requests, in addition to making a statement on victim assistance. At the intersessional Standing Committee meetings in May 2009, Jordan made statements on victim assistance, risk education, and mine clearance.

Jordan has only rarely engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1 and 2, regarding the issues of joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, and antivehicle mines with sensitive fuzes or antihandling devices.

Jordan is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It has not submitted its annual report as required under Article 13.³ Jordan is not party to CCW Protocol V on Explosive Remnants of War. As of 1 July 2009, it had not yet signed the Convention on Cluster Munitions.⁴

Production, use, stockpile destruction, and retention

Jordan never produced or exported antipersonnel mines and last used them in 1978. It completed the destruction of its stockpile of 92,342 antipersonnel mines in April 2003. It included Claymore mines in its stockpile destruction.

Until 2007, Jordan consistently reported that it retained 1,000 mines for training and research purposes; it had not consumed any of these retained mines since it first reported in August 1999.⁵ In its 20 March 2008 Article 7 report, Jordan reported retaining 950 mines and noted that 50

¹ NCDR, "The Anti-Personnel Mine Ban Law: Law Number 10 for the year 2008," Amman, April 2008, www.ncdr.org.jo. The law bans the use, import, export, transfer, trade, production, development, possession, sale, purchase, or acquisition of antipersonnel mines, and also bans assisting, encouraging, or inducing these prohibited activities. It includes penal sanctions that apply equally to violators of the law and anyone assisting activity prohibited by the law. The law also endorses the NCDR as the lead mine action coordinating and supervising agency in Jordan. The law was passed by the Cabinet of Ministers in November 2007, approved by the parliament on 17 January 2008 and the Senate on 12 February 2008, then "following the endorsement of His Majesty King Abdullah, [the law] was passed by parliament and came into effect on April 1, 2008." Statement of Jordan, Standing Committee on the General Status and Operation of the Convention, Geneva, 6 June 2008. For more details see *Landmine Monitor Report 2008*, p. 459.

² Previous reports were submitted on 20 March 2008, 20 March 2007, 9 May 2006, 2 May 2005, 5 May 2004, 1 May 2003, 17 March 2003, 27 November 2002, 5 June 2002, 30 June 2000, and 9 August 1999.

³ Jordan's latest CCW Amended Protocol II Article 13 report was submitted on 26 September 2006, covering the period 25 September 2005 to 19 July 2006.

⁴ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 215.

⁵ Jordan had listed the same number and types of mines retained in each of its Article 7 reports: 800 M14, 100 M35, and 100 M18A1. In June 2004, Jordan stated that live antipersonnel mines were unnecessary for training purposes. Jordan also said States Parties should set a limit of 1,000 retained mines. Statement of Jordan, Standing Committee on the General Status and Operation of the Convention, 25 June 2004.

mines (40 M14 and 10 M35) had been consumed during mine detection training.⁶ Jordan's 30 April 2009 Article 7 report still indicated 950 mines retained.

In June 2009, the NCDR's national director informed Landmine Monitor that Jordan plans to use some of the remaining 950 mines for further training of mine detection dogs (MDD), as well as more deminers, but did not provide any detailed plans.⁷

Scope of the Problem

Contamination

Jordan is contaminated by antipersonnel and antivehicle mines as well as ERW, including grenades, artillery shells, and aircraft bombs. Contamination results from the 1948 partition of Palestine, the 1967–1969 Arab-Israeli conflict, the 1970 civil war, and the 1975 confrontation with Syria. There are also believed to be cluster munition remnants in remote areas, the result of the armed forces testing cluster munitions on firing ranges.⁸ The NCDR has no data on the extent of contamination, but believes that it is not extensive. A NATO-funded ERW survey initiated in September 2008 had recorded no cluster munition remnants as of end June 2009.⁹

A Landmine Retrofit Survey (LRS) completed in September 2007 concluded that 10.5km² of suspected mined areas remained,¹⁰ concentrated in well-defined and mapped military minefields along the border between Jordan and Syria.¹¹ The LRS also identified six affected communities in the Jordan Valley, which have since been cleared of mines.¹² However, a sampling and verification project in the Jordan Valley in August 2008 (see below) has identified 108 suspected hazardous areas.¹³ These areas will need to be surveyed and, if mines are confirmed, cleared as part of Jordan's fulfillment of its Article 5 obligations.

ERW contamination, mostly from the 1970 civil war, is concentrated around Ajloun and North Shunah in the Jordan Valley, particularly near former Palestine Liberation Organization bases, where munitions were hidden in caves and buried underground. ERW are said to pose a greater risk than mines, causing a higher number of incidents.¹⁴ The NATO-funded ERW survey found more contamination than expected and by May 2009 had identified 264 affected communities.¹⁵

Jordan has also had to deal with ERW that entered from Iraq through the scrap metal trade. Under a plan drawn up by the NCDR and various government ministries and departments, army engineers have been positioned at the border to check scrap metal entering the country for UXO, and ex-military personnel have been contracted to work at factories inspecting the scrap metal. The Jordanian government has a plan to establish a central market for all scrap metal, which can then be regulated.¹⁶

⁶ Article 7 Report, Form D, 20 March 2008. See also *Landmine Monitor Report 2008*, pp. 460–461. In June 2008, Jordan reported that NPA used the mines to train four new MDD teams in the south for the Wadi Araba project and in the north for the Northern Border Clearance Project. Statement of Jordan, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008. NPA reported that 150 of Jordan's retained mines were used in 2007 for MDD training in Wadi Araba; all were destroyed. Email from Henrik Mathiesen, Desk Officer for Mine Action in the Middle East, NPA, 22 August 2008.

Casualties¹⁷

In 2008, the NCDR recorded at least 18 new mine/ERW casualties, including six killed and 12 injured, in 11 incidents. The majority of casualties were civilians (16), and two were military on a routine patrol. All were Jordanian nationals. Children were the biggest casualty group (nine boys and one girl). The remaining casualties were men. ERW caused 10 casualties and landmines eight. The most common activity at the time of the incident was collecting scrap metal (10). Casualties were recorded mainly in Mafraq (nine), followed by Al Karak (four), Irbid and Zarqa (two each), and Balqa (one).

The NCDR revised its 2007 mine/ERW casualty figure downwards from 10 to seven (two killed and five injured in six incidents) after verification home visits. The increased casualty rate in 2008 compared to 2007 and 2006 (nine)¹⁸ may be due to increased scrap metal collection activities (three incidents alone during scrap metal collection caused nine casualties in 2008).

In 2009, the NCDR recorded just one new casualty to 21 June 2009: a 22 year-old shepherd was injured by ERW in Balqa.

The NCDR identified at least 779 mine/ERW casualties (125 killed and 654 injured) between 1949 and 22 June 2009. Of these, 673 verified mine/ERW casualties (19 killed and 654 injured) had been entered in the National Victim Database. The remaining 106 fatalities occurring prior to 2005 were not entered, as verification was not possible. The large majority of verified casualties occurred before 2000 (584). Of all verified casualties entered in the database, 294 were civilians, 279 military, 21 deminers, and the status of 79 was unknown. Only 45 casualties were women, 18 were boys, one was a girl, and the rest were men. Information on activity at the time of incident, device type, and location was not made available.

From 2000 to December 2008, 88 verified mine/ERW casualties were recorded by the NCDR (13 killed and 75 injured); 60 were civilians, 23 military, three deminers, and two of unknown status.¹⁹ Most casualties were men, and only 18 boys, five women, and one girl became casualties. At least 13 Jordanian peacekeepers were hurt abroad,²⁰ including eight peacekeepers injured in Eritrea in 2001.²¹ It is unclear if they are included in NCDR data.

The Higher Council for the Affairs of Persons with Disabilities reported that some 180,000 people (3% of the population) are disabled.²² Other sources placed the number closer to 500,000.²³

Risk profile

The main casualty groups are men of working age and boys. Livelihood activities are the most common cause of casualties,²⁴ and in 2008 the most common activity was scrap metal collection.²⁵ In May 2009, the NCDR reported that scrap metal imported from Iraq has become an issue of concern.²⁶

Socio-economic impact

Mine clearance in the Jordan Valley and around Aqaba has opened up land to development of infrastructure, including dams, pipelines, airfield expansion, and housing, as well as for commercial farming and large-scale tourist developments. The LRS found that 34 communities

¹⁷ Unless noted otherwise, information and casualty data covering 1999–2009 provided by email from Adnan Telfah, Head Mine Risk Education/Victim Assistance Department, NCDR, 31 May, 4, 21, 22, and 25 June 2009.

¹⁸ See *Landmine Monitor Report 2008*, p. 465.

¹⁹ The NCDR does not have separate calendar year information prior to 2000. In 2000, Landmine Monitor reported four casualties (two killed and two injured), but NCDR could not confirm whether it had been able to verify these for its database. See *Landmine Monitor Report 2001*, pp. 981–982.

²⁰ See *Landmine Monitor Report 2007*, p. 469.

²⁶ Interview with Mohammad Breikat, NCDR, in Geneva, 27 May 2009.

with a total population of 69,000 claimed to be affected by mines, 17 of them in northern Mafraq governorate.²⁷ Mined areas exacerbate already acute shortages of land and deny access to agricultural land and pasture and to scarce supplies of water, particularly in the northeast.²⁸ Northern border clearance was expected to open access to at least 33 wells, assisting 7,000 people, and interviews with local residents found they expected household incomes to rise by a quarter as a result of the clearance.²⁹

Program Management and Coordination

Mine action

Jordan established the NCDR under Law No. 34, passed in 2000, and an April 2002 royal decree, which appointed its board of directors. It includes representatives of the Jordanian Armed Forces, the government, NGOs, landmine survivors, and the media. It became fully operational in 2004 when Prince Mired Raad Zeid Al-Hussein, a cousin of King Abdullah, became the NCDR's chair, and after a UNDP technical advisor had joined the staff.³⁰ UNDP will fund the position until July 2009.³¹

The NCDR was established as "the primary national mine action authority" responsible for preparing and overseeing implementation of a national mine action plan, including mine clearance, mine/ERW risk education (RE), and victim assistance (VA), and ensuring that mine action is integrated into the country's wider development strategies. It is also responsible for coordinating, accrediting, and regulating all organizations involved in mine action as well as for fundraising.³²

The NCDR also conducts quality management of demining operations and in 2007 increased its staff to 18 to cope with the increased level of clearance.³³ The NCDR, with funding from Sweden, recruited a technical advisor for RE in September for four months and another technical advisor to strengthen NCDR's quality management, who started in January 2009.³⁴

Risk education

The NCDR is responsible for coordination and monitoring of RE activities.³⁵ In November 2008, an RE steering committee and working group were established among RE operators, and they met at least quarterly.³⁶

Victim assistance

The NCDR has a VA steering committee, including governmental and non-governmental stakeholders, to ensure mainstreaming of victim assistance into other relevant strategies. However, in November 2008 it delegated actual coordination of VA and appointed the Higher Council on the Affairs of Persons with Disabilities (HCAPD) as Jordan's VA focal point.³⁷ The HCAPD was established in 2007 and monitors the implementation of the National Strategy on Disabilities, ensures quality standards for services, provides training, advocacy, and networking

services, and supports the cost of rehabilitation and education services for poor persons with disabilities as well as the development of disability programs in rural areas.³⁸

Data collection and management

The NCDR manages data using the Information Management System for Mine Action (IMSMA) Version 5. Data from the LRS was entered into the IMSMA database in 2008.³⁹ In May 2009, Jordan announced that the NCDR had completed the verification and consolidation of casualty data registered in the National Victim Database.⁴⁰ However, some gaps remained in information provided to Landmine Monitor, such as conflicting sets of data and a lack of detailed device type information (the only categories are landmines and UXO). The NCDR reported that discrepancies were due to “translation problems” and that information in IMSMA would be translated from Arabic to English.⁴¹ The verified information comes from the LRS conducted by the NCDR and Survivor Corps (SC) who organized home visits.⁴² Prior to the LRS and until 2007, casualty data was maintained in separate databases and information collected remained incomplete.⁴³

The NCDR believes that the updated data is now accurate, but expressed concerns that incidents involving scrap metal collectors and dealers⁴⁴ or occurring at the border may not always be reported.⁴⁵ SC believes NCDR reporting structures have improved significantly. Local authorities report more directly and efficiently to NCDR.⁴⁶

The NCDR reported plans to develop a Mine/ERW Victims Surveillance Mechanism to be used by all VA operators under the coordination of the NCDR. The mechanism will include collection, assembly, and dissemination of relevant data using the Epi Info system.⁴⁷ In 2008, the NCDR VA officer participated in a Field Epidemiology for Mine Action course organized by UNICEF.⁴⁸ In 2008, the NCDR, in coordination with SC, carried out a needs assessment survey in Mafraq and Irbid through home visits to mine survivors. The results were not available as of 31 May 2009.⁴⁹

IMSMA is used to record RE activities.⁵⁰

Plans

Strategic mine action plan

The 2008–2012 workplan set out by Jordan's Article 5 deadline extension request provided for completing clearance of the 104km-long northern border with Syria by October 2011. The workplan breaks down clearance of minefields along the border into three main tasks:

- the east sector, comprising 54km of border, with 39 mined areas covering 5.5km²;
- the northeast sector, along 31km of border, comprising 26 mined areas covering 2.96km²; and
- the northwest sector, along 19km of border, with 28 mined areas covering 1.85 km².

As foreseen in the plan, technical surveys began in the east sector in November 2007⁵¹ and were planned to continue in the other sectors ahead of clearance operations. Detailed timelines indicated that clearance of the east sector would continue until January 2010; clearance of the northeast sector from November 2009 until September 2010; and clearance of the northwest sector from September 2010 until July 2011.⁵² The northwest sector includes border areas disputed by Syria and was left to the end in the hope that a joint border committee set up to resolve the dispute would complete its work in time for the start of clearance operations.⁵³

The Jordan National Mine Action Plan 2005–2009 published in 2005 was still under revision by the NCDR as of July 2009 to take into account data gathered in the LRS. The NCDR expected to complete a draft of a new plan by the end of 2009 that would cover the period through the end of its Article 5 extension period in 2012.⁵⁴

Jordan's national mine action plan did not include clearance of ERW but, with funding from NATO, the NCDR started an ERW survey in September 2008. The first phase was due for completion in February 2010 (see Demining and Battle Area Clearance section below).⁵⁵

RE was included in Jordan's National Mine Action Plan 2005–2009.⁵⁶ The plan was to design and coordinate an RE program based on assessment of current RE efforts, undertake a train-the-trainers program, and deliver the new RE program to all high-risk communities.⁵⁷ Previous RE action plans were not implemented due to a lack of funds,⁵⁸ and so a new two-part action plan (April 2007–July 2008 and August 2008–December 2009) was developed in line with the 2006 LRS findings and a 2005 RE needs assessment (see Risk Education section below).⁵⁹

Following the changes in the risk profile, and in line with the new timeframe of the Article 5 deadline extension request,⁶⁰ in December 2008, the NCDR organized a meeting with all relevant RE actors to develop a Strategic Framework for Mine Risk Education 2009–2012, and a new action plan covering calendar year 2009.⁶¹ The new objectives include: carrying out an RE needs assessment in all mine/ERW-affected communities in the governorates of Ajloun, Irbid, Jerash, Mafraq, and Zarqa; providing RE through public dissemination of RE messages through the mass media, material distribution, etc., in all identified affected communities, targeting in particular out-of-school children, scrap metal collectors and dealers, shepherds, farmers, and women; and providing school-based RE in Ajloun, Irbid, Jerash, Mafraq, and

Zarqa governorates.⁶² With UNICEF support, the UNICEF technical advisor who had supported the NCDR in 2007 returned in September 2008.⁶³

VA was included in Jordan's National Mine Action Plan 2005–2009,⁶⁴ with the following objectives: developing and implementing comprehensive activities; strengthening national rehabilitation capacity; supporting socio-economic reintegration; and supporting the construction of a National Rehabilitation Center for Amputees (NRCA).⁶⁵ In 2007, the NCDR developed a draft action plan, with six strategic outputs: developing and mainstreaming VA capacity for long-term sustainability; unifying and verifying casualty data accessible to all implementers; improving geographic coverage of services and information; monitoring of VA implementers; issuing "victim cards" and recording assistance provided; and ensuring assistance to all survivors under NCDR coordination.⁶⁶ The plan was never finalized.⁶⁷

In May 2009, Jordan reported that the National Strategy on Disabilities (2007–2015) was under review, and the HCAPD intended to integrate mine/ERW victim assistance into the national strategy and other national policies/strategies.⁶⁸

National ownership

Mine action is nationally managed through the NCDR with support from one expatriate UNDP technical advisor (see Program Management and Coordination section above).⁶⁹

National mine action legislation

Jordan established the NCDR under Law No. 34, passed in 2000, and an April 2002 royal decree.

National mine action standards/Standing operating procedures

Jordan has national standards based on the International Mine Action Standards which were drawn up for the NCDR in 2006 by an international advisor.⁷⁰

Demining and Battle Area Clearance

The Armed Forces' Royal Engineering Corps (REC) had exclusive responsibility for demining until 2006. It continues to undertake clearance in the Jordan Valley and to conduct explosive ordnance disposal (EOD) in support of the NATO-funded ERW survey, and in response to public reports. In 2006, the NCDR signed an agreement with Norwegian People's Aid (NPA) to clear minefields on Jordan's borders with Israel and Syria.⁷¹ NPA completed clearance of minefields in Wadi Araba and Aqaba on the border with Israel in 2007 and in 2008 started clearing the northern border.⁷²

Demining and battle area clearance in 2008

Jordan started the ERW survey in September 2008 with four staff in headquarters and three four-person survey teams and expected to finish the first phase in February 2010 (see Strategic mine action plan section above).⁷³ The survey includes a desk assessment of data available from

government agencies as well as field visits and community mapping of suspected hazardous areas. By June 2009, it had completed visits to Balqa, Mabada, and Zarqa governorates. The NCDR had expected to find about 100 affected communities, but by May 2009 reported it had identified 264. NCDR survey teams can call for clearance of surface UXO by the REC but are short of capacity for deep search.⁷⁴

A Belgian Navy reconnaissance team inspected the banks of the Jordan River, accompanied by members of the Jordan Valley sampling and verification project, in January 2009 to ensure that no mines had been deposited in the course of flooding, particularly close to tourist areas. No mines have been found, but the Belgian team recommended the installation of several wire mesh traps in the river as a precautionary measure.⁷⁵

The REC cleared 15 mined areas covering a total of 1.7km² under the European Union-funded North Shunah project over two years, completing work in December 2007. The REC then took on another 18 mined areas in the Jordan Valley and Mount Nebo area. The project ended with completion of clearance of these areas covering 0.62km² in June 2008.⁷⁶

The NCDR, supported by the REC, implemented a sampling and verification project in areas previously cleared by the REC in the Jordan Valley after NCDR quality management teams had found a number of mines in these areas. The NCDR felt compelled to check the area because the REC had cleared it before NCDR had been set up and mine action standards had been adopted.⁷⁷ Under the first phase of the sampling and verification project, conducted from August to October 2008, NCDR reviewed records provided by REC of 267 mined areas cleared between 1993 and 2007. In the second phase, which lasted until 31 March 2009, NCDR conducted field visits and community interviews. In November 2008, the NCDR started a third phase of sampling and verification involving clearance of UXO, supported by three 12-person REC teams. By April 2009, sampling had been conducted in 22 areas leading to clearance of 51 items, including 31 antipersonnel mines, two antivehicle mines, and 18 live fuzes.⁷⁸

NPA started clearance of the northern border in April 2008 with 150 staff making up six demining teams, two mechanical teams, and one mine detection dog team of 10 dogs and five handlers.⁷⁹ Work had been due to start a year earlier, but NPA only received authorization to conduct limited technical survey in November 2007. NPA eventually received authorization to commence clearance operations to start on 1 April 2008, and full-scale operations only started in July 2008, after delays in delivery by UNDP of European Union funding held back recruitment and training.⁸⁰

Once underway, NPA also encountered technical difficulties as the rakes used by deminers for clearance operations in Wadi Araba did not work well with the different, much harder ground encountered on the northern border. Detectors bought for the project were not yet accredited by the NCDR and also initially encountered technical difficulties with the ground conditions until the manufacturers modified the software in 2009. To accelerate clearance, NPA recruited an additional 66 deminers in May 2009 and at the same time added a second demining shift.⁸¹

Total	1.098	10,481	4,730	0	3	6.08	0.02

Quality management

The NCDR undertakes daily quality management of NPA clearance on the northern border.⁸³ The NCDR brought in a technical advisor from Mines Advisory Group for four months from January–April 2009 to help develop the management and operational capacity for quality management.⁸⁴ The assignment was extended for two months to develop standing operating procedures for UXO clearance and the Jordan Valley sampling and verification project.⁸⁵

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Jordan is required to clear all antipersonnel mines in areas under its jurisdiction or control as soon as possible, but not later than 1 May 2009. In March 2008, however, Jordan acknowledged it would not be able to meet the deadline and submitted a request for an extension until 1 May 2012.⁸⁶ In its critique of Jordan's extension request, the ICBL stated that, "Earlier action to mobilize additional demining capacity and international financial support could have avoided the need for an extension. However, Jordan's request shows clear determination to fulfill its obligations; comprehensive and detailed planning for clearance of the remaining mine hazard; and mobilization of the necessary demining and financial resources needed to implement these plans in the time stipulated."⁸⁷

In November 2008, at the Ninth Meeting of States Parties, Jordan was granted a three-year extension.⁸⁸ States Parties found the plan "workable and fully-funded although complete implementation was contingent upon resolving border demarcation issues."⁸⁹ At the

⁸⁹ Decision on Jordan's Article 5 deadline Extension Request, Ninth Meeting of States Parties, Geneva, 28 November 2008.

intersessional Standing Committee meetings in May 2009, Jordan stated that although border demarcation involving a 45km stretch of the border had yet to be fully resolved, the government had approved clearance in disputed areas “without reservation.” Jordan added that, “therefore complete implementation of the 104km-long mine belt of the Northern Border Project is not contingent on border demarcation issues.”⁹⁰

Jordan’s March 2008 extension request had included a workplan that planned completion of clearance by November 2011.⁹¹ Despite delays in starting northern border clearance, in June 2009 NPA stated that increases in capacity and productivity would enable it to complete border clearance by the end of 2010.⁹²

Demining from 1999–2008

	Mine clearance (km ²)	Area released (km ²)

N/R = not reported

Risk Education

In 2008, RE activities continued to increase, reaching an estimated 21,600 direct beneficiaries including 16,200 children and 5,400 adults.⁹³ Indirectly, a further 75,000 people were reached.⁹⁴ This represents an increase compared to 2007, when 14,700 people received RE,⁹⁵ and results from the NCDR’s increased RE capacity and improved funding situation.⁹⁶ The NCDR believes that RE had an overall positive impact in reducing incidents in target areas and in teaching communities to report hazardous objects,⁹⁷ although there was an increase in ERW casualties in 2008.⁹⁸ RE continues to be necessary in Jordan due to the increase in scrap metal collection activities and ERW contamination.⁹⁹

In 2008, RE activities were carried out by the NCDR’s RE department which is composed of four NCDR staff working with a joint team of eight RE field officers from the REC, the Jordanian Red Crescent Society (JRCS), the Hashemite Commission for Disabled Soldiers (HCDS), and SC. It was also conducted through a JRCS program, with assistance from the ICRC.¹⁰⁰ RE messages were disseminated through public education activities and community liaison.¹⁰¹ The NCDR reported that activities targeted all at-risk groups including herders, farmers, children, housewives, scrap metal collectors, and community leaders.¹⁰² Activities were organized in Ajloun, Irbid,

Mafraq, and the Jordan Valley.¹⁰³ In 2008, new RE material was produced including an animated cartoon, a coloring book, and an RE song for children in affected communities.¹⁰⁴ RE messages were standardized based on RE national standards, standard operating procedures, and a manual that was developed by the NCDR according to international standards.¹⁰⁵ The NCDR has an RE quality management officer who monitors RE activities.¹⁰⁶ A refresher course for volunteer RE providers was organized in August and September 2008.¹⁰⁷

Awareness messages have been delivered without interruption from 1999 to 2008 by several operators, including the NCDR, the REC, Civil Defense, the Ministry of Education, the JRCS in cooperation with the ICRC, the UN Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), and SC.¹⁰⁸ In 2005, the NCDR, UNICEF, and the Geneva International Centre for Humanitarian Demining (GICHD) conducted an RE needs assessment which concluded that there was no need for a major RE program in Jordan, although there would be a merit in conducting specific RE sessions among communities living close to mined areas.¹⁰⁹ In April 2007, the NCDR launched its comprehensive RE program with funding from the United States Department of State and technical support from UNICEF, and became the main RE provider in Jordan.¹¹⁰ Jordan used Form I of its annual Article 7 report to provide generic information on RE activities in 1999–2009.¹¹¹

Victim Assistance

The estimated number of mine/ERW survivors in Jordan is 654.¹¹² In May 2009, Jordan stated that it considered victim assistance “a major pillar in mine action.”¹¹³ In 2008, as in previous years, Jordan continued to be active in providing services to mine/ERW survivors and to persons with disabilities. Persons with disabilities remained among the most disadvantaged groups in Jordanian society and suffer from stereotyping by the general population.¹¹⁴ Access to services in rural areas for persons with disabilities was said to be problematic.¹¹⁵

Since 1999, services have been provided by a large number of organizations.¹¹⁶ Mine/ERW survivors are treated within the general health system, which is reasonably well developed.¹¹⁷ Emergency medical care is free of charge, but continuing medical care is not free for those who

are not insured. On a case-by-case basis, the NCDR ensures that the government pays the costs of treatment for uninsured survivors.¹¹⁸ It is unknown how many landmine survivors are insured, but the NRCA reported that in 2008 the costs of treatment for all its non-insured patients were covered by the government.¹¹⁹ The quality of healthcare for the military is said to be better than for civilians.¹²⁰

The main institutions for prosthetic and rehabilitation services are al-Bashir Hospital, the King Hussein Medical Center, and the NRCA—all located in Amman.¹²¹ The NRCA reported a lack of machinery, equipment, and raw materials.¹²² In 2009, Jordan's rehabilitation capacity was expanded as the Queen Rania Center for Military Personnel with Special Needs, under the HCDS, started functioning.¹²³ Lack of supplies and long waiting lists remained a challenge.¹²⁴ In 2008, Canada launched a project in cooperation with the Ministry of Health and the Royal Medical Services to enhance the standards of rehabilitation services and to train doctors and technicians.¹²⁵ The first batch of 10 students graduated in 2008.¹²⁶

Jordan acknowledged that more effort is needed for socio-economic reintegration, which remained limited to vocational training and financial assistance by some NGOs.¹²⁷

The law mandates that 4% of jobs must be reserved for persons with disabilities, but there were reports of discrimination.¹²⁸ High unemployment rates further hampered job opportunities for persons with disabilities. Financial assistance is granted to persons with severe disabilities whose families earn less than JOD250 (US\$350) per month.¹²⁹

Jordan has legislation to protect the rights of persons with disabilities.¹³⁰ In 2007, revised rights-based disability legislation entered into force (Law on the Rights of Persons with Disabilities 31/2007).¹³¹ Jordan ratified the UN Convention on the Rights of Persons with Disabilities on 31 March 2008, but as of 1 July 2009 it had not ratified its Optional Protocol.

Progress in meeting VA26 victim assistance objectives

Jordan is one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors.¹³² Jordan declared its responsibility for significant numbers of survivors for the first time at the Eighth Meeting of States Parties in November 2007 and clarified its status through its Article 5 deadline

extension request in March 2008.¹³³ Jordan stated that, although the total number of casualties “may not compare highly on a global scale, it is significant when measured against the size of the population.”¹³⁴ It also added that Jordan’s priority is to develop an action plan with SMART (specific, measurable, achievable, relevant, and time-bound) objectives.¹³⁵ A national review conference on the rights of persons with disabilities is scheduled for November 2009.¹³⁶

In May 2009, Jordan reported on its victim assistance (VA) activities against the actions set in the Nairobi Action Plan. The HCAPD reported that Jordan’s efforts to mainstream VA into disability policies are to be seen as a major success.¹³⁷ As of May 2009, Jordan identified some specific gaps and weaknesses in service provision in the health, rehabilitation, and psychosocial and socio-economic reintegration areas.¹³⁸

In 2008, a process support visit was undertaken by the Mine Ban Treaty Implementation Support Unit (ISU).¹³⁹ During the visit, the NCDR organized a roundtable discussion with governmental and non-governmental actors working in the field of disability.¹⁴⁰ Jordan reported on its VA activities at the Meeting of States Parties in 2008, and at the Standing Committee meetings in 2008 and 2009.¹⁴¹ Jordan did not use the voluntary Form J to its annual Article 7 report to provide an update on victim assistance activities in 2008 and 2009.¹⁴² However, in Form I of its Article 7 report submitted in 2009, it noted that a list of mine/ERW casualties had been completed and that the list will be used to provide rehabilitation services to survivors.¹⁴³ Jordan included a VA expert on its delegation to the Ninth Meeting of States Parties in 2008 and at the intersessional Standing Committee meetings in May 2009.¹⁴⁴

Victim assistance activities

The number of mine/ERW survivors that received assistance in the last 10 years is unknown, but Jordan reported that all known mine/ERW survivors received some form of physical rehabilitation and psychological support; services were provided by both governmental bodies and NGOs.¹⁴⁵

¹⁴⁵ Statement of Jordan, Standing Committee on Victim Assistance and Socio-Economic Reintegration, Geneva, 26 May 2009.

In 2008, the NRCA, with funds from the Royal Medical Services and support from the NCDR, assisted 17 new patients (four civilians, two military, and 11 persons from Yemen and Iraq), including an unknown number of mine/ERW survivors with prosthetics, rehabilitation, and psychological support.¹⁴⁶

In 2008, SC provided 6,193 services for persons with disabilities, including 1,394 services to mine/ERW survivors: 20 socio-economic activities, 77 direct health assistance services, 92 referrals, and 1,205 peer support home visits.¹⁴⁷

Support for Mine Action

Landmine Monitor is not aware of comprehensive long-term cost estimates for fulfilling mine action obligations in Jordan. Jordan has reported a required budget of \$13 million to carry out the Northern Border Clearance Project for the period 1 April 2008–1 May 2012.¹⁴⁸ In November 2008, Jordan reported that all finances had been raised to support clearance in the Northern Border Clearance Project during its Article 5 extension period. However, it reported that raising funds for review and verification efforts in the Jordan Valley remained an outstanding task.¹⁴⁹ Jordan has not reported on comprehensive estimates or the status of resource mobilization for long-term VA.

National support for mine action

In its Article 5 deadline extension request, Jordan reported total funding for mine action of \$84.5 million since 1993, with government contributions accounting for some \$52.5 million or 62% of total funds. Jordan reported that annual national funding has remained roughly stable at \$3.5 million annually during the past 15 years.¹⁵⁰ Annual funding in 2007 was reported in the extension request to be \$3.5 million.

International cooperation and assistance

In 2008, seven countries, Belgium, Canada, Germany, Italy, Norway, Spain, and the US, reported providing \$6,800,877 to mine action in Jordan. Reported mine action funding in 2008 was roughly 43% less than reported in 2007, but covers a substantial portion of overall funds required according to Jordan's national mine action plan. As noted above, Jordan has stated that all required funds for the Northern Border Clearance Project have been raised. As of March 2008, contributions to the Northern Border Clearance Project consisted of \$787,287 from Australia, \$1,276,675 from Canada, \$6,880,289 from the European Commission, \$382,238 from Germany, \$185,006 from Japan, and \$3,576,281 from Norway.¹⁵¹

KENYA

Ten-Year Summary

The Republic of Kenya became a State Party to the Mine Ban Treaty on 1 July 2001. It has not enacted national implementation legislation. Kenya completed destruction of its stockpile of antipersonnel mines in August 2003. It served as co-chair of the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies from September 2002 to September 2003. In November/December 2004, Kenya hosted the First Review Conference of the Mine Ban Treaty. It served as co-chair of the Standing Committee on the General Status and Operation of the Convention from November 2007 to November 2008. As of 31 July 2008, Kenya reported retaining 1,020 mines for training purposes.

Kenya has not had an antipersonnel mine problem since becoming a State Party, but it continues to be affected by UXO at military training ranges. In February 2005, the International Mine Action Training Centre opened in Embakasi, near Nairobi's international airport, with the support of the United Kingdom; it has since become an important regional mine action training center.

As Kenya is only slightly contaminated by UXO, most risk education has been targeted at refugees and, sporadically, at Kenyans in the north. Discrimination and poor access to services remained problematic for persons with disabilities, including mine/ERW survivors.

Mine Ban Policy

Kenya signed the Mine Ban Treaty on 5 December 1997 and ratified it on 23 January 2001, becoming a State Party on 1 July 2001. Kenya has been reporting that national legislation was in process since 2004.¹ Kenya submitted its sixth Article 7 report on 31 July 2008. As of 1 July 2009, Kenya had not submitted its annual Article 7 report due on 30 April 2009.²

Kenya served as the co-rapporteur and then co-chair of the Standing Committee on the General Status and Operation of the Convention from 2006–2008. At the Ninth Meeting of States Parties, it made a statement during the general exchange of views noting the “background of unprecedented challenges pertaining to the implementation of the convention and the coordination of the gains already achieved.” It expressed concern about the lack of progress on universalization of the treaty and about the large number of requests for extensions of Article 5 clearance deadlines.³ It commented on the requests by Senegal, the UK, and Zimbabwe. Kenya also participated in the intersessional Standing Committee meetings in Geneva in May 2009 but did not make any statements.

¹ In its Article 7 report dated 31 July 2008, Kenya stated, “Legislation for domestication of land mine ban treaty to follow.” Article 7 Report, Form A, 31 July 2008. In November 2007, Kenya assured States Parties that it “is committed to fulfill her [treaty] responsibilities including that of domestication of the instrument.” Statement of Kenya, Eighth Meeting of States Parties, Dead Sea, 18 November 2007. Earlier, Kenya reported that the Attorney General's office drafted national implementation legislation and sent it to the Office of the President for approval in June 2005. Parliament reportedly approved the preparation of national implementation legislation on 9 December 2004. See *Landmine Monitor Report 2008*, p.472.

² Kenya's latest Article 7 report, covering 31 March 2007 to 31 March 2008, was dated 31 July 2008 but was not received by the UN until 17 October 2008. Kenya has submitted five previous Article 7 reports: in February 2008 (covering 1 April 2006 to 31 March 2007); 1 April 2005; 31 March 2004; 4 June 2002; and 27 December 2001. Kenya did not submit reports covering 1 April 2005 to 1 April 2006, or 1 May 2002 to 30 April 2003.

³ Statement by Amb. Philip Owade, Permanent Mission of Kenya to the UN in Geneva, Ninth Meeting of States Parties, Geneva, 24 November 2008.

With respect to issues of treaty interpretation under discussion by States Parties, Kenya has said, on Article 1, that its military may not participate in joint operations or drills where antipersonnel mines are being used.⁴ On Article 2, it has said that “any mine that functions or has the capacity to function as an antipersonnel mine...should be considered as an antipersonnel mine and is therefore banned.”⁵

Kenya has never produced or exported antipersonnel mines. In August 2003, Kenya’s military destroyed its stockpile of 35,774 antipersonnel mines, far ahead of its treaty-mandated deadline of 1 July 2005.⁶

In its Article 7 report submitted in July 2008, Kenya cited a total of 1,020 antipersonnel mines retained for training purposes.⁷ This is a reduction of 1,980 mines since its Article 7 report submitted in February 2008; however the report submitted on 31 July 2008 does not give details of the actual uses of the mines consumed. At the April 2007 Standing Committee meetings, Kenya reported that the number of retained mines stood at 2,460 “after using 540 APMs [antipersonnel mines] for the provided purposes.”⁸ It is not known if the total of 3,000 retained mines in the February 2008 report indicates an unexplained increase back to 3,000, or if it is an error.⁹

Kenya is not party to the Convention on Conventional Weapons. Kenya signed the Convention on Cluster Munitions in December 2008 but had not ratified as of 1 July 2009.¹⁰

Scope of the Problem

Contamination

Kenya is not believed to be mine-affected, although it has had a problem with UXO on training ranges at Archer’s Post.¹¹ Kenya’s latest Article 7 report listed no known or suspected mined areas, as did its previous report.¹² In 2008, the British Army carried out its annual Exercise Pineapple, in which explosive ordnance disposal (EOD) personnel spend up to a month clearing UXO that may have been left in Kenya.¹³ Media reports claimed that an incident which killed a

⁴ The government stated this position in interventions on Article 1 at the Standing Committee on the General Status and Operation of the Convention, Geneva, 9 February 2004. Notes by Landmine Monitor. It is also contained in its draft legislation, “The Prohibition of Antipersonnel Mines Bill 2004.”

⁵ It continued, “We therefore consider mines with sensitive fuzes and all anti-vehicle mines with antihandling devices to be covered under Article 2 and therefore prohibited under the Convention.” Statement of Kenya, Standing Committee on the General Status and Operation of the Convention, Geneva, 12 May 2006.

⁶ Article 7 Report, Form B, 1 April 2005; and see *Landmine Monitor Report 2002*, p. 323, for details on the types of mines, which were obtained from Belgium, Israel, and the UK.

⁷ Article 7 Report, Form D, 31 July 2008. The 1,020 mines include: 176 No. 4 mines, 42 No. 409 mines, 475 No. 6 mines, and 327 NR PRB mines.

⁸ Statement of Kenya, “Kenya’s Progress on Aspects of Articles 3 and 5,” Standing Committee on the General Status and Operation of the Convention, Geneva, 27 April 2007. It stated that the mines were used for training in detection, clearance, and destruction techniques at training institutions, and were consumed during “humanitarian demining and EODs; demolition/destruction practical exercises; mine awareness training to peacekeeping contingents deployed to various missions.”

⁹ Prior to the 2007 statement, Kenya had, since its initial declaration in 2001, consistently reported a total of 3,000 mines retained, suggesting that no mines had been consumed (destroyed) during training activities. However, in June 2006, an IMATC official told Landmine Monitor that it was using antipersonnel mines provided by the Kenyan Army for its training activities, and that the mines were being consumed during the training courses. Interview with Lt. Col. Tim Wildish, Commandant, IMATC, Nairobi, 6 June 2006.

¹² Article 7 Reports, Form C, 31 July 2008, February 2008, and 1 April 2005.

¹³ Email from Col. John Steed, Defence Advisor, Kenya and Tanzania, and Defence Attaché, Eritrea and the Seychelles, British High Commission, 26 June 2008.

child in Samburu district in June 2009 was caused by a cluster munition remnant.¹⁴ Landmine Monitor was unable to verify the details of the reports. Kenya has not previously been considered affected by cluster munition remnants and had even made a declaration to that effect at the Wellington Conference on Cluster Munitions in February 2008.¹⁵

Casualties

The British High Commission in Kenya reported five new UXO casualties occurring in 2008, including one person killed and four injured. Further detail was not provided.¹⁶ In 2007, one man was killed by ERW.¹⁷ In 2009 through July, in the incident referred to above, a 12-year old boy was killed in June, reportedly by a cluster munition remnant.

Landmine Monitor has identified 79 mine/ERW casualties between 1999 and the end of 2008 (24 people killed and 55 injured).¹⁸ The last recorded landmine casualties occurred in 2005, when a bus drove over a mine near the border with Somalia, killing six people and injuring 10.¹⁹ In 2002, media reported that at least 500 people had been killed by UXO since the start of military drills in 1945 and that many more had been injured.²⁰ In 2002, the British Ministry of Defence paid compensation to 1,046 people reportedly injured by UXO from training areas used by the British Army.²¹ Figures are likely incomplete, as there is no systematic casualty data collection mechanism in Kenya.

Preliminary results of the 2007–2008 National Disability Survey found that 4.6% of the population was disabled.²²

Program Management and Coordination

There is no mine action program in Kenya. The situation does not warrant specific victim assistance programs. The Ministry of Health is the lead ministry responsible for the care of persons with disabilities.²³

Risk Education

Due to limited contamination, there were no mine/ERW risk education (RE) programs in Kenya, and in its most recent Article 7 report, Kenya left blank Form I regarding measures to provide warnings to the population.²⁴

Since 1999, the majority of RE activities have been targeted at refugees from neighboring countries, mostly Sudan. However, activities decreased significantly in early 2008 when Handicap International (HI)—present since 2005—ended its program for southern Sudanese in the Kakuma Refugee Camp. A December 2007 evaluation of the HI RE program indicated that it had a positive impact on the behavior of its recipients and that it had a good potential

²⁴ Article 7 Report, Form I, 31 July 2008.

for sustainability.²⁵ As an exit strategy, HI established RE clubs in schools and provided an RE video to its partners.²⁶ In March 2009, HI could not confirm whether these activities continued after its departure.²⁷ HI provided RE to some 129,577 people between 2005 and January 2008.²⁸

Before 2005, other organizations providing RE included Jesuit Refugee Service Eastern Africa, the Kenyan military, the Organisation for the Survival of Il-Laikipiak Indigenous Maasai Group Initiative, and the Nairobi Rotary Club.²⁹

Victim Assistance

The total number of survivors is unknown but is at least 1,068 (1,046 from the British claims and the 2003–2008 survivors). Mine/ERW survivors receive the same services as other persons with disabilities, but access to services remained limited.³⁰ Public health facilities are considered to provide adequate treatment.³¹ Physical rehabilitation is available at national, provincial, and district levels.³²

The ICRC Special Fund for the Disabled (SFD) continued to support two physical rehabilitation centers in Kenya: the Kangemi Rehabilitation Centre (Kangemi, mainly serving refugees) and the Kikuyu Orthopaedic Rehabilitation Centre (Nairobi). Due to budgetary constraints at the Office of the UN High Commissioner for Refugees, the ICRC had to provide one-off financial support to the Kangemi center in 2008, and in Nairobi production decreased due to a lack of funding, subsequent lower staff motivation, and access difficulties.³³

The British Ministry of Defence has paid compensation to alleged UXO casualties, the last time in 2002. Although the 2007 casualty was allegedly due to UXO found at a British Army training field,³⁴ no additional claims were made to the British High Commission in 2008.³⁵

The Persons with Disability Act 2003 prohibits discrimination and calls for the creation of a National Development Fund for the Disabled. As of March 2009, this fund had not been established and the Act was not implemented effectively.³⁶ Students with disabilities were often denied access to regular schools and less than 10% of children with disabilities were enrolled.³⁷ Kenya ratified the UN Convention on the Rights of Persons with Disabilities on 19 May 2008, though it had not signed its Optional Protocol as of 1 July 2009.

Support for Mine Action

International Mine Action Training Centre

The International Mine Action Training Centre (IMATC) is jointly funded by the UK and Kenyan governments. Kenya has not reported in detail to Landmine Monitor on the financial structures or national contributions to the center, but IMATC has in the past reported Germany, the European Commission, the UK, and the US among its funding partners. It has also reported receiving funds from the UN Mine Action Service and UNDP, and staff support from the UK and the US.³⁸ In July 2007, the UK House of Commons Defence Committee reported that Ministry of Defence budget estimates including support to IMATC totaled £987,000 (US\$1.8 million) for 2007–2008.³⁹ The UK did not report specific funding to Kenya or IMATC for the 2007–2008 or 2008–2009 fiscal years to Landmine Monitor.

KUWAIT

Ten-Year Summary

The State of Kuwait became a State Party to the Mine Ban Treaty on 1 January 2008. Kuwait reported a stockpile of 91,432 antipersonnel mines in its initial Article 7 report in May 2008. In July 2009, Kuwait informed States Parties that it had destroyed its stockpile.

Kuwait has a residual mine and explosive remnants of war (ERW) problem, mostly unexploded submunitions. The number of mine/ERW casualties in Kuwait is unknown. Between 1999 and 2008, no formal mine/ERW risk education activities targeting at-risk groups were organized. Kuwait has the capacity to deliver disability services. However, foreign mine/ERW survivors encountered problems in accessing services in Kuwait.

Mine Ban Policy

Kuwait acceded to the Mine Ban Treaty on 30 July 2007, becoming a State Party on 1 January 2008. In its second Article 7 report, submitted on 24 May 2009, Kuwait stated that it was “in progress to enact the required legislation to meet the elements of this convention” as required by Article 9. It also indicated that the “recent” penal code was being applied, which prohibits “such acts mentioned in the convention.”¹ In July 2009, Kuwait stated that “The Government of Kuwait has submitted a draft Military Law to the Parliament in Kuwait to prohibit the possession of conventional weapons for those not authorized....”²

Kuwait attended the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings in May 2009, but did not make any statements.

Kuwait has not yet made known its views on key matters of interpretation and implementation related to Articles 1, 2, and 3 of the Mine Ban Treaty (joint military operations with states not party to the treaty, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Kuwait is not party to the Convention on Conventional Weapons. It has not signed the Convention on Cluster Munitions.³

Stockpiling, destruction, production, transfer, and use

In its initial Article 7 report, Kuwait declared a stockpile of 91,432 antipersonnel mines, composed of six types.⁴ In July 2009, Kuwait informed States Parties that it had destroyed its stockpile.⁵ This was accomplished far in advance of its treaty-mandated deadline of 1 January

¹ Article 7 Report, Form A, 24 May 2009. The report covers the period from 1 April 2008 to 31 March 2009. Kuwait reported the same thing in its initial Article 7 transparency report submitted on 28 May 2008.

² Letter M 134/2009 from the Permanent Mission of Kuwait to the UN in Geneva to the Mine Ban Treaty Implementation Support Unit, 9 July 2009.

³ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 220.

⁴ This total quantity of mines was inconsistent with the quantity listed next to each of the six mine types, which added up to 87,582. These included: 12,151 P-40 bounding fragmentation mines (apparently with fuze assemblies, produced by Italy); 6,848 TS-50 blast mines (apparently without fuzes, provided by Egypt); 2,765 NR-409 blast mines (produced by Belgium); 64,033 C3A1 Elsie blast mines (produced by Canada); 446 M14 blast mines (origin not specified); and 1,339 of an unknown type of high explosive mine with, presumably, a tripwire. Article 7 Report, Form B, 28 May 2008.

⁵ The letter states that Kuwait “would like to communicate that the Competent Authorities in the State of Kuwait (Ministry of Defense) have destroyed the stockpile of Anti-Personnel Mines as mentioned in the State of Kuwait’s report on transparency measures (7.1b) reporting period 1st June 2008 – 30 March 2009.” Letter M 134/2009 from the Permanent Mission of Kuwait to the UN in Geneva to the Mine Ban Treaty Implementation Support Unit, 9 July 2009. The reference to the Article 7 report presumably applies to Kuwait’s initial report, dated 28 May 2008, which erroneously lists the reporting period as 1 June 2008 to 30 March 2009.

2012. Kuwait did not provide any details on the destruction process, such as the location and method of destruction, the numbers or types of mines destroyed, or the dates of initiation and completion.

Kuwait's May 2009 Article 7 report lists no stockpiled mines, yet it does not report specifically on the destruction of the mines, nor does it report any mines transferred for the purpose of destruction.⁶ At the intersessional Standing Committee meetings in May 2009, Kuwait did not inform States Parties that it had completed stockpile destruction.

Kuwait's Article 7 reports indicate that it is not retaining any mines for training purposes.⁷

Previously, in 2004, the Minister of Defense told the UN Mine Action Service that Kuwait did not have any stockpiles of antipersonnel mines.⁸

Kuwait is not known to have produced or exported antipersonnel mines. It did not declare any production facilities in its Article 7 reports.⁹ Officials from the Ministry of Defense told Landmine Monitor in 2002 that Kuwaiti forces have never used mines.¹⁰

Scope of the Problem

Contamination

Wide desert and coastal areas of Kuwait were contaminated with mines and ERW, including unexploded submunitions, as a result of the 1990–1991 Gulf War. Despite massive demining operations that employed foreign contractors following the war, mines remain in some areas, particularly along the natural sand corridors, although the precise extent of residual contamination is not known. In its initial Article 7 report, submitted in May 2008, Kuwait declared no known or suspected mined areas, noting that there are “no mined areas left in Kuwait recently and formally [sic].”¹¹ However, according to a 2009 United States Overseas Security Advisory Council report, “[u]nexploded bombs, mines, and other ordnance from the 1991 Gulf War remain present in some desert areas in Kuwait.” The US embassy in Kuwait “urges caution if traveling off paved surfaces outside of Kuwait City. Unexploded ordnance has also been discovered in piles of sand used at construction sites, including at Camp Arifjan, the largest U.S. military base in the country.”¹²

In addition, in the west, southeast, and north of the country, it is believed that mines (and UXO) can still be found under oil lakes as a consequence of the destruction of Kuwaiti oil wells by Iraqi forces in 1991. There are also said to be mines in parts of the desert and on Bubiyan Island off the northeast coast of Kuwait, which have both been used for military exercises.¹³

Casualties

In 2008, Landmine Monitor identified at least three new mine casualties injured in two incidents. In July, two Bangladeshi shepherds were injured in Kabad while tampering with a landmine. Reportedly, the men were not aware of the risks.¹⁴ In September, a 50-year-old Bangladeshi man was injured by a mine in the Amghara scrapyard area, west of Kuwait City.¹⁵ The 2008 casualty rate is a sharp decrease compared to 2007 (20 casualties) and the lowest since 2003.

⁷ Article 7 Reports, Form D, 24 May 2009 and 28 May 2008.

⁸ Amb. Satnam Jit Singh, Consultant, UN Mine Action Service, “Mission Report–Saudi Arabia/Kuwait, 22–28 October 2004,” undated.

⁹ Article 7 Reports, Form E, 24 May 2009 and 28 May 2008.

¹⁰ Information provided by the Kuwaiti Ministry of Defense, 10 April 2002.

¹¹ Article 7 Report, Forms C and F, 28 May 2008.

¹² US Overseas Security Advisory Council, “Kuwait 2009 Crime & Safety Report,” 12 February 2009, www.osac.gov.

¹³ See *Landmine Monitor Report 2007*, p. 481.

¹⁴ “Landmine blast injures 2,” *Arab Times Online* (Kuwait), 28 June 2008, www.arabtimesonline.com; and see also *Landmine Monitor Report 2008*, p. 479.

¹⁵ “Mine hurts expat,” *Arab Times* (Kuwait City); and “Mine explosion in Amghara area,” *Al Qabas* (Kuwait), 25 September 2008.

Casualties continued to be reported in 2009. In March, a 13-year-old boy was injured while playing with a mine.¹⁶ In February 2009, it was reported that a foreign worker had been “recently” killed while attempting to remove wiring from an item of ERW near a border checkpoint with Iraq.¹⁷

The Kuwait Institute for Scientific Research (KISR) holds the most comprehensive information on mine/ERW casualties covering the period from August 1990 to 2002. Its records show that mines killed 85 people and injured 1,026, and ERW killed 119 and injured 175 during this period.¹⁸ A nationwide government casualty survey between 1991 and 1993 found 20 people killed and 429 injured by mines and ERW. Additionally, at least 191 demining casualties occurred.¹⁹ Between March 2000 and December 2008, Landmine Monitor identified at least 85 casualties (24 injured and 61 killed).

Program Management and Coordination

There is no formal mine action program in Kuwait. The Ministry of Defense is responsible for coordinating all demining operations. The Engineering Corps of the Land Forces deals with mines and ERW in desert areas, while the Ministry of Interior deals with ordnance in populated areas. Both bodies respond to calls from public and private organizations.

The Ministry of Social Affairs and Labor coordinates disability issues, and the Higher Council for Handicapped Affairs is responsible for disability policy as well as financial and socio-economic reintegration issues.²⁰ There is no mine/ERW casualty data collection mechanism in Kuwait and the main source of information remains media.

Demining and Battle Area Clearance

Both mines and unexploded submunitions continue to be disposed of across the country. In August 2008, explosive ordnance disposal specialists detonated a submunition found in a desert along the al-Salmi highway.²¹ On 3 October, a mine was found by a member of the public in the Um al-Aish area in the north of the country; the mine was cleared by army engineers.²² On 19 November, a submunition was found by a member of the public in al-Wafra Farms, in the southwest of Kuwait, and again it was disposed of by army engineers.²³

Risk Education

In 2008–2009, no mine/ERW risk education (RE) activities were identified, even though Kuwait listed some RE activities planned between 1 June 2008 and 30 March 2009 in its initial Article 7 report.²⁴ No formal RE has been reported since 1999, but some basic public information dissemination and lectures for students were provided by the government, the Kuwait Red Crescent Society, the Center for Research and Studies on Kuwait, and KISR in 2000–2001 and 2007–2008.

Victim Assistance

The estimated number of mine/ERW survivors in Kuwait is unknown but at least between 62 (Landmine Monitor data) and 1,201 (KISR data). In its initial Article 7 report, Kuwait did not make use of Form J to report on victim assistance activities.²⁵ While the Kuwaiti health system is said to be one of the best in the Gulf region, problems such as staff shortages and inadequate service provision are increasingly reported. Some believe the system might not be able to cope with the increasing (foreign) population.²⁶ In early 2009, there were reports of poor treatment of foreign workers, who make up the majority of recent mine/ERW casualties.²⁷ Access to disability services was also problematic for foreign nationals in Kuwait. Kuwaiti citizens and non-citizens are entitled to financial compensation for disabilities caused by work. Military mine/ERW casualties are treated in separate military facilities. As of 1 July 2009, Kuwait had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

LATVIA

Ten-Year Summary

The Republic of Latvia acceded to the Mine Ban Treaty on 1 July 2005. Before adhering to the treaty, Latvia submitted three voluntary Article 7 reports and voted for every annual pro-ban UN General Assembly resolution. Latvia inherited a small stockpile of antipersonnel mines and completed their destruction in August 2006. It has retained mines for training purposes. The total number of mine and explosive remnants of war (ERW) casualties since 1999 in Latvia is unknown, but at least eight civilian ERW casualties have been reported. Some limited mine/ERW risk education has taken place in Latvia since 2000, but by 2006 this was limited to warnings in media reports about ERW discoveries. No specific victim assistance activities were reported for Latvia from 1999 to 2008.

Mine Ban Policy

Latvia acceded to the Mine Ban Treaty on 1 July 2005, becoming a State Party on 1 January 2006. Latvia has not enacted new legislation specifically to implement the Mine Ban Treaty, but has detailed a number of national implementation measures.¹

Latvia submitted its fourth Article 7 transparency report on 29 April 2009, covering calendar year 2008.² The report included voluntary Form J with information on Latvian involvement in international mine clearance operations and a regional landmine meeting. Before adhering to the treaty, Latvia submitted three voluntary reports.³

Latvia attended the Ninth Meeting of States Parties in Geneva in November 2008, and the intersessional Standing Committee meetings in Geneva in May 2009, but made no statements.

Latvia has not made its views known on matters of interpretation and implementation related to Articles 1, 2, and 3, including the issues of joint military operations with states not party to the treaty, foreign stockpiling of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training.

Latvia did not produce or export antipersonnel mines in the past, but inherited a small stockpile of Soviet antipersonnel mines. Latvia completed destruction of its stockpile of 2,490 PMN-2 mines on 2 August 2006.⁴In its latest Article 7 report, Latvia reported that, as of the end

¹ In its Article 7 report for 2007, Latvia for the first time included details about national implementation measures in accordance with Article 9 of the treaty. The report listed four measures, which were: (1) Law on the Convention on the Prohibition of the Use, Stockpiling, Production and Transfer of Anti-Personnel Mines and their Destruction, which is the law authorizing accession to the treaty; (2) Cabinet of Ministers Regulations No. 645 of 25 September 2007 on the List of National Strategic Goods and Services, which prohibits export and transit of antipersonnel mines; (3) The Code for Administrative Violations, which lays down liability for violations of circulation, manufacturing, storage, and use of strategic goods and arms and explosive devices as well as their export, import, and transfer; and (4) The Criminal Law, which provides for liability in case of smuggling explosive devices. Section XX of the Criminal Law stipulates punishment for unauthorized manufacture, acquisition, storage, and sale, as well as transportation and conveyance of weapons and explosives. In the past, Latvia had only reported its Law on the Circulation of Arms prohibiting the export and transit of antipersonnel mines. Article 7 Report (for calendar year 2007), Form A.

² Previous Article 7 reports were submitted in 2008 (for calendar year 2007), 2007 (for calendar year 2006), and on 28 April 2006.

³ It submitted voluntary reports on 16 June 2005, 14 May 2004, and 1 May 2003.

⁴ Statement of Latvia, Seventh Meeting of States Parties, Geneva, 20 September 2006. Latvia's reporting on its stockpile has been inconsistent. Over the years, it has declared its stockpile to consist of between 0 and 4,666 antipersonnel mines. See *Landmine Monitor Report 2005*, p. 403. Also, in its four Article 7 reports, Latvia did not include in its stockpile the MON-50, MON-100, MON-200, and "Defense Charge-21" Claymore-type directional fragmentation mines listed in its previous voluntary reports. It has stated that "they are defence charge and not observed by the Ottawa Convention. Latvia is committed not to use them as APM [antipersonnel mines]." Article 7 Report, Form B, 28 April 2006. Use of Claymore-type mines in command-detonated mode is permissible under the Mine Ban Treaty, but use in victim-activated mode (with tripwires) is prohibited. The ICBL has urged States Parties to report on steps taken to ensure that these types of mines can only be used in command-detonated mode.

of 2008, it retained a total of 899 antipersonnel mines (881 OZM-4 and 18 PMN-2) for training purposes. It did not consume any mines for training in 2008. It used the expanded Form D on retained mines to state, "There are no reasons for retaining mines other than for training EOD (explosive ordnance disposal) experts for participation in international operations."⁵ In 2007, Latvia consumed three PMN-2 mines during training activities⁶ and in 2006 it consumed 399 PMN-2 mines. Latvia originally declared that it was retaining 1,301 mines for training purposes, including 420 PMN-2 and 881 OZM-4 mines.⁷

Latvia is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines. It submitted its annual report for 2008 required by Article 13 of the protocol, although this appears to be identical to its report for 2007.⁸ Latvia is not party to Protocol V on Explosive Remnants of War. As of 1 July 2009, Latvia had not signed the Convention on Cluster Munitions.

Scope of the Problem

Latvia is contaminated by ERW from World War II and military bases from the Soviet era. There is also a small residual problem with mines, but no known mined areas.⁹

Casualties

Landmine Monitor did not record any mine/ERW casualties in Latvia from 2008 to 1 April 2009. There is no casualty data collection mechanism in Latvia.¹⁰ Landmine Monitor information has been collected from media reports and provided by Latvian Armed Forces personnel. There were at least nine ERW casualties in Latvia from 1999 to the end of 2007 (five killed and four injured); no active duty EOD personnel casualties were reported.¹¹

Risk Education

In the context of the small number of ERW casualties reported, the level of mine/ERW risk education (RE) available seems adequate. There may be some risk from scrap metal collection: for example, in 2006 companies complained that sometimes people bring in UXO as scrap.¹² Between 2006 and 2008, Latvian newspaper reports on discoveries of ERW included phone numbers for the public to call when suspicious objects were found.¹³ Previously, the Latvian EOD center reported conducting RE for visiting groups and in some schools.¹⁴ In 2000, an NGO implemented RE with international support.¹⁵

Victim Assistance

The estimated number of survivors is at least three. Due to the small number of known ERW survivors, there is no need for specialized mine/ERW victim assistance in Latvia. Emergency medical attention is available through the public health system. Reform of the healthcare system in 2008 included major structural changes to the emergency system to increase its effectiveness before and during hospitalization.¹⁶

⁵ Article 7 Report, Form D, 29 April 2009.

⁶ Article 7 Report (for calendar year 2007), Form D.

The Ministry of Welfare was responsible for coordination of disability issues between relevant ministries, and the National Council of Disability Affairs (NCDA) facilitated the engagement of NGOs. NCDA has both advisory and implementation functions.¹⁷ Latvia has had a disability action plan since 2006, but limited progress has been made due to a lack of financial resources.¹⁸

Legislation prohibiting discrimination against persons with disabilities was generally enforced.¹⁹ As of 1 July 2009, Latvia had not ratified the UN Convention on the Rights of Persons with Disabilities, which it signed on 18 July 2008.

FORMER YUGOSLAV REPUBLIC OF MACEDONIA

Ten-Year Summary

The Former Yugoslav Republic of Macedonia (FYR Macedonia) became a State Party to the Mine Ban Treaty on 1 March 1999. FYR Macedonia completed clearance of all emplaced antipersonnel mines in mined areas on 15 September 2006, in advance of its Article 5 deadline of 1 March 2009. Demining activities had searched and cleared a total of nearly 7km² of land, particularly on the country's northwestern border with Kosovo and Albania, and destroyed 558 antipersonnel mines. FYR Macedonia provided the Seventh Meeting of States Parties with a Declaration of Completion, pledging to report and clear any previously unknown mined areas that may be subsequently discovered "as a matter of urgent priority."¹ FYR Macedonia completed destruction of its stockpile of antipersonnel mines in February 2003. Ethnic Albanian insurgents reportedly used mines in 2001 in a conflict in the region bordering Kosovo.

FYR Macedonia continues to have a problem with explosive remnants of war, mostly from World Wars I and II, for which the Protection and Rescue Directorate is the responsible government body. During clearance activities in 2007 and 2008, it did not report the destruction of any antipersonnel mines. No new mine/ERW casualties have been reported in FYR Macedonia between 2006 and 1 July 2009. The last reported casualty occurred in 2005. There are no dedicated victim assistance programs in FYR Macedonia.

Mine Ban Policy

FYR Macedonia acceded to the Mine Ban Treaty on 9 September 1998, becoming a State Party on 1 March 1999. While it has not enacted new national implementation legislation, it has reported that prohibited activities are covered by existing criminal law.²

FYR Macedonia attended the Ninth Meeting of States Parties in Geneva in November 2008, but made no statements. It did not participate in the intersessional Standing Committee meetings in May 2009.

FYR Macedonia submitted its ninth Article 7 transparency report in April 2009, covering calendar year 2008. The report consists of a cover page which states that all items are either "unchanged" or "non applicable."³

With respect to matters of interpretation and implementation related to Articles 1, 2, and 3, FYR Macedonia has strong positions consistent with those articulated by the ICBL and many States Parties regarding the prohibition on antivehicle mines with sensitive fuzes, the prohibition on transit or foreign stockpiling of antipersonnel mines, and the requirement during joint operations with states not party to the treaty to reject any rules of engagement permitting use of antipersonnel mines.⁴

¹ FYR Macedonia, Declaration of Completion, Seventh Meeting of States Parties, Geneva, 19 September 2006, www.apminebanconvention.org.

² See *Landmine Monitor Report 2004*, p. 545; and *Landmine Monitor Report 2002*, p. 329.

³ Article 7 Report (for calendar year 2008). The report states "unchanged" for Forms A (national implementation measures) and G (antipersonnel mines destroyed after entry into force), and "non applicable" for the other forms. Its previous reports were submitted in 2008 (for calendar year 2007), 5 June 2007, 26 April 2006, 18 November 2005, 30 April 2004, 24 February 2003, 25 June 2002, and 25 May 1999.

⁴ See *Landmine Monitor Report 2006*, pp. 506–507.

FYR Macedonia has stated that it never produced or exported antipersonnel mines.⁵ It completed destruction of its stockpile of 38,921 antipersonnel mines on 20 February 2003, just ahead of the treaty-mandated deadline. It decided initially to retain 4,000 mines for training and research, but on 10 July 2006 destroyed them.⁶

FYR Macedonia is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines. For the third straight year, it has not submitted its annual Amended Protocol II Article 13 report. FYR Macedonia gave its consent to be bound by Protocol V on Explosive Remnants of War on 19 March 2007. FYR Macedonia signed the Convention on Cluster Munitions in December 2008, but had not yet ratified it as of 1 July 2009.⁷

⁵ Some of the former Yugoslavia's mine production facilities were located in FYR Macedonia, but the government states that production had ceased. Fax from Ministry of Defense, 20 April 2004.

⁶ For additional details, see *Landmine Monitor Report 2006*, p. 508.

⁷ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 113.

MALI

Ten-Year Summary

The Republic of Mali became a State Party to the Mine Ban Treaty on 1 March 1999. It destroyed its stockpiled antipersonnel mines in 1998, even before the treaty entered into force. In 2000, Mali adopted national implementation measures. In February 2001, Mali hosted an Africa-wide regional conference on the Mine Ban Treaty. Mali has not submitted an updated Article 7 report since July 2005. It has reported retaining 600 antipersonnel mines for training.

Mali is believed to be affected by antivehicle mines and explosive remnants of war (ERW). It is not known if it has an antipersonnel mine problem. Its Article 5 deadline for clearance of antipersonnel mines in mined areas expired on 1 March 2009. Mali did not request an extension to the deadline at the Ninth Meeting of States Parties.

Following antivehicle mine incidents in 2007–2008 causing 19 casualties, some limited mine/ERW risk education was provided in Mali; none had been recorded prior to 2008. Access to disability services is difficult outside of urban areas.

Mine Ban Policy

Mali signed the Mine Ban Treaty on 3 December 1997 and ratified on 2 June 1998, becoming a State Party on 1 March 1999. National implementation measures were adopted in 2000 which include penal sanctions and fines.¹

As of 1 July 2009, Mali had not submitted its annual updated Article 7 report, due 30 April 2009. Mali has not submitted an annual report since July 2005.²

Mali attended the Ninth Meeting of States Parties in Geneva in November 2008, but did not make any statements, and did not attend the intersessional Standing Committee meetings in Geneva in May 2009. Mali has not made known its views on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Mali has never produced or exported antipersonnel mines. In 1998, prior to becoming a State Party, Mali destroyed its stockpile of 7,127 antipersonnel mines, together with 5,131 antivehicle mines.³ Mali reported in 2003 that it retained 600 antipersonnel and 300 antivehicle mines for training purposes.⁴ It has not since reported on the number of retained mines, or on the use of mines retained.

¹ Two legal texts, an ordinance and a decree, prohibit the development, manufacturing, production, acquisition, stockpiling, retention, offer, import, export, transfer, and use of antipersonnel mines. Breach of the legislation is punishable with a maximum of life imprisonment and a fine of between CFA500,000 and CFA3 million (approximately US\$1,150 to \$6,900). Ordinance No. 049/P-RM on the Implementation of the Convention, adopted on 27 September 2000; and Decree No. 569/P-RM on the Application of the Ordinance, adopted on 15 November 2000. An interministerial National Commission for a Total Ban on Landmines was established in June 2002 to take responsibility for the mine issue. See *Landmine Monitor Report 2002*, p. 341.

² Mali submitted its initial Article 7 report, due 27 August 1999, on 17 May 2001, and additional reports on 31 July 2003, 15 September 2004, and 8 July 2005.

³ Article 7 Report, Form B, 17 May 2001.

⁴ Article 7 Report, Form D, 31 July 2003. Mali initially reported in 2001 that it retained 2,000 antipersonnel and 1,000 antivehicle mines for training purposes. In 2003 it reported having consumed 1,400 antipersonnel mines and 700 antivehicle mines during training activities.

Mali stated in 2001 that it had never used antipersonnel mines and that there had been no reports of use by government forces or rebels during the Touareg rebellion.⁵ The resurgence of the Touareg rebellion in 2007 brought reports of mine use by the rebels. Some reports in 2007 cited the possible use of antipersonnel mines, but none were substantiated.⁶ Sporadic conflict in northern Mali with the Alliance Touareg Nord-Mali continued in 2008 and 2009, with no credible reports of the use of antipersonnel mines.

Mali is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Mali ratified CCW Protocol V on Explosive Remnants of War on 24 April 2009. Mali signed the Convention on Cluster Munitions in December 2008 but had not ratified it as of 1 July 2009.⁷

Scope of the Problem

Mali appears to have a problem with antivehicle mines,⁸ as well as with ERW. The precise extent of the threat is not known. At a regional seminar in October 2008 (see below), Mali suggested, implausibly, that the extent of contamination was approximately 2,000km².⁹

As of March 2009, there was no evidence of a problem with antipersonnel mines. Mali has not submitted an Article 7 report since 2005, in which it declared that there were no mined areas containing antipersonnel mines on its territory.¹⁰

In 2008, Landmine Monitor identified at least eight people killed in two landmine incidents in the region of Kidal in northern Mali.¹¹ Five casualties were civilian (one child) and three were military. Media reported an additional incident in February involving a military convoy. The exact number of casualties resulting from this incident is unconfirmed and therefore not included in the total.¹² In 2007, 11 people were killed in landmine incidents and an unknown number were injured (at least three). Casualties included one soldier and 11 civilians. Prior to 2007, no landmine casualties were recorded in Mali.¹³

No new landmine casualties were reported in 2009, but Landmine Monitor identified at least six ERW casualties (two killed and four injured) in two separate grenade incidents in northern Mali in January. All casualties were civilian (five children and one woman).¹⁴

⁵ Statement of the Ministry of Defense, Seminar on the Universalization and Implementation of the Ottawa Convention in Africa, Bamako, 16 February 2001.

⁶ In all cases of mine use known to Landmine Monitor, the mines used appear to have been antivehicle mines, which caused both civilian and military casualties in 2008. See *Landmine Monitor Report 2008*, p. 500.

Program Management and Coordination

An interministerial decision establishing a national mine action authority and mine action center was adopted in 2002, and a further decree was adopted on 16 March 2006.¹⁵ It is not known whether either of these bodies is functioning.

Assistance to mine survivors appears to be addressed by existing services with no need for a separate victim assistance program. The Ministry of Social Affairs is responsible for disability issues.¹⁶

Demining and Battle Area Clearance

Clearance in Mali is the responsibility of the armed forces. In January 2008, Mali was among the countries whose armed forces received training in demining at the West African Center for Humanitarian Mine Action Training (CPADD) in Benin.¹⁷

In October 2008, at the first regional Francophone seminar organized by the Geneva International Centre for Humanitarian Demining at CPADD, demining was said to be ongoing, with progress said to be “satisfactory given the means available and conditions of work.”¹⁸ During the build-up of government armed forces in northern Mali following the retreat of rebels in October 2007, government troops had reportedly demined areas previously occupied by rebels.¹⁹

Progress since becoming a State Party

Under Article 5 of the treaty, Mali was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. As of that date, there was no firm evidence of any antipersonnel mine contamination, and Mali has not submitted a request for an extension. Should areas contaminated by antipersonnel mines be confirmed, Mali will be required to submit a report on the location of mined areas under Article 7 of the treaty and request an extension in accordance with Article 5(3).

Risk Education

In 2008, following mine incidents in northern Mali, limited risk education was provided by the Network of Journalists for the Security and Development of West Africa (Réseau des Journalistes pour la Sécurité et le Développement de l’Afrique de l’Ouest, RJSDAO). RJSDAO organized two conferences in Gao and Bamako delivering basic awareness messages to the general public and the media on the danger of mines.²⁰ In 1999–2007, no formal risk education was conducted in Mali.²¹

Victim Assistance

The total number of survivors is unknown, but is at least seven. At the First Meeting of States Parties in 1999, Mali stated that it sought to share its experience and expertise in the area of prosthetics and orthopedics and the special reintegration of survivors.²² Since then, it has not made statements on victim assistance or made reference to it in its annual Article 7 reports.

¹⁵ Interministerial Decision No. 021370/MAEME-MFAAC-MSPC of 7 June 2002; and Decree No. 06-117/P-RM of 16 March 2006.

Healthcare in Mali is not free of charge, and lacks qualified staff, medication, and adequate medical standards.²³ Persons with disabilities have little to no access to services.²⁴ The six grenade casualties identified in 2009 were treated at the Gao Regional Hospital;²⁵ they had to cover the cost themselves.²⁶ The ICRC Special Fund for the Disabled (SFD) has continued to support physical rehabilitation in Mali.²⁷

There is no specific legislation for persons with disabilities in Mali,²⁸ although it ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol on 7 April 2008.

MAURITANIA

2008 Key Data

State Party since	1 January 2001
Contamination	Antipersonnel and antivehicle mines, cluster munition remnants, other UXO
Estimated area of contamination	51km ² as of May 2009
Casualties in 2008	0 (2007: three)
Article 5 (clearance of mined areas)	1 January 2011
Demining in 2008	Clearance of mined areas: 2km ² Clearance of battle areas: 2km ² Release of suspected hazardous areas by survey: 10km ²
Risk education recipients in 2008	32,200 (2007: 64,200)
Progress towards victim assistance aims	Limited, but increasing
Support for mine action in 2008	International: \$427,631 (2007: \$460,000) National: \$800,000 (2007: \$750,000)

Ten-Year Summary

The Islamic Republic of Mauritania became a State Party to the Mine Ban Treaty on 1 January 2001. It completed destruction of 21,168 stockpiled antipersonnel mines in December 2004, while retaining 728 mines for training purposes. Mauritania adopted national implementation legislation in January 2008.

Despite being slow to initiate a mine action program after becoming a State Party, Mauritania has made steady progress in clearing mined areas since completing a Landmine Impact Survey in 2006, having subsequently released 25km² of suspected hazardous areas. As of May 2009, however, Mauritania was not on course to meet its Article 5 deadline for clearance of all emplaced antipersonnel mines by 1 January 2011. The country is also affected by cluster munition remnants and other explosive remnants of war (ERW).

The National Humanitarian Demining Program for Development recorded at least 42 mine/ERW casualties (20 killed, 20 injured, and two of unknown status) between 2001 (the earliest date for reliable data) and 2008. Since 1978, at least 618 casualties might have occurred. Risk education activities focused on nomads and children but were hampered by lack of funds. Services for mine/ERW survivors remain limited, but some activities started in 2008.

Mine Ban Policy

Mauritania signed the Mine Ban Treaty on 3 December 1997 and ratified on 21 July 2000, becoming a State Party on 1 January 2001. A national commission was set up to be responsible for the mine issue and implementation of the Mine Ban Treaty in July 2002.¹ On 2 January 2008, Mauritania adopted national legislation implementing the Mine Ban Treaty.²

¹ Article 7 Report, Form A, 25 April 2005.

² Law No. 2008-06 Relative to the Prohibition of Antipersonnel Mines in Mauritania, 2 January 2008. The legislation bans the acquisition, manufacture, stockpiling, transfer, import, export, and use of antipersonnel mines. It provides penalties of one to three years' imprisonment and fines of MRO100,000 to 1 million (\$442 to 4,417) for violations. The law permits retention of mines for training and development, and sets conditions for implementing Article 8 of the Mine Ban Treaty on compliance.

Mauritania submitted its ninth annual Article 7 report on 30 April 2009, covering the period from 30 April 2008 to 30 April 2009.³

Mauritania attended the Ninth Meeting of States Parties in Geneva in November 2008, where it commented on the Article 5 extension request put forward by Senegal and made a statement on mine clearance. Mauritania also attended the intersessional Standing Committee meetings in May 2009, where it made statements on mines retained for training and mine clearance.

Mauritania has not stated its views on matters of interpretation and implementation related to Articles 1 and 2 (joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, and antivehicle mines with sensitive fuzes or antihandling devices). With respect to Article 3, in April 2007 Mauritania said that it agreed with the ICBL and others that the number of mines retained for training and development purposes should at most be in the hundreds or thousands.⁴

Mauritania is not party to the Convention on Conventional Weapons. It had not signed the Convention on Cluster Munitions as of 1 July 2009.

Production, transfer, stockpile destruction, and retention

Mauritania has reported that it has never manufactured antipersonnel mines.⁵ It is not known to have exported mines. Mauritania completed the destruction of its stockpile of 21,168 antipersonnel mines on 5 December 2004, ahead of its deadline of 1 January 2005.⁶

Mauritania initially intended to retain 5,728 mines for training purposes, but decided in 2004 to reduce the number to 728. Mauritania reported in April 2009 that it still retained 728 antipersonnel mines: 100 PMN mines, 161 Model 51 mines, and 467 MP mines.⁷ Thus, no mines were consumed (destroyed) in training activities from 2005 to 2008.⁸

In its Article 7 report submitted in April 2009, Mauritania reported that its retained mines were used to train military academy personnel in mine identification. It stated that it was looking at the possibility of gradually destroying the retained mines starting in 2010.⁹ At the May 2009 Standing Committee meetings, Mauritania said that it hoped that all its retained mines would be destroyed by 2011.¹⁰

³ Previous Article 7 reports were submitted on 24 April 2008, 20 April 2007, 26 April 2006, 25 April 2005, 18 June 2004, 30 April 2003, 12 June 2002, and 20 June 2001.

⁴ Statement of Mauritania, Standing Committee on the General Status and Operation of the Convention, Geneva, 27 April 2007. Notes by Landmine Monitor. In May 2006, Mauritania called on other States Parties to reduce the number of mines retained as much as possible. Statement of Mauritania, Standing Committee on the General Status and Operation of the Convention, Geneva, 12 May 2006. Notes by Landmine Monitor.

⁵ Article 7 Report, Forms E and H, 30 April 2009. This has been stated in previous Article 7 reports.

⁶ It destroyed 16,168 French-made APID 51 mines in 2001 and 2002, and destroyed the final 5,000 antipersonnel mines on 5 December 2004, including 1,738 Soviet PMN mines, 1,728 French Model 51 mines, and 1,533 “MP” mines, which are most likely Yugoslav PMA-3 mines. The quantities provided for each type of mine total 4,999, not 5,000. See *Landmine Monitor Report 2005*, pp. 422–423.

⁷ Article 7 Report, Forms B and D, 30 April 2009.

⁸ The Article 7 reports submitted in 2008 and 2009 contain no information on mines transferred for training purposes; the reports submitted in 2006 and 2007 indicated that Mauritania had transferred 85 retained antipersonnel mines for training purposes (30 PMN mines, 30 Model 51 mines, and 25 MP mines), but the mines were apparently not consumed, and no details about the transfers were provided. See, for example, Article 7 Report, Form D, 20 April 2007.

⁹ Article 7 Report, Form D, 30 April 2009.

¹⁰ Statement of Mauritania, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 May 2009. Notes by Landmine Monitor.

Scope of the Problem

Contamination

Northern Mauritania is contaminated by mines and ERW, mostly UXO, the result of the conflict over Western Sahara from 1975–1978.¹¹ Contamination includes cluster munition remnants.¹² A 2006 Landmine Impact Survey (LIS) found a total of 65 suspected hazardous areas (SHAs), covering 76km² and affecting 60 communities.¹³ Subsequent release of land by clearance and technical survey reduced the total SHA to 51km² as of May 2009.¹⁴ Of this total, 15km² of SHA were believed to contain both antipersonnel and antivehicle mines as well as ERW, while the remaining 36km² of SHA were believed to contain antivehicle mines and ERW only.¹⁵

The National Humanitarian Demining Program for Development (Programme National de Déminage Humanitaire pour le Développement, PNDHD) has told Landmine Monitor that it has found cluster munition remnants around the town of Bir Mogrein in the extreme north of Mauritania, close to the border with Western Sahara. Unexploded submunitions found are reported to be the Mk-118, BLU-63, and M42. The contaminated areas already identified cover some 6km², but more survey is planned in these areas, depending on the availability of funding.¹⁶

Casualties¹⁷

There were no reports of new mine/ERW casualties in Mauritania in 2008 or to 31 May 2009. In 2007, the PNDHD reported three civilian mine casualties (one killed and two injured) in three incidents.¹⁸

In 2008, two Mauritanian nomads were involved in a mine incident in Western Sahara; their status remained unverified.¹⁹ More Mauritanian casualties were reported in Western Sahara in 2009 when two nomads were killed by antipersonnel mines in two separate incidents in January. Although these casualties occurred outside Mauritania, the PNDHD entered them into its database.²⁰

The total number of mine/ERW casualties in Mauritania remains unknown. However, the PNDHD has information on 618 casualties (358 killed, 258 injured, and two of unknown status) between 1978 and the end of 2008. The PNDHD was not confident about the accuracy of data prior to 2001.²¹

The PNDHD recorded 42 mine/ERW casualties (20 killed, 20 injured, and two of unknown status) between January 2001 and December 2008. All casualties were civilians. The majority of casualties were men (24), followed by boys (nine), women (two), girls (two), and five of unknown age/gender. Antipersonnel mines caused 22 casualties, antivehicle mines 11, ERW

²¹ Telephone interview with Lt.-Col. Alioune O. Mohamed El Hacen, PNDHD, 24 June 2009.

three, unknown mines two, and for four casualties, the type of device was unknown.²² All casualties were recorded in Adrar, Dakhlet Nouadhibou, and Tiris Zemmour regions, and the most common activities at the time of the incidents were nomadic herding, playing, and driving.²³ From data previously transmitted by the PNDHD, it appears that at least four casualties were foreigners (two Qatari, one French, and one Portuguese).²⁴ In 2005, a Mauritanian man was killed in a border minefield between Greece and Turkey, but he was not recorded in the database.²⁵

The LIS recorded 14 “recent” landmine casualties (eight people killed and six injured).²⁶ One casualty was female, 12 were male, and the gender of the other person was unknown. Most casualties (nine) were between 30 and 44 years old, and all casualties were older than 14 years. Eight of the casualties were herders. All the survivors were from Dakhlet Nouadhibou and suffered amputations.²⁷ An estimated 7% of Mauritania’s population is disabled.²⁸

Risk profile

According to the PNDHD, the groups most at risk of being injured or killed by mines/ERW are nomads and children. The LIS identified nomads to be more at risk to the dangers of landmines because they travel throughout the impacted areas. The PNDHD reported that nomadic herders engage in risk-taking behavior for economic reasons. Other at-risk groups include tourists, miners, and fishermen.²⁹

Program Management and Coordination

Mine action

The PNDHD is mandated by decree to coordinate mine action operations in Mauritania.³⁰ Since August 2007, the PNDHD has been the responsibility of the Ministry of Interior and Decentralization.³¹ The PNDHD is overseen by an interministerial Steering Committee, set up by decree on 3 September 2007.³²

Risk education and victim assistance

The PNDHD is responsible for overall coordination and monitoring of risk education (RE) and victim assistance (VA) activities.³³ The Steering Committee is responsible for establishing national priorities and approving the PNDHD’s workplan.³⁴ VA providers include the Ministry of

Health, UNICEF, the National Orthopedic Center for Physical Rehabilitation (Centre National d'Orthopédie et de Réadaptation Fonctionnelle, CNORF), and several disability organizations.³⁵

Data collection and management

The PNDHD has installed the latest version of the Information Management System for Mine Action (IMSMA).³⁶ In 2009, the PNDHD reported that casualty data collection in Mauritania had improved in recent years due to the mobilization of all actors working in affected areas. However, due to the size of the country and the nomadic lifestyle of many people, some older incidents remain unreported.³⁷ Since 2004, the PNDHD has been collecting casualty data within the framework of the mine action program, in cooperation with UNICEF and operators.³⁸ All the information is stored in the IMSMA database, including RE and VA activities.³⁹

Plans

Strategic mine action plan

A revised National Mine Action Strategy was drafted in 2008 to cover the period from 2009 to 2011.⁴⁰ The focus of demining for the coming years will be the 15km² of SHA that was believed to contain antipersonnel mines.⁴¹

Both RE and VA were included in the revised National Mine Action Strategy, which aims at “reducing mine incidents to arrive to zero victims” through awareness activities.⁴² Two strategic objectives for RE were presented for 2008–2011: marking and fencing all antivehicle minefields not covered by the Mine Ban Treaty; and providing RE in affected areas through local NGO networks. The implementation plan lists RE activities and allocates tasks. Awareness messages are to be delivered by the PNDHD and local NGO networks to all affected areas, specifically targeting children and women. It is also planned to mainstream RE in the school curriculum, to conduct public information dissemination for nomads, and to continue marking of areas in affected communities.⁴³

For VA, the aims are to strengthen CNORF’s capacity and to involve partner organizations in the rehabilitation of survivors, and to provide survivors with vocational training to further their socio-economic reintegration.⁴⁴ The goals reflect a 2007 needs assessment, which recommended: development of a specific VA project; strengthening CNORF; creating a survivor database; developing a vocational training program; providing micro-credit opportunities; creating a survivor network; and encouraging access to education for young survivors.⁴⁵ Progress on making a specific five-year VA strategy had not been made as of May 2009 due to lack of funds.⁴⁶ Implementation of VA under earlier mine action plans was equally hampered by lack of funds.⁴⁷

Integration of mine action with reconstruction and development

Efforts have been made to integrate mine action into both development policy and practice at the national and local levels.⁴⁸ Mine action is said to have been included in the country's poverty reduction strategy, as illustrated by the presentation of demining projects by Mauritania at a donor meeting in Paris in December 2007.⁴⁹ Mine action is not, however, mentioned in Mauritania's 2006–2010 Poverty Reduction Strategy Paper.⁵⁰ At the local level, mine action is integrated into a number of community development plans “as an important action for good governance and enabling their full socio-economic development.” Examples include the annual development plan for the villages of Bou Lenoir, Inal, and Tmeimichatt, as well as the town of Zoueratt.⁵¹

National ownership

Commitment to mine action and victim assistance

Mauritania has been providing the bulk of the resources for its mine action program. According to the UN Mine Action Service (UNMAS), “small-scale demining and mine awareness activities have fallen short of the need for more systematic operations and wider campaigns.”⁵²

National management

The demining program in Mauritania is managed by the PNDHD with “full” technical support from UNDP.⁵³

National mine action legislation and standards/Standing operating procedures

Legislation supporting the managing institutions for mine action was adopted in 2007.⁵⁴ National mine action standards and standing operating procedures (SOPs) have been developed and adopted.⁵⁵ A national standard on land release was developed at the end of 2007,⁵⁶ finalized at the end of 2008, and was due to be implemented in 2009.⁵⁷

Demining and Battle Area Clearance

All demining in Mauritania has been conducted by the Army Engineers Corps.⁵⁸ In 2008, mine clearance was conducted in Boulenoir, Hank Labbara, Mbalket Choumad, Sweiciya 1, and Sweiciya 2, while battle area clearance was conducted in Bir Mariam, Etoijil, and Rich Enajem.⁵⁹ For 2009, Mauritania was seeking funds to support a mechanical demining capacity with “a medium machine with combined tiller and flail systems.”⁶⁰ It was also planned that UNMAS would fund the Swedish Civil Contingencies Agency (MSB), which includes the former Swedish Rescue Services Agency, to train Mauritania's explosive ordnance disposal

(EOD) team in cluster munition clearance.⁶¹ No cluster munition remnants were cleared in 2008 or 2007, although marking was installed around the contaminated areas.⁶²

Land release in 2008

SHA (km ²) at 1 January	Mined area cleared (km ²)	Battle area cleared (km ²)	Area released by survey (km ²)	Anti-personnel mines destroyed	Antivehicle mines destroyed	Unexploded submunitions destroyed	Other UXO destroyed
64	2	2	10	915	58	0	163

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Mauritania is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 January 2011. In November 2008, UNMAS noted that Mauritania “has firmly stated it expects to meet its treaty obligations by 2011.”⁶³ In May 2009, however, PNDHD’s coordinator said that Mauritania was unlikely to meet its 2011 deadline as the program was facing a major funding shortfall. As a consequence, Mauritania will likely ask for a short extension that would imply a change to its National Mine Action Strategy.⁶⁴

Demining and Battle Area Clearance: 1999–2008

Time Period	Area released (km ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	Unexploded submunitions destroyed	Other UXO destroyed
2008	22	915	58	0	163
2007	2	215	21	0	255
2006	2.45	397	72	N/R	177
1999–end 2005	5	5,500	N/R	N/R	5,250
Total	31.45	7,027	151	0	5,845

N/R = not reported

According to UNMAS, “While Mauritania’s armed forces have 120 deminers who should be able to respond to the mine and UXO problem, the Government does not have the resources for the maintenance and fuel to deploy these troops. Government capacity and resources should be assessed annually to determine if the armed forces can fill gaps or if development cooperation resources should go towards deploying commercial companies or non-governmental organizations to clear mined areas.”⁶⁵

⁶⁵ UN, “2009 Portfolio of Mine Action Projects,” New York, November 2008, p. 251.

Risk Education

In 2008, RE activities were provided to some 32,200 people through public information dissemination and school-based activities. The PNDHD estimates that at least double this number were reached indirectly, as RE recipients were given extra materials so they could pass messages to their families and friends.⁶⁶ The PNDHD believes that RE played a crucial role in decreasing casualty rates in 2008 and deems it necessary to continue providing awareness messages until the dispute over Western Sahara is settled. However, activities decreased compared to 2007, when 64,200 people were reached, partly due to funding shortfalls, but also because recipients of indirect RE were not counted then.⁶⁷

In 2008, RE continued to be provided by two networks of national NGOs, NEJDA and the Nouadhibou Network, and by community facilitators (“relais communautaires”).⁶⁸ Among nomads, women are traditionally in charge of educating children, so they were included more systematically in RE activities.⁶⁹ Some 70% of the members of the two NGO networks were women.⁷⁰

RE targeted 17,200 nomads in 60 communities in the three regions identified by the LIS as being affected by mines/ERW: Adrar, Dakhlet Nouadhibou, and Tiris Zemour.⁷¹ Awareness messages were provided through interactive presentations, “tea debates,” and a radio station for nomads.⁷² To maximize the number of beneficiaries reached, RE sessions were organized in transit areas, including water points. Posters were also distributed and additional materials left with the communities.⁷³

RE is part of the school curriculum in Dakhlet Nouadhibou and Tiris Zemour (Adrar has no schools); 15,000 primary and secondary school students were reached. RE sessions were given by trained teachers one day each month.⁷⁴

The PNDHD continued marking mined areas: 30 new signs were added in Boulenour, in Dakhlet Nouadhibou region, together with the maintenance of previously laid warning signs.⁷⁵

Between 2001 and 2008, awareness messages have been provided to affected populations, mainly nomads and children, by the PNDHD, UNICEF, local NGOs, and community facilitators, with one major interruption (November 2005 to November 2006) due to lack of funds.⁷⁶ The PNDHD trained RE trainers in 2007.⁷⁷ Mauritania used Form I of its annual Article 7 reports submitted in 2001–2009 to provide information on RE activities.⁷⁸ The LIS recorded that RE had been conducted in 32 of the 60 mine/ERW-affected communities (53%), mostly in Nouadhibou, where 72% of affected communities had received RE, followed by Tiris Zemour (42%) and Adrar (36%). RE occurred in six of the nine communities where recent casualties had been recorded by the LIS.⁷⁹

Victim Assistance

The estimated number of survivors is unknown but at least 258. Mauritania's vision is to "promote the rehabilitation of survivors and their social integration."⁸⁰ However, mine/ERW survivors have received little attention due to lack of funds.⁸¹ Mauritania's VA project in the 2009 Portfolio of Mine Action had not received funding as of June 2009.⁸²

Mauritania has a network of basic health centers, and 67% of the population lives within 5km of healthcare services, but in remote rural areas access to, and quality of, services is very limited.⁸³ Even when casualties can access medical care, the long distances to reach medical facilities are a "major challenge," and mine incidents usually occur in remote locations. Medication, transport, and accommodation have to be covered by the patients, which is problematic for the majority of survivors.⁸⁴

Regional rehabilitation centers in affected areas are not operational, and CNORF in Nouakchott remains the only physical rehabilitation facility capable of providing adequate assistance to mine/ERW survivors. The center has limited means.⁸⁵ The quality of services and productivity needs to be improved. The social security system covers 90% of services delivered by CNORF. Patients cover the remaining costs,⁸⁶ unless their fees are covered by the PNDHD.⁸⁷

Reportedly, the Ministry of Health is in charge of providing psychological support to all persons with disabilities, and it has supported some survivors.⁸⁸ In 2008, the PNDHD provided some funds to survivors to start income-generation projects.⁸⁹ Mauritania has legislation to protect the rights of persons with disabilities, and there have been no reports of discrimination.⁹⁰ As of 1 July 2009, Mauritania had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

Victim assistance activities

CNORF, with PNDHD and UNICEF support, assisted 20 mine/ERW survivors with physiotherapy services and orthopedic appliances. Transport, food, and accommodation were also covered. Each survivor also received funds for income-generation projects.⁹¹

In 2008, the ICRC Special Fund for the Disabled (SFD) continued to support CNORF with material assistance, monitoring visits, and training. Two CNORF technicians received training at the regional SFD training center in Addis Ababa, Ethiopia. CNORF prosthetic and orthotic production increased by 19% in 2008 (192 patients) compared to 2007 (162 patients).⁹²

Support for Mine Action

Landmine Monitor is not aware of any long-term comprehensive cost estimates for meeting mine action needs (including RE and VA) in Mauritania. In December 2007, UNDP reported that all mined areas in Mauritania could be cleared by 2011 at a cost of US\$14 million (€10,210,780), which would cover survey, clearance, clearance training, and RE.⁹³

UNDP reported the creation in 2007 of a dedicated mine action line in Mauritania's national budget to support PNDHD staff and operations. As of June 2009, no specific allocations for mine action within the budget had been reported by Mauritania.

National support for mine action

The PHDHD reported Mauritania's contributions in 2008 as \$800,000 composed of \$725,000 in-kind and \$75,000 for clearance operations.⁹⁴ In 2007 Mauritania reported contributing MRO200 million (\$747,214), with the government reportedly allocating the same annual amount since 2002.⁹⁵

International cooperation and assistance

In 2008, Spain reported contributing \$427,631 (€290,392) for mine action in Mauritania: \$220,890 (€150,000) for integrated mine action and \$206,741 (€140,392) in-kind for mine clearance personnel training. Reported funding in 2008 was approximately 7% less than in 2007.

The United States, a contributor to mine action in Mauritania in 2007, cut mine action funding after the coup in Mauritania in August 2008, applying a 2006 act of Congress calling for "non-humanitarian" US assistance to be cut off to countries in which governments are overthrown by the military.⁹⁶

Funding at 2008 levels appears adequate to meet Mauritania's RE needs but does not address the country's demining and VA needs.

⁹³ "Donor funds needed to clear landmines," *IRIN* (Nouakchott), 19 December 2007, www.irinnews.org. The PNDHD indicated that the \$14 million cost estimate for the 2007–2011 mine action plan includes VA. Email from Lt.-Col. Alioune O. Mohamed El Hacen, PNDHD, 29 July 2009.

MOLDOVA

2008 Key Data

State Party since	1 March 2001
Contamination	Possibly UXO from World War II; mines and UXO (unconfirmed) in breakaway Transnistria region
Estimated area of contamination	Unquantified
Casualties in 2008	0 (2007: 0)
Estimated mine/ERW survivors	Unknown
Article 5 (clearance of mined areas)	Deadline: 1 March 2011 Completed: 2000 (government-controlled areas)
Demining in 2008	Spot clearance of ERW
Progress towards victim assistance aims	Slow

Ten-Year Summary

The Mine Ban Treaty entered into force for the Republic of Moldova on 1 March 2001. It has not enacted domestic legislation to implement the treaty, but has cited its Criminal Code which includes penal sanctions. In November 2002, Moldova completed destruction of its stockpile of 13,194 antipersonnel mines, far ahead of its March 2005 deadline. Moldova initially declared 849 mines retained for training, but destroyed the last of these in 2006.

Moldova is affected by explosive remnants of war (ERW), particularly UXO. It remains unclear whether territory within the breakaway Transnistria region is mine-affected. Moldova completed mine clearance operations on territory under its control in 2000, prior to becoming a State Party. Many details on issues relating to antipersonnel mines in the Transnistria region, not under the control of Moldova, remain unknown.

The number of mine and ERW casualties occurring in Moldova between 1999 and 2009, including in Transnistria, is unknown. There were no systematic mine/ERW risk education (RE) activities in Moldova and no known RE activities in the Transnistria region. Services to persons with disabilities, including mine/ERW survivors, were not adequate to meet the level of need.

Mine Ban Policy

Moldova signed the Mine Ban Treaty on 3 December 1997 and ratified it on 8 September 2000, becoming a State Party on 1 March 2001. Moldova has not enacted any legal measures to implement the treaty domestically. It believes that the Criminal Code passed on 18 April 2002 covers all aspects necessary for adequate implementation of the treaty.¹

¹ Interview with Dorin Panfil, Head, Division for Political-Military Cooperation, Ministry of Foreign Affairs and European Integration, Chisinau, 31 March 2009; and interview with Emil Druc, Deputy Head, General Department for Multilateral Cooperation, Ministry of Foreign Affairs and European Integration, Chisinau, 13 March 2007. See also Article 7 Report, Form A, 30 April 2006, which states “The Criminal Code of the Republic of Moldova envisages penal sanctions for the storage, purchase, selling and use of weapons and ammunitions that also includes anti-personnel mines. Although there is not national legislation specifically related to the Convention, the existing one is sufficient to give effect to the Convention.”

Moldova has submitted its ninth Article 7 transparency report, covering calendar year 2008.² It cited no changes from the previous year. It did the same in its report covering calendar year 2007, reporting no changes since 2006.

Moldova attended the Ninth Meeting of States Parties in Geneva in November 2008, but did not make any statements. It participated in the intersessional Standing Committee meetings in May 2009, where it made a statement highlighting issues related to Moldova's implementation of the treaty and stating that, because of lack of access, "it was not possible to collect and report accurate information concerning the issue of antipersonnel mines in the Transnistria region." Moldova said that it had invited the NGO Geneva Call to engage representatives of the region and that it had held discussions with Moldovan NGOs and the Organization for Security and Cooperation in Europe (OSCE) office in Chisinau on obtaining better information on the antipersonnel mine situation in the region, with a view toward pursuing implementation of the treaty.³

In 2006, Moldova expressed its views on key issues of interpretation and implementation related to Articles 1, 2, and 3 of the Mine Ban Treaty, when it made strong statements in agreement with the positions of the ICBL and many States Parties.⁴

Moldova is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It submitted an annual Article 13 report on 27 October 2008. Moldova adhered to CCW Protocol V on Explosive Remnants of War on 12 April 2008. It signed the Convention on Cluster Munitions on 3 December 2008, but had not yet ratified it as of 1 July 2009.⁵

Production, transfer, stockpiling, and mines retained

Moldova has stated that it has never produced, imported, or exported antipersonnel mines. It destroyed its stockpile of 13,194 antipersonnel mines inherited from the Soviet Union in 2002, as part of a destruction program managed by the NATO Maintenance and Supply Agency.⁶ In 2002, Moldova declared it would retain 849 antipersonnel mines for training. It reported destroying a number of these during 2004, indicating that 249 remained retained for training. In 2006, Moldova destroyed the remaining 249 antipersonnel mines.⁷

Scope of the Problem

Contamination

Moldova is affected by UXO⁸, but the precise extent to which territory under its jurisdiction or control is mine-affected remains unclear.

Moldova reported previously that it had completed the destruction of all antipersonnel mines in mined areas under its control by August 2000.⁹ In its Article 7 report for calendar year 2005, Moldova claimed that there were no mined areas containing antipersonnel mines on

² Previous Article 7 reports were submitted on 28 August 2001, 8 April 2002, 17 April 2003, 29 April 2004, 6 May 2005, 30 April 2006, 23 April 2007, 2008, and 5 May 2009.

territory under its control, while acknowledging that it had no information on the situation in Transnistria.¹⁰ Subsequent Article 7 reports have been marked “unchanged.”¹¹

Transnistria region

The Transnistrian region of Moldova declared independence in September 1990 as the Transnistrian Moldovan Republic (Pridnestrovskaya Moldavskaya Respublika, PMR), but has not been recognized internationally. PMR forces maintain control of the region. In 2007, a top military official from Transnistria’s military forces told Landmine Monitor that the PMR will not recognize the obligations of any international agreement such as the Mine Ban Treaty until Transnistria is internationally recognized.¹²

Both sides used landmines when fighting broke out between Moldovan and PMR forces in 1992.¹³ Transnistria military forces are believed to still have a stockpile of antipersonnel mines, but have not reported on numbers or types.¹⁴

In its CCW Article 13 reports, however, Moldova has stated that there is a “high probability” of mined areas in some regions on the side of the Nistru river where the Transnistrian conflict took place in 1992.¹⁵ Subsequent reports have marked this information as “unchanged.”¹⁶ In the 1992 conflict, landmines were reportedly laid in Dubasari region, Cosnita-Pogrebea, and Varnita-Bender.¹⁷ In addition, on 2 August 2008 following the flooding of the Nistru river, 510 antipersonnel mines left from World War II were reportedly discovered in Bender by inhabitants, and were subsequently destroyed by Transnistrian military forces.¹⁸

Casualties

No new mine/ERW casualties were reported in 2008 and to June 2009 on territory controlled by the Moldovan government. Three new ERW casualties (two killed and one injured) were reported in three incidents in the ceasefire “security zone.” All incidents were believed to have involved hand grenades or grenade components.¹⁹

Moldova’s 2006 CCW Amended Protocol II Article 13 report stated in relation to mine casualties, “There are no such victims on the territory controlled by the constitutional authorities of the Republic of Moldova.”²⁰ Subsequent Article 13 reports stated that the situation was unchanged.²¹ Landmine Monitor has identified at least 14 civilian ERW casualties in Moldova (10 killed and four injured) since 1999.²²

In Transnistria, 47 civilian landmine casualties (21 killed and 26 injured) were recorded in eight villages in the Dubasari region between 1992 and 2005. Ten military casualties (two killed and eight injured) occurred during the same period.²³ In 2006, a boy was injured, and a man

¹² Telephone interview with Gen. Vladimir Atamaniuk, Chief of General Staff, Transnistria military forces, 6 April 2007.

¹³ A July 1992 cease-fire agreement established a “security zone” and a tripartite peacekeeping force comprised of Moldovan, Russian, and PMR units. The “security zone” separating Transnistria from the rest of Moldova is 10 to 20km wide and 140km long on both sides of the Nistru river. From 1992 to 31 May 2006, 5,207 antipersonnel mines and 2,850 antivehicle mines were cleared from the security zone.

and a girl were killed in separate incidents in Transnistria involving hand grenades; it was not specified whether the grenades were ERW.²⁴

In 2004, a Moldovan citizen was killed and another injured after they entered a minefield while trying to cross the border between Greece and Turkey.²⁵

Program Management and Coordination

There is no ongoing mine action program and no ongoing mine clearance in Moldova. The Moldovan Ministry of Social Protection, Family and Child is responsible for persons with disabilities, including mine/ERW survivors.²⁶

Data collection and management

Moldova does not have a comprehensive casualty data collection or reporting system and information in the local media was incomplete. Information on casualties in Transnistria is not publicly available.²⁷

Demining

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Moldova is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2011. It cleared mined areas under its control prior to becoming a State Party. In its Article 7 report for 2001, Moldova reported that there were “no mined areas available.”²⁸ It reported the destruction of the “minefield Northern Pohrebea” by the Ministry of Defense from 3 May to 12 August 2000 using “electrical method.”²⁹ In a subsequent Article 7 report, Moldova stated that, “As a result of this operation, 85 ha [hectares] of terrain mined during the military conflict of 1992 have been cleared. A total of 345 explosive objects have been extracted and eliminated. Presently, the Republic of Moldova does not have any mined terrain.”³⁰ During the intersessional Standing Committee meetings in June 2008, Moldova stated that in “carrying out in good faith the obligations which it assumed by the Ottawa Convention, the Republic of Moldova completed, inter alia, the destruction of all anti-personnel mines far ahead of the established deadlines under Articles 4 and 5.”³¹

According to one Moldovan official, it is already in compliance with Article 5 since it already destroyed all antipersonnel mines in mined areas in the territory under its control. With regard to the Transnistria region, which is not controlled currently by the central authorities, an obligation will arise as soon as *de facto* control by the central government is restored.³² In 2008, however, Geneva Call was invited by the Moldovan government to assess the landmine situation in Transnistria and to contribute to confidence-building efforts in the region.³³

³³ Interview with Markus Haake, Programme Officer for the Caucasus, and Mehmet Balci, Programme Director and Permanent Representative of Geneva Call to the European Union, Geneva Call, Chisinau, 3 October 2008.

Further, in contrast to the position it has expressed previously, at the regional seminar Towards Global Coherence in Addressing the Problems caused by Landmines, Cluster Munitions, and Explosive Remnants of War, organized by Lithuania on 26–27 June 2008, Iurie Tabunicic, an official from the Moldovan Ministry of Foreign Affairs and European Integration, declared that Moldova would need to request an extension to its Article 5 deadline.³⁴ In March 2009, however, an official from the same ministry contradicted this statement, stating that until the Moldovan government had restored its control over the territory of Transnistria all discussions on this issue “would be irrelevant.”³⁵

The ICBL believes that should any mined areas under Moldova’s jurisdiction but not its control remain upon expiry of its Mine Ban Treaty deadline, in accordance with Article 5, Moldova will need to seek an extension to that deadline.³⁶

Risk Education

No mine/ERW RE activities were reported in Moldova from 2008–2009 and no systematic RE activities were carried out from 1999–2009. From 1999 to August 2000, during clearance operations, deminers told the local population what to do if they found landmines, except in the Transnistria region.³⁷ During the 2007–2008 school year, the only RE activity reported by the Red Cross Society of Moldova was a module in its optional human rights school course.³⁸

Victim Assistance

The estimated number of survivors is unknown. There are no specific mine/ERW victim assistance activities in Moldova.³⁹ In June 2008, the Deputy Minister of the Ministry of Social Protection, Family and Child noted that government assistance to persons with disabilities did not meet their needs. In 2000 and 2007, veterans and pensioners protested against the irregular payment or non-payment of benefits.⁴⁰ Legislation prohibiting discrimination against persons with disabilities was not enforced and few resources were allocated.⁴¹ Moldova had not ratified the UN Convention on the Rights of Persons with Disabilities or signed its Optional Protocol as of 1 July 2009.

In Transnistria, the level of support provided to mine/ERW survivors and other persons with disabilities also remained below what is stipulated in public policy.⁴²

Support for Mine Action

From September 2003 to December 2008, explosive ordnance disposal (EOD) units of the Moldovan National Army were deployed to Iraq for the clearance and disposal of mines, UXO, and improvised explosive devices.⁴³ The final contingent of 20 military personnel, including 16 mine engineers and four staff officers, was deployed on 19 August 2008. An EOD team was attached to the 3rd Armored Cavalry Regiment in Mosul and the four staff officers were attached to the Multi-national Force–Iraq headquarters in Baghdad.⁴⁴ Moldova withdrew its contingent of personnel from Iraq in December 2008, citing Iraq’s “stability... and the transfer of de-mining operations to (Iraqi) armed forces.”⁴⁵ Moldova did not report the in-kind value of deployment of demining personnel in Iraq in 2008.

MONTENEGRO

2008 Key Data

State Party since	1 April 2007
Estimated area of contamination	Cluster munition remnants: 250,000m ²
Casualties in 2008	0 (2007: 0)
Estimated mine/ERW survivors	Unknown but at least 260
Demining in 2008	Disposal of underwater UXO: 104,000m ²
Article 5 (clearance of mined areas)	1 April 2017
Progress towards victim assistance aims	No progress

Ten-Year Summary

The Republic of Montenegro gained independence in June 2006 and became a State Party to the Mine Ban Treaty on 1 April 2007. On 16 May 2007, the last of Montenegro's stockpiled mines were destroyed in Serbia. Montenegro decided not to retain any mines for training purposes. Following its independence from Serbia, in November 2007 Montenegro was reported in the media as having completed mine clearance operations, but had still to survey an area bordering Croatia for possible contamination as of April 2009. No formal declaration of compliance with Article 5 had been made. In addition, Montenegro still faces contamination from unexploded submunitions and underwater explosive remnants of war (ERW) located offshore.

The number of mine and ERW casualties is unknown, but at least 260 survivors were said to be residing in Montenegro. No formal mine/ERW risk education has been provided in Montenegro as officially there is no mine problem. The capacity and quality of the Montenegrin healthcare system deteriorated during the war in the 1990s, and little progress has been noted since. Progress was made in the field of disability law, although the level of implementation remains unclear.

Mine Ban Policy

Montenegro deposited its instrument of succession to the Mine Ban Treaty on 23 October 2006, becoming a State Party on 1 April 2007.¹ Montenegro has not enacted new legislation to implement the Mine Ban Treaty, but instead relies on existing laws. The head of the Regional Center for Divers' Training and Underwater Demining (RCUD) told Landmine Monitor in February 2009 that existing laws and regulations are sufficient and that due to the small scale of the landmine problem there is no need for further adjustments.² Montenegro's Article 7 reports have all declared that the requirements of Article 9 (national implementation measures) have been fully implemented.³

¹ On 3 June 2006, Montenegro ended its union with Serbia and became independent. It was accepted as a member of the UN on 28 June 2006. The former state of Serbia and Montenegro had acceded to the Mine Ban Treaty in September 2003.

² Interview with Veselin Mijajlovic, Director, RCUD, Podgorica, 18 February 2009.

³ Article 7 Reports, Form A, October 2007, 2008 (for calendar year 2007), and 2009 (for calendar year 2008). The 2008 and 2009 reports include excerpts from the Criminal Code of Montenegro (2003 and 2004) on "use of forbidden means of combat" and the "manufacture of forbidden weapons," citing relevant penal sanctions. The 2009 report also refers to Article 25 of the "Law on Army of Montenegro," which states that the military must function in the framework of international law and that military personnel must be equipped in accordance with international conventions.

Montenegro submitted its third Article 7 report in 2009, covering calendar year 2008.⁴ It includes voluntary Form J with an explanation of Montenegro's view of MRUD (Claymore-type) mines.⁵

Montenegro attended the Ninth Meeting of States Parties in Geneva in November 2008, but did not participate in the intersessional Standing Committee meetings in May 2009.⁶
