Montenegro has not participated in States Parties' discussions on issues of interpretation and implementation related to Articles 1, 2, and 3 of the treaty, including what acts are prohibited by the ban on joint military acts with states not party, antivehicle mines with sensitive fuzes, and mines retained for training.⁷

Montenegro is party to the Convention on Conventional Weapons, but has not yet joined Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. Montenegro signed the Convention on Cluster Munitions on 3 December 2008, but had yet to ratify it as of 1 July 2009.⁸

Use, production, transfer, stockpiling, and destruction

In October 2008, a Montenegrin border guard was injured when his vehicle hit what was initially reported as an antipersonnel mine on the border with Albania and Kosovo. It was reported that the mine could have been newly laid as the road is frequently used and in an area previously declared free of mines, or that it might be a remnant from the Kosovo war.⁹ In March 2009, the police stated that it was a criminal act and that the investigation was ongoing.¹⁰

In March 2007, Montenegro reaffirmed earlier reports that the former state of Serbia and Montenegro did not produce any type of landmine after 1990.¹¹ Montenegro has also confirmed that there are no facilities for mine production on its territory.¹² In the past, the former Serbia and Montenegro stated several times that mine exports halted in 1990.¹³

On 16 May 2007, Montenegro and Serbia destroyed the last of their stockpiled antipersonnel mines in advance of their respective deadlines of 1 April 2011 and 1 March 2008.¹⁴ In total, Montenegro transferred 199,387 mines to Serbia for destruction, including approximately 40,000 after independence.¹⁵ However, in its Article 7 report submitted in 2008, Montenegro stated, "All mines had been destroyed before Montenegro gained independence."¹⁶

⁴ The previous reports were submitted in October 2007 and in 2008 (for calendar year 2007). The initial report consisted of a single page, with one or two sentences for each form, and the period covered was not specified.

⁵ Article 7 Report (for calendar year 2008), Form J.

⁶ In March 2008, a Montenegrin official informed Landmine Monitor that Montenegro's lack of participation in some of these meetings was due to a shortage of staff. Interview with Maja Boskovic, Third Secretary, Department for UN and Other International Organizations, Multilateral Sector, Ministry of Foreign Affairs, Podgorica, 17 March 2008.

⁷ In a 10 October 2006 letter to the UN Secretary-General, Montenegro reconfirmed the view stated by the former Serbia and Montenegro that "mere participation" in military activities with states not party to the treaty which engage in activities prohibited by the treaty is not a violation of the treaty.

⁸ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 121–122.

¹⁴ After its independence, Montenegro continued to participate in the stockpile destruction process initiated by the former Serbia and Montenegro in 2005 as a project of the Ministry of Defense and the NATO Maintenance and Supply Agency (NAMSA). For details, see *Landmine Monitor Report 2007*, pp. 522–523.

¹⁵ Email from Graham Goodrum, Technical Officer, NAMSA, 25 June 2007. This included the following antipersonnel mines: 109,003 PMR-2; 42,081 PMA-3; 20,926 PMA-1; 20,448 PMA-2; 5,929 PROM-1; and 1,000 PMR-3. The mines came from army stockpiles in Danilovgrad, Nikšić, Opatovo, Petrovići, Podgorica, and Sasovići.

¹⁶ Article 7 Report (for calendar year 2007), Form D.

Montenegro has not retained any mines for training purposes.¹⁷

In its initial Article 7 report, Montenegro stated that it had 23,826 MRUD (Claymore-type) directional fragmentation mines in stock.¹⁸ However, its Article 7 report submitted in 2008 did not list any MRUD mines.¹⁹ Montenegro did not initially explain this change.²⁰ In March 2009, a Ministry of Defense official informed Landmine Monitor that Montenegro does not consider its MRUD mines covered by the Mine Ban Treaty, since these, according to the official, are command-detonated and not victim-activated.²¹ Montenegro's Article 7 report submitted in 2009 similarly states that the MRUD mines "are permissible under Mine Ban Treaty, it does not classify as antipersonnel mines and can not be activated by accidental contact."²²

Scope of the Problem

Contamination

Montenegro became contaminated with mines and ERW, mainly UXO, as a result of conflicts during the break-up of the former Socialist Federal Republic of Yugoslavia in the 1990s. Contamination included cluster munition remnants left after NATO air strikes on Serbian and Montenegrin military positions in 1999.²³

Montenegro reported in the press in November 2007 that it had become the first country in the Balkan region to be cleared of mines.²⁴ By April 2009, Montenegro had not officially declared completion of its Article 5 obligations although its Article 7 report submitted in 2009 did not report any mined areas.²⁵ However, Montenegro still had to survey a mountainous area on the border with Croatia and Bosnia and Herzegovina (BiH) to clarify if the contamination that affects the Croatian side of the border also affects Montenegro. A technical survey of the area was planned to be conducted (see Demining and battle area clearance section below).²⁶

Montenegro has a problem with cluster munition remnants, consisting of unexploded BLU-97 submunitions, mainly located on and around Golubovci airfield, near the capital Podgorica. Contamination, which is estimated to cover 250,000m²,²⁷ directly affects four villages around the airfield.²⁸ A technical survey of the area that was planned to start in 2007²⁹ was postponed to 2009, and was still dependent on securing the necessary funding.³⁰ Officials say cultivated land in the area has been cleared and is safe for use, but edges of the land have not been cleared and may still pose a threat to the population.³¹

¹⁷ Article 7 Report, Form D, October 2007; and Article 7 Report (for calendar year 2007), Form D.

¹⁸ Article 7 Report, Forms B and H, October 2007. It states that the "detonator is electrical capsule."

¹⁹ Article 7 Report (for calendar year 2007), Form B.

²⁰ Claymore-type mines that are used in victim-activated mode, with tripwires, are banned by the treaty. Those used in command-detonated mode are not. States Parties have been urged to report on what steps they have taken to ensure that any such mines that are retained cannot be used in victim-activated mode.

³⁰ Interview with Veselin Mijajlovic, RCUD, Podgorica, 18 February 2009.

³¹ Ibid; and telephone interview with Borislav Miskovic, Montenegro Police Force, 18 February 2009.

Another area of approximately 30,000m² around Golubovci airfield is suspected to be contaminated by UXO from munitions fired during Yugoslav military aviation drills. The area is mostly used by the local population, who are said to be aware of the possible threat.³²

The Bojana river, which represents the natural border between Montenegro and Albania, is suspected to be contaminated by UXO and abandoned explosive ordnance (AXO) from earlier conflicts. The river is used by small boats and its banks by border police.³³ Montenegro's Adriatic coast is also contaminated with underwater UXO left after World Wars I and II and the 1991–1995 conflict in the former Yugoslavia. The precise location of all residual underwater contamination remains unknown, although two bays are confirmed to be affected.³⁴

Casualties

In 2008, no new landmine casualties were identified in Montenegro, but the Montenegro Police Force reported that one child was injured by an M35 Italian hand grenade he found in a wall in Podgorica.³⁵ The RCUD added that the device dated back to World War II.³⁶

In October 2008, the media reported that a member of the border police had been injured when his car drove over a mine in Bjelaje.³⁷ The police stated in March 2009 that the incident was a criminal act and an investigation was ongoing.³⁸

The total number of mine/ERW casualties in Montenegro remains unknown. From 1999 to 2008, at least 10 ERW casualties, including five children, were recorded in four incidents (four killed and six injured). Submunitions caused four casualties, grenades three, and unknown ERW the remaining three. In 2009, the Montenegro Police Force and RCUD provided information on three previously unreported casualties: two people injured by an M35 grenade in 2006 and one Bosnian killed in 2002 (the two other casualties of this incident had been reported before).³⁹ In 2004, 260 mine/ERW survivors were recorded as living in Montenegro.⁴⁰

Socio-economic impact

In the past, the main socio-economic impact of ERW was said to be preventing people from using forests to collect firewood and lumber, which for some inhabitants were the main sources of income.⁴¹ In addition, businesses investing in areas that may be affected by World War II-era bombs or unexploded submunitions may require survey and possibly clearance to be conducted.⁴²

Program Management and Coordination

The Ministry of Interior Affairs and Public Administration established a Department for Emergency Situations and Civilian Safety in 2007, and set up an explosive ordnance disposal (EOD) team within it, but due to a lack of human resources, responsibility for EOD remained with the police in 2008.⁴³ Officials said in 2008 that Montenegro was in the process of clarifying roles and responsibilities for mine action but, as of March 2009, had yet to issue any clarification.⁴⁴

The RCUD continued its role as the national mine action center.⁴⁵ The RCUD was set up in 2002 by the government, which assigned the Ministry of Interior Affairs and Public Administration to “develop [the center’s] organization and its specification.” It describes itself as a “public institution and has status of a legal entity realizing independently its functions assigned by the [government].”⁴⁶

There is no need for a specific victim assistance framework in Montenegro; mine/ERW survivors receive the same services as other persons with disabilities. The Ministry of Health, Labor and Social Welfare and the Ministry of Education and Science are responsible for disability issues.⁴⁷ A Commission for Anti-Personnel Mine Victims was reportedly established by the Ministry of Health, Labor and Social Welfare in 2004. In 2009, however, the ministry stated that it had no knowledge of the commission’s existence.⁴⁸ In November 2007, Montenegro adopted a Strategy for the Integration of Persons with Disabilities 2008–2016,⁴⁹ and in June 2008 a two-year action plan with specific objectives and timeframes was launched.⁵⁰

Data collection and management

Montenegro and Serbia shared a joint database on contamination and victims during their union, but since their separation, Montenegro has not established its own mine action database. RCUD staff have received training in the use of the Information Management System for Mine Action (IMSMA),⁵¹ but the RCUD stated in 2009 that it will not use IMSMA because of the limited extent of ERW contamination and the absence of recent victims.⁵²

There is no systematic collection of mine action data in Montenegro. The RCUD has general information on previously mined areas and suspected hazardous areas, and it has recorded the number of mines found and destroyed during demining.⁵³ The Ministry of Interior Affairs and Public Administration also has some information on the progress of mine action and some victim data.⁵⁴

Plans

Strategic mine action plans

Montenegro did not draw up a strategic mine action plan due to the relatively small extent of its mine problem.⁵⁵ For 2009, the RCUD was planning to give priority to general and technical surveys of suspect land around the military airfield at Golubovci and the Bojana river, as well as the mountainous area on the border with Croatia and BiH, which may still be contaminated with antipersonnel mines. Where surveys confirmed contamination, clearance operations would then be planned.⁵⁶

National ownership

Landmine Monitor is not aware of any legislation establishing the RCUD. However, it functions under rules published in the Official Gazette for regulating as well as implementing underwater mine/UXO clearance.⁵⁷

National mine action legislation and standards

The RCUD says that it disposes of mines/UXO in accordance with international standards and has developed its own standing operating procedures (SOPs) for clearance operations. The RCUD also says its SOPs for underwater demining are “unique.”⁵⁸

Demining and Battle Area Clearance

In February 2009, in cooperation with the Croatian Mine Action Centre (CROMAC), the RCUD planned to survey difficult-to-access areas in the mountains along the border with Croatia and BiH that might be mine-affected.⁵⁹ CROMAC had agreed to send mine situation maps covering the border areas between BiH, Croatia, and Montenegro.⁶⁰ As of 1 April 2009, no further progress had been reported with respect to the survey, and it was not known when it would be carried out.

Demining

The RCUD said no mine clearance took place in 2008.⁶¹

Identification of hazardous areas

The RCUD had planned to conduct a technical survey in 2008 of the area around Golubovci airfield, which is believed to be contaminated with unexploded submunitions.⁶² It postponed the project due to lack of funding and expected to carry it out in 2009.⁶³ As of March 2009, however, the RCUD had not received authorization from the airfield’s management to operate in the airfield zone.⁶⁴

The RCUD and the police EOD team surveyed the area around a former Yugoslav People’s Army (JNA) ammunition storage area.⁶⁵ In response to requests by a commercial company investing in the area, the RCUD undertook a general underwater survey of 600,000m² in Tivat bay (a bay within Boka Kotorska bay in the Adriatic sea). The survey defined 104,000m² of area for clearance. The area will be used for construction of a marine complex.⁶⁶

⁶⁵ Interview with Veselin Mijajlovic, RCUD, Podgorica, 18 February 2009.

⁶⁶ *Ibid.*

Battle area clearance

As a result of the underwater survey, RCUD conducted clearance on 104,000m² in 2008, finding and destroying 13 tons (13,000kg) of UXO.⁶⁷ The RCUD also undertook 11 underwater clearance tasks, acting on information provided by the local population, and reported clearing approximately 500kg of ammunition and UXO. RCUD interventions included clearance of explosive ordnance to a depth of 40m; the ordnance had been inadvertently dragged up by fishermen who threw it back, marked the location, and then informed the police or RCUD.⁶⁸

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Montenegro is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 April 2017. Officials stated publicly in November 2007 that Montenegro was free of mines, but the Ministry of Foreign Affairs had not made a formal declaration of compliance with Article 5 as of April 2009, nor had it said when it planned to do so.⁶⁹

Demining: 1999–2008⁷⁰

Year	Mine clearance (m ²)	Area released by survey (m ²)	Battle area clearance (m ²)
2008	0	0	0
2007	78,028	76,179	394,700
2004–2006	0	0	0
2003	241,000	0	0
1999–2002	0	0	0
Total	319,028	76,179	394,700

Between 2002 and 2008, the police EOD team removed and destroyed a total of 58 air bombs of 100–500kg, 176 rocket projectiles, 986 cannon and howitzer grenades, 794 mortar shells, 565 rocket-propelled grenades, 560 rifle grenades, 140 antipersonnel mines, 18 antivehicle mines, 32 unexploded submunitions, 5,587 hand grenades, three antiship/antisubmarine mines, and several thousand other munitions.⁷¹

Risk Education

In 2008, as in previous years, no formal mine/ERW risk education (RE) was provided in Montenegro.⁷² According to the police, the local residents around Golubovci airfield are aware of the danger from cluster munition remnants, having lived there during the NATO air strikes and having knowledge of where the cluster munitions were dropped and their impact. Therefore, warning signs have not been installed,⁷³ although marking costs are included in the expenditures

⁷³ Telephone interview with and email from Borislav Miskovic, Montenegro Police Force, 18 February and 26 March 2009.

document of the technical survey of the airfield.⁷⁴ The RCUD believes that submunitions still pose a threat to the local population.⁷⁵

Montenegrin authorities reported that over the years some sporadic RE was provided during survey and clearance activities.⁷⁶ Since the creation of the EOD team within the Montenegro Police Force, communities have been informed on how to reach the police if ERW are found. The media has also been used on several occasions to inform the public about the dangers of ERW.⁷⁷

Victim Assistance

The estimated number of survivors is unknown but at least 260; this is presumed to be the result of conflicts in other parts of the former Yugoslavia.

Montenegro did not retain the former Serbia and Montenegro's status as one of the 26 States Parties with the greatest numbers of survivors and the greatest needs.⁷⁸ Support is limited to state benefits and services, and in 2007–2008 healthcare services did not meet the needs of the population.⁷⁹ Economic reintegration of persons with disabilities was problematic with only 2% of them employed in 2008. It was hoped that the August 2008 Law on Professional Rehabilitation and Employment of Persons with Disabilities would generate positive changes. Disability allowances are low.⁸⁰ Civilian victims of war, including mine/ERW survivors, are organized in local associations with units in each community.⁸¹

Support for Mine Action

No international contributions were reported for mine action in Montenegro in 2008.

MOZAMBIQUE

2008 Key Data

State Party since	1 March 1999
Contamination	Antipersonnel and antivehicle mines, UXO, AXO
Estimated area of contamination	10.49km ² of mined areas (end 2008) and additional SHAs
Casualties in 2008	Nine (2007: 47)
Estimated mine/ERW survivors	Unknown but at least 185
Article 5 (clearance of mined areas)	Deadline: 1 March 2014 Original deadline: 1 March 2009
Demining in 2008	1.75km ² of mined areas 0.5km ² of land surveyed for development projects
Risk education recipients in 2008	At least 52,911
Progress towards victim assistance aims	Slow
Support for mine action in 2008	National: \$1.6 million (2007:\$1.3 million) International: \$3.2 million (2007: \$3.5 million)

Ten-Year Summary

The Republic of Mozambique became a State Party to the Mine Ban Treaty on 1 March 1999. It hosted the First Meeting of States Parties in May 1999, and served as co-chair of the Standing Committee on Mine Clearance in 1999 and 2000. It has not enacted national legal measures to implement the treaty. Mozambique completed its stockpile destruction in February 2003. It reported retaining 2,088 mines for training purposes at the end of 2008.

Landmines and explosive remnants of war (ERW) in Mozambique are a legacy of nearly 30 years of conflict that ended in 1992. Inaccurate surveys and poor data led to poor targeting of clearance and unnecessarily large expenditure for many years of the mine action program. In 2007 and 2008, a Baseline Assessment and the completion of clearance in the four northern provinces reduced the remaining problem to an estimated 12km². In November 2008, Mozambique received a five-year extension to its Article 5 deadline for clearance to 1 March 2014. Since 1993, national, nongovernmental, and commercial entities have carried out demining in Mozambique. By 2008, three NGOs remained and commercial demining companies were contracted to verify the safety of land related to construction and development projects.

Between 1999 and 2008, Landmine Monitor identified 447 casualties (86 killed, 183 injured, and 178 unknown). During the same period, the National Demining Institute (Instituto Nacional de Desminagem, IND) identified 285 casualties (100 killed and 185 injured). While there is probably significant overlap between Landmine Monitor and IND data, inadequate details on casualties from IND and from media reports make comparisons unreliable.

Mozambique credits its risk education (RE) program for helping to reduce the number of mine/ERW casualties. In 2005, UNICEF determined that there was no longer a need for RE in the country, although an assessment by the Geneva International Centre for Humanitarian Demining suggested there was still a need for RE to be integrated with mine clearance activities.

Overall, victim assistance improved little, although some investments were made to infrastructure and staff training for physical rehabilitation services. Progress made towards the achievement of VA26 objectives was limited, especially in psychological support and social and economic reintegration. Mozambique has legislation to protect the rights of persons with disabilities, but few resources were available to enforce existing laws and discrimination was prevalent.

Mine Ban Policy

Mozambique signed the Mine Ban Treaty on 3 December 1997 and ratified it on 25 August 1998, becoming a State Party on 1 March 1999. No implementing legislation is in place. Mozambique has reported that a draft law was submitted to Parliament for analysis, that it is on the government's agenda, and "it's likely to be approved in July [2009] by the Council of Ministers."¹

Mozambique submitted its ninth Article 7 transparency report in 2009, undated, covering calendar year 2008.² It did not submit a report in 2008 for calendar year 2007.³

Mozambique participated in the Ninth Meeting of States Parties in Geneva in November 2008, where it made a statement on its Article 5 clearance deadline extension request, and commented on Zimbabwe's extension request. It attended the intersessional Standing Committee meetings in Geneva in May 2009, where it made statements on mine clearance and victim assistance.

Mozambique has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training). In June 2004, however, a government legal advisor told Landmine Monitor that Mozambique believes any mine that is capable of exploding from the contact of a person is prohibited by the treaty.⁴

Mozambique is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008, but had not yet ratified it as of 1 July 2009.⁵

Production, transfer, use, stockpile destruction, and retention

Mozambique has never produced or exported antipersonnel mines.⁶ Throughout the civil war, antipersonnel mines were imported from many countries and used by different parties to the conflict. Mozambique completed destruction of its stockpile of 37,318 antipersonnel mines on 28 February 2003, a few days before its treaty-mandated deadline.⁷

In its Article 7 report submitted in 2009, Mozambique reported that it retains a total of 2,088 mines for training purposes, including mines retained by NGOs operating in the country.⁸ This surpasses the 1,265 antipersonnel mines last reported at the end of 2006, and the numbers cited in prior reports.⁹ Mines retained at the end of 2008 included: 900 mines of various types (PMD,

¹ Article 7 Report (for calendar year 2008), Form A. Mozambique stated in 2005, 2006, and 2007 that a proposed law to fulfill Article 9 of the Mine Ban Treaty had been submitted to Parliament. Article 7 Reports, Form A, (for calendar year 2006), 27 April 2006, and 25 April 2005.

² Previous reports were submitted in 2007 (for calendar year 2006), on 27 April 2006, 25 April 2005, 23 April 2004, in 2003 (for the period 1 January 2002–1 March 2003), 2 July 2002, 30 October 2001, and 30 March 2000.

³ According to IND's records, this Article 7 report was submitted "through the normal channels"—the Mozambican Embassy. Email from Hanoch Barlevi, CTA, UNDP/IND, 5 September 2008.

⁴ Interview with Numbio Mambique, Legal Advisor, IND, in Geneva, 29 June 2004.

⁵ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 122–123.

⁶ Article 7 Report (for calendar year 2006), Form E, and earlier Article 7 reports.

⁷ For more details, see *Landmine Monitor Report 2004*, p. 580; and Article 7 Report (for calendar year 2008), Form B. Mozambique initially reported that it destroyed 37,818 mines, but later changed the figure to 37,318.

⁸ Article 7 Report (for calendar year 2008), Form D. Mozambique cites a total figure of 1,963 mines in the Form D table, but the actual total of the mines listed within the table adds up to 2,088.

⁹ Article 7 Report (for calendar year 2006), Form D. For details see *Landmine Monitor Report 2007*, p. 530. Mozambique's first three Article 7 reports stated that no antipersonnel mines would be retained for training or development purposes. The 2003 report indicates 1,427 mines would be kept; the 2004 and 2005 reports both cite a figure of 1,470 antipersonnel mines; the report for 2006 cites 1,319. The reduction of 151 mines from 2005 to 2006 was the result of the Accelerated Demining Program destroying its mines when the program ended in June 2005.

MN, PMN-2, POMZ-2M, POMZ-2, OZM-72, MON-50, and OZM) held by the Mozambique Armed Forces; 520 mines of unspecified types held by IND; 343 mines held by APOPO, a Belgian research organization that uses rats to detect mines; 42 mines held by Handicap International (HI);¹⁰ 138 by HALO Trust; and six by Integra.¹¹ Mozambique's reporting of 1,265 mines retained in 2006 did not include the 520 mines in the possession of IND, which accounts for much of the overall discrepancy in numbers reported at the end of 2006 and the end of 2008.

Mozambique did not report on mines actually consumed during 2008 for training purposes. It reported that the 520 mines retained by IND, after being turned over by Norwegian People's Aid in 2005, would be destroyed by June 2009 as IND has no mandate to carry out training operations.¹²

Mozambique did not explain why the number of retained mines increased from 2006, and it has yet to provide details on the intended purposes and actual uses of its retained mines, as agreed by States Parties at the First Review Conference in December 2004.

Scope of the Problem

Contamination

Mozambique is affected by landmines and ERW, a legacy of nearly 30 years of conflict that ended in 1992.¹³ The results from the Landmine Impact Survey (LIS) from 2001 have been updated by three major surveys of the problem—two by HALO and one by HI—that reduced the total estimated mined area in Mozambique to approximately 12km².¹⁴

Between March 2005 and 8 December 2006, HALO conducted a Mine Impact Free District survey in the four northern provinces of Cabo Delgado, Nampula, Niassa, and Zambézia, where it had been operating since 1994. On completion of the survey, HALO stated it had identified and cleared every known mined area in the four provinces.¹⁵ In April 2009, HALO's Executive Director Guy Willoughby said every village in the four provinces in northern Mozambique was free of landmines.¹⁶ In its Article 5 deadline extension request revision, Mozambique stated that it had met its treaty obligations in the northern provinces and accepted the findings of the survey,¹⁷ despite the fact that after the survey local authorities had received police reports from the provincial authorities of 146 sites containing a residual threat from UXO or mines. IND planned to send quality assurance (QA) teams to the four provinces in 2009 to make a technical assessment of the reported problem.¹⁸

In the 2007 Baseline Assessment, HALO surveyed Gaza, Inhambane, Manica, Maputo, Sofala, and Tete provinces for contamination. Further surveys by HALO and HI in 2008 added 57 contaminated areas for a new total of 541 mined areas amounting to 12.16km² across six

provinces.¹⁹ At the end of 2008, Mozambique had 386 confirmed mined areas in 59 districts in six provinces covering an estimated 10,28km².²⁰ IND planned to release up to 3.5km² of suspected hazardous areas (SHAs) in 2009.²¹

The Baseline Assessment also identified contaminated areas that include the following:

- six battle areas comprising 81,000m² in Manica, Sofala, and Tete provinces;
- roads on the border with Zimbabwe;
- infrastructure, such as dams at Cahora Bassa and Chicamba in Tete province;
- the Beira-Machipanda railway in Manica province and the Limpopo railway in Gaza province;
- 170 electricity pylons between Maputo city and the border with South Africa; and
- 75 UXO spot clearance tasks.²²

Mozambique has yet to provide official clearance estimates for minefields along its border with Zimbabwe and IND has categorized one SHA in Cheringoma district in Sofala province and one SHA in Mabalane district in Gaza province for further survey.²³ IND did not expect the areas to be resurveyed in 2009.²⁴ Between May and September 2009, HALO surveyed the border areas with Zimbabwe, estimated to be 7km long with an estimated contaminated area of 210,000m².²⁵ Initial funding came from the United States Department of State.²⁶

Mined areas and UXO sites in Mozambique, December 2008²⁷

Province	No. of mined areas in Baseline Assessment	No. of SHAs remaining	Estimated area (m ²)	Area cleared (m ²)	Area remaining (m ²)	Mined roads	UXO sites remaining
Gaza	20	13	1,931,793	73,066	1,858,727	6	23
Inhambane	251	182	3,720,474	246,501	3,473,973	7	0

Casualties

IND recorded nine mine/ERW casualties (three killed and six injured) in four incidents in 2008. Four casualties were caused by mines, and five by ERW. The majority of casualties were girls (four), followed by men (two, including a deminer), boys (two), and women (one deminer).²⁸

This represents a significant decrease from the 24 mine/ERW casualties (14 killed and 10 injured) recorded by IND or the 47 mine/ERW casualties (22 killed and 25 injured) identified by Landmine Monitor in 2007.²⁹ IND believed that the reduced number of casualties was the result of reduced mine contamination and successful RE, including RE activities particularly targeting scrap metal collection, which has reduced risk-taking behavior.³⁰ Mine clearance operators agreed that there was a general perception that the number of casualties had reduced and that SHAs were well known by the population.³¹ However, it is also suspected that some casualties go unreported.

In April 2008, two girls were injured by ERW while playing near a former military training site in Chicualacuala, Gaza. In a separate incident, on 18 April 2008, an adult male and a four-year-old girl were killed, and a girl injured in Mutarara, Tete, when the adult attempted to take apart an ERW that he had found near his home. RE was provided in that district in 2007, but it was unknown if the casualties themselves had received RE.³² In September 2008, two boys were injured when one stepped on a landmine in Tete province. The boys live near a known minefield but given their young age, it was unlikely either had received RE, since it was last provided in that area in 2004.³³

On 7 July 2008, a male deminer was killed and a female deminer was injured when the male deminer (the team supervisor) set off a landmine in the Mafuiane minefield in Namaacha district, Maputo province. An investigation into the accident determined that the supervisor had violated standing operating procedures but that all others involved, including the injured deminer and medical staff, followed instructions and responded adequately.³⁴

In 2009, one mine casualty (killed) was identified up to 31 May. On 1 March, in Mabalane, Gaza, a woman was killed when she set off a landmine while preparing an oven to make charcoal on the outskirts of her village.³⁵

Between 1999 and 2008, Landmine Monitor identified 447 casualties (86 killed, 183 injured, and 178 unknown).³⁶ Landmine Monitor data was gathered from IND, Mozambique's Article 7 reports, the Article 5 deadline extension request, and from media reports. During the same period, IND identified 310 casualties (100 killed, 185 injured, and 25 unknown).³⁷ While there is probably significant overlap between Landmine Monitor and IND data, inadequate details on casualties from IND and from media reports make comparisons unreliable. The most comprehensive collection of casualty data remains the nationwide LIS, completed in August 2001, which recorded 2,145 mine/ERW casualties (but did not provide a breakdown of those killed and injured).³⁸

2001	1	7	80	88
2000	8	21	0	29
1999	6	30	60	96
Total	86	183	178	447

Casualties identified by IND from 1999–2008

Year	Killed	Injured	Unknown	Total
2008	3	6	0	9
2007	14	10	0	24
2006	14	16	0	30
2005	23	34	0	57
2004	3	27	0	30
2003	6	8	0	14
2002	16	16	0	32
2001	0	0	25	25
2000	9	20	0	29
1999	12	48	0	60
Total	100	185	25	310

In August 2008, Mozambique reported that annual casualty rates had decreased since 2001.³⁹ In both IND and Landmine Monitor data, however, the number of casualties has not consistently decreased each year. That, and the general unreliability of data, makes it difficult to determine trends with any certainty.

Risk profile

IND believed that people were now aware of the dangers of mines and ERW and that scrap metal collection was no longer a cause of mine/ERW incidents in 2008.⁴⁰ Representatives of mine-affected communities believed that children were at greater risk because, while adults were familiar with and avoided mined areas, children were more likely to enter restricted areas.⁴¹ In 2008, six of the nine casualties were children who were playing in known mine/ERW contaminated areas.⁴² The second highest risk group were people cutting wood (minefields tend to be densely vegetated as people have not been using the land) or expanding their fields into the margins of suspected areas due to land pressure.⁴³

Socio-economic impact

With the problem largely confined to 386 small mined areas in six provinces at the beginning of 2009, the socio-economic impact and level of risk has been greatly reduced over the past decade.⁴⁴ The remaining mined areas impact farming and access to water, and present a risk to certain hospitals and schools.⁴⁵

Program Management and Coordination

Mine action

IND serves as the mine action center in Mozambique under the supervision of the Ministry of Foreign Affairs. It coordinates demining, including QA and data management, at both the national and provincial levels.⁴⁶

Risk education

IND is also responsible for coordinating RE. In 2008, there were no coordinating meetings specific to RE, but RE was included in all mine clearance coordination meetings.⁴⁷ IND monitored the work of demining operators to ensure that they included community liaison activities, as needed.⁴⁸

Victim assistance

While the National Mine Action Plan 2008–2012 (Plano Nacional de Acção contra Minas 2008–2012, NMAP) (see Strategic mine action plans section below) reaffirms the role of IND in coordinating victim assistance (VA),⁴⁹ IND itself says it does not coordinate VA. Its role is limited to mobilizing resources, encouraging other government agencies to act, ensuring that the national disability plan includes mine/ERW survivors, and preventing further casualties through clearance and RE activities.⁵⁰ In its Article 7 report for 2008, as in previous years, Mozambique reported that responsibility for VA was shared by the Ministry of Health (Ministério de Saúde, MISAU) and Ministry of Women and Social Action (Ministério da Mulher e da Acção Social, MMAS) in coordination with IND.⁵¹

MISAU coordinates all healthcare and physical rehabilitation activities and directly manages the country's 10 orthopedic centers.⁵² MMAS coordinates social and economic reintegration services for persons with disabilities, such as pensions, income-generating projects, transportation to help access physical rehabilitation services, inclusive education, and disability rights and awareness activities.⁵³

Data collection and management

The national mine action database, which uses the Information Management System for Mine Action (IMSMA) software, is located at IND.⁵⁴ It is updated, but numbers provided to Landmine Monitor on contaminated areas did not add up correctly.

IND also collects RE and casualty data. In theory, RE activity reports are received from the mine clearance operators—IND QA staff who also serve as RE promoters and volunteers or “agents.” In practice, IND only received RE data from one mine clearance operator in 2008 and from IND QA staff.⁵⁵ IND RE agents are expected to give their activity reports to the local government to pass them to IND, but no reports were received in 2008.⁵⁶ In 2008, RE information was not entered into IMSMA. While it was expected that this would happen by

⁵⁶ Interview with António Belchior Vaz Martin, Mila Massango, and Fernando Mulima, IND, Maputo, 20 April 2009.

the end of 2009, it was thought unlikely that data would be entered retroactively.⁵⁷ RE data is believed to be incomplete since some mine clearance operators who carry out community liaison activities do not provide IND with information about these activities.⁵⁸

There is no comprehensive database of mine/ERW casualties in Mozambique.⁵⁹ In August 2008, Mozambique stated that some of its casualty data was “subject to confirmation” and that the data did not represent “the real situation of surviving people of accidents with mines/ERW in Mozambique.”⁶⁰

IND receives casualty data from local authorities, hospitals, the media, mine clearance operators, QA staff, and RE agents. IND provides local authorities and mine clearance operators with casualty data collection forms. In 2008, however, only one incident was reported using the designated form.⁶¹ The PNAM and IND annual plan for 2009 include an objective to update and complete the database on mine survivors by 2010.⁶² Little progress was observed and, as of March 2009, casualty data had not yet been included in IMSMA,⁶³ although it was expected that it would start being included by end-2009. As in the case of RE data, there were no plans to input data retroactively.⁶⁴

Casualties are believed to be under-reported for a variety of reasons. First, in cases where the casualty dies, the family has no expectation of receiving any benefit or service. Second, people are afraid to report incidents for fear they may be punished for doing something wrong. Third, incidents occur in remote locations where there is little contact with any government officials. Fourth, government staff turnover at the district or provincial level, and/or unclear reporting instructions, prevent local authorities from reporting casualties to IND. Finally, mine clearance operators (who are often the first to learn of incidents) do not systematically report incidents to IND.⁶⁵ In 2007, Landmine Monitor identified 32 casualties through media monitoring, of which 23 were not included in IND records.⁶⁶ In most cases, when casualties are reported, only partial data is received and more complete information is difficult to collect because of a lack of roads and telephones in some remote locations where incidents occur.⁶⁷

Efforts by MISAU and MMAS to develop a casualty database, first reported in the IND 2006 Annual Report,⁶⁸ had not been completed as of March 2009 and data collected up to that point had not yet been shared with IND.⁶⁹ The 2007 national census included four questions on disability, but as of April 2009, disability data had not been made available to IND or MMAS.⁷⁰

Plans

Strategic mine action plans

The Council of Ministers approved the NMAP in April 2008.⁷¹ The NMAP aims to establish sustainable mine action planning, coordination, and operational capacities and to fulfill international obligations, including clearing all known minefields.⁷² It is based on the results of the Baseline Assessment, lessons learned from the implementation of the 2002–2006 strategic plan, and results of other surveys conducted by HALO and HI.⁷³

IND also developed detailed annual plans and targets based on a district-by-district approach to clearance as part of its Article 5 deadline extension request.⁷⁴ For 2009, with APOPO, HALO, and HI, and a number of commercial companies as operational partners, IND planned to:

- clear 82 areas and 1.997km² of area in Gaza, Inhambane, Manica, Maputo, Sofala, and Tete provinces;
- conduct a three-month survey of the Mozambique-Zimbabwe border;
- clear 170 electrical pylons; and
- begin clearance around the Cahora Bassa dam.⁷⁵

In May 2009, IND announced the clearance of the 170 electrical pylons would begin as soon as funding was available. António Belchior, the head of operations at IND, said, “After 17 years of peace ... we have to remove them [the mines] as we have also received appeals from communities who want to open up fields along the power lines.”⁷⁶

Mozambique does not have separate RE or VA national plans. The NMAP includes the following RE objectives: targeting RE at affected communities as identified by surveys; analyzing incident data to determine the most at-risk groups; and establishing community-based RE by 2010.⁷⁷ The plan’s VA objectives included supporting mine survivors’ socio-economic reintegration by providing information and directing them to appropriate service providers and continued advocacy to ensure that the needs of survivors are addressed by relevant government ministries.⁷⁸ Annual plans with more specific objectives are developed for RE and VA based on the NMAP four-year cycle.⁷⁹

The National Disability Plan 2006–2010 (Plano Nacional de Acção da Arena da Deficiência, PNAD) includes all persons with disabilities. In 2009, IND requested that VA objectives be included in the PNAD and that IND be included in the committee monitoring the implementation of the plan.⁸⁰ MMAS said that this request will be considered when they review the plan in 2010. MMAS had no objection to IND being on the committee.⁸¹ The African Union Plan for the Decade of Persons with Disabilities 1999–2009 includes a component that will touch on plans for improving disability rights in Mozambique. As of April 2009, Mozambique was revising its objectives for an updated version of the African Union Plan, which would begin in 2010.⁸² It is not known how this plan relates to the PNAD.

Integration of mine action with reconstruction and development

The 2008–2012 NMAP seeks to contribute to Mozambique's poverty reduction strategy for 2006–2009 in areas where demining is considered "a strategically crucial activity... [and by] making sure that mines are cleared in the affected regions in order to (i) prevent and reduce the loss of human life and (ii) allow the implementation of economic projects, resettlement, and greater mobility of population groups."⁸⁴ The remaining SHAs are in agricultural areas and in areas where economic development is planned. IND believes the demining of these areas would contribute to achieving the objectives of the government's poverty reduction strategy.⁸⁵

Mozambican law requires that all land designated for infrastructure and construction of new buildings be verified free of landmines. The appropriate government ministry contracts an international or national demining company to carry out this verification.⁸⁶

National ownership

Commitment to mine action and victim assistance

For many years the Mozambique mine action program was plagued with management problems and a general indifference to mine action, despite significant support with international funds, the UN, international NGOs, and technical advisors. Mozambique's drafting of the 2008–2012 NMAP and its Strategic Plan for Resource Mobilization (see Support for mine action section below), as well as larger financial contributions to the program from the national budget, has demonstrated a greater commitment to meeting its Mine Ban Treaty obligations.

While IND officially coordinates VA, IND staff asserted that the government committed to assisting mine/ERW survivors without assigning this responsibility to any particular agency or ministry.⁸⁷ While Mozambique has reported that responsibility for VA is shared by MISAU and MMAS, representatives of IND said that, aside from MMAS, other government agencies feel "no responsibility for the Mine Ban Treaty and have no special concern for mine victims."⁸⁸ In IND's projected budget for 2009–2013, no funds were included for VA coordination or activities.⁸⁹ Mozambique lacked funding for implementing PNAD and few resources were dedicated to enforce anti-discrimination laws.⁹⁰

National management

Mine action is managed nationally and at the provincial level by IND. As of December 2008, IND had 45 staff members: 35 based in Maputo and 10 in the regional office in Beira. This represents a decrease of 12 staff from 2007. IND planned to maintain the same staffing levels in 2009.⁹¹ Since 1993 when the Mozambique mine action program began, UNDP has supported IND and its predecessors through a chief technical advisor (CTA), an operations manager, and an IMSMA officer. In January 2008, UNDP reduced its technical support to a CTA. When the need arises, short-term consultants will be hired.⁹²

⁹² Email from Katrine Kristensen, Programme Analyst, Conflict Prevention and Recovery Team, Bureau of Crisis Prevention and Recovery, UNDP, 15 July 2008.

National budget

Over the 2009–2014 Article 5 extension period, Mozambique has committed to contributing US\$10.5 million, or about 38% of the total demining funding requirements, including \$1.8 million in 2009.⁹³

National mine action legislation and standards/Standing operating procedures

IND was established by decree in 1999 under the supervision of the Ministry of Foreign Affairs.⁹⁴ The National Demining Commission, the predecessor to IND, issued national standards in 1998. They were revised in 2001 with technical assistance from the international NGOs operating at the time in Mozambique, to reflect procedures and principles found in the International Mine Action Standards.⁹⁵ Mozambique does not have separate RE national standards, but mine clearance standards include a requirement that all mine clearance operators include RE alongside clearance.⁹⁶

Program evaluations

The Canadian Landmine Fund, as part of a global evaluation of the mine action programs it has funded, conducted field work for the evaluation in Mozambique in March 2008.⁹⁷ The findings of the evaluation were not available as of July 2009.

Demining and Battle Area Clearance

Demining operations are conducted in all the remaining six mine-affected provinces by APOPO, HALO, and HI. IND tasks them with annual targets according to the operational plan in the Article 5 deadline extension request. Private international and national demining companies are contracted by various ministries involved in investment and development projects to verify that the land for each project is free from mines. In 2009, IND planned to contract local commercial companies to clear some suspected mined areas in Tete province contained in the national database.⁹⁸

Mine clearance in 2008

IND reports that the NGOs cleared almost 1.75km² of land in 2008.⁹⁹ The results of clearance in 2008 by NGOs are summarized in the table below.

Demining in 2008¹⁰⁰

NGO Operator	No. of SHAs cleared	SHA cleared (m ²)	UXO sites cleared	Mines destroyed	UXO destroyed
APOPO	7	130,272	0	43	2
HALO	42	540,178	36	841	677
HI	179	1,076,696	27	238	164
Total	228	1,747,146	63	1,122	843

Commercial companies

Commercial companies in 2008 were tasked, according to the law, with verifying that land for new buildings or infrastructure was free from mines and that construction could commence. In 2008 they cleared 495,000m² and found 22 mines and five items of UXO.¹⁰¹ They conducted mine clearance to assist in investment and development projects such as building schools, hospitals, and other infrastructure. The companies, which are accredited by IND, were contracted by the Ministry of Housing and Public Works, the Ministry of Transport and Communications, the Ministry of Mineral Resources, the Ministry of Energy, and the Ministry of Tourism. In early 2009, IND issued tenders for commercial companies to clear some of the remaining 386 SHAs in the baseline data.¹⁰² The extent of the commercial companies' participation is dependent on the availability of funds.¹⁰³

Demining for Development Projects in 2008¹⁰⁴

Operators	Land released (m ²)	Antipersonnel mines destroyed	UXO destroyed during mine clearance
ADDC	161,353	0	2
BACTEC	0	5	2
JVD	110,730	0	2
MMA	223,500	17	1
Total	495,583	22	7

Land release

Mozambique considers the adoption of land release principles and policies to be integral to meeting its Article 5 obligations.¹⁰⁵ IND invited the Survey Action Center to Maputo in March 2009 to facilitate a workshop on land release for IND operations staff and QA teams. The aim was to develop operational procedures for land release (particularly through non-technical means and technical surveys), for QA of the process, and for documentation of the results. IND had not adopted a land release policy as of April 2009.¹⁰⁶ According to Aderito Ismael, HI's Mine Action Programme Manager in Mozambique, neither land release concepts in general nor the specific methodologies to release land by means other than clearance were well understood at the village level.¹⁰⁷

Battle area clearance in 2008

The Baseline Assessment identified six battle area clearance (BAC) tasks: three in Manica, two in Tete, and one in Sofala.¹⁰⁸ No BAC took place in 2008. There is no special priority to clear these areas. Instead, they will be included in the district-by-district planning and will be cleared when each district is cleared.¹⁰⁹

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Mozambique was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. On 6 May 2008, Mozambique submitted a request to extend its deadline to 1 March 2014 (although the operational plan to clear the remaining mined areas was due to be completed by 31 December 2013).¹¹⁰

Controversial large estimates of the number and size of SHAs have plagued the mine action program since 2001 when the LIS estimated there were 561km² of contaminated area in the country. In 2005–2007, the estimated contaminated area had decreased to some 12km² as well as several road and infrastructure clearance projects as presented in its Article 5 deadline extension request in May 2008.¹¹¹ By the end of 2008, the total SHA had been reduced to 10.28km².¹¹²

The ICBL stated in June 2008 at the Standing Committee meetings that Mozambique's extension request was well conceived and realistic. Clearance of the remaining mined areas may even require less than six years, given sufficient resources.¹¹³

Risk Education

In 2008, RE was increasingly integrated alongside mine clearance activities and QA, and included within the Ministry of Education's curriculum: it was rarely a stand-alone activity. This was in accordance with a recommendation made by the Geneva International Centre for Humanitarian Demining (GICHD) in 2005.¹¹⁴ Mozambique stated that "mine risk education continued to be a priority for the government in 2008."¹¹⁵

RE was provided by IND, the Ministry of Education, and NGOs to at least 52,911 beneficiaries. This represents a sharp decrease compared to the 503,100 beneficiaries identified by Landmine Monitor in 2007. However, 349,100 of the 2007 beneficiaries had received emergency RE following the ammunition storage area (ASA) explosion in Maputo and flooding in mine-affected provinces.¹¹⁶ In addition, RE beneficiary figures are not collected systematically by IND and it is possible that, in both years, some beneficiaries were counted twice or not at all.¹¹⁷ Government representatives and mine clearance operators felt that 2008 activities were sufficient to address potential risks, given the reduced levels of mine/ERW contamination in the country and the decrease in the number of new incidents in recent years.¹¹⁸

In 2008, there was an increased focus on reducing risks associated with scrap metal collection through a radio and television campaign and messages provided by IND QA teams.¹¹⁹ While there was one incident in 2008 (the 18 April incident, see Casualties section above) that was believed to have been related to scrap metal collection, government representatives and

practitioners in Mozambique felt that risks had been successfully reduced.¹²⁰ In 2007, there were at least two incidents related to scrap metal collection.¹²¹

Mine clearance operators (APOPO, HALO, and HI) were required by the national standards to carry out RE activities alongside clearance activities. IND QA teams also spread RE messages when conducting surveys or QA for sites during and post clearance.¹²² RE activities carried out by mine clearance operators are funded by international donors.¹²³ HALO reported that community reports collected during community liaison resulted in the identification and destruction of 20 mines and 651 ERW.¹²⁴

Risk Education Activities in 2008¹²⁵

Organization	Type of activity	Geographic location	No. of beneficiaries
APOPO	RE through community meetings	Gaza province	No figures available
CinemArena	Community presentations through theater, production of film based on theater performances	Inhambane province	Film to 30,000 people, additional beneficiaries but no figures available
HALO	RE through community meetings	Maputo province	16,000
HI	RE through community meetings, training of RE agents, facilitation of CinemArena RE	Inhambane province	140 RE agents trained, but no figures available for community liaison beneficiaries
IND	RE through QA teams survey and community liaison, and through IND volunteers	All six mine affected provinces; follow-up on 2007 ASA weapons depot explosion in Maputo	109 RE sessions by QA teams; 24 RE agents trained; 6,911 beneficiaries; no figures available for volunteer activities
Ministry of Education	RE messages in the school curriculum	Unknown	No figures available
Mozambique Christian Council (MCC)	Emergency RE following 2007 ASA explosion	Maputo city	5 MCC staff trained as RE agents, but no figures available on RE beneficiaries

In 1999, RE in Mozambique was implemented jointly by HI, the Ministry of Education, and the Mozambique Red Cross (MRC). In 2000, this program was handed over to IND to coordinate and manage. Mozambique's 2002–2006 NMAP called for "aggressive and sustained" RE, but by 2004, because of a lack of funding, few activities were implemented. In 2005, UNICEF

determined that there was no longer a need for RE in the country, although an assessment by the GICHD felt that there was still a need for RE integrated with mine clearance activities.¹²⁶ Emergency RE was provided in 2000 and 2007 in response to flooding in mine-affected areas and, in 2007, in response to the ASA explosion in Maputo.¹²⁷ In its Article 7 report for 2008, Mozambique stated that “Due to effectiveness of MRE activities, we have registered a reduction of number of accidents and casualties among civil population compared to previous years.”¹²⁸

Victim Assistance

The total number of survivors is unknown, but is at least 185. Since 2005, Mozambique has repeatedly recognized that VA is the “weakest component” of its program and, in 2008, there were few programs specifically dedicated to mine/ERW survivors.¹²⁹ Some progress was noted in the provision of services to all persons with disabilities, however, which could benefit mine/ERW survivors.

Mozambique’s healthcare structure is weak and heavily dependent on international assistance (representing 73% of the national health budget in 2008), a result of long years of armed conflict and repeated natural disasters. About one-third of the population cannot access health services and only half have access to an acceptable level of healthcare. There are not enough trained healthcare professionals and insufficient funds dedicated to basic healthcare delivery.¹³⁰ District level hospitals have poor capacities to provide emergency and continuing care to mine/ERW survivors and there is no referral service to help people access this care elsewhere.¹³¹

Rehabilitation services are provided in 10 centers in provincial capitals, all operated by the government. In 2008, the last remaining privately operated center, the MRC Society’s Jaipur Orthopedic Center in Gaza province, began a transition to government operation, which was completed in January 2009.¹³² But services were out of reach for those survivors based in rural areas because of a lack of assistance for transportation and accommodation costs. While services are supposed to be free for war-disabled people, survivors were often unaware of this or did not know how to process the paperwork necessary to access them.¹³³ Four centers were renovated in 2008, bringing the number of renovated centers to six; four remaining centers still required renovation to have “appropriate conditions” to provide services.¹³⁴

The most highly equipped orthopedic center, based in Maputo, had “long waiting lists that keep getting longer” because of a lack of trained staff.¹³⁵ A national prosthetics and orthotics course, which began in 2008 and was the first of its kind since 1990, expected to increase the number of staff by 2010.¹³⁶ Practitioners and survivors complained about a lack of adequate equipment and the poor quality of prosthetics because of inferior materials and the repeated recycling of materials.¹³⁷

¹³⁷ Interviews with Sérgio Nhantumbo, MISAU, Maputo, 22 April 2009; Adelia Macie, Orthopedic Technologist, Orthopedic Center, MISAU, Maputo, 23 April 2009; Mario Maute, Technician and Landmine Survivor, Orthopedic Center, MISAU, Maputo, 23 April 2009; and Eufêmia Amela, President, Mozambican Association of Disabled Women, 21 April 2009.

Psychosocial support and economic integration activities remained limited. Many persons with disabilities were isolated in their homes, education remained physically inaccessible and there were insufficient employment opportunities, especially in the formal sector.¹³⁸ Existing programs were mainly run by NGOs with limited resources. Government officials expressed interest in implementing inclusive education, but called on NGOs for support because of a lack of resources.¹³⁹ From 2006–2007, the Network for Mine Victims (Rede para Assistência às Vítimas de Minas, RAVIM) carried out a needs assessment of mine/ERW survivors in one district in Maputo province. Of the 98 survivors they identified, none had received vocational training and the vast majority were unemployed since they were unable to farm, the main occupation in the area.¹⁴⁰

Although Mozambique has legislation to protect the rights of persons with disabilities, few resources were available to enforce existing laws and discrimination was prevalent.¹⁴¹ As of 1 July 2009, Mozambique had signed but not ratified the UN Convention on the Rights of Persons with Disabilities, although the government was doing preparatory work for ratification.¹⁴²

In 1999, the Ministry of Health received technical assistance in physical rehabilitation from HI and POWER, a disability organization focused on advocacy and social reintegration, and was dependent on international assistance to provide basic healthcare services. Few to no services were available for psychological support or socio-economic reintegration. In 2004, Mozambique acknowledged that few mine survivors had benefited from assistance programs and that there was a need for a stronger government commitment in this area. Since 2004, Mozambique has repeatedly identified VA as the weakest component in its mine action program. By 2009, mine/ERW survivors still had extremely limited access to all VA services, especially survivors living outside provincial capitals. The Ministry of Health still depended on significant external support for healthcare, but had assumed responsibility for the management of all orthopedic centers and was investing in staff training and the renovation of buildings housing orthopedic centers.¹⁴³

Progress in meeting VA26 victim assistance objectives

As one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate attention to survivors,¹⁴⁴ Mozambique presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005.¹⁴⁵ Revisions to these objectives had not been presented by May 2009 and thus they remained largely non-SMART (specific, measurable, achievable, relevant, and time-bound). In 2009, IND reported that the PNAD had taken the place of Mozambique’s Nairobi VA objectives and that IND was working with MMAS to ensure that all VA objectives were integrated within the PNAD.¹⁴⁶

Progress made from 2008–2009 towards the achievement of VA objectives was limited, especially in psychological support and socio-economic reintegration. More progress was observed in physical rehabilitation. Achievements included: the renovation of four orthopedic centers; increased equipment for physical rehabilitation services; the launching of a two-and-a-half year national course in prosthetics and orthotics with 21 students, operated by MISAU;

advances in promoting inclusive education; and the creation of a department within MMAS to address the needs of former combatants, including those with a disability, such as pensions, healthcare and increased awareness of the rights of persons with disabilities.¹⁴⁷

The creation of a National Disability Council, originally expected by the end of 2008, thus fulfilling Mozambique's objective within the area of "laws and public policy,"¹⁴⁸ had not been formed as of April 2009, but MMAS was developing a proposal for its formation.¹⁴⁹ Mozambique has no VA objectives related to data collection, although this is included as an objective in their 2008–2012 NMAP; no progress was noted in this area in 2008, but RAVIM began a needs assessment of mine/ERW survivors in two districts in Maputo province.¹⁵⁰ No progress could be observed in developing a national VA action plan (an objective included in IND's 2007 Annual Report).

Mozambique included a VA/disability expert on its delegation to the meetings of States Parties from 2005–2008, and to the Standing Committee meetings in 2005 and 2009.¹⁵¹ The person acting as Mozambique's VA expert has changed at nearly every meeting, preventing continuity from one meeting to the next. Mozambique has reported on progress and challenges in VA at the Standing Committee meetings in 2005 and 2009 and at all meetings of States Parties since 2006. Mozambique used voluntary Form J in its annual Article 7 reports to provide details on VA activities in 2005, 2006, and 2008.¹⁵²

Victim assistance activities

In 2008, 1,150 people, including 57 mine/ERW survivors, received physical rehabilitation services for the first time from MISAU.¹⁵³ MMAS provided vocational training in areas such as tailoring, metalworking, electrical work, bicycle repair, refrigeration, small business management, craftsmanship, mechanics, shoemaking, carpentry, and brick making, for 441 youths with disabilities. Another 86 persons with disabilities (38 men and 48 women) received vocational training or support in securing employment.¹⁵⁴ It was not known if this included mine/ERW survivors. IND assisted 84 mine survivors from Inhambane province with vocational training, scholarships and/or mobility devices, with funds from Italy.¹⁵⁵ RAVIM also facilitated access to physical rehabilitation services for an unspecified number of mine/ERW survivors.¹⁵⁶

In 2007 and 2008, HI and RAVIM identified 50 persons with disabilities that were direct (those injured in the explosion) or indirect (those already disabled but unable to access services because of the explosion) survivors of the ASA explosion in Maputo in 2007.¹⁵⁷ Based on the needs of the beneficiary, HI and RAVIM facilitated access to physical education, provided support to start a new business, or provided school scholarships for survivors or their family members.¹⁵⁸

Support for Mine Action

Mozambique has reported a cost estimate of \$28 million (approximately €19 million) for completion of its Article 5 obligations—including the costs of survey, mine clearance, land release, coordination, and maintenance of IND—during the period from March 2009 to March 2013.¹⁵⁹ Costs under the plan are roughly \$5.4 million in 2009, \$6 million in 2010, \$6.9 million in 2011, \$6.7 million in 2012, and \$3.4 million in 2013.¹⁶⁰ Mozambique has committed to cover “more than a third” of costs with international donors contributing an estimated \$3.6 million per year.¹⁶¹ Landmine Monitor is not aware of any comprehensive long-term cost estimates for fulfilling VA obligations in Mozambique.

National support for mine action

In 2008, Mozambique contributed \$1,563,270 to mine action.¹⁶² It reported contributing \$1.3 million from national funds to mine action in 2007. In its revised Article 5 deadline extension request, Mozambique committed to providing \$1.8 million in national funds in 2009, \$2 million in 2010, \$2.5 million in 2011 and 2012, and \$1.7 million in 2013.¹⁶³

International cooperation and assistance

In 2008, eight countries reported providing a total of \$3,184,248 (€2,162,331) to mine action in Mozambique. Reported international mine action funding in 2008 was 9% less than reported in 2007, and falls short of the international funds required during the first four years of Mozambique’s Article 5 extension period (ranging from approximately \$3.6 million to \$4.4 million). This does not take into account the fact that some international funding in 2008 was directed to VA programs, without which the total international funding would be less than \$3.2 million. Mozambique reported \$2.7 million in international contributions in 2007, down from \$6.2 million in 2006 and \$15 million in 2005. This decline coincided with the departure of Norwegian People’s Aid and the focus on surveying rather than clearance in 2007.¹⁶⁴

NAMIBIA

Ten-Year Summary

The Republic of Namibia became a State Party to the Mine Ban Treaty on 1 March 1999. It has not enacted national implementation legislation. Angolan rebels and Angolan government forces used antipersonnel mines inside Namibia prior to the peace accords in 2002. Namibia submitted its initial Article 7 report nearly five years late in July 2004. It reported having destroyed its stockpile of antipersonnel mines in May 1998. It has not submitted an updated report since April 2006, when it reported retaining 3,899 mines for training purposes, down from an initial 9,999.

By the expiry of its Article 5 deadline on 1 March 2009 Namibia had still to clarify the extent of its residual mine problem. In its Article 7 report submitted in 2006, Namibia declared that demining had been completed in 2001 and ongoing surveys in 2005 had not identified new mined areas. The survey results have not been released. Namibia did not request an extension to its Article 5 deadline at the Ninth Meeting of States Parties in November 2008.

At least 618 mine/explosive remnants of war (ERW) casualties have been recorded since 1999; the last mine casualty occurred in 2005. No mine/ERW risk education has taken place in Namibia since 2006, with UNICEF noting in 2008 that it was not necessary. Disabled people's organizations and the government recognized that access to health and rehabilitation services was unequal and insufficient.

Mine Ban Policy

Namibia signed the Mine Ban Treaty on 3 December 1997 and ratified it on 21 September 1998, becoming a State Party on 1 March 1999. The Mine Ban Treaty is part of national law under the Namibian Constitution.¹ However, Namibia has not enacted national implementation legislation.²

As of 1 July 2009, Namibia had not submitted its annual updated Article 7 report, due 30 April 2009. It did not submit reports in 2007 or 2008.³

Namibia did not participate in the intersessional Standing Committee meetings in Geneva in May 2009 or the Ninth Meeting of States Parties in November 2008. It has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Namibia maintains that it has never produced or exported antipersonnel mines and that it obtained mines as "leftovers during the liberation struggle."⁴ There have been no serious allegations of use of antipersonnel mines by Namibian forces since the April 2002 peace agreement in Angola.⁵

¹ For details on Article 144 of Namibia's Constitution, see *Landmine Monitor Report 2001*, p. 121. It is not clear how penal sanctions would be applied to offending parties with regard to specific articles of the Mine Ban Treaty.

² In 2004 and 2005, Namibia reported that draft implementation legislation was "under consideration." In May 2006, a defense official told Landmine Monitor that it may not be necessary since the government believes that it has completed its obligations under the treaty. Article 7 Reports, Form A, 7 July 2004, 9 September 2005, and 20 April 2006. Interview with Maj. Filemon Kotokeni, Chief of Mine Action, Namibian Defence Force, Ministry of Defence, in Geneva, 9 May 2006.

³ It has submitted three reports previously: 7 July 2004, 9 September 2005, and 20 April 2006. Namibia submitted its initial report almost five years after the due date.

⁴ Statement of Namibia, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 21–22 June 2004. The US Department of Defense claimed that Namibia produced PMD-6 antipersonnel mines in the past. See *Landmine Monitor Report 1999*, p. 65.

⁵ In 2000 and 2001, Landmine Monitor reported on antipersonnel mine use in Namibia by UNITA rebel forces and Angolan government forces, and on unsubstantiated allegations of use by Namibian troops. See *Landmine Monitor Report 2000*, pp. 81–84; and *Landmine Monitor Report 2001*, pp. 123–125.

In 2004, Namibia reported that by May 1998 it had destroyed 21,857 stockpiled antipersonnel mines and was retaining 9,999 mines.⁶ By the end of 2005, it had reduced the number of retained mines to 3,899.⁷ Namibia has not provided any update since that time and has never reported in detail on the intended purposes and actual uses of its retained mines, as agreed by States Parties.

Namibia is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions in December 2008 but had not yet ratified it as of 1 July 2009.⁸

Scope of the Problem

Contamination

Namibia is affected by ERW, particularly UXO, but the extent of its residual mine problem remains unclear. According to its Article 7 reports, Namibia has no known mined areas containing antipersonnel mines. In November 2007, the United States Department of State declared Namibia had achieved “impact free” status.⁹

There are, however, indications that landmines may still pose a problem for Namibia. Media reports in 2008 stated bilateral development projects with Angola required mine clearance to ensure all landmines and explosive devices in the area were found. On 25 June 2008, when Namibia announced an agreement with the Kunene Consortium to build a power station on the Kunene river basin bordering Angola, Namibia’s Deputy Minister of Mines and Energy, Bernard Esau, said that Angola and Namibia would have to ensure all landmines and explosive devices still in the area were cleared first.¹⁰

Since November 2007, Canada has warned its citizens they should be aware of the presence of landmines in the border area from Katwitwi (a village on the Okavango river in western Kavango region) to Kongola town (Caprivi region).¹¹ In a May 2009 travel advisory, Australia warned travelers in Caprivi and Kavango regions to stay on well-travelled routes because: “Unexploded landmines and munitions remain in these regions.”¹² Although the US does not mention landmines in its travel advisory for Namibia, the US Embassy in Windhoek website lists “Remove landmines leftover from the struggle for independence” under special US government programs in the country.¹³

The origins of the landmine problem in Namibia lie with the 23-year struggle for independence between the South West African People’s Organization (SWAPO) and South Africa that ended in 1990 and the decision by the government of Namibia in 1999 to allow the government of Angola to use Namibian territory as a base to attack the National Union for the Total Independence of Angola (União Nacional para a Independência Total de Angola, UNITA) forces in southeastern Angola during its internal conflict.¹⁴

An assessment mission by the UN Mine Action Service (UNMAS) in 1999 concluded the landmine situation in Namibia was neither a humanitarian emergency nor a major obstacle for development.¹⁵ Prior to 1999, support from the US resulted in 135 deminers and 20 explosive ordnance disposal specialists in the Namibian Defence Forces being trained, but the clearance

⁶ Article 7 Report, Forms D and G, 7 July 2004. Prior to this Namibia had made no official declarations about its stockpile, even though its treaty deadline for stockpile destruction was 1 March 2003.

⁷ Article 7 Report, Form D, 20 April 2006. In June 2005, Namibia stated that it had destroyed 3,848 of the retained mines during training activities, leaving 6,151 mines. Statement of Namibia, Standing Committee on the General Status and Operation of the Convention, Geneva, 17 June 2005. Notes by Landmine Monitor.

¹⁵ UNMAS, “Joint Assessment Mission Report: Namibia,” 13 March 2000, p. 4.

operations after the training were eventually suspended due to the high incident rates in “cleared” areas.¹⁶ The US government stated that the US commercial demining firm RONCO had cleared 10 minefields by January 2001 comprising 1km² of land and 410 electrical pylons, destroying 5,000 mines and 1,300 items of UXO in the process.¹⁷

South African Defence Force (SADF) and Namibian security force bases, as well as villages, were mined in the densely populated Caprivi, Kavango, Kunene, Ohangwena, Omusati, Oshana, and Oshikoto regions of northern Namibia. Some demining by the SADF, the UN Transition Group forces, and a Namibian demining company occurred during the transition period leading up to Namibian independence from South Africa in 1990.¹⁸

In 2002, Namibia requested international assistance for mine action.¹⁹ Although the mined areas were reportedly cleared by 2001²⁰ and declarations were made that Namibia was “mine safe,”²¹ other media reports and statements by the government of Namibia at international meetings seemed to indicate Namibia still had a landmine problem.²² Despite a claim by the US Department of State in 2002 that Namibia’s only mined area was in Kavango region, an area near the border with Angola, local residents in the northern areas of Onamunama and Utomba continued to report the presence of landmines.²³ Farmers also reported that they could not plant crops in Caprivi region because of landmines.²⁴

Most UXO has been found around former shooting ranges and consisted of grenades either from the SADF or from three South African ammunition storage areas in the north that exploded.²⁵ Namibian police reported clearing many more items of UXO (8,415 items) than mines in 2006 (10 antipersonnel mines and five antivehicle mines). In 2006–2007, Namibian police reported finding more than 11,000 UXO while finding 17 landmines during the same period.²⁶

Casualties

Landmine Monitor did not identify new mine/ERW casualties from 2008 to March 2009. However, since Namibian police did not provide casualty data for 2008, under-reporting is likely. In 2007, 12 ERW casualties were reported.²⁷ The last known mine casualty was in March 2005 involving one man who lost his leg.²⁸

Since 1999, the number of new mine/ERW casualties per year in Namibia has declined rapidly. In 2000, official statistics reported 14 people killed and 126 injured by mines/ERW. By 2002, this number had decreased to two people killed and 17 injured.²⁹ Between 1999 and December 2008, at least 145 civilians have been killed and 473 injured by mines/ERW.³⁰

Program Management and Coordination

Mine action

There is no national mine action authority or mine action center in Namibia. The Namibian Defence Force maintains ownership through the landmine focal point who reports to the Permanent Secretary of the Ministry of Defence. The Namibian Defence Force is nominally responsible for mine clearance, and the Police Explosives Unit is responsible for clearing ERW (although it also reports on mine clearance).³¹

Victim assistance

Namibia has no specialized mine/ERW victim assistance program or coordinating agency. On 10 July 2008, the National Disability Council was launched to coordinate and monitor implementation of disability policy in cooperation with disabled people's organizations (DPOs), service providers, and government agencies.³²

There is no nationwide casualty data collection mechanism in Namibia. The police and media are the main sources of information. In November 2008, the National Federation of People with Disabilities in Namibia (NFPDN) began a living conditions survey to include information on gender, income, education, and access to health services in its database on persons with disabilities. The survey is due for completion at the end of 2009.³³

Demining and Battle Area Clearance

There are no reports of any demining or battle area clearance in 2008 or 2009 through July.

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Namibia was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. In March 2006, Namibia stated that it was "mine-safe," but that it was not ready to declare itself mine-free until the completion of ongoing surveys.³⁴ Since then, no further information has been reported. Namibia did not intervene during the Standing Committee meetings in April 2007 to provide an update on its mine-affected status or on progress in achieving its mine action "strategic objectives" for 2005–2009.³⁵

Namibia did not apply for an extension of its Article 5 deadline, and as of 1 March 2009, Namibia had not declared whether it was in compliance with the provisions of the article.

Risk Education

There were no risk education (RE) activities in 2008. In 2008, UNICEF said it did not conduct mine/ERW RE in Namibia because mines were not a major problem. The Police Explosives Unit requested assistance for RE but has not received support since 2004.³⁶ The unit carried out an RE campaign from 1990 to 2004. From 2003 to 2006, the Namibian Red Cross, with support from the ICRC, provided RE to Angolan refugees in Namibia.³⁷

³⁵ See *Landmine Monitor Report 2007*, p. 545.

³⁶ See *Landmine Monitor Report 2008*, p. 542.

³⁷ See *Landmine Monitor Report 2006*, p. 563.

Victim Assistance

The total number of survivors is estimated to be at least 473. On 10 June 2008, the NFPDN stated, “We, the majority of people with disabilities in Namibia, have lost hope in the top government especially those whom we thought could make a difference for the people with disabilities in Namibia.”³⁸ However, the US Department of State noted that disability issues received “greater public attention than in previous years” and that the Prime Minister recruited a disability advisor.³⁹

There are no specialized services for mine/ERW survivors in Namibia, but persons with disabilities are referred to services, including psychological support and pensions, through the government or NGOs.⁴⁰ However, DPOs and the government acknowledged that access to health and rehabilitation services was unequal and insufficient, especially outside the capital.⁴¹

In 2002, the ICRC assisted the Ministry of Health to set up a physical rehabilitation workshop in Rundu, near the border with Angola. In 2007, the ICRC Special Fund for the Disabled (SFD) reduced its support partly because the workshop was somewhat under-used.⁴² In 2008, the SFD ended its support as the government increased its responsibility in accordance with a 2005 agreement between the government and the SFD.⁴³

In Oshana region, an economic reintegration project for persons with disabilities was shut down in 2008 because of a lack of skilled staff to run it.⁴⁴ The law prohibiting discrimination against persons with disabilities was not enforced effectively, and discrimination persisted.⁴⁵ The NFPDN reported cases of physical abuse and neglect of persons with disabilities within families and by institutions.⁴⁶ Namibia ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol on 4 December 2007.

NICARAGUA

2008 Key Data

State Party since	1 May 1999
Contamination	Antipersonnel mines, UXO
Estimated area of contamination	Total area not quantified, but 10 mined areas remained as of May 2009
Casualties in 2008	Three (2007: 15)
Estimated mine/ERW survivors	1,145
Article 5 (clearance of mined areas)	Deadline: 1 May 2010 Original deadline: 1 May 2009
Demining in 2008	29 mined areas were cleared, but the size of the areas was not reported
Risk education recipients in 2008	34,541
Progress towards victim assistance aims	Slow, but some improvements
Support for mine action in 2008	International: \$3.3 million (2007: \$4.5 million) National: \$1 million (2007: \$1 million)

Ten-Year Summary

The Republic of Nicaragua became a State Party to the Mine Ban Treaty on 1 May 1999 and national implementation legislation was signed into law on 7 December 1999. Nicaragua destroyed its stockpile of 133,435 antipersonnel mines between April 1999 and August 2002. Nicaragua hosted and was President of the Third Meeting of States Parties to the Mine Ban Treaty in September 2001. Nicaragua has twice served as co-chair of the Standing Committee on Victim Assistance (2000–2001, and 2004–2005).

Nicaragua is contaminated by mines and explosive remnants of war (ERW) as a result of armed conflict between 1979 and 1990. More than 1,000 mined areas have been recorded or identified. Mines were mostly located in the border areas in the north and south of the country, the majority along the Honduran border, and by 2009 the remaining mined areas were only on the border with Honduras. Nicaragua requested, and was granted, a one-year extension to its Article 5 deadline of 1 May 2009.

Between 1999 and 2008, Landmine Monitor identified 117 mine/ERW casualties in Nicaragua: 27 killed and 90 injured. Nicaragua has reported 1,236 casualties since 1980. It has consistently carried out mine/ERW risk education since 1999, which has been evaluated and assessed regularly. Starting in 2006, the coverage of risk education activities and the number of beneficiaries began to decrease to just two departments of the country, corresponding to the reduction in contamination.

As of March 2009, 1,107 of Nicaragua's 1,145 registered survivors had received regular rehabilitation services and 450 had also received socio-economic reintegration services with support from the Organization of American States. Efforts to improve national capacity were limited throughout much of the 10-year period, though some improvements in quality and access to emergency and continuing medical care and physical rehabilitation services were noted in 2008.

Mine Ban Policy

Nicaragua signed the Mine Ban Treaty on 4 December 1997 and ratified it on 30 November 1998, becoming a State Party on 1 May 1999. Legislation to enforce the antipersonnel mine prohibition domestically, Law 321, was enacted on 7 December 1999 and includes penal sanctions.¹

Nicaragua participated in the Ninth Meeting of States Parties in Geneva in November 2008, where it made a statement regarding its Article 5 extension request and announced its intent to host a regional meeting to prepare for the Second Review Conference. Government representatives from 18 countries across the region attended the Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas from 24–26 February 2009, in addition to campaigners and mine survivors from 12 countries.²

On 13 April 2009, Nicaragua submitted its tenth Article 7 report, covering the period to 31 December 2008.³

Nicaragua attended the intersessional Standing Committee meetings in Geneva in May 2009, where it reported on mine clearance and risk education efforts.

Nicaragua has not expressed clear views with respect to key issues of interpretation of Articles 1, 2, and 3 of the treaty, including what acts are prohibited by the ban on “assistance,” whether antivehicle mines with sensitive fuzes are banned, and the acceptable number of mines retained for training.⁴

Nicaragua is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Nicaragua has never submitted an annual report as required by the protocol’s Article 13. Nicaragua is also party to CCW Protocol V on Explosive Remnants of War. Nicaragua signed the Convention on Cluster Munitions in December 2008, but had not yet ratified it as of 1 July 2009.⁵

Production, transfer, stockpile destruction, and retention

Nicaragua has stated that it has never produced antipersonnel mines.⁶ It is not known to have ever exported mines. Nicaragua destroyed its stockpile of 133,435 antipersonnel mines between 12 April 1999 and 28 August 2002.

According to its most recent Article 7 report, the Nicaraguan army retained a total of 1,004 antipersonnel mines for training as of April 2009, the same number as reported in 2008 and 2007.⁷ In previous years, Nicaragua reported consuming some of its retained mines.⁸ The report stated that the army transferred 26 PMN mines to the Engineer Corps for detector calibration and 46 mines to the mine detection dog training unit.⁹

¹ Law for the Prohibition of Production, Purchase, Sale, Import, Export, Transit, Use and Possession of Antipersonnel Landmines, Law No. 321, published in the Official Gazette on 12 January 2000.

² ICBL, “A Week of Advocacy Activities in Managua, Nicaragua,” www.icbl.org.

³ The previous reporting period was from 28 February 2007 to 28 February 2008. Nicaragua submitted reports on 28 February 2008, 28 February 2007, 28 February 2006, 19 May 2005, 28 April 2004, 31 March 2003, 22 May 2002, 7 May 2001, and 30 September 1999.

⁴ See *Landmine Monitor Report 2006*, p. 565. Nicaragua has said it “supports all elements of Article 1” and the prohibition on assisting banned acts, but it has not elaborated on what acts it considers permissible and prohibited. Nicaragua reiterated in May 2006 that it has not taken a position on whether antivehicle mines with sensitive fuzes or sensitive antihandling devices are banned under Article 2 of the treaty.

⁵ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 132–133.

⁶ This is stated in all of Nicaragua’s Article 7 reports.

⁷ The 1,004 mines retained are: 300 PMN-2, 274 PMN, 240 POMZ-2M, 90 PPMI-SR11, 50 POMZ-2, 25 OZM-4, and 25 PMFH. Article 7 Report, Form D, 13 April 2009; Article 7 Report, Form D, 28 February 2008; and Article 7 Report, Form D, 28 February 2007.

⁸ It consumed 19 and 17 retained mines in 2005 and 2006, respectively. Article 7 Report, Form D, 28 February 2007; and Article 7 Report, Form D, 8 February 2006.

⁹ Article 7 Report, Form D, 13 April 2009. The 46 mines included 20 PMN, 15 PPMISR-11, and 11 POM-Z. The same numbers and types of mines were transferred to the same entities in Article 7 reports submitted in 2008 and 2007. See Article 7 Report, Form D, 28 February 2008; and Article 7 Report, Form D, 28 February 2007.

In March 2009, Nicaragua informed Landmine Monitor that following the completion of its demining program it would present a plan for reducing the number of mines retained for training.¹⁰

Nicaragua has previously reported that it possesses 121 MON-series (Claymore-type) directional fragmentation mines.¹¹

Scope of the Problem

Contamination

Nicaragua is contaminated by mines and ERW as a result of armed conflict between 1979 and 1990. Most of the mines used were antipersonnel, but antivehicle mines were also laid along the northern border with Honduras. Mined areas have been reported in 105 communities,¹² in 74 municipalities, in 14 of the 15 departments, and in the two autonomous regions. In addition, almost 1.9 million ERW have been destroyed in the course of demining operations.¹³

Based on records from the Nicaraguan Army, which Nicaragua considered to be 80% complete,¹⁴ the total number of antipersonnel and antivehicle mines emplaced was initially said to be 135,643 in 991 minefields.¹⁵ This estimate had risen to more than 179,195 mines (32% more than the original estimate) in 1,019 mined areas, covering 11km², by May 2009 as a result of clearance operations and reports from communities of new suspected hazardous areas (SHAs).¹⁶

In May 2009, it was reported that at least 5,471 mines remained in 10 mined areas¹⁷ across four municipalities: three in the department of Nueva Segovia (Mozonte, San Fernando, and Wiwili) and one in the department of Jinotega (Wiwili de Jinotega), all of which are on the border with Honduras.¹⁸

Casualties

In 2008, there were three new mine/ERW casualties (all three injured) in two incidents and one demining accident. The casualties were registered by the Organization of American States (OAS) Assistance Program for Demining in Central America (Programa de Apoyo al Desminado en Centroamérica, PADCA) and confirmed by the Nicaraguan Demining Commission (Comisión Nacional de Desminado, CND). All three were men injured by antipersonnel mines.¹⁹ Two civilian incidents occurred in Jalapa municipality in the department of Nueva Segovia. The first, on 18 September, occurred while a farmer, who had received RE, was transporting the mine to

¹⁰ Interview with Dr. Juan Umaña, Technical Secretary, CND, San Fernando, 4 March 2009.

¹¹ Nicaragua has stated these mines are “not included in the restrictions established by the Ottawa Convention.” Article 7 Report, Form D, 19 May 2005. This total of 121 appears to include 100 MON-50 mines, 11 MON-100 mines, and 10 MON-200 mines, based on previous Article 7 reports. ICBL has urged States Parties to report on the steps they have taken to ensure that Claymore mines can be used in command-detonated mode only (and not with tripwires), so that the mines conform to the treaty.

a “safe place” before reporting it.²⁰ The other, on 14 October, occurred when a farmer lost his foot to a mine 21m from a minefield cleared in 2006; following this, clearance within 100m² of the incident was conducted and no mines were found.²¹ The third injury came in a demining accident on 9 December 2008 in the “Las Nubes” minefield in San Fernando, Nueva Segovia. The mine was one meter outside a suspected mined area and exploded when the squadron chief entered the area to carry out an inspection.²²

The three casualties in 2008 were a significant decrease from 2007 (one killed and 14 injured in six incidents) and the lowest number of casualties identified by Landmine Monitor since 1999. This may be the result of an intensified risk education campaign to respond to ERW casualties in 2008, military clearance, and police efforts to halt transportation of explosives.²³

So far in 2009, a man was injured in Tipitapa, Managua department, when he struck an ERW while digging a latrine for his home.²⁴

As of 13 May 2009, the OAS PADCA database had information on 1,236 casualties in Nicaragua since 1980 (91 deaths and 1,145 injuries), including 43 demining accidents.²⁵ Of these, 117 casualties occurred between 1999 and 2008 (27 killed and 90 injured).²⁶ Ninety percent of Nicaraguan mine/ERW survivors are men between 20 and 40 years old at the time of their injury, the majority being farmers injured while working on the land.²⁷

Socio-economic impact

No more than 15,000 people were believed to be living near the remaining mined areas.²⁸ This represents a 95% reduction in the number of people potentially impacted since the start of the mine action program in 1991.²⁹ All the remaining mined areas are, however, in impoverished areas.³⁰ The demand for land is so great that at times farmers are said to begin to use the newly demined areas before they are officially handed over to the local government.³¹

Program Management and Coordination

Mine action

The CND, created in 1998, is responsible for formulating national mine action policy, assisting and coordinating implementation of the National Humanitarian Demining Program (Programa Nacional de Desminado Humanitario, PNDH), managing international funds, and conducting risk education.³²

Risk education

Mine/ERW risk education (RE) is nominally coordinated by the CND and its Sub-Commission on Education and Prevention, which includes representatives from government ministries, NGOs, the Nicaraguan Red Cross, UNICEF, and OAS PADCA. However, the sub-commission did not meet in 2007 or 2008.³³

Victim assistance

Victim assistance (VA) is nominally coordinated by the CND and its Sub-Commission for Medical Assistance and Rehabilitation of Mine Survivors. However, the sub-commission did not meet in 2008.³⁴ On 5 February 2009, the Director General of Health Services within the Ministry of Health was named the VA focal point, a position that had been vacant since the closure of the ministry's Rehabilitation Office in 2007.³⁵ The National Rehabilitation Council (Consejo Nacional de Rehabilitación, CONARE) coordinates the national plan for physical rehabilitation.³⁶ OAS PADCA's VA program coordinates and provides financial support for the provision of physical rehabilitation and economic reintegration services to mine survivors.³⁷

In 2008, the Nicaraguan Commission for Verification, Reconciliation, Peace, and Justice established a plan to respond to the needs of victims of war, including those disabled during the war as a result of landmines and other causes, based on the commitments of Nicaragua's peace process.³⁸

Data collection and management

The identification of the location of mined areas is based on records from the Nicaraguan Army, new mined areas discovered during clearance operations, RE sessions, and reports from local officials and communities. The OAS manages the mine action database including the victim database, using the Information Management System for Mine Action (IMSMA) software, at its offices in Managua.³⁹

Casualty data is collected by the Nicaraguan Army and OAS PADCA risk educators, using a joint form that asks for details of the incident, personal details, and assistance received.⁴⁰ Data is stored in IMSMA and managed by OAS PADCA. While this database has been described as "very complete,"⁴¹ an official within the demining program estimated that the number of survivors could be significantly higher.⁴²

When the OAS first began collecting casualty data, it required hospital records for confirmation. Many survivors did not have this record so they were not counted. In addition, civilians who were involved in mine incidents during the war are counted as "victims of war" rather than mine survivors.⁴³ However, in 2008, OAS PADCA reported that the victim assistance database

was much more complete than in the past, as a result of ongoing data collection efforts through RE campaigns.⁴⁴ In 2008, the Ministry of Health began collecting information about the cause of amputations from children receiving medical and physical rehabilitation services.⁴⁵ In 2009, OAS PADCA and the Nicaraguan government started discussing plans to transfer responsibility for the database to the government, anticipating the future closure of the OAS PADCA office.⁴⁶

Plans

Strategic mine action plan

Due to the “high number” of unrecorded mines discovered during clearance, in every year since 2004, operations have been delayed and the projected completion of the mine action program put back. In March 2008, Nicaragua declared that it would not be able to meet its Article 5 deadline of 1 May 2009 and requested a one-year extension of its deadline.⁴⁷ Clearance priorities for 2008 and 2009 included all known mined areas.⁴⁸ An unspecified part of the US\$5 million sought for demining operations in 2009 was needed to replace boots, metal detectors, and communications equipment.⁴⁹

Integration of mine action with reconstruction and development

A study conducted on behalf of the OAS by the National Institute of Statistics and Census (Instituto Nacional de Estadísticas y Censos, INEC) from August 2006 through April 2007 found a direct relationship between mine clearance in previously affected areas and subsequent improvements in various development indicators, such as health, access to education, and access to water and electricity.⁵⁰ Some of the improvements in development indicators may be due to improved access to formerly affected communities as a result of the repair or construction of roads for mine clearance operations.⁵¹ By the end of 2008, 138.5km of roadwork had been completed to facilitate mine action.⁵² The roads were built by the National Institute for Rural Development and the Nicaraguan Army Corps of Engineers and will be maintained by the local government and farmers.⁵³ One example of successfully using demined land is a farmer and his family who returned to reclaim land that was suitable for planting coffee. In 2008, they won the honor of “best cup” in an annual coffee contest, and his crop subsequently fetched more than \$41,000 on the international market.⁵⁴

National ownership

Commitment to mine action and victim assistance

Nicaragua has been clearing mines on its territory since the end of the decade-long conflict in the 1980s. Since joining the Mine Ban Treaty in 1999, it has established a national mine action coordination body, engaged the army in demining, and provided considerable funding for mine action, while actively seeking international assistance.

National management

CND employees are paid by the Ministry of Defense, but the CND has no operational budget and works with resources from donor countries channeled through the OAS or bilaterally. Since 1993 (except in 1995–1996) the OAS, through its Program for Integrated Action against

Antipersonnel Mines (Acción Integral Contra las Minas Antipersonal, AICMA), has provided support to mine action activities in Nicaragua through PADCA, with technical support from the Inter-American Defense Board.⁵⁵

The Mine Clearance Assistance Mission in Central America (Misión de Asistencia para la Remoción de Minas en Centro América, MARMINCA), which is part of the Inter-American Defense Board based in Washington, DC, monitors demining operations to ensure that they meet humanitarian demining standards. It is planned that MARMINCA will retain up to three people in-country during the six months after Nicaragua clears its last known mined area in case any new suspected mined areas are identified.⁵⁶

National mine action legislation and standards/Standing operating procedures

National mine action legislation was enacted with Presidential decree 84–98 published on 5 December 1998, which created the civilian CND as the interagency coordination body responsible for the implementation of the Mine Ban Treaty and the development of the National Humanitarian Demining Program. It authorized the CND to conduct surveys, establish and manage a database, assess the socio-economic impact, support the special demining unit of the Nicaraguan Army in its work, raise funds, receive reports from the Ministry of Defense on demining activities, and negotiate with the proper officials to ensure mine survivors are included in social and rehabilitation programs.⁵⁷

Nicaragua reports that it respects the International Mine Action Standards and national standing operating procedures.⁵⁸

Demining and Battle Area Clearance

Clearance operations in Nicaragua are the responsibility of the Nicaraguan Army Engineer Corps. From 1999–2008, more than 600 Nicaraguans worked in the national mine action program (both civilians and army personnel), but in early 2009, the total number was reduced to 450 as a result of a decline in funding.⁵⁹ Clearance operations are organized on five “fronts” consisting of between 70 and 100 personnel each. A group of 29 deminers referred to as the Marking Platoon (Pelotón de Señalización), which responded to new reports of mines and UXO and marked mined areas, was disbanded in December 2008 due to a lack of funding.⁶⁰

In 2008, all mine clearance in Nicaragua was done manually. The conditions and remoteness of minefields along the Honduran border do not make mechanical clearance feasible, according to MARMINCA.⁶¹ In 2008, Nicaragua cleared 29 mined areas in Boca de Paiwas, Jalapa, La Dalia, and Murra municipalities, destroying 7,123 antipersonnel mines.⁶²

⁶¹ Interviews with Normando Bona do Nascimento and other staff, MARMINCA, Managua, 11 March 2008; and with Dr. Juan Umaña, CND, Managua, 13 March 2008.

⁶² Presentation by Nicaragua, Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas, 25 February 2009. Nicaragua accounts for mines in three ways: 1) mines that have been found by deminers and are exploded where they are found; 2) evidence of the presence of a mine that had exploded during clearance activities; and 3) mines that are listed in the registry but that are no longer there based on the pattern of other mines found around it. The sum of these three figures is the total number of mines cleared reported by Nicaragua in its Article 7 transparency report and other reports. Interview with Lt.-Col. Jorge Castro, Nicaraguan Army Engineer Corps, San Fernando, 4 March 2009.

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Nicaragua was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 May 2009. Between 1990 and 28 February 2008, Nicaragua's mine clearance program released 53.03km² of SHAs and destroyed 158,661 mines in 958 minefields.⁶³ Each year since 2004, Nicaragua has declared it needed one more year to meet its treaty obligations. Each year, however, completion was pushed back for another year, and in March 2008, Nicaragua declared that it would not meet its 1 May 2009 deadline and applied for a one-year extension. The extension request cited the discovery of new minefields and the decline in international funding as justifications for the need for an extension.

States Parties granted Nicaragua the extension on 28 November 2008. As of late May 2009, Nicaragua reported that 10 mined areas remained to be cleared.⁶⁴

Risk Education

In 2008, mine/ERW RE activities continued to decrease in line with the reduced area of contamination in the country. Mine/ERW casualties decreased compared to 2007 and the number of public reports of mines or ERW received by RE personnel continued to be high (130), providing two indicators of an effective program.⁶⁵

As in past years, the number of RE beneficiaries continued to decline, with 34,541 people receiving RE in 2008 compared to 42,327 in 2007.⁶⁶ The RE program in 2008 focused on ERW risk prevention, given the increase in ERW incidents in 2007.⁶⁷

In 2008, all RE activities were carried out by OAS PADCA in cooperation with the Ministry of Education and local authorities. Geographic targets for RE activities were reassessed every three months based on remaining known mined areas, public reports of mines or ERW that had been found, and mine/ERW casualties.⁶⁸ In the departments of Boaco, Jinotega, León, Matagalpa, and Nueva Segovia, a total of 28,658 adults and children received RE messages. Four methodologies were used: community presentations (2,466 beneficiaries), door-to-door or peer-to-peer messages (18,930), classroom presentations (2,789), and community festivals (4,473).⁶⁹ In order to include adult men, sessions were held when men would be home and arrangements were made with farm owners to provide sessions to their employees.⁷⁰

A further 5,883 people in León and Matagalpa received ERW RE alongside the destruction of obsolete munitions.⁷¹ RE messages for scrap metal collectors were also aired on television warning scrap metal collectors.⁷²

⁷² Interview with Lt.-Col. Jorge Castro, Nicaraguan Army Engineer Corps, Managua, 19 March 2009.

In 1999, RE activities had been underway for three years, but it was assessed that more community-based organizations needed to be involved. In 2002, the CND became responsible for the implementation of the national RE plan, and worked to harmonize the activities of the operators by providing supervision and developing a National Guide for the Development of Educational Materials. In June 2004, UNICEF reported that RE activities had become more organized and effective in terms of coverage, coordination, and the methodologies used. An OAS/CND evaluation of RE materials in 2005 resulted in an increased focus on ERW and more information about the physical and economic impact of mines/ERW. Starting in 2006, the coverage of RE activities and number of beneficiaries began to decrease, corresponding to the reduction of mine contamination to just two departments of the country.

Victim Assistance

The estimated number of survivors is 1,145. As of March 2009, a total of 1,107 survivors had received regular rehabilitation services and of these, 450 had also received socio-economic reintegration services with support from the OAS.⁷³ Some advances were noted in data collection, government coordination and planning, the provision of emergency medical care, and physical rehabilitation services. However, despite the large number of survivors receiving individual attention, NGO representatives still expressed concern over the national sustainability of physical rehabilitation and socio-economic reintegration programs, the centralization of these services, and the lack of trained staff.⁷⁴

In 2008, the Nicaraguan government committed to address the needs of war victims, including mine survivors, in recognition of their sacrifice during Nicaragua's revolution and civil war.⁷⁵ However, as of March 2009, this commitment had not yet resulted in tangible action.⁷⁶

Nicaragua's urban hospitals have sufficient surgical capacity for emergency care and specialized services. Some regional hospitals close to demining operations, such as the Ocotal Hospital in Nueva Segovia, have sufficient capacity to provide care to deminers as well as civilian casualties.⁷⁷ However, hospitals in more remote regions of the country, such as the mine-affected department of Jinotega, lack such capacity, requiring expensive evacuations to Managua, beyond the reach of most civilian casualties.⁷⁸ In 2008, the Ocotal Hospital provided emergency care to all three new survivors before referring cases to Managua. The military provided free evacuation services to one of the civilian casualties in 2008.⁷⁹

In 2008, the government restructured the management of physical rehabilitation and increased national funding,⁸⁰ though services remained limited to three workshops (one public and two private). Two of these were based in the capital and all were distant for most survivors.⁸¹ One physical therapy center reopened in 2008 in Ocotal, in a region with a large number of mine survivors.⁸² Increased government funding for the National Center for the Production of Technical Assistance and Orthoprosthetic Devices (Centro Nacional de Producción de Ayudas

Técnicas y Elementos Ortoprotésicos, CENAPORTO) resulted in a 25% increase in production of orthopedic devices.⁸³

In June 2008, Nicaragua began developing a national plan for physical rehabilitation. Initially convened by the ICRC-Special Fund for the Disabled, CONARE assumed responsibility for the planning process and convened additional planning meetings in October 2008, and January and June 2009.⁸⁴ As of March 2009, the plan was not finalized, delaying the implementation of a revised rehabilitation program within the Ministry of Health.⁸⁵

Psychosocial support is available to survivors who are accessing other services, through the three physical rehabilitation workshops and the National Technological Institute (Instituto Nacional Tecnológico, INATEC).⁸⁶ Economic reintegration and educational opportunities remain inadequate to meet the demand, but INATEC's capacity to provide vocational training to persons with disabilities improved in 2008.⁸⁷ As of March 2009, 450 mine survivors had received socio-economic reintegration assistance through the OAS; 50 individuals remained on a waiting list.⁸⁸ But a "large majority" of mine survivors remain unemployed.⁸⁹ Only some survivors receive a disability pension ranging from \$7 to \$26.60 per month, depending on the severity of their disability.⁹⁰

Nicaragua has various laws protecting the rights of persons with disabilities.⁹¹ However, these laws are not effectively enforced and discrimination is "widespread."⁹² Nicaragua ratified the UN Convention on the Rights of Persons with Disabilities on 7 December 2007, and signed its Optional Protocol on 21 October 2008. As of 25 March 2009, Nicaragua was in the process of reviewing and updating its national legislation to comply with the convention.⁹³ Nicaragua has also ratified the Plan of Action for the Decade of the Americas for the Rights of Persons with Disabilities (2006–2016).⁹⁴

Progress in meeting VA26 victim assistance objectives

As one of the 26 States Parties with significant numbers of mine survivors, and "the greatest responsibility to act, but also the greatest needs and expectations for assistance" in providing adequate attention to survivors, Nicaragua presented its 2005–2009 objectives to implement the Nairobi Action Plan at the Sixth Meeting of States Parties in 2005. However, neither revisions to the objectives nor plans to achieve them had been presented formally as of March 2009. Nicaragua's victim assistance focal point reported that Nicaragua did not compare progress in victim assistance with its Nairobi Action Plan objectives but said "they could."⁹⁵

Nicaragua provided updates on its victim assistance activities at the Seventh and Eighth Meetings of States Parties and at intersessional Standing Committee meetings in 2005, 2006, and 2007. Nicaragua included a victim assistance/disability expert on its delegation to the intersessional Standing Committee meetings in 2007 and the Sixth and Eighth Meetings of States Parties. In 2005, 2006, and 2007 Nicaragua did not use voluntary form J in its Article 7 report to provide information on victim assistance.⁹⁶ In 2008 and 2009, it did use Form I to provide information on casualty data collection (the same information both years).⁹⁷ In February 2009, Nicaragua hosted a regional preparatory meeting for the Second Review Conference of the Mine Ban Treaty, where it provided an update on its victim assistance activities.⁹⁸

Victim assistance activities

In 2008, the Foundation for Rehabilitation “Walking Unidos” (Fundación para la rehabilitación “Walking Unidos”), through its two rehabilitation centers—Walking Unidos in León and Different Abilities (Capacidades Diferentes, CAPADIFE) in Managua—and CENAPRORTO in Managua assisted more than 1,000 persons with disabilities, including fitting 513 prostheses, 432 orthoses, and the delivery of 36 wheelchairs and 87 pairs of crutches. Approximately 25% of those assisted were mine survivors.⁹⁹

The OAS supported physical rehabilitation services at CENAPRORTO and CAPADIFE for 394 survivors in 2008, with either new mobility devices or, more typically, maintenance of existing devices.¹⁰⁰ It also supported comprehensive socio-economic reintegration for 88 survivors, including counseling, vocational training and, when appropriate, small business seed support at INATEC.¹⁰¹

Support for Mine Action

Nicaragua has reported a cost estimate of \$8.3 million for fulfillment of its Article 5 obligations during the period 2008–2010, with annual costs estimated at \$1.8 million in 2008, \$6 million in 2009, and \$500,000 in 2010.¹⁰² National funds were projected to account for \$1.7 million or roughly 20% of total required funds, with the remaining \$6.6 million provided by international donors.¹⁰³

As of March 2008, Nicaragua reported a deficit of \$1.2 million in funding towards meeting its 2008 mine clearance obligations.¹⁰⁴ In April 2009, it reported that during the second half of 2008 its programs were fully funded, but funds were lacking for all of 2009, with the exception of its mechanized minesweeper detachment, and for the first quarter of 2010.¹⁰⁵ For 2009, \$5 million was outstanding; for 2010, \$400,000 was needed. Lack of funding was listed first among problems in carrying out mine clearance operations.¹⁰⁶

In August 2009, Russia announced approximately \$6 million in bilateral funding to the government of Nicaragua to cover mine clearance operations until May 2010. Of the total contribution approximately \$3 million is reportedly a combination of in-kind contributions of

equipment and monetary contributions to purchase equipment, including mine detectors and road-building machinery to improve accessibility to mine-affected areas; roughly \$3 million will cover the costs of clearing the remaining mined areas. Nicaragua planned to set aside a small portion of the contribution to fund a rapid response clearance team until the end of 2010.¹⁰⁷ In December 2008 the rapid response teams had ceased operations due to a funding shortage.¹⁰⁸

National support for mine action

Nicaragua has reported contributing about \$1 million annually to its mine action program since 1999. In total, Nicaragua has contributed approximately one-sixth of the funds needed for demining.¹⁰⁹ Nicaragua did not report any contributions to its mine action program in 2008. Nicaragua reported covering CND staffing costs, while international donors covered operational costs.¹¹⁰

International cooperation and assistance

In 2008, three countries reported providing \$1,524,756 (€1,035,418) to mine action in Nicaragua. Reported mine action funding in 2008 was approximately 66% less than in 2007. As noted by Nicaragua in April 2009, funding in 2008 was insufficient to meet mine action needs.

2008 International Mine Action Funding to Nicaragua: Monetary¹¹¹

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Japan	Government of Nicaragua	Mine clearance	\$1,005,790 (¥103,689,704)
Canada	OAS	Mine clearance	\$876,658 (C\$900,842)
Italy	OAS	RE, mine clearance, VA	\$381,770 (€258,282)
Norway	OAS	RE, mine clearance	\$316,550 (NOK1,612,880)
Spain	OAS	RE, mine clearance	\$600,230 (€428,595)
United States	OAS	VA	\$140,000
Total			\$3,320,998 (€4,890,502)

As noted above, the OAS supports Nicaragua's national demining plan by providing training, technical advice, supervision, equipment, and logistical and administrative support, including fundraising for humanitarian demining operations.¹¹²

¹⁰⁷ Telephone interview with Dr. Juan Umaña, CND, 18 August 2009 and email from Carl Case, Director, Office of Humanitarian Mine Action, OAS, 18 August 2009. The OAS reported slightly different figures, citing \$6.5 million overall funding with \$3.5 million to support clearance operations and at least \$1.9 million earmarked for equipment purchases.

NIGER

2008 Key Data

State Party since	1 September 1999
Contamination	Antivehicle mines and possibly antipersonnel mines and ERW
Estimated area of contamination	Unquantified
Casualties in 2008	89 (2007: 96)
Estimated mine/ERW survivors	Unknown but estimated 157
Article 5 (Clearance of mined areas)	Deadline: 1 September 2009
Demining in 2008	Only spot clearance
Risk education recipients in 2008	Not reported

Ten-Year Summary

The Republic of Niger became a State Party to the Mine Ban Treaty on 1 September 1999. National implementation legislation entered into force in September 2004. Niger completed its stockpile destruction in April 2003, and did not retain antipersonnel mines for training purposes. An additional 1,772 mines were discovered and destroyed in 2008. Niger carried out a program to buy mines from traffickers to prevent them from falling into the hands of rebels.

Niger is contaminated with antivehicle mines as a result of insurgency in the north of the country, but the extent of any contamination from antipersonnel mines or explosive remnants of war (ERW) remains unknown. Niger announced the adoption of a four-year strategic mine action plan in April 2009.

From 1999 to 2008, Landmine Monitor identified at least 205 landmine casualties, including 48 killed and 157 injured. The majority of casualties occurred in 2007 and 2008. There has never been a formal risk education program, but basic awareness messages were provided in 2007–2008.

No specialized assistance for mine/ERW survivors is in place. Emergency and continuing medical care is insufficient, as are rehabilitation services. There are no known psychological support or socio-economic reintegration programs for survivors. Niger has legislation protecting the rights of persons with disabilities, but discrimination against them is reported to have continued.

Mine Ban Policy

Niger signed the Mine Ban Treaty on 4 December 1997 and ratified on 23 March 1999, becoming a State Party on 1 September 1999. National implementation legislation (Law 2004–044) entered into force on 15 September 2004.¹

Niger submitted its seventh annual Article 7 report on 26 May 2009, covering calendar year 2008. Niger did not submit an Article 7 report in 2007 or 2008.²

¹ Article 7 Report, Form A, 26 May 2005. According to Article 13 of Law 2004–044, use, production, stockpiling, or transfer of antipersonnel mines can be punished with a prison term of between 10 and 20 years, as well as a fine of CFA1 million–3 million. Article 16 of the law directs that the CNCCAI is responsible for ensuring the law's application.

² Niger submitted Article 7 reports on 26 May 2009, 29 June 2006, 26 May 2005, 30 April 2004, 4 April 2003, and 12 September 2002. In addition, Landmine Monitor received a copy of an Article 7 report dated 9 August 2001, which apparently was never received by the UN.

Niger attended the Ninth Meeting of States Parties in Geneva in November 2008, where it made statements on destruction of stockpiled mines and on mine clearance. Niger participated in the intersessional Standing Committee meetings in Geneva in May 2009, where it made a statement on destruction of previously unknown stockpiles.

Niger has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling or transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Niger is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines, but not its Protocol V on Explosive Remnants of War. Niger signed the Convention on Cluster Munitions in December 2008 and ratified it on 2 June 2009.³

Production, transfer, stockpile destruction, and use

Niger has never produced or exported antipersonnel mines. In April 2003, Niger reported that it had destroyed its stock of 48 antipersonnel mines, fulfilling its Article 4 obligation.⁴ In its earlier Article 7 reports, Niger indicated that it was retaining for training purposes 949 antivehicle mines and 146 French “éclairant” (flare) mines.⁵ It appears that none of these are considered antipersonnel mines under the Mine Ban Treaty. In its Article 7 report submitted in 2009, Niger reported only the 146 flare mines as retained, and reported that none of the flares contained explosives.⁶

In 2008, Niger destroyed an additional 1,772 antipersonnel mines. These consisted of: 251 NR 409, four PMA-3, 1,447 BMP1, 22 BMP, and 48 mines of unspecified type.⁷ At the intersessional Standing Committee meetings in May 2009, Niger provided additional details, indicating that the NR 409 and PMA-3 mines, as well as 12 unspecified mines and 1,487 detonators, were destroyed at Dirkou on 26 August 2008, followed by destruction of the BMP1 and BMP mines at Dirkou between 13 and 22 October 2008.⁸ The other 36 unspecified antipersonnel mines detonated accidentally while being prepared for destruction during a ceremony in Gouré on 24 August 2008 when a non-state armed group was reportedly surrendering the mines to government control. The incident reportedly killed one person and injured approximately 40 others.⁹

The mines apparently came from two sources, some discovered on the border with Chad and some purchased from traffickers. It was reported in the media that in July 2008 Niger had discovered more than 1,000 abandoned mines on the Niger-Chad border. The mines were believed to have been lifted from minefields by smugglers for resale.¹⁰

The government initiated a program to buy mines and other weapons from traffickers to prevent them from falling into the hands of rebels.¹¹ Niger said in May 2009 that the program had recovered many mines, all of which had been destroyed, but the program was halted as it

³ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 133–134.

⁴ Article 7 Report, Form G, 4 April 2003. Previously, Niger reported that it had no stockpile of antipersonnel mines, including for training purposes. See *Landmine Monitor Report 2002*, pp. 384–385.

⁵ Article 7 Report, Form D, 29 June 2006. This was also declared in the May 2005 and April 2003 reports.

⁶ Article 7 Report, Form D, 26 May 2009.

⁷ Ibid, Form B; statement of and presentation by Niger, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009. The NR 409 mine is Belgian-made. The PMA-3 is typically designated as Serbian, but Niger has cited it as Chinese-made. Landmine Monitor is not familiar with the BMP designation, but Niger cited it as a Belgian bounding mine, which likely refers to the NR442.

⁸ Statement of and presentation by Niger, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009. Article 7 Report, Form F, 26 May 2009, cites the destruction dates as 22–26 August and 13–22 October.

⁹ See *Landmine Monitor Report 2008*, p. 559; and Statement of and presentation by Niger, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009. While numerous media accounts cite the date in August, in its statement, Niger cited the date as 24 October.

¹⁰ “Niger: Army seizes outlawed anti-personnel mines,” IRIN (Niamey), 29 August 2008, www.irinnews.org. While transporting the mines to a destruction site, at least one mine reportedly accidentally detonated, destroying a vehicle and killing all personnel on board.

¹¹ Statement of and presentation by Niger, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

actually increased the flow of arms into the country.¹² The head of the CNCCAI told Landmine Monitor in May 2009 that the mines acquired were old mines that had been removed from the ground, and were believed to have come from Chad.¹³

In 2007, an armed insurgency reignited in the north of the country with the Touareg non-state armed group, the Niger Justice Movement (Mouvement des Nigériens pour la Justice, MNJ) and some splinter factions. In November 2008, Niger told other States Parties that insurgents have not used antipersonnel mines, but have used antivehicle mines, causing both military and civilian casualties. It noted that while its Article 7 report had listed some suspected areas, on investigation no antipersonnel mines had been found.¹⁴ Niger confirmed again in May 2009 that no antipersonnel mines had been used by the rebels, but said it cannot guarantee that they will not be used as the conflict has not ended.¹⁵ MNJ representatives have denied any use of antipersonnel mines.¹⁶

Scope of the Problem

Contamination

Niger is contaminated with antivehicle mines, especially in the north of the country,¹⁷ where the army has been fighting the MNJ. Other antivehicle mine explosions have occurred elsewhere in the country, including in the capital, Niamey.¹⁸ An incident in February 2009 that cost the lives of six Gambians occurred on the border between Niger and Libya (see Casualties section below).¹⁹

Whether Niger is also contaminated by antipersonnel mines remains unclear. In its Article 7 report for 2008, Niger reported no areas in which antipersonnel mines were known or suspected to be emplaced.²⁰ It further stated that antipersonnel mines had never been used in Niger.²¹ In its previous Article 7 report, covering April 2005 to March 2006, Niger declared eight suspected areas: the plateaus of Djado, Karama, Manguéni, and Tchigai; the Afafi and Air mountain ranges; the Talak plain; and the Emi Fezzan region.²²

In November 2007, a UNDP rapid assessment of the situation²³ concluded that most of the numerous incidents in 2007 had occurred as a result of antivehicle mines in the Agadez region on the main and secondary roads east of the Air mountain range,²⁴ and there was no evidence of use of antipersonnel mines in the current situation.²⁵ However, analysis by Landmine Monitor of

²⁵ Ibid, pp. 25, 27.

the casualty data included in the report indicated that a number of the incidents—some of which did not inflict any injuries—did not seem consistent with the explosion of an antivehicle mine.²⁶

The extent of ERW contamination is not known.

Casualties

In 2008, at least 89 new landmine casualties were identified in Niger, including 14 killed and 75 injured.²⁷ The CNCCAI recorded 85 casualties, including 10 killed and 75 injured from January to September 2008.²⁸ Landmine Monitor identified four additional casualties reported in the media (four military killed between Elmiki and Dabaga in the Agadez region) in November 2008 that are not in CNCCAI data.²⁹

The large majority of casualties were men (77). The remaining casualties were woman (seven), boys (three), and girls (two). Detailed information on the date, location, civilian status, device type, and activity was not available, but the CNCCAI reported that military were the biggest casualty group and that the most common activity at the time of the incident was driving/traveling.³⁰ All casualties were caused by antivehicle mines, except for one incident in which one person was killed and 40 injured in Gouré, Zinder province by the explosion of a number of antipersonnel mines during a weapon handover ceremony between the government and the rebels.³¹

The CNCCAI revised its 2007 mine casualty data upwards from 90 to 104, including 28 killed and 76 injured. Men were the biggest casualty group (98); four were women; and two were children, one boy and one girl.³² Detailed information was not available, but the majority of casualties were military personnel who were driving/traveling. All casualties were caused by antivehicle mines.³³ The 2008 casualty rate is lower than 2007. Almost half of 2008 casualties occurred in the single incident in Gouré. With slow data collection and ongoing verification of information, however, these figures might well under-represent the problem.

No new mine/ERW casualties had been identified in 2009 as of May.³⁴ The CNCCAI's mine action consultant reported that "some casualties have been found in 2009," but details were not available as of June.³⁵

The total number of mine/ERW casualties in Niger remains unknown, and the CNCCAI reported that data was being verified as of June 2009.³⁶ From 1999 to 2008, Landmine Monitor identified at least 205 landmine casualties, including 48 killed and 157 injured.³⁷ The majority

of casualties were identified in 2007 and 2008, linked to the Touareg rebellion. Some 80,035 persons with disabilities have been registered in Niger,³⁸ but numbers could be 10 times higher.³⁹

Risk profile

The main at-risk group is military personnel traveling on the roads in northern Niger,⁴⁰ while civilian travelers, including humanitarian aid workers, are also at risk.⁴¹

Program Management and Coordination

The CNCCAI serves as the national mine action authority for Niger. In accordance with the 1994 decree that established it,⁴² the commission reports directly to the President and one of its functions is to monitor Law 2004–044 on the implementation of the Mine Ban Treaty.⁴³ The CNCCAI is also responsible for coordinating risk education (RE) and victim assistance (VA) activities.⁴⁴ Its role in VA remained limited in 2008, due to lack of funds.⁴⁵ The Ministry of Population and Social Welfare is responsible for disability issues.⁴⁶

There is no separate mine action center, given the lack of formal demining operations, as access to the north is restricted because of the ongoing conflict.⁴⁷ In February 2008, however, a working group on mine action, including RE, was jointly established by the CNCCAI and UNDP.⁴⁸ The working group has since been meeting several times each month.⁴⁹

Data collection and management

Casualty data collection remains incomplete in Niger. In 2008, the CNCCAI, with the support of a UNDP consultant, established a casualty database.⁵⁰ As of June 2009, detailed information remained limited and data was being verified.⁵¹

Casualty data is collected by the “gendarmerie” (police), the National Forces for Intervention and Security (Forces Nationales d’Intervention et de Sécurité), health personnel, and local organizations.⁵² A standard data collection form was developed in 2008 and shared with data collectors.⁵³ In May 2009, the CNCCAI reported that verification of data and collection of further details was slowed down by the volatile security situation in the north.⁵⁴ Casualties also continued to be reported in the media, but the information provided was limited.⁵⁵

Plans

Strategic mine action plans

The Anti-Mine Action Plan 2009–2013 was presented at an RE workshop organized on the International Day of Mine Action in 2009.⁵⁶ Under the plan, Niger will seek to develop the CNCCAI's capacity to coordinate mine action, set up a mine action database, conduct demining, promote international humanitarian law relating to mines and ERW, carry out RE, and support health structures to ensure assistance is provided to survivors. Demining objectives include the following:

- procure demining equipment;
 - conduct training in mine clearance;
 - begin identifying, marking, and, where possible, clearing suspected areas while the conflict is ongoing; and
 - complete clearance operations once the conflict is over.
- Niger will also destroy all mines that are handed in to the authorities.⁵⁷

Both RE and VA were also included in the plan.⁵⁸ The RE objective is to reduce the risk of incidents through information dissemination, awareness-raising, and education of the population. A communication plan (to develop awareness messages, define communication networks and materials, and train trainers) will be implemented and evaluated.⁵⁹

The VA objective is to support health structures and ensure monitoring of the assistance provided to mine survivors.⁶⁰ Three activities are planned to:

- develop a strategy and a mechanism to provide assistance to victims;
- recruit and train doctors and military and civilian personnel; and
- create a rehabilitation and socio-economic reintegration center.⁶¹

The 2007 UNDP rapid assessment recommended developing a mine action plan, including VA, based on the Nairobi Action Plan.⁶² UNDP planned to finance a national strategic plan for VA in 2009.⁶³ In 2008, Niger reported that a VA consultant was to be hired, but no progress was reported as of late April 2009.⁶⁴

Niger's Poverty Reduction Strategy for 2008–2012 contains some priority actions targeting vulnerable people, including persons with disabilities. The actions are to promote sports for persons with disabilities, and ensure their legal protection and social reintegration.⁶⁵

National ownership

Commitment to mine action and victim assistance

Niger has set up mechanisms to address mine action and VA, but its overall response has been slow. Following preliminary talks between the Niger government, the MNJ, and two splinter factions, the NGO Geneva Call lobbied the government and the MNJ to address mine action, particularly demining, in possible future peace negotiations.⁶⁶

National management

Niger's nascent mine action program is nationally managed, under the responsibility of the CNCCAI. The program has been receiving technical assistance from UNDP.⁶⁷ No national mine action legislation or standards have yet been drafted.

Demining and Battle Area Clearance

The Niger Armed Forces are responsible for demining and to date have marked a number of suspected mined areas and carried out some spot demining.⁶⁸ There was, however, no humanitarian demining carried out in 2008.⁶⁹ Twice during the year, Niger sent members of its armed forces for professional training in basic demining and clearance techniques at the West African Center for Humanitarian Mine Action Training (Centre de Formation au Déminage Humanitaire–Afrique de l'Ouest⁷⁰) in Benin.⁷¹

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Niger was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 September 2009. Given the uncertainty surrounding the possibility of antipersonnel mine contamination, in March 2008, Colonel Maï Moctar Kassouma, the head of the CNCCAI, wrote to the Mine Ban Treaty Implementation Support Unit noting that since the conflict was still ongoing, it was not possible to confirm that there had been no use of antipersonnel mines.⁷²

In June 2008, however, at the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Colonel Kassouma, representing Niger, stated, "In the current context, and based on the accidents recorded to date, Niger can today confirm that the presence of antipersonnel mines is no longer suspected on its territory and that the problem that confronts it currently is linked to the presence of antivehicle mines."⁷³ Niger also noted, however, that rebels had used "antivehicle mines intended for use against people."⁷⁴ It is not known which type of mines are referred to.

Niger further declared, "If previously unknown mined areas [containing antipersonnel mines] are found, Niger promises to report to the other States Parties in accordance with the provisions of Article 7 and to take the appropriate measures to destroy all antipersonnel mines in these areas with respect to the obligations of Article 5 of the Convention."⁷⁵

Risk Education

In 2008, RE continued to be provided on an ad hoc basis. The number of people reached is unknown. In Form I of its Article 7 report for 2008, Niger stated that "antipersonnel mines have never been used in Niger. However, because of traffickers, awareness campaigns are done to invite the population to be cautious and to denounce and/or voluntarily hand over [mines]."⁷⁶ The 2007 UNDP rapid assessment recommended starting emergency RE activities.⁷⁷

⁷⁵ *Ibid.*

⁷⁶ Article 7 Report, Form I, 26 May 2009.

⁷⁷ Eric Debert, "Rapid Assessment," UNDP, December 2007, p. 47.

In January and February 2008, UNICEF broadcast awareness messages in French and in three local languages on the national radio and on seven regional radio stations.⁷⁸ It is estimated that 80% of the population was reached.⁷⁹ In August and September 2008, the CNCCAI, with UNDP support, organized three training courses in Agadez, Niamey, and Zinder for RE focal points among local authorities and civil society.⁸⁰ An awareness campaign was organized countrywide from 26 November to 3 December 2008.⁸¹ Basic RE messages were provided to the population.⁸²

There has never been any formal RE program.⁸³ At the Standing Committee meetings in February 2004, Niger presented a draft action plan, which included RE,⁸⁴ but the plan was not implemented. In Form I of its Article 7 reports, Niger has stated that awareness messages were provided to the population and that the army informed people who were traveling about the safety of their itinerary.⁸⁵ In 2007, transport and other unions, as well as some local NGOs, alerted their drivers about the threat posed by mines.⁸⁶

Victim Assistance

The total number of survivors is unknown, but is estimated to be at least 157. With more than 70% of the population living below the poverty line,⁸⁷ Niger remains one of the poorest countries in the world.⁸⁸ Despite efforts to improve it, healthcare remains inadequate due to poor quality of services, lack of personnel, and a shortage of medicines and equipment, particularly in rural areas.⁸⁹ In 2008, service provision was further strained by the volatile security situation and by the threat of landmines in the north of the country.⁹⁰ The healthcare system was challenged by an increased influx of weapon-injured people, both civilian and military.⁹¹

National law mandates that the state provide for persons with disabilities,⁹² but in practice the social security system assists less than one citizen out of ten.⁹³ Persons with disabilities receive limited services and their survival and reintegration are issues of concern.⁹⁴ Military mine survivors received some support from the government and are said to be better off than civilians.⁹⁵

⁹⁴ *Ibid.*, p. 60.

⁹⁵ Response to Landmine Monitor questionnaire by Allassan Fousseini, CNCCAI/UNDP, 29 April 2009.

Emergency and continuing medical care are insufficient, due to limited resources.⁹⁶ Mine casualties were transported by ambulance or air to one of the three hospitals in Arlit, some 300km from Agadez, when means were available.⁹⁷ As the lack of medical personnel, especially surgeons, remains a problem,⁹⁸ Niger's mine action plan envisages recruiting and training new doctors.⁹⁹ Rehabilitation and orthopedic services are also insufficient and there are no rehabilitation centers in Agadez.¹⁰⁰ Orthopedic workshops are located in Dosso, Niamey, and Zinder.¹⁰¹ No psychological support or socio-economic reintegration programs are known to exist for survivors. There are no regulations to mandate special education for persons with disabilities.¹⁰²

Niger has legislation protecting the rights of persons with disabilities: the law was generally enforced, but discrimination continued to be reported.¹⁰³ Niger ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol on 24 June 2008.

Victim assistance activities

In 2008, there was no specialized VA program.¹⁰⁴ The total number of mine/ERW survivors assisted in 2008 remains unknown and Niger did not provide information on its VA activities in Form J of its Article 7 report submitted in 2009.¹⁰⁵

The ICRC covered the medical and orthopedic expenses of one mine survivor.¹⁰⁶ It provided medicines and materials to health facilities in the north and the Agadez hospital.¹⁰⁷ In addition, it organized three war-surgery seminars to improve the treatment of weapon-injured, including mine-injured, in Agadez, Arlit, and Niamey.¹⁰⁸ The seminar was attended by 35 civilians and 27 military health professionals.¹⁰⁹

UNICEF trained 80 social workers on psychological support for children affected by the ongoing insecurity in Agadez and Tahoua.¹¹⁰ Handicap International works with children with disabilities in Niamey and conducts disability advocacy activities.¹¹¹ One Gambian civilian injured in a mine incident in Libya received medical assistance in Niger in 2009.¹¹²

Support for Mine Action

No international funding was reported for Niger in 2008. In 2007, France reported contributing US\$108,313 (€78,997) in-kind funding to Niger.¹¹³

On 23 January 2008, UNDP approved \$100,000 for emergency activities, following several landmine incidents in urban areas.¹¹⁴

NIGERIA

Ten-Year Summary

The Federal Republic of Nigeria acceded to the Mine Ban Treaty on 27 September 2001, and the treaty entered into force on 1 March 2002. Nigeria has stated since 2004 that it is in the process of enacting national legislation to implement the treaty. Nigeria stated in 2001 that it no longer possessed antipersonnel mines, but in 2004 declared that it had a stockpile of 3,364 mines, and indicated that it would retain the entire stock for research and training purposes. However, Nigeria reported that it destroyed all of these mines in 2005. Yet, in its Article 7 report submitted in 2009, Nigeria again listed 3,364 mines as retained for training and stated that it had destroyed 9,786 stockpiled mines in 2005.

It is not known to what extent Nigeria is contaminated with landmines, although contamination from explosive remnants of war (ERW) has been reported across nine states. In May 2009, Nigeria reported a possible mine threat left over from the Biafra conflict in the 1960s to the intersessional Standing Committee meetings. Its Article 5 deadline for clearance of antipersonnel mines in mined areas is 1 March 2012.

The total number of mine/ERW casualties in Nigeria is not known. Landmine Monitor identified at least two casualties from 1999 to 2008, but these figures do not represent the real scope of the problem, as the number of casualties from the Biafran conflict has never been established. In 2009, the government announced the beginning of data collection on survivors. There is no risk education program in Nigeria. Services for persons with disabilities are limited and there is no legislation prohibiting discrimination.

Mine Ban Policy

Nigeria acceded to the Mine Ban Treaty on 27 September 2001, and the treaty entered into force on 1 March 2002. Nigeria has voted in favor of every UN General Assembly resolution calling for universalization and full implementation of the Mine Ban Treaty since 1996.

Nigeria has stated since 2004 that it is in the process of enacting national legislation to implement the treaty. Its latest Article 7 report stated, "Domestication of MBT is in progress." It further stated that an inter-ministerial committee had been formed to prepare a draft bill and that once drafted, the bill would be presented to the National Assembly for consideration.¹ In a July 2007 letter to the ICBL, Nigeria indicated that the draft legislation would criminalize any activity prohibited under the convention and "as far as the application of Article 9 of the treaty is concerned, Nigeria's efforts have reached an advanced stage."² Nigeria previously reported that as of December 2005, the implementation bill was undergoing its first reading in the National Assembly.³

Nigeria submitted an Article 7 report in 2009, which covered an unspecified period from 2006 to 2009. Nigeria submitted three previous Article 7 reports.⁴

Nigeria attended the Ninth Meeting of States Parties in Geneva in November 2008, but did not make any statements. At the meeting, it was named co-rapporteur of the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies. It attended the intersessional Standing Committee meetings in Geneva in May 2009, where it made a statement

¹ Article 7 Report (for the period 2006–2009), Form A.

² Letter from Amb. Dr. Martin I. Uhomoihi, Permanent Mission of Nigeria to the UN in Geneva, 10 July 2007.

³ Article 7 Report, Form A, 22 August 2006.

⁴ Nigeria submitted its initial Article 7 transparency report, which was due on 28 August 2002, almost two years late on 22 June 2004. It submitted updates on 15 April 2005 (for the period 1 January 2004 to 31 March 2005), and 22 August 2006 (for the period 1 April 2005 to 31 March 2006).

outlining how it planned to investigate recent reports that there may be mined areas in Nigeria.⁵ In the past, Nigeria has reported that there are no mined areas under its jurisdiction or control.

With respect to matters of interpretation and implementation related to Articles 1, 2, and 3 of the treaty, Nigeria has indicated that its draft implementation legislation “prohibits transfer of anti-personnel mines through any part of the Nigerian territory.”⁶ Nigeria stated in 2005, after reporting that it had destroyed all mines it had previously retained under Article 3, “If you are really convinced about a mine free world, what would you need mines to train for?”⁷ Nigeria has not made known its views on issues related to joint military operations with states not party and antivehicle mines with sensitive fuzes or antihandling devices.

In March 2009, the IANSA Women Network (Nigeria) organized a roundtable discussion to commemorate the 10th anniversary of the Mine Ban Treaty’s entry into force and to review Nigeria’s progress towards full implementation of the treaty. The event was attended by representatives from the Ministry of Defence, the Nigerian Police, and the Ministry of Environment, as well as by foreign diplomats, the ICRC, NGOs, and the media. A main focus of the meeting was on how Nigeria had not yet adopted national implementation measures.⁸

Nigeria has signed but not ratified the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 12 June 2009, but had not ratified as of 1 July 2009.⁹

Production, transfer, stockpiling, and use

Nigeria is not known to have ever produced or exported antipersonnel mines. In the past, Nigeria has stated that it has not acquired or used antipersonnel mines since the 1967–1970 Biafra Civil War. Nigeria has denied allegations that its Economic Community of West African States (ECOWAS) troops used mines in the 1990s in Liberia and Sierra Leone.¹⁰

In February 2001, the Chief of Operations of the Nigerian army reported to Landmine Monitor that Nigeria had destroyed its antipersonnel mines remaining after the war, and had retained none for training or development purposes.¹¹ In May 2002, however, Nigeria presented photographs to the Standing Committee on Stockpile Destruction showing that antipersonnel mines were among munitions involved in a January 2002 fire and explosion at the Ammunition Transit Depot in Ikeja Cantoment, Lagos.¹²

In its initial Article 7 report in 2004, Nigeria declared a stockpile of 3,364 so-called ‘Dimbat’ mines and reported that it would retain the entire stockpile for research and training.¹³ Following the Mine Ban Treaty’s First Review Conference in 2004, Nigeria reversed this position and issued a presidential directive to destroy the mines. In April 2005, Nigeria reported that all of its retained mines had been destroyed.¹⁴ Nigeria stated, “With the completion of these destruction

¹¹ Interview with Maj. General Yellow-Duke, Bamako, Mali, 15 February 2001.

¹² Presentation by Bob Scott, Munitions Consultants, UK, Standing Committee on Stockpile Destruction, Geneva, 30 May 2002. For details, see *Landmine Monitor Report 2004*, pp. 638–641.

¹³ Article 7 Report, Form D, 22 June 2004. The origins of the mines were not given, but Landmine Monitor has reported that in the past that Nigeria imported antipersonnel mines from former Yugoslavia, the former Soviet Union, former Czechoslovakia, France, and the United Kingdom. For details, see *Landmine Monitor Report 1999*, pp. 202–203.

¹⁴ Article 7 Report, Forms D and G, 15 April 2005. Two hundred antipersonnel mines were destroyed in November 2004, and the remaining 3,164 were destroyed in February 2005 in a ceremony witnessed by Nigeria’s then-President, officials from the Ministry of Defence, and foreign observers. Nigeria also reported destroying at the same time 1,836 pieces of unexploded ordnance recovered from the Lagos Ammunition Transit Depot explosion. It did not specify how many of these items were antipersonnel mines.

exercises, we are able to report that there are no more anti-personnel mines on Nigeria soil.”¹⁵ However, in its 2009 Article 7 report, Nigeria again listed 3,364 “British made AP mines” as retained for training.¹⁶ Moreover, it reported that it had destroyed 9,786 stockpiled “British made AP landmines” in 2005 under the supervision of the then President.¹⁷

Scope of the Problem

Contamination

Nigeria is contaminated with explosive remnants of war (ERW), primarily as a legacy of the Biafra conflict that ended in 1970.¹⁸ Contamination was reported across nine states: Abia, Anambra, Akwa Ibom, Benue, Cross River, Delta, Ebonyi, Enugu, and Imo; as of end-June 2009, according to the Minister of Defence, a total of at least 649 suspected hazardous areas (SHAs) had been identified.¹⁹ The extent of any landmine problem is not yet known, although media reports in 2009 suggested that landmines formed part of the residual threat.²⁰ Nigeria’s Article 7 report submitted in 2009 stated that there were suspected mined areas in the “war-affected areas in the Eastern part of Nigeria” that might be contaminated with “Biafran ‘locally fabricated’ explosive device (OBGUNIGWE), which was used as AP Landmine.”²¹

Casualties

There were no reports of new mine/ERW casualties in Nigeria in 2008 or in 2009, as of May 2009.²² In 2004, Nigeria reported that “we have not had mine-related incidents for a very long time.”²³ However, in January 2009, the Ministry of Defence reported that “cases of explosions of unexploded mines have continued to be a threat to our people’s lives [*sic*] causing loss of lives and property.”²⁴

The only two mine incidents ever identified in Nigeria occurred in 2002 and were reported by the media. In January 2002, after an explosion occurred at the Lagos Ammunition Transit Depot, a young man was reportedly injured after stepping on a landmine at the scene.²⁵ In its 2005 and 2004 Article 7 reports, however, Nigeria stated that “no casualty was reported.”²⁶ In December 2002, a person of unknown gender and age was injured by an ERW.²⁷

In September 1997, 11 Nigerian soldiers from the ECOWAS Monitoring Group (ECOMOG) were killed in a mine explosion in Sierra Leone.²⁸ It is not known if any Nigerian soldiers involved in peacekeeping operations since have been killed or injured by landmines.²⁹

²⁹ See *Landmine Monitor Report 2004*, p. 641.

The total number of mine/ERW casualties in Nigeria is unknown. The Biafran conflict claimed a number of landmine victims, although their number has never been established.³⁰ In 2009, the government announced plans to count mine survivors in 10 states: Abia, Anambra, Bayelsa, Benue, Cross River, Ebonyi, Enugu, Imo, Lagos, and River.³¹ In January 2009, an interministerial Committee was set up to deal with mine issues; one of its tasks was collecting mine survivor data.³² In April 2009, the chair of the committee reported that a team had been sent to the Ebonyi state, in southeastern Nigeria, to count mine survivors.³³ Nigeria did not report on progress made in collecting casualty data at the Standing Committee meetings in May 2009.³⁴ In its Article 7 report submitted in 2009, Nigeria stated that 147 survivors had been identified in a resettlement center in Anambra state and additional 41 outside of this the resettlement center.³⁵

Program Management and Coordination

There is not yet a formal mine action program in Nigeria, although there are plans to establish one. In April 2009, the chair of the Committee on Landmine Clearance and Unexploded Ordnance from the Ministry of Defence visited Ebonyi state in accordance with President Yar'Adua's approval for the clearance of landmines and UXO arising from the Biafra conflict.³⁶

It is unknown which governmental body has the final responsibility for mine/ERW survivors. The Ministry of Women's Affairs is in charge of disability issues.³⁷ The interministerial Committee on Landmine Clearance and Unexploded Ordnance reported that, upon identification of mine victims in Nigeria, a request for assistance will be submitted to the UN.³⁸

Demining and Battle Area Clearance

As of May 2009, a demining program was not yet underway. In May 2009, at the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Nigeria declared that it was discussing with the Mine Ban Treaty's Implementation Support Unit the possibility of technical assistance in demining. An initial assessment mission was said to be planned for July 2009.³⁹

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Nigeria is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2012. Nigeria has reported to States Parties on the possibility of mine contamination through the Standing Committees and in August 2009 submitted an Article 7 report in which it declared suspected mined areas. Should mine contamination be confirmed, Nigeria declared its commitment to addressing it as quickly as possible.⁴⁰

⁴⁰ *Ibid.*

Risk Education

From 1999 to 2009, there was no formal risk education program in Nigeria. The government declared in earlier Article 7 reports that Form I was not applicable to Nigeria.⁴¹ However, in its latest Article 7 report, Nigeria reported that, from 2006 to 2009, basic awareness messages were disseminated through posters, media, and sign posts; churches and mosques also provided some basic awareness.⁴²

In May 2009, at the Standing Committee meetings, Nigeria stated that if the technical assessment planned was to confirm the presence of mined areas, Nigeria “will do what is required to ensure the effective exclusion of civilians until all AP mines contained therein have been destroyed.”⁴³

Victim Assistance

The number of survivors is unknown, but at least 188.⁴⁴ The number of persons with disabilities in Nigeria is also unknown, although the World Health Organization has estimated that some 19 million people are disabled (20% of the population).⁴⁵

Nigeria is classified among the 25 poorest countries in the world,⁴⁶ and its health system is said to be in poor condition.⁴⁷ Services for persons with disabilities are limited; medical care and rehabilitation are inadequate.⁴⁸ Prosthetics remain unaffordable for the majority of the disabled population.⁴⁹ There are government-run vocational training centers in Abuja and Lagos for poor persons with disabilities.⁵⁰ There are several international and national NGOs working within the disability sector including Leonard Cheshire Disability, the Leprosy Mission, and Christianblinden Mission.⁵¹

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates for fulfilling Nigeria’s mine action needs, including risk education and victim assistance. No international mine action funding was reported for Nigeria in 2008, nor was any reported in 2007. Nigeria did not report national funding in 2008, but its 2009 Ministry of Defence budget includes an item for “Enumeration of Landmines Victims and Removal of Anti-Personnel Mines,” with appropriations in 2009 amounting to N100 million (US\$680,000).⁵² In its 2009 Article 7 report Nigeria reported contracting a consultant to carry out “pre-enumeration of landmine victims and removal of mines and explosive remnants of war”, starting in January 2009, but did not specify the contract amount or the consulting party involved.⁵³ There is not enough data on landmine contamination or casualty statistics to assess the adequacy of national funding in meeting Nigeria’s mine action needs.

PALAU

Ten-Year Summary

The Republic of Palau became a State Party to the Mine Ban Treaty on 1 May 2008. In August 2008, draft national implementation legislation was introduced into the Senate, and Palau hosted a sub-regional workshop to promote the Mine Ban Treaty.

Mine Ban Policy

Palau acceded to the Mine Ban Treaty on 18 November 2007, becoming a State Party on 1 May 2008. Palau submitted its initial Article 7 report in 2008, covering the period from 1 May 2008 to 15 September 2008. As of August 2009, it had not yet submitted an annual updated report for 2009.

According to Palau's initial Article 7 report, Senator Caleb Otto introduced draft legislation—the Anti-Personnel Mine Prohibition Act of 2008 (SB No. 7-270)—into the Senate on 20 August 2008.¹ The legislation passed its first reading and was referred to the Senate Committee on Judiciary and Governmental Affairs. Its progress was delayed by national elections held on 4 November 2008, but according to the Article 7 report, legislative action was anticipated in the next Senate session in February 2009. No update on the legislation was available as of August 2009.

Palau attended the Ninth Meeting of States Parties in Geneva in November 2008, but did not attend the intersessional Standing Committee meetings in May 2009. At the Meeting of States Parties, Palau said it would host a regional nuclear disarmament meeting in May 2009, where it would press states not party to the Mine Ban Treaty from the Pacific to join.² At the opening of the regional meeting, Palau's Minister of State, Sandra Pierantozzi said, "Like the AP Mine Ban Treaty, we in the Pacific may not possess nuclear weapons and other weapons of mass destruction, but our joining this Treaty would strengthen the universalization of this Treaty, thus isolating the users and wanna-be users of these weapons to their own regions."³

In August 2008, Palau hosted a sub-regional workshop to promote Mine Ban Treaty accession by Micronesia and ratification by the Marshall Islands.⁴

In November 2007, at the Eighth Meeting of States Parties in Jordan, Palau's Minister of State, Temmy L. Shmull, announced Palau's accession to the treaty and said Palau had "worked diligently" on the accession process since it first attended a Mine Ban Treaty annual meeting in 2005. He also said Palau "sees a moral obligation and responsibility to do its part" to promote universalization of the Mine Ban Treaty.⁵

⁴ Government of the Federated States of Micronesia, "FSM Participates in Landmine Treaty Workshop," Press release, Palikir, Pohnpei, 22 August 2008, www.fsmgov.org.

⁵ Statement by Hon. Temmy L. Shmull, Minister of State of the Republic of Palau, Eighth Meeting of States Parties, Dead Sea, 18 November 2007.

In its initial Article 7 report, Palau confirmed that it does not possess antipersonnel mine stockpiles, has never produced the weapon, and has no mined areas.⁶ Palau had previously said on several occasions that it did not produce or stockpile antipersonnel mines, and that it was not mine-affected.⁷

Palau told States Parties in November 2005 that there is UXO still to be found in many of Palau's 200 islands left over from World War II.⁸

Palau signed the Convention on Cluster Munitions in December 2008, but had not ratified it as of 1 July 2009.⁹ Palau is not party to the Convention on Conventional Weapons.

PERU

2008 Key Data

State Party since	1 March 1999
Contamination	Antipersonnel and antivehicle mines, UXO
Estimated area of contamination	192,000m ² covering 35 mined areas in the Condor Mountain Range, three prisons (11,167m ²), and two police bases (area not reported)
Casualties in 2008	Eight (2007: 48)
Estimated mine/ERW survivors	Unknown but at least 372
Article 5 (clearance of mined areas)	Deadline: 1 March 2017 Original deadline: 1 March 2009
Demining in 2008	1,155m ² of mined areas on the border with Ecuador and 324,800m ² of national infrastructure
Risk education recipients in 2008	At least 10,896
Progress towards victim assistance aims	Slow
Support for mine action in 2008	National: \$960,911 (2007: \$1.3 million) International: \$447,257 (2007: \$200,000)

Ten-Year Summary

The Republic of Peru became a State Party to the Mine Ban Treaty on 1 March 1999. It completed destruction of its 338,356 stockpiled antipersonnel mines in December 2001. Peru has retained 4,047 antipersonnel mines for training, but few have been consumed. Peru enacted domestic implementation legislation in July 2006. Remnants of the Shining Path armed group have reportedly used antipersonnel mine-like devices in recent years. Peru served as co-chair of the Standing Committee on Mine Clearance from 2001–2002 and 2007–2008, and as co-chair of the Standing Committee on the General Status and Operation of the Convention from 2002–2003. In November 2008, Peru became co-rapporteur of the Standing Committee on Victim Assistance and Socio-Economic Reintegration.

Peru's mine problem is the result of the conflict with Ecuador in 1995 and from internal conflict with non-state armed groups that ended in 1992. In December 2002, Peru created the Peruvian Center for Mine Action (Centro Peruano de Acción contra las Minas Antipersonales, Contraminas), which, under the Ministry of Foreign Affairs, is responsible for mine action planning and policy-making. Peru has developed its mine clearance capacity under the supervision and monitoring of the Organization of American States, but clearance on the border with Ecuador has been generally slow. Unable to meet its March 2009 treaty deadline for clearance, at the Ninth Meeting of States Parties, Peru requested, and was granted, an extension until March 2017.

Between 1999 and 2008, Landmine Monitor identified 141 casualties (29 killed and 112 injured) caused by mines, explosive remnants of war (ERW), and victim-activated improvised explosive devices. During the same period, Contraminas reported 84 casualties (five killed, 69 injured, and 10 unknown), mostly from mines. In 2008, Contraminas reported that it had identified 318 mine casualties (49 killed, 265 injured, and four unknown), and 107 ERW survivors in Peru since 1991. Limited risk education has been conducted in Ica, Junín, and Lima departments, and along the border with Ecuador through direct presentations and training of teachers and community leaders.

Victim assistance initiatives started relatively late in Peru, with the formation of Contraminas in 2002 and the Association of Mine Victims in 2003. Previously, data collection on casualties was irregular and few services were available specifically for survivors. Peru is one of the 26 States Parties with significant numbers of mine survivors (VA26). As of May 2009, limited progress had been made in achieving its VA26 objectives. Most advances were part of broader efforts to improve healthcare services.

Mine Ban Policy

Peru signed the Mine Ban Treaty on 3 December 1997 and ratified on 17 June 1998, becoming a State Party on 1 March 1999. On 22 July 2006, Peru enacted domestic legislation to penalize violations of the Mine Ban Treaty.¹

On 29 April 2009, Peru submitted its tenth Article 7 report, covering the period from March 2008 to March 2009.²

Peru participated in the Ninth Meeting of States Parties in Geneva in November 2008 and the May 2009 intersessional Standing Committee meetings, speaking on both occasions about mine clearance, risk education, and victim assistance. At the Ninth Meeting of State Parties, States Parties approved Peru's mine clearance deadline extension request to 1 March 2017 (see below). Peru also became co-rapporteur of the Standing Committee on Victim Assistance and Socio-Economic Reintegration.

In February 2009, Peru participated in a regional Mine Ban Treaty meeting held in Managua, Nicaragua, to prepare for the Mine Ban Treaty's Second Review Conference.

Peru has made few formal statements on key issues of interpretation and implementation related to Articles 1, 2, and 3, concerning joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes and antihandling devices, and mines retained for training purposes.

Peru is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It last submitted an Article 13 report on 3 February 2006. Peru ratified CCW Protocol V on Explosive Remnants of War on 29 May 2009.

Peru signed the Convention on Cluster Munitions on 3 December 2008, but had not yet ratified as of 1 July 2009.³

Production, transfer, use, stockpiling, and retention

Peru is a former producer of antipersonnel mines.⁴ The Ministry of Defense has stated that Peru has never exported antipersonnel mines.⁵ Peru used antipersonnel mines around its electricity towers and public infrastructure during and after the internal conflict of 1980–1992.⁶

¹ Law 28824 imposes penal sanctions of 5–8 years imprisonment. Article 7 Report, Form A, April 2007; and Statement of Peru, Seventh Meeting of States Parties, Geneva, 21 September 2006. The text can be found in the Boletín oficial de normas legales (Official Bulletin of Legal Norms) of the legal newspaper El Peruano, www.gacetajuridica.com.pe.

² Previous reports were submitted in April 2008, April 2007, 1 May 2006, 2 May 2005, 6 May 2004, April 2003, 16 May 2002, 4 May 2001, and 2 May 2000.

³ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 142–144.

⁴ The police produced the DEXA mine until production facilities were closed in 1994, while the navy produced the CICITEC MG-MAP-304 and the CICITEC MGP-30 mines until production facilities were closed in 1997. Article 7 Report, Form H, 2 May 2005; Article 7 Report, Forms E and H, April 2003; and ICRC, “Programa de Sensibilización de los Peligros de las Minas Antipersonal” (Mine Risk Education Program), Lima, 2002, p. 7.

⁵ Telephone interview with Gen. Raúl O'Connor, Director, Information Office, Ministry of Defense, 19 April 2000.

⁶ Peru has denied mine-laying during the 1995 border conflict with Ecuador. Article 7 Report, Form C, 6 May 2004.

From 1999 to December 2001, Peru destroyed its stockpile of 338,356 antipersonnel mines.⁷ In April 2009, Peru reported a stockpile of 4,047 antipersonnel mines retained for training.⁸ This is 47 more mines than reported in 2008 as, according to its Article 7 report, Peru's National Penitentiary Institute informed the government on 3 April 2009 about 47 antipersonnel mines stored in the inventory of a regional office.⁹

Peru reported the destruction of 12 mines during training activities in 2007, but it still has not reported in any detail on the intended purpose and actual use of its retained mines.¹⁰ In 2005, a military official told Landmine Monitor that mines are held by different army Combat Engineer Units for use in instruction on the safe storage and transportation of mines, meaning the mines are not usually destroyed during training.¹¹

Since early 2007, remnants of the non-state armed group Shining Path (Sendero Luminoso) have reportedly used victim-activated explosive devices, referred to as "explosive traps," to protect illegal coca fields in the Alto Huallaga sector of Huánuco department, and in San Martín department. In October 2008, the Peruvian media agency InfoRegion reported that since 2004 Shining Path had carried out 84 attacks against coca field eradicators in the Alto Huallaga sector, using "explosive traps" in 24 of the attacks.¹²

In August 2008, Peru launched an offensive in Vizcayan province against Shining Path in which 24 members of the army, air force, and navy were injured, reportedly mainly by "explosive traps."¹³ A March 2009 media report indicated that since moving into Vizcayan, troops had "detonated landmines" in their campaign against the guerrillas.¹⁴ Also in March 2009, a journalist told Landmine Monitor that the Ministry of Defense had warned him of explosive devices on dirt roads inside and outside the region.¹⁵

In the past decade, the only other reports of use of antipersonnel mines or antipersonnel mine-like devices by Shining Path came in June and July 2003.¹⁶ Victim-activated improvised explosive devices (IEDs) are prohibited by the Mine Ban Treaty.

⁷ Two destructions of a total of 11,784 antipersonnel mines between March 2000 and March 2001 are sometimes not included in Peru's destruction totals. Peru destroyed the bulk of its stockpile, 321,730 mines, between 30 May and 13 September 2001. Peru declared stockpile destruction complete in September 2001, but then destroyed a further 926 mines in December 2001 that it had intended to retain for training. See *Landmine Monitor Report 2004*, p. 658.

⁸ Article 7 Report, Form D, 29 April 2009. The 4,047 mines include 775 CICITEC (MGP), 600 M18-A1 Claymore, 525 M409, 500 PMA-3, 500 PMB-6N (possibly PMD-6M), 500 PMD-6, 500 POMZ-2M, 100 M35 C/ESP M5, and 47 CICITEC mines. All are held by the army, except the 47 CICITEC mines which are held by the National Penitentiary Institute.

⁹ Article 7 Report, Form D, 29 April 2009.

¹⁰ Peru stated in its Article 7 report that 12 MAP-CICITEC mines held by the national police were destroyed in 2007, but did not provide details. Article 7 Report, Form D, April 2008. In April 2008, Contraminas told Landmine Monitor that 12 retained mines were used by DIVSECOM in training operations. Telephone interview with Wilyam Lúcar Aliaga, General Coordinator, Contraminas, 4 April 2008.

¹⁵ Email from Simon Romero, Reporter, *New York Times*, 17 March 2009. See also, US Department of State, "To Walk the Earth in Safety," Washington, DC, July 2009, p. 37.

¹⁶ See *Landmine Monitor Report 2004*, p.657. There were isolated reports of incidents involving explosive devices in subsequent years. See *Landmine Monitor Report 2005*, p. 476; and *Landmine Monitor Report 2006*, p. 588.

According to a January 2009 media report, municipal workers in Lima found three grenades and a Claymore mine in a garbage container.¹⁷ Contraminas has sought more information.¹⁸

Scope of the Problem

Contamination

Landmines and ERW in Peru are the result of internal and international armed conflicts. Peru has two distinct mine problems. One is the Condor Mountain Range in the sparsely populated Amazon basin, where in 1995 during an armed conflict with Ecuador, antipersonnel mines were emplaced along the border in Amazonas, Cajamarca, Piura, and Tumbes departments.¹⁹ In November 2008, Peru reported that 35 mined areas remained covering a total of 192,700m² in the sectors of Achuime, Cenepa, and Santiago in Amazonas department, containing approximately 29,200 mines.²⁰

The other mine problem is in the center of the country where, in the 1980s, mines were planted to protect infrastructure against attacks from non-state armed groups.²¹ In response to the destruction of 10 high-tension electricity pylons in one day in 1986, resulting in a nationwide blackout, the government of Peru decided to mine the pylons to protect them.²² Mines were also planted around three maximum security prisons in 1993–1996 to prevent prisoners escaping and around police anti-narcotics bases as a defensive measure.²³ In total, 837 electricity pylons, three antenna transmitters, one electricity substation, three high-security prisons, and two police bases were mined.²⁴ By the end of 2008, all of the mined pylons, transmission antennas, and substations had been cleared, leaving the three prisons and two police bases to be demined.²⁵ In February 2009, Peru reported that technical surveys of the prisons had begun.²⁶

An unknown number of ERW, mainly UXO, remain to be cleared from both internal armed conflicts as well as the war with Ecuador. There may also be another, more recent, explosive hazard. As noted above, since 2007 Shining Path rebels have reportedly used victim-activated explosive devices, mainly to protect cocoa crops.

Casualties

In 2008, Landmine Monitor identified eight ERW and victim-activated IED casualties (five killed and three injured) in two separate incidents. On 15 March 2008, in the province of La Convención, two children brought an abandoned explosive, found near an army base, into their home. It exploded, killing both children and an adult male family member and injured two women and one boy.²⁷ On 5 May 2008, two civilian community guards (“ronderos”) were killed

by a victim-activated IED while guiding an army patrol looking for members of Shining Path in Chungui district in La Mar province.²⁸

The eight casualties identified in 2008 is a decrease from the 48 casualties (five killed and 43 injured) reported in 2007. The high number of casualties reported in 2007 was mostly due to increased media attention to incidents occurring during coca eradication activities; 34 of the casualties in 2007 were caused by victim-activated IEDs planted in coca growing areas. It is also likely that there were additional casualties from victim-activated IEDs during 2008. Because media reports are the only source of information on these casualties, it is difficult to get precise data. One 2008 media report included information on 24 casualties between 30 August and 28 September (21 security guards and 3 civilians, all injured) that were “primarily” caused by victim-activated IEDs.²⁹

In its 2009 Article 7 report, Form J, Peru stated that it was not aware of any antipersonnel mine casualties between March 2008 and March 2009.³⁰ Contraminas also reported no mine/ERW/IED casualties in 2008 or 2009, as of 31 March.³¹

In 2009, one casualty was identified as of 31 May. On 23 April, a 23-year-old male farmer was injured when he stepped on an explosive in Huanta province, Huancavelica department in the VRAE (River Apurímac and River Ene valley) region, an area with significant coca cultivation. Media reports identified the explosive as an antipersonnel landmine, believed to have been planted by Shining Path to prevent coca eradication.³² As of 6 July 2009, Contraminas was not yet able to confirm or deny the type of explosive involved in the incident.³³

Between 1999 and 2008, Landmine Monitor identified 141 casualties (29 killed and 112 injured) caused by mines, ERW, and victim-activated IEDs. Casualty data provided by Contraminas had a significantly lower casualty total of 84 for the same period (five killed, 69 injured, and 10 unknown). This can primarily be explained by the fact that Contraminas only has a mandate to collect data on mine casualties, although there are also some ERW casualties included in their total. Landmine Monitor data includes information provided by Contraminas on landmine casualties as well as ERW and victim-activated IED casualties reported in the media or identified by the Association of Victims and Survivors of Minefields (Asociación de Víctimas y Sobrevivientes de Campos Minados, AVISCAM).

Annual fluctuations in casualty figures and incomplete data make it impossible to establish any clear trends between 1999 and 2008.

The total number of casualties in Peru is not known. In April 2008, Contraminas reported it had registered 318 mine casualties (49 killed, 265 injured, and four unknown) since 1991, and in June 2008 it reported 107 ERW survivors. In 2007, AVISCAM estimated that more than 500 mine/ERW casualties had occurred in Peru.³⁴

Risk profile

Casualties result from ERW and, to a limited extent, antipersonnel mines located mainly in the center of the country and the Condor Mountain Range near the border with Ecuador. Additionally, Peruvians crossing illegally into Chile are at risk from mines on the Chilean side of the border. Victim-activated IEDs planted to prevent coca eradication are a significant cause of incidents.

Program Management and Coordination

Mine action

The National Mine Action Authority is the Executive Council, comprised of representatives of the ministries of defense, education, health, interior, and the National Council for the Integration of Disabled Persons (Consejo Nacional Para la Integración de la Persona con Discapacidad, CONADIS) and chaired by the Ministry of Foreign Affairs. The Executive Council sets strategy and priorities and approves plans and budgets.³⁵ Under the Ministry of Foreign Affairs, Contraminas coordinates planning and operations to meet Peru's Mine Ban Treaty obligations, including for clearance.³⁶

Risk education

Contraminas is responsible for the coordination of mine risk education activities, and held six meetings in 2008, with the participation of the Ministry of Education.³⁷ There is no body responsible for ERW education.³⁸

Victim assistance

Contraminas coordinates all mine action activities, including victim assistance (VA). In 2006, Contraminas formed an inter-ministerial permanent committee made up of representatives from the ministries of health, women, and education, and the armed forces, to facilitate coordination. As in 2007, it met irregularly in 2008.³⁹ In 2009, the VA committee was expanded to include representatives from civil society and, as of 29 April, it had held three formal meetings.⁴⁰

CONADIS is responsible for disability policy. The Office of the Public Advocate for Persons with Disabilities, within the Office of the Ombudsperson (Defensoría del Pueblo), receives complaints regarding discrimination.⁴¹ On February 2009, the Office of the Ombudsperson created the Program of Defense and Promotion of the Rights of the Persons with Disabilities.⁴²

Data collection and management

Contraminas manages the national mine action database at its offices in Lima using the Information Management System for Mine Action (IMSMA) software. Risk education activities are recorded in IMSMA.⁴³

Contraminas receives information on both landmine and ERW casualties from the army, police, AVISCAM, and the Office of the Ombudsperson, and until 2006, also received information from the ICRC.⁴⁴ However, only mine casualties are recorded in IMSMA, because

⁴³ Telephone interview with Wilyam Lúcar Aliaga, Contraminas, 29 April 2009.

⁴⁴ Email from Krisztina Huszti Orban, Legal Attaché, Arms Unit, Legal Division, ICRC, 19 August 2009.

Contraminas' mandate does not include ERW casualty data collection. As of 25 May 2009, legal procedures were underway to expand this mandate to include ERW casualties.⁴⁵

Impact studies carried out by the Peruvian Armed Forces General Directorate of Humanitarian Demining (Director Ejecutivo de la Dirección General de Desminado Humanitario del Ejército de Perú, DIGEDEHUME), in preparation for demining in border areas near Ecuador, included questions about mine casualties but, as of February 2009, none had been identified.⁴⁶

In 2007, Contraminas recognized that casualty data was not complete and launched a pilot project, originally planned to start in 2004, to verify data and undertake a needs assessment of 20 survivors based in Lima with support from the Organization of American States (OAS). Contraminas' 2008–2019 Mine Action Plan includes the objective of identifying and registering all mine victims by March 2009.⁴⁷ As of 26 May 2009, the original pilot needs assessment was completed, but not all mine survivors had been identified.⁴⁸ Reasons given for the delay in data collection included the remote location of many survivors, the long time that had passed since incidents occurred, and the unwillingness of some survivors to be identified (because of possible connections with, or fear of, being connected with a non-state armed group).⁴⁹ In 2009, the expanded VA committee met to discuss plans for data collection; survivor identification and registration was expected to be completed by August. Data was to be used in the development of a VA strategy to be completed by November 2009.⁵⁰

Contraminas, AVISCAM, and the ICRC have all asserted that casualties are under-reported,⁵¹ in part because of the reluctance of survivors to be identified and also because, prior to the creation of Contraminas in December 2002, there was no focal point to collect reports of incidents from the police, nor was there a procedure to determine the type of explosive involved.⁵² Recent casualties are better recorded, since it is believed that the police now report all casualties to Contraminas.⁵³ Contraminas has also improved data collection procedures with military and police health units.⁵⁴ As a result of these recent improvements, the total number of registered casualties in the Contraminas database increased from 318 in April 2008 to 332 as of 10 June 2009, with all added casualties having occurred prior to 2008.⁵⁵ The ICRC still believes, however, that a comprehensive, national casualty survey is needed.⁵⁶

Plans

Strategic mine action plans

On 1 April 2008, the Executive Council approved the “National Action Plan Against Antipersonnel Mines,” for 2008–2017. This action plan mirrors the plan described in Peru's Article 5 deadline extension request.⁵⁷ The overall strategic goal of the project is to reinforce the peace process between Peru and Ecuador.⁵⁸

⁵⁸ Russell Gasser, “Evaluation of EC-Funded Mine Action Programmes in Latin America, 2002–2007 Country Report – Peru,” GICHD, 2008, p. 2.

The national police planned to complete clearing the prisons and police stations in 2010. In anticipation the police demining teams being available after the infrastructure is cleared, Contraminas and the army began discussions about sending some police demining units to clear mines along the border.⁵⁹ With technical advice from the commercial clearance company RONCO, Peru plans to establish a training center in Bagua, Amazonas department, where police and army deminers and other personnel would train together.⁶⁰

Peru's 2008–2017 Mine Action Plan includes risk education activities on the borders with Ecuador and Chile, and around the penal institutes and police stations. Although it was not approved as of 1 July 2009, implementation has started. The Ministry of Education plan has been approved.⁶¹

The Action Plan also covers VA with the overall objective of “providing assistance to all mine victims in Peru, promoting their self-sufficiency.”⁶² The plan includes a specific objective to “implement a Victim Assistance plan,”⁶³ although as of May 2009, a national VA plan had not yet been developed.⁶⁴ In 2009, the United States-based NGO the Polus Center was awarded a grant to bring together local governments, organizations involved in VA, and landmine survivors and their families to develop a VA plan. As of 6 July 2009, activities had not yet started.⁶⁵

On 23 December 2008, Peru approved the “Plan of Equality of Opportunity for Persons with Disability 2009–2018” which includes “goals, objectives and precise indicators to allow for the efficient monitoring of progress in its implementation.”⁶⁶ As called for by the plan, a permanent, multisectoral commission was created on 2 March 2009, to ensure that all relevant sectors are involved in its implementation. CONADIS is the technical secretary for this commission.⁶⁷ The plan was developed with participation from civil society, including persons with disabilities.⁶⁸ However, a government representative noted that the Plan of Equality of Opportunity lacked sufficient funds to be implemented.⁶⁹

Integration of mine action with reconstruction and development

The peace agreement that ended the territorial dispute between Peru and Ecuador included the creation of jointly managed contiguous national parks called the Condor Mountain Range Transboundary Protected Area. The government of Peru has also reported the possibility of extracting minerals from the Condor Mountain Range area after all the mines have been removed. Mine action was the impetus for creating the Coordination and Political Consultation of the Ministry of Foreign Affairs and the Ministry of Defense for Peru and Ecuador Forum (the “2+2” Framework) in which representatives from the armies of each country and the presidents meet to discuss and resolve issues related to clearing mines on their shared border.

Since October 2007, Peru and Ecuador have met three times within the “2+2” framework to discuss progress towards meeting Mine Ban Treaty obligations within the extension periods granted by States Parties to the two nations in November 2008. At the meeting in October 2008

the presidents of Peru and Ecuador agreed to use the Andean Development Corporation as a funding mechanism for mine action and each country committed US\$2 million as seed money.⁷⁰ It was also agreed that Peru be allowed to evacuate injured deminers to Quito, Ecuador, thus halving the travel time for evacuations.⁷¹

National ownership

Commitment to mine action and victim assistance

Peru has demonstrated a commitment to mine action through its earlier engagement with the OAS in establishing a program to clear mines on the border with Ecuador and the creation of Contraminas. In February 2009, a government representative recognized the need for greater focus on VA, stating that, “The government knows that it must emphasize its efforts in improving the planning and implementation of victim assistance.”⁷² In April 2009, Contraminas added a dedicated staff position for VA.⁷³

National management

Contraminas is responsible for overall management and day-to-day coordination of mine action activities and the OAS has assisted Peru in mine clearance since May 2001. The Assistance Mission for Mine Clearance in South America (Misión de Asistencia a la Remoción de Minas en Suramérica, MARMINAS), established by the Inter-American Defense Board in May 2003 to support mine clearance in both Ecuador and Peru, provides technical advice to the OAS and monitors demining operations.⁷⁴ OAS monitors from Brazil and Chile are based in Ecuador to support the Peruvian army’s clearance operations.⁷⁵

National mine action legislation

Contraminas was established in December 2002 by government decree.⁷⁶ A further decree of 2 July 2005 clarified its roles and responsibilities.⁷⁷

National mine action standards/Standing operating procedures

The Peruvian Armed Forces follow procedures drafted by Contraminas in 2004 and the army’s technical manual drafted in 2002, which are both said to be based on international standards.⁷⁸ Demining by the police also follows the army manual, which has a chapter dedicated to procedures for demining high-tension electricity pylons.⁷⁹ In July 2008, the Geneva International Centre for Humanitarian Demining (GICHD) conducted a workshop in Lima on the development of national standards based on the International Mine Action Standards for representatives of the Peruvian government, the army and police, and the OAS.⁸⁰ GICHD reviewed Contraminas’ revised national mine action standards and provided comments in November 2008, and a second workshop in support of national standards was held in Lima in March 2009.⁸¹ There are no national standards for risk education.

Program evaluations

In January 2008, GICHD conducted an evaluation of the 2005–2007 European Commission (EC) Mine Action Strategy in Latin America. In the case study of Peru the evaluation concluded that even though mine clearance at the border was very slow and Peru was not a heavily mine-affected country, it has been a success in terms of peace-building with Ecuador. The evaluation was critical of the isolation of the national police demining unit whereby the same technical assistance provided to the army was not provided to the police. It recommended that, unless the EC improves its technical capacity in Peru to monitor any project it funds, the EC should otherwise stop funding mine action.⁸²

The evaluation also concluded that the initial work of the OAS in establishing contact between the Peruvian and Ecuadoran armies after the conflict ended had been a significant contribution to starting mine action in Peru, but that more recently it seemed the Peruvian army did not clearly understand the technical contribution offered by the OAS to the clearance work on the border with Ecuador. The evaluation was critical of the achievements at the border (197 mines cleared when the target was 1,500 out of about 30,000 to be cleared) and questioned the OAS's effectiveness based on such modest outputs.⁸³

Demining and Battle Area Clearance

The Armed Forces Demining Directorate, DIGEDEHUME, is responsible for clearance of the border with Ecuador. A specialized unit of the national police, the Security Division (División de Seguridad, DIVSECOM), is responsible for clearing mines around the high-tension electricity pylons and other infrastructure. The police units demining infrastructure planned to finish clearing the three prisons and two police bases in 2010. It is anticipated that the completion of infrastructure clearance may make available 70 to 80 trained and equipped deminers who could be integrated with the army units working along the border. The decision on this will have to be taken at the ministerial level.⁸⁴

As a result of fewer resources, in 2008 Peru reduced the number of personnel in each demining team and trained the deminers to perform multiple functions, which was expected to increase efficiency, if not productivity. In addition, each paramedic would support two teams.⁸⁵

In 2008, the police demining teams cleared the remaining 324,800m² of land near 393 electrical pylons, three antennas, and one substation. During the clearing of the pylons, antennas, and substations since 1999 the police demining teams cleared 2,040,925m² and found and destroyed 82,125 mines.⁸⁶

The Peruvian army destroyed 767 antipersonnel mines in the Chiqueiza area of Río Santiago district (Amazonas department) in the Condor Mountain Range.⁸⁷ Peru did not report that any mined areas were completely cleared or that any suspected areas were reduced. The mountainous terrain and rainy weather are cited as the main reasons for the slow progress in clearing mines at the border. The frequent wet weather also limits the availability of the sole helicopter assigned by the Peruvian army to the demining teams.⁸⁸

⁸⁸ Statement of Peru, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009.

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Peru was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. In previous years, Peru had made several statements that it would meet its Article 5 deadline. In November 2005, an OAS-EC agreement for joint demining in Peru and Ecuador stated that the activities being funded should enable Peru to “achieve the objective of declaring its national territory free from antipersonnel mines in 2010.”⁸⁹ In September 2006, Peru informed other States Parties that it would develop a national plan for mine action, in order to complete clearance by 2009. Peru stated all minefields associated with 1,711 high-tension electricity towers would be cleared by 1 July 2007, all police stations would be cleared by 1 July 2008, and the remainder of the electricity towers would be cleared by March 2009.⁹⁰

In January 2007, however, Peru announced it would not be able to meet its deadline. It presented a draft request for a 10-year deadline extension at the April 2007 intersessional Standing Committee meetings. In March 2008, Peru formally submitted a request for a 10-year extension to its Article 5 deadline, until 1 March 2019. Peru cited a number of factors, such as troop rotations, logistics, weather, and lack of helicopter support, for not meeting its deadline. In its extension request, Peru did not include plans to increase clearance capacity despite the poor level of progress so far. After two productive years in 1999 and 2000 when 34 mined areas covering 298,954m² were cleared, its mine clearance program on the border in the subsequent eight years cleared only 33,000m². Peru also submitted an operational plan to clear all mined areas around high-tension electricity pylons, antenna transmitters, penitentiaries, and police substations by 2010.⁹¹

Demining from 1999–2008

	No. of mined areas in 1999	No. of mined areas at end-2008	Size of mined area in 1999 (m ²)	Size of mined area at end-2008 (m ²)
Border	69	34	512,329	192,061
Prisons	3	3	11,167	11,167
Police Stations	2	2	N/R	N/R
Electrical Towers	2,518	0	2,040,945	0
Transmission Antennas	3	0	1,600	0
Substations	1	0	6,200	0

N/R = not reported

In response to the request, the ICBL noted that “even allowing for the difficult terrain, granting a blanket 10-year extension is not recommended to a country that has not adequately addressed contamination on its border with a former adversary. An extension of no more than six years is recommended, and Peru should re-submit an operational plan that includes addressing the number of deminers, logistics and communications and new arrangements with Ecuador.”⁹²

In August 2008, Peru submitted a revised request seeking an eight-year extension. In November 2008, States Parties granted Peru the requested extension. States Parties noted that if Peru used all its resources and techniques available, it could clear all the remaining mined areas

sooner than eight years and this would benefit both the Mine Ban Treaty and Peru, given the indication by Peru of the socio-economic benefits that will flow from demining.⁹³

Risk Education

In 2008, risk education (RE) reached at least 10,896 people, and consisted mainly of mass media and *ad hoc* activities in communities alongside clearance and some training of teachers.⁹⁴ It was implemented by the police, ministries of interior and education, Contraminas, AVISCAM, EDEGEL, and the OAS.

In 2008, most direct RE was conducted on the outskirts of Lima for communities living near the mine contaminated high-tension electricity pylons to deliver messages about mines, as well as improvised mines and grenades. Training of teachers was conducted for communities living near the border with Ecuador, which are at risk from 35 hazardous areas, and communities near the high-tension electricity towers. During an assessment of the mine problem around the penal institutions in mid-2008, a one day presentation on RE was given to the authorities and police in preparation for future RE activities. Security problems around the contaminated police stations prevented RE from taking place there.⁹⁵

RE has been limited for the last 10 years, and has focused on communities around the high-tension electricity towers in the departments of Ica, Junín, and Lima, and along the border with Ecuador. Since 2000 it has been implemented by the national police and the army. The ICRC started RE in 2002 with the support of the Unit of Peasant Communities of the Central Andes (Unidad de Comunidades Campesinas de la Sierra Central del Peru, UCSICP), and Contraminas ran an RE training program for teachers and community leaders in Junín and Huancavelica in 2003. However, plans to extend this project to other regions were not realized until 2007. In 2005, AVISCAM started to conduct RE. In late 2007 the Ministry of Interior launched its “Fields that Kill” campaign about victim-activated IEDs during coca eradication.

Risk education activities in 2008⁹⁶

Organization	Type of organization	Type of activity	Geographic area	No. of beneficiaries
Contraminas, national police, and AVISCAM	NGO and Government	Basic RE in a three week program, through one day workshops for community members	Lima (Naña and Huinco sectors) near the high-tension electricity towers	6,996, including 6,251 students and 745 adults in 18 schools and 9 communities
OAS and Ministry of Education	Government	Training of teachers	Near the border with Ecuador, and in Huancavelica and Junín departments, near the high-tension electricity towers	50
DIVSECOM	Police	In schools and communities alongside clearance activities	Lima (Barranca, Lima, and Huarochiri provinces), Junín (Yauli, Jauja, Concepción, Chupaca, and Huancayo provinces) and Huancavelica (Castrovirreña province)	3850
Contraminas	Government	Workshop on international humanitarian law included awareness of landmines on the Chilean side of the border with Peru	El Escudero and Papayacu, around Santiago river, Condor Mountain Range Puno, Tacna department	Not available
Ministry of Interior	Government	"Fields that kill" mass media campaign about IEDs during coca eradication	Pucallpa city Coronel Portillo province, Ucayali department; Tingo Maria city (Leoncio Prado province, Huanuco department); and Tocache province (San Martín department)	Not available

Victim Assistance

The total number of survivors is unknown, but is at least 372.⁹⁷ Most persons with disabilities in Peru do not receive adequate services.⁹⁸ The "scattered and rural nature" of landmine/ERW incidents made it challenging to identify and provide services to landmine survivors, since the limited services available remained centralized in the capital, Lima.⁹⁹ Military and police mine/

⁹⁶ Response to Landmine Monitor questionnaire from Jorge Liza, DIVSECOM, 31 March 2009; interview with Wilyam Lúcar Aliaga, Contraminas, in Geneva, 27 May 2009; telephone interview with Sixto Estrada, Ministry of Education, 28 April 2009; telephone interview with Wilyam Lúcar Aliaga, Contraminas, 29 April 2009; and email from Carlos Estrada, former President, AVISCAM, 10 March 2009.

⁹⁷ Calculated by adding the 265 injured by mines and 107 ERW survivors reported by Contraminas in 2008. See *Landmine Monitor Report 2008*, p. 575.

⁹⁸ National Human Rights Coordinator, "Informe Anual 2008" ("Annual Report 2008"), Lima, 4 April 2009, p. 123.

ERW survivors are entitled to adequate services,¹⁰⁰ but bureaucratic procedures have prevented some from accessing this care.¹⁰¹

In 2008, the government found that 62% of persons with disabilities lacked health insurance and only 13% were receiving some kind of therapy or rehabilitation.¹⁰² While specialized services for emergency care and physical rehabilitation existed in Lima, not all services were accessible to civilian mine/ERW survivors and services in rural areas were limited.¹⁰³ Ninety percent of Ministry of Health staff were based in Lima.¹⁰⁴ Emergency medical care for mine/ERW casualties depended on the incident location, the availability of emergency transport, and climatic and road conditions.¹⁰⁵ The evacuation of the 23 April 2009 casualty to an appropriate medical facility took nearly 23 hours because of the remote location, rain which prevented a helicopter evacuation, and lack of sufficient medical facilities nearby.¹⁰⁶ Regional and local health centers continued to lack funding and trained personnel.¹⁰⁷

In November 2008, Peru stated that 20 regional health centers had the equipment and trained staff to provide rehabilitation services, as did the health facilities of the national police and the armed forces. In the same statement, however, Peru reported that amputations and other complicated procedures were only done at the National Institute of Rehabilitation (Instituto Especializado de Rehabilitación, INR) near Lima, which is difficult to reach for most survivors.¹⁰⁸ The INR has no technicians with internationally recognized credentials and some of its equipment was antiquated and in need of replacement.¹⁰⁹ The ICRC Special Fund for the Disabled (SFD) found that the INR faced challenges in the quality and quantity of its services.¹¹⁰ In 2008, the Saint John Clinic and Home (Hogar Clínica San Juan de Dios, HCSJD), a rehabilitation center based in Lima offering prosthetics and orthotics to children with disabilities, closed its prosthetics department.¹¹¹

Comprehensive care is available at the INR and physiotherapy and psychosocial support services are free of charge for survivors.¹¹² In 2008, the OAS began covering the costs for the prostheses, transport and accommodation for landmine survivors referred to the INR by Contraminas.¹¹³ In 2008, AVISCAM went to the INR to request prosthetic devices for two landmine survivors but were told there were no materials available. They found services at a private rehabilitation center to be cheaper and more efficient.¹¹⁴

¹¹⁴ Email from Carlos Estrada, AVISCAM, 10 March 2009.

Community-based rehabilitation (CBR) services exist in poor neighborhoods in Lima, and there were plans to expand the program to other parts of the country. As of March 2009, however, this had not happened, due to a lack of funding.¹¹⁵

Economic reintegration opportunities for survivors were limited and employment rates for persons with disabilities were low.¹¹⁶ Centro de Formación Técnica para Personas con Discapacidades (Center for Technical Training for Persons with Disabilities), managed by CONADIS, is the only training center in the country focused on persons with disabilities. The center faced budgetary shortfalls in 2008 and access was limited to students from one section of Lima, because of a lack of public transportation.¹¹⁷

Civilians who have demonstrated that their disability makes them unable to work receive a pension of PEN415–800 (\$144–278), depending on the degree of the disability.¹¹⁸ An NGO representative believed that few survivors received a pension.¹¹⁹ In November 2007, Peru stated that the National Council for Reparations for Political Violence (Consejo Nacional de Reparaciones por la Violencia Política) had amended its regulations so that mine casualties and their families who could demonstrate that their incident was caused by “terrorism” could apply for compensation.¹²⁰ In 2009, Contraminas began notifying survivors to let them know how to apply to the fund.¹²¹

Discrimination against persons with disabilities is prohibited by law, but the government provided limited funding to enforce the law and many persons with physical disabilities remained economically and socially marginalized. Despite a law requiring physical accessibility to public spaces for persons with disability, the government made little effort to ensure access to public buildings.¹²² On 7 February 2009, Peru passed a law establishing penalties for failing to comply with the General Law of Persons with Disability.¹²³ On 30 January 2008, Peru ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol.

Progress in meeting VA26 victim assistance objectives

As one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate attention to survivors,¹²⁴ Peru presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005. As of July 2009, it had not updated its objectives nor had it developed formal plans to achieve them. All but two of Peru’s objectives had timeframes of “by end 2006” and all of these had lapsed without significant progress having been observed.¹²⁵ Some limited progress occurred in data collection and coordination in the first half of 2009. A lack of funding has been cited to explain delays in implementing VA objectives.¹²⁶

¹²⁶ Interview with Wilyam Lúcar Aliaga, Contraminas, in Geneva, 26 May 2009.

Peru's 2008–2019 Mine Action Plan elaborated four VA objectives similar to Peru's 2005–2009 objectives, three of which had more specific (and delayed) timeframes. These were: to identify medical, physical rehabilitation, and economic integration services for survivors by July 2008; to identify and register all mine victims in Peru by March 2009; and to develop a pilot project to provide services to landmine survivors before 2008.¹²⁷ The first two objectives had not been achieved by the deadline and the third objective was mostly completed only by the end of 2008. As of July 2009, no progress had been observed in identifying services for survivors and Peru had not yet identified all survivors or assessed their needs, an obstacle that prevented the development of a strategy to assist survivors.¹²⁸ Progress had been made in verifying data of survivors living in Lima and there had been improvements in collecting casualty data from the military and the police.¹²⁹ By the end of 2008, the pilot project to assist survivors, originally planned for 2004, had provided comprehensive care to 14 survivors, a reduction from the goal of 23 that it sought to assist.¹³⁰

As of May 2009, a national VA strategy had not yet been developed (an objective to be completed by 2009).¹³¹ The Polus Center project activities to develop a VA plan had not started as of 6 July 2009.¹³² Progress towards Peru's one objective in psychological support and social reintegration, "to facilitate accessibility to services offering psychosocial support, if requested, for all registered mine survivors by 2006" had completely stalled in 2008.¹³³ AVISCAM, the only functioning survivor group in the country, reported that there had been no cooperation with the authorities on any survivor services in 2008.¹³⁴

Peru has provided updates on progress and challenges in VA at all intersessional meetings and meetings of States Parties since 2005 and has also used the Article 7 Form J to provide similar information for all years since 2005.¹³⁵ The statements have mainly provided general information on government bodies and policies dealing with disability and activities conducted by the INR. Statements in 2008 and 2009 repeated the objectives outlined in the mine action plan (including the objectives that had expired at the time of the May statement but had not been revised) without reporting specifically on progress towards the 2005–2009 objectives. Statements from 2007, 2008, and 2009 repeated information on general health advances without noting the year in which the progress occurred.¹³⁶ Peru's delegation included an INR representative as its VA expert to the intersessional meetings in 2006, 2007, 2008, and 2009, and meetings of States Parties in 2005, 2007, and 2008.¹³⁷ Peru had two VA/disability experts attend the VA parallel session at the Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas in February 2009.

¹³⁷ Statement by the Co-Chairs of the Standing Committee on Victim Assistance and Socio-economic Reintegration, Ninth Meeting of States Parties, Geneva, 28 November 2008, p. 15.

Victim assistance activities

In 2008, through the Victim Assistance Pilot Project, with support from the OAS, the INR provided psychological support and rehabilitation services to nine landmine survivors, referred by Contraminas, bringing the total number of beneficiaries to 14 for 2007 and 2008.¹³⁸ The project originally aimed to provide comprehensive services to 23 people but four recipients refused help and another five could not be located.¹³⁹ Peru's latest Article 7 report listed 10 beneficiaries assisted by the INR between 1 March 2008 and 1 March 2009.¹⁴⁰ Social Security, the armed forces and police rehabilitation services assisted 40 military landmine survivors.¹⁴¹

The INR offers training courses in starting small businesses to persons with disabilities, supported by private funding,¹⁴² and in 2008, the Ministry of Health launched an initiative to open convenience stores in all health centers to employ persons with disabilities.¹⁴³

In 2008 and 2009, CONADIS' Center for Technical Training for Persons with Disabilities provided eight three-month employment training courses.¹⁴⁴ Some 120 to 150 students attend courses at the center each quarter; it is unknown if students have included any mine/ERW survivors.¹⁴⁵

In 2008, AVISCAM provided prostheses and support for transportation, accommodation, and costs of medicine for 18 landmine survivors. While in 2007 Contraminas and AVISCAM worked on a project to include mine survivors in RE and VA planning and as "observers" during humanitarian demining operations,¹⁴⁶ in 2008, AVISCAM was excluded by the national authorities from all of these activities, including VA planning.¹⁴⁷

The ICRC SFD carried out support visits to the INR and the HCSJD in Lima in August 2008.¹⁴⁸ According to the INR, "the materials delivered in 2008 by the ICRC SFD were used to assist one landmine survivor and the rest were used to assist persons with disabilities living in poverty."¹⁴⁹ An INR technician attended a three-week SFD course at the Universidad Don Bosco School of Prosthetics and Orthotics in El Salvador on polypropylene technology for lower-limb prostheses.¹⁵⁰

Support for Mine Action

In March 2008, Peru reported a projected total estimated cost of \$17,944,207 (€13,087,453) for fulfilling its mine clearance obligations during a requested extension period of 2009–2019. Of this amount, \$16,236,207 (€11,841,738) was required for mine action operations by the armed forces and \$1,708,000 (€1,245,715) for operations by the national police.¹⁵¹ In August 2008, Peru issued a revised Article 5 extension request for the period 2008–2017, including a new budget totaling PEN87,196,123.¹⁵² Peru reported the US dollar equivalent as \$25,889,106; however, at the average 2008 exchange rate, the amount is closer to \$30,335,531. The budget does not break down costs by year, but provides totals for each budget item for the entire extension period.

¹⁵¹ Article 5 deadline Extension Request, 28 March 2008, p. 42.

¹⁵² Article 5 deadline Extension Request (revised), 18 August 2008, p. 147.

Ecuador and Peru continued in 2008 to coordinate resource mobilization as part of their overall cooperative efforts in mine action. Ecuador and Peru held a joint meeting in Quito in September 2008 with mine action NGOs and representatives from diplomatic missions of donor countries to develop coordinated funding for clearance operations in both countries.¹⁵³ Peru has not reported on the results of this meeting or subsequent resource mobilization efforts.

National support for mine action

Peru re-established mine action as a specific item in the national budget in 2006, after suspending it in 1999.¹⁵⁴ In its August 2008 Article 5 deadline extension request, Peru stated its intention to provide \$17,807,906 in national funds during the extension period, or 69% of the total reported cost of \$25,889,106. Peru reported contributing \$960,911 from national funds to mine action in 2008, consisting of \$768,463 to the armed forces and \$192,448 to the national police.¹⁵⁵

National budget

Between 1999 and 2008, Peru's own contributions to all funds for mine action in the country totalled more than \$7 million (approximately 60%). Peru's Article 5 deadline extension request indicates it intends to cover a greater proportion of costs during the extension period by doubling its annual state contributions, beginning with approximately \$2 million in 2009. For the complete eight-year extension period Peru has committed to contributing more than \$17.8 million, of which \$16.56 million is for clearing areas along Peru's border with Ecuador and \$1.25 million for clearing national infrastructure.¹⁵⁶ The private electricity companies, ETECEN, EDEGEL, and CAHUA, which have concessions for the power lines, have contributed to the clearance/quality control of the electricity pylons.¹⁵⁷

International cooperation and assistance

In 2008, two countries reported providing a total of \$447,257 (€235,812) directly to mine action in Peru. The United States contributed \$300,000 via the Department of State for unspecified mine action, while Germany contributed \$147,257 (€99,998) worth of equipment to support mine clearance operations. In 2007, Spain reported providing \$207,232 (€151,143) to mine action in Peru.

In 2008, the OAS reported funding to Ecuador/Peru mine action projects via the OAS totaling \$1,285,195 (€872,739), from Canada (\$318,773), Norway (\$300,000), the EC (\$280,259), Spain (\$280,092), and Italy (\$106,071). The OAS did not specify how much was allocated to each country. Reporting to Landmine Monitor by Spain and Italy for 2008 included contributions to the OAS for projects in Latin America, including mine action in Ecuador and Peru, but Spain did not specify the amount directed to projects in those countries.¹⁵⁸

In June 2009, RONCO, under contract with the US Department of State, opened an office in Lima and began providing technical assistance to Contraminas to expand its capacity, including developing a centralized training capacity for police and army deminers. The contract also includes providing Peru with \$150,000 in new demining equipment, out of an assessed need for \$600,000.¹⁵⁹ As of May 2009, the Polus Center had received a grant of \$120,000 to increase national VA capacity through training.¹⁶⁰

PHILIPPINES

Ten-Year Summary

The Republic of the Philippines became a State Party to the Mine Ban Treaty on 1 August 2000. It had already destroyed its stockpile of Claymore-type antipersonnel mines in 1998. Implementation legislation has been repeatedly introduced in Congress since 2000, but has never been passed. At least three rebel groups have used antipersonnel mines or victim-activated improvised explosive devices (IEDs): New People's Army (NPA), Moro Islamic Liberation Front (MILF), and Abu Sayyaf Group. The NPA's use violated a 1998 agreement with the government that included a commitment not to use landmines. Five other rebel groups, including the MILF, have formally pledged in writing not to use antipersonnel mines.

The Philippines denies the existence of any mined areas, but has reported and continues to face use of landmines and IEDs in continuing low-level insurgencies by the NPA and Muslim groups. Since 1999, Landmine Monitor has identified 457 casualties from landmines, explosive remnants of war, and IEDs. Landmine Monitor reported risk education activities for the first time in 2006, but activities appear to be insufficient. Access to emergency medical care and physical rehabilitation for persons with disabilities was limited because of the centralization of services. Disability regulations were weak and unimplemented.

Mine Ban Policy

The Philippines signed the Mine Ban Treaty on 3 December 1997 and ratified it on 15 February 2000, becoming a State Party on 1 August 2000.

On 4 March 2009, the Philippine Congress took an important step toward passing national implementation legislation by holding the first hearing on the Philippine Landmine Bill.¹ Previous bills introduced in the Congress since 2000 were never called for public hearing, as they were given low priority.² As of July 2009, the bill was still at the Technical Working Group level.³ In May 2009, the Philippines stated, "it is hoped that our law will pass before the next round of national elections to be held in May 2010."⁴

As of 1 July 2009, the Philippines had not submitted its annual Article 7 report due 30 April 2009. It also never submitted a report in 2008.⁵ In March 2009, a Department of Foreign Affairs official said that it was working on the report.⁶ The Philippines has submitted eight previous reports, the most recent of which is dated 31 March 2007.⁷

¹ The Philippine Landmine Bill refers to House Bill No. 1054 and Senate Bill No. 1595. The bill would comprehensively prohibit victim-activated antipersonnel mines and implement both the Mine Ban Treaty and CCW Amended Protocol II.

² See *Landmine Monitor Report 2008*, p. 583; and *Landmine Monitor Report 2007*, p. 576.

³ The Chair of the Committee on Foreign Affairs, Rep. Antonio V. Cuenco, organized a Technical Working Group to consider the bill, headed by Rep. Roque Ablan and bill author Rep. Ana Theresia Hontiveros-Baraquel.

⁴ Statement of the Philippines, Standing Committee on the General Status and Operation of the Convention, Geneva, 29 May 2009.

⁵ At the June 2008 intersessional Standing Committee meetings, the Philippines informed States Parties that it would "in due course update" its reporting. Statement of the Philippines, Standing Committee on the General Status and Operation of the Convention, Geneva, 6 June 2008.

⁶ Telephone interview with Leah B. Ruiz, Director, Political and Security Issues Division, Department of Foreign Affairs, Manila, 6 March 2009.

⁷ Previous reports were submitted: 31 March 2007, 3 November 2006, 9 May 2005, 15 February 2004, 14 May 2003, 5 April 2002, 12 September 2001, and 12 September 2000. Some reports were incomplete.

The Philippines attended the Ninth Meeting of States Parties in November 2008 in Geneva, where it made a statement in support of Thailand's request for an extension of its mine clearance deadline. It also attended the May 2009 intersessional Standing Committee meetings, where it made a statement outlining its progress on national implementation legislation and other matters.

The Philippines has not made known its views on key matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

The Philippines is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It has not submitted an annual Article 13 national report since 2005. It is not party to CCW Protocol V on Explosive Remnants of War. The Philippines signed the Convention on Cluster Munitions in December 2008, but had not yet ratified it as of 1 July 2009.⁸

Production, transfer, stockpiling, and use

The Philippines has previously stated that it did not produce or export antipersonnel mines. It destroyed its entire stockpile of antipersonnel mines—all Claymore-type mines—in 1998. It did not retain any live mines for training purposes. The Armed Forces of the Philippines (AFP) has stated that it has never used antipersonnel mines to combat insurgency within the country.

Non-state armed groups

The Moro Islamic Liberation Front (MILF) on 21 October 2008 became the fourth armed group in the country to sign the "Rebel Group Declaration of Adherence to International Humanitarian Law on Landmines" produced by the Philippine Campaign to Ban Landmines (PCBL).⁹ The MILF previously signed Geneva Call's Deed of Commitment, thereby committing to no use of antipersonnel mines, as did two other rebel groups.¹⁰

There have been reports of use of improvised antipersonnel mines by rebel groups in this reporting period (since May 2008). Non-state armed groups (NSAG) in the Philippines have produced and used both command-detonated and victim-activated IEDs, but are not known to possess or use factory-made landmines, other than Claymore-type directional fragmentation devices.¹¹

The government has accused both the NPA and the MILF of using "banned" landmines. In January 2009, Defense Secretary Gilbert Teodoro condemned what he described as the increasing use of landmines, while Interior Secretary Ronaldo Puno said that the Philippine National Police (PNP) has basis to file a case of human rights violation against the NPA for its continued use of landmines.¹²

⁸ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 144.

⁹ PCBL, "Moro Islamic Liberation Front Signs New Declaration For Rebel Group Adherence To IHL On Landmines," Press release, 15 November 2008, www.nonviolenceinternational.net. This declaration unilaterally commits the signatory to the spirit of the Mine Ban Treaty, CCW Amended Protocol II and Protocol V (Explosive Remnants of War), as well as customary international humanitarian law rules regarding use of landmines and explosive devices. The other signatories are: the Rebolusyonaryong Partido ng Manggagawa-Mindanao/Revolutionary People's Army (RPMM/RPA) in February 2008; the Rebolusyonaryong Partido ng Manggagawa-Pilipinas/Revolutionary Proletarian Army-Alex Boncaya Brigade (RPMP/RPA-ABB) faction of Nilo de la Cruz, in May 2008; and the Marxista-Leninistang Partido ng Pilipinas/Rebolusyonaryong Hukbong Bayan (MLPP/RHB) in July 2008.

¹⁰ The Revolutionary Workers Party of the Philippines/Revolutionary Proletarian Army-Alex Boncayao Brigade and the Revolutionary Workers Party of Mindanao/Revolutionary People's Army.

¹¹ In October 2008, a factory-made M18A1 Claymore mine was recovered from a house in General Santos City. "11 injured in grenade, rocket attacks in Mindanao," *GMA News and Public Affairs*, 4 October 2008, www.gmanews.tv. When command-detonated, use of these devices is permitted by the Mine Ban Treaty. When victim-activated, usually by a tripwire, they are banned.

¹² Raymond Africa, Victor Reyes, and Jocelyn Montemayor, "Rights violation charges vs NPA over mines eyed," *Malaya*, 6 January 2009, p. A6.

The AFP and the PNP annually provide the PCBL with data on landmine incidents, including information on the type of mines, seizures and recoveries, and number and names of casualties, whether killed or injured.¹³ The data may indicate some use by both the MILF and the NPA of victim-activated improvised explosive devices, which are prohibited by the Mine Ban Treaty, but nearly all instances appear to involve the use of command-detonated devices, which are permitted under the Mine Ban Treaty.

New People's Army

The NPA, the armed wing of the Communist Party of the Philippines, signed a Comprehensive Agreement to Respect Human Rights and International Humanitarian Law (CARHRIHL) with the Philippine government in The Hague, Netherlands, in 1998.¹⁴ Government and AFP officials have accused the NPA of violating CARHRIHL by repeatedly using landmines in 2008 and 2009. In December 2008, a military spokesperson said, "The Philippines Army strongly condemns the NPA's continued and growing use of landmines in their attacks on government troops and calls out to the international community to make appropriate action or sanction on this."¹⁵

The NPA again acknowledged, in 2008, that it manufactures and uses command-detonated antivehicle and antipersonnel weapons, but denied any use of victim-activated mines, insisting that it will continue to use only command-detonated explosives not prohibited by the Mine Ban Treaty. It stated that it does not permanently plant its command-detonated devices, but rather "they are immediately taken when no enemy pass these routes."¹⁶

AFP and media accounts indicate the NPA on some occasions may have used victim-activated devices. In July 2008, two soldiers on patrol were reportedly injured when a "pressure released" landmine exploded in Maco, Compostela Valley.¹⁷ In September 2008, three soldiers were killed and 14 injured after they "tripped" landmines used as booby-traps near an NPA camp in Surigao del Sur province.¹⁸ In November 2008, six soldiers were killed and four injured after "they stepped on landmines planted by NPA rebels" in Baganga, Davao Oriental, and Maco, Compostela Valley.¹⁹ All other reported incidents appear to have been command-detonated antipersonnel mines and IEDs used in ambushes, or antivehicle mines and IEDs (some of which may have been vehicle-activated).

Moro Islamic Liberation Front

Following the collapse of negotiations between the government and the MILF, renewed hostilities in Mindanao resulted in increased armed conflict. The AFP launched air and ground attacks in suspected MILF areas for three days in August 2008, during which the AFP accused MILF rebels of planting landmines in North Cotabato and Maguindanao, and preventing more than 130,000 people from returning to their homes.²⁰ The AFP said that it had to clear landmines

¹³ The latest were "Matrix of Landmine Incidents and Recoveries," provided by Maj.-Gen. Carlos B. Holganza, Deputy Chief of Staff for Operations, J3, AFP, 18 March 2009; and "Landmine Explosion Incidents, Matrix," provided by email from Ferdinand Garay, Superintendent, PNP, 11 March 2009.

¹⁴ CARHRIHL, Part III: Respect for Human Rights, Article 2 (15), 16 March 1998, hdcentre.org. The government considers use of command-detonated devices as well as any type of landmine as banned by CARHRIHL, while the NPA considers only use of victim-activated devices banned.

¹⁹ "Landmine Explosion Incidents, Matrix," provided by PNP, 11 March 2009. The same incident was reported in the "Matrix of Landmine Incidents and Recoveries," provided by AFP, 18 March 2009.

²⁰ See *Landmine Monitor Report 2008*, p. 587.

from areas vacated by MILF rebels in North Cotabato and Maguindanao.²¹ The MILF, however, denied the AFP's allegations that it planted landmines.²²

On 27 April 2009, Landmine Monitor met four AFP officers at the 36th Infantry Battalion Headquarters, Barangay San Roque, Bislig City, Surigao del Sur and was shown recovered mines, all of which were command-detonated Claymore antipersonnel mines or command-detonated antivehicle mines. No victim-activated mines were recovered, according to the AFP officers.²³

There have been reports of explosive incidents in which the weapons may have been victim-activated. In August 2008, a Scout Ranger soldier reportedly "tripped" a landmine during a clearance operation in Aleosan town in central Cotabato province.²⁴ On 14 October, in Tukanalipao village, Maguindanao, a soldier reportedly "stepped on a landmine, causing it to explode."²⁵ On 17 October, a landmine allegedly planted by MILF rebels was detonated by a farmer's water buffalo, injuring both the farmer and his animal, in Datu Piang, Maguindanao.²⁶

Based on the available information, Landmine Monitor cannot conclude definitively that the MILF used victim-activated antipersonnel mines or IEDs during this reporting period. In addition to the lack of clarity about victim-activated versus command-detonated devices, it is not clear in some incidents if the MILF was responsible, or another armed group such as Abu Sayyaf. In April 2009, the armed forces approved a mission by Geneva Call to verify allegations of violations of the Deed of Commitment.²⁷

Scope of the Problem

Contamination

The Philippines is affected by explosive remnants of war (ERW), especially UXO. The extent to which it is also affected by mines is unclear. The Philippines has consistently denied in its Article 7 reports that it has any mined areas containing antipersonnel mines and says that whenever mines or IEDs are found they are immediately removed.²⁸ However, a low level insurgency continues in which NSAGs have used mines and IEDs, and UXO continues to accumulate in areas of continued insurgency in the south.

The AFP claims that the NPA and MILF continued to use antipersonnel mines in 2008 and 2009. It reported 38 landmine incidents or retrieval of landmines involving the two non-state armed groups in Mindanao, the Visayas, and Luzon provinces (see Non-state armed groups section above).²⁹ In July 2008, the AFP reported that the NPA may have placed landmines in residential areas.³⁰ Police Superintendent George Gaddi also reported nine landmine incidents in 2008, most involving the NPA.³¹

³¹ Statement by George Gaddi, Superintendent, PNP, Congressional Hearing on Landmines Bill, Philippine Congress, 4 March 2009.

The NPA denies using landmines, but acknowledges that it continues to use command-detonated IEDs in attacks on government security forces, asserting that these are legitimate weapons of war (See New People's Army section above).³²

Mindanao is affected mainly by UXO resulting from conflict between the government and Muslim rebels dating back more than 30 years. UXO contamination reportedly increased in 2007 and 2008 because of continuing hostilities between the MILF and the AFP involving use of air strikes and ground artillery.³³ However, the AFP also reported 14 landmine incidents involving the MILF in 2008.³⁴

A preliminary assessment of contamination in areas of conflict in central Mindanao conducted by the Swiss Foundation for Mine Action (FSD) in 2005 showed the presence of hand grenades, mortar rounds, artillery shells, and aerial bombs remaining from armed hostilities over the years. These explosive hazards pose a threat to evacuees returning to their homes and farms, and could hinder rehabilitation and development projects in their communities.³⁵

Casualties

In 2008, 69 new mine/ERW/IED casualties were reported in 12 incidents, including 25 people killed, 43 injured, and one unknown. All casualties were adult men: two civilians and 67 security personnel, including three police. Mines caused 36 casualties, victim-activated IEDs nine, and unknown devices 24. Incidents occurred in seven provinces, mostly on Mindanao island, which is most affected by ongoing conflict. The greatest number of casualties (17) happened in Surigao del Sur province.³⁶

The 2008 casualty rate was nearly triple the 25 casualties in 2007, though fewer than the 145 casualties reported in 2005 at the height of the counterinsurgency campaign.³⁷ The increase in 2008 was due to intensified NPA activity and hostilities erupting between the MILF and the government.³⁸

Casualties continued to be reported in 2009, with at least four people killed and eight injured in two mine/ERW incidents through to 31 March. On 3 March, three children were killed and five others injured when an ERW exploded while they were playing in Buldon, Maguindanao. The adult casualties were from the security forces.³⁹

From 1999 to 2009 through 31 March, Landmine Monitor has identified 457 casualties from landmines, ERW, and IEDs (176 killed, 280 injured, and one unknown). The number of casualties per year has varied significantly over this period making it difficult to identify a trend. Additionally, the lack of detail about device types and detonation mechanisms in data provided by the AFP, PNP, and in media reports has made it difficult to accurately count the number of casualties of victim-activated devices.⁴⁰ Most explosive devices are used to target the military and are planted in regions where there is ongoing armed conflict. However, victim-activated devices and ERW posed a limited danger to the population in general in conflict areas.⁴¹

Program Management and Coordination

Mine action

The Philippines has no formal program for dealing with landmines, IEDs, or ERW. The AFP's Office of Civil Defense reported in August 2008 that it conducted mine clearance operations in Aleosan, North Cotabato, and Mindanao before allowing people displaced by war to return home.⁴²

United States forces provide some demining training and technical advice to the AFP, but they do not engage in demining, and training appears to be on a limited scale.⁴³

In 2007, the government and the MILF accepted in principle a joint proposal submitted by FSD and the PCBL to conduct survey, marking, and destruction of mines and UXO in MILF territory.⁴⁴ Discussions on implementing guidelines continued in 2008, but final agreement was held up by a resumption of hostilities between the government and the MILF following the collapse of negotiations over a Memorandum of Agreement on Ancestral Domains.⁴⁵

In 2007, the PNP increased the total number of its explosive ordnance disposal (EOD) technicians deployed in Mindanao from eight to 55—five in each of Mindanao's 11 provinces. The main purpose of the training was to prepare EOD teams to respond to terrorist bomb attacks.⁴⁶ In addition, the army, navy, air force, and the PNP each have EOD units deployed in a defensive role to areas of armed conflict such as Jolo and Cotabato. These include the army's EOD battalion and the air force's 710 Wing. These units dispose of IEDs and UXO in accordance with standing operating procedures after armed hostilities occur.⁴⁷

Victim assistance

Recognizing the need to strengthen governmental disability programs, the National Council on Disability Affairs (NCDA, previously the National Council for the Welfare of Disabled Persons) was transferred from the Department of Social Welfare and Development to the Office of the President in early 2008.⁴⁸ The NCDA formulates policies, coordinates activities by government agencies,⁴⁹ and monitors the implementation of legislation.⁵⁰

Data collection and management

There is no comprehensive government database of mine/ERW/IED casualties. The PCBL receives data from the AFP, PNP, and the Department of Foreign Affairs. This information is supplemented by nongovernmental sources such as the Philippine National Red Cross, NGOs, media, and private citizens.⁵¹

Risk Education

The AFP have implemented mine/ERW risk education (RE) activities in conflict-affected areas since 2005. The Philippines' latest Article 7 report, dated 31 March 2007, states that the AFP conducts EOD "Training and Bomb Threat Prevention Seminars to Military and Civilians as part of [its] sustainable Mine Awareness Education Program."⁵² The MINSIED Foundation, which provided RE in Mindanao in 2006 and 2007, reported no further activities.⁵³ The Philippine National Red Cross have disseminated visual material in displacement camps, highlighting the risks posed by UXO.⁵⁴

The plans of PCBL and FSD to conduct RE activities were put on hold in August 2008 when hostilities broke out between the AFP and MILF.⁵⁵ In 2009, they stated that RE to the internally displaced persons in Mindanao was "their first priority" and were looking for funding.⁵⁶

Given the relatively high number of mine/ERW/IED casualties, the amount of RE activities in the Philippines has been very limited over the last 10 years.

Victim Assistance

The estimated number of survivors is at least 275. No improvements in services for persons with disabilities were observed during 2008. As in previous years, services remained centralized in urban areas while armed clashes and most mine/ERW/IED casualties occurred in remote areas with limited healthcare.⁵⁷ Rehabilitation services were mainly provided by national NGOs. In 2008, the ICRC provided assistance to the Davao Jubilee Center.⁵⁸ In 2007, the Ministry of Health estimated that only 20% of persons with disabilities had access to rehabilitation services because of high transportation costs.⁵⁹

In 2008, increased hostilities in Mindanao caused the suspension of some planned disability activities.⁶⁰ In the second half of 2008, the ICRC increased support for emergency medical services, doubling personnel and distributing emergency medical supplies.⁶¹

Military mine/ERW/IED survivors receive some financial assistance from the government for their everyday needs. While there is no pension for civilian landmine survivors, some have been able to receive limited government support.⁶² The Alay sa Kawal (ASK) Foundation's Saludo sa

⁶² See *Landmine Monitor Report 2008*, p. 592.

Kawal (Salute to Soldiers) program, which previously assisted soldiers and their families, was unable to continue this support in 2008 because of a lack of funding.⁶³

Republic Act No. 9442, also known as the Magna Carta for Persons with Disabilities, outlines the rights of persons with disabilities, including employment quotas and health benefits.⁶⁴ But implementation remained ineffective because of weak regulations, insufficient funding, and an inadequate focus on integration of persons with disabilities.⁶⁵ The Philippines ratified the UN Convention on the Rights of Persons with Disabilities on 15 April 2008, but not its Optional Protocol. The 30th National Disability Prevention and Rehabilitation Week was celebrated from 17 to 23 July 2008, to raise awareness.⁶⁶

Support for Mine Action

The US reported contributing US\$800,000 to the Philippines through the USAID Leahy Fund in 2008.⁶⁷ USAID reported contributing at least \$626,750 to Handicap International for socio-economic reintegration of persons with disabilities in the Philippines, covering the period from October 2008 to September 2010.⁶⁸ These funds are presumably part of the overall \$800,000 contribution. No funding was reported for the Philippines for 2007.

RWANDA

2008 Key Data

State Party since	1 December 2000
Contamination	Antipersonnel and antivehicle mines, UXO
Estimated area of contamination	18,000m ² of mined areas (May 2009)
Casualties in 2008	Six (2007: 10)
Estimated mine/ERW survivors	Unknown but possibly 403–1,000
Article 5 (clearance of mined areas)	Deadline: 1 December 2010
Demining in 2008	520,192m ² of mined areas
Support for mine action in 2008	International: \$441,780 (2007: None)

Ten-Year Summary

The Republic of Rwanda became a State Party to the Mine Ban Treaty on 1 December 2000. It has not enacted national implementation legislation. Rwanda reported that prior to joining the treaty it destroyed all stockpiled antipersonnel mines inherited from the previous government. There were serious allegations of use of antipersonnel mines by Rwandan forces in the Democratic Republic of the Congo (DRC) in 2000, and of transfer of antipersonnel mines to non-state armed groups in the DRC as late as 2004. Rwandan officials have strongly denied all allegations.

The landmine problem in Rwanda originates from the 1994 genocide and its aftermath, affecting four of the country's 12 provinces. Rwanda established the National Demining Office under the Ministry of Defense in 1995 with army personnel conducting clearance. Progress slowed until 2006 when Mines Awareness Trust began supporting operations. In 2008, Norwegian People's Aid brought in mechanical assets to help clear the last major minefield. As of 1 July 2009, Rwanda was close to fulfilling its Article 5 obligations in advance of its deadline.

The number of casualties occurring between 1999 and 2008 is unknown as no reliable and complete data exists. From 1995 to 2001, Rwanda had a formal mine/explosive remnants of war (ERW) risk education program which, combined with clearance, resulted in decreased casualties. Since 2001, however, only basic awareness was provided due to lack of funds. There is no specific victim assistance strategy and mine/ERW survivors receive the same services as other persons with disabilities in Rwanda. Despite post-conflict efforts, the majority of persons with disabilities cannot afford the cost of services, including medical care.

Mine Ban Policy

Rwanda signed the Mine Ban Treaty on 3 December 1997 and ratified on 8 June 2000, becoming a State Party on 1 December 2000. The treaty was incorporated into domestic law with the presidential order of 24 December 1998.¹ Rwanda has not enacted further domestic legislation to implement the Mine Ban Treaty.²

¹ Order of the President, No. 38/01, 24 December 1998. Rwanda has also stated that an existing law, Decree-Law 12/79, which prohibits illegal import, use, transfer, and possession of arms and ammunition, covers mines, although mines are not explicitly mentioned. Article 7 Report, Form A, 1 June 2006.

² It reported in 2004 and 2005 that efforts were underway. It then reported that a bill was before cabinet for approval as of April 2006. A Ministry of Defense official told Landmine Monitor in May 2006 that the draft law had been submitted to parliament. No further progress has been reported. See *Landmine Monitor Report 2008*, p. 594.

As of 1 July 2009, Rwanda had not submitted its annual Article 7 report, due 30 April 2009. It submitted six previous reports, including in April 2008.³

Rwanda participated in the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings in May 2009, but made no statements. Rwanda has not taken part in discussions among States Parties on matters of interpretation and implementation related to Articles 1, 2, and 3 of the Mine Ban Treaty (“assisting” acts prohibited by the treaty, joint military operations with states not party to the treaty, foreign transit and stockpiling of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Production, transfer, stockpiling, and use

There have been no reports of use of antipersonnel mines in Rwanda since 1998.⁴ Rwanda has stated that it has never produced and has no stockpiles of antipersonnel mines.⁵ In its Article 7 report submitted in April 2008, it stated, “Rwanda government has never imported antipersonnel mines since 1994 and has destroyed all that were imported by the former government forces.”⁶ This was the first time Rwanda indicated that it destroyed stockpiles inherited by the previous government.⁷

After initially indicating that it retained no antipersonnel mines for training or development purposes, Rwanda reported in April 2003 that it possessed 101 antipersonnel mines “uprooted from minefields and retained for training purposes.”⁸ In its Article 7 report submitted in 2008, Rwanda reported 65 mines retained for training purposes, a reduction of 36 mines.⁹ While it did not explicitly explain the reduction, it did report, “So far 25 EOD [Explosive Ordnance Disposal] personnel have been trained.”¹⁰ Rwanda used the expanded Form D to report more generally that retained mines would be used to train deminers according to International Mine Action Standards, to train EOD personnel, and to train mine detection dogs.¹¹

Rwanda is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008, but had not yet ratified as of 1 July 2009.¹²

Scope of the Problem

Contamination

Rwanda has a small residual problem with landmines and ERW, the legacy of the 1990–1994 war against the government that committed the 1994 genocide, from the retreat of the army and Interahamwe militias to neighboring countries, and their subsequent attacks launched from the DRC in 1996–1998 in the northwest of the country.¹³

³ Previous reports were submitted in April 2008, and on 1 June 2006, 15 June 2005, 1 April 2004, 22 April 2003, and 4 September 2001.

⁴ However, there were allegations of mine use by Rwandan forces in the DRC in 2000, and of transfer of antipersonnel mines to non-state armed groups in the DRC as late as 2004. Rwandan officials have repeatedly denied all allegations of involvement in mine use in the DRC. See *Landmine Monitor Report 2006*, p. 612.

⁵ Article 7 Report, Form E, April 2008.

⁶ *Ibid.*, Form B.

⁷ No details are provided about when or how many mines were destroyed. Previously, Rwanda said that in 1994, the former government “fled into neighboring Congo with all arms and ammunitions including antipersonnel mines,” and that the current government “has never imported antipersonnel mines, and therefore no stockpiled antipersonnel mines [are] in Rwanda.” Article 7 Report, Form E, 1 June 2006. The same language is used in earlier reports.

⁸ Article 7 Report, Form D, 22 April 2003. The mines included 32 PMD-6, 26 TS-50, and 43 M-35 mines.

⁹ Article 7 Report, Form D, April 2008. The mines included 22 PMD-6, 26 TS-50, and 17 M-35, which would indicate that 10 PMD-6 and 26 M-35 mines had been consumed in training.

¹⁰ Article 7 Report, Form D, April 2008. The 25 personnel included five EOD technicians, 10 operators, and 10 “Recce” agents. The report did not provide details on the number or types of mines used in each instance of training.

¹¹ Article 7 Report, Form D, April 2008.

¹² For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 147.

¹³ See *Landmine Monitor Report 2006*, p. 613.

In a 2002–2003 assessment, four of the 12 former provinces (since 2006, Rwanda has only five provinces) reported a mine threat: Byumba, Gisenyi, Kigali (including in the capital itself), and Ruhengeri. Two additional minefields were discovered in Ruhengeri after the assessment; both have since been cleared.¹⁴ As of June 2009, the Muhororo minefield in Northern province was the sole remaining minefield, which the National Demining Office (NDO) began clearing in May.¹⁵ The main battle area site is in Gabiro district of Eastern province,¹⁶ although there are also spot items of UXO found across the country.

Casualties

In 2008, the NDO recorded six new mine casualties (two killed and four injured), all caused by TS-50 antipersonnel mines.¹⁷ Four casualties were girls between five and nine years old, plus a seven-year-old boy and a 28-year-old man. The NDO did not provide information on the activity at the time of the incident or the exact incident dates. Four casualties occurred in Kigali and two in Gicumbi, North province.

The NGO Survivor Corps “had heard” of two mine/ERW casualties occurring in the south in 2008, which were not included in the NDO database and Landmine Monitor was unable to verify this information.¹⁸ In 2007, 10 casualties were recorded, compared to 15 in 2006, but in 2008 casualty data was incomplete.¹⁹

In 2009, no new mine/ERW casualties were reported as of 10 May.²⁰

The number of mine/ERW casualties in Rwanda is unknown and estimates vary. In 2009, the NDO was unable to provide detailed information on cumulative casualties between 1999 and 2008. However, from data made available from the NDO previously, it appears that between 1991 and 2008 the NDO recorded at least 702 casualties, including 299 killed and 403 injured.²¹ In 2009, the NDO reported that casualty rates have been declining over the years from an average of two casualties per week reported prior to 1995.²² Between 1999 and 2008, Landmine Monitor identified at least 131 mine/ERW casualties (54 killed, 74 injured, and 3 unknown).²³

Risk profile

Casualties have declined, indicating a reduced level of risk. The majority of recorded casualties are men, but since 2006, child casualties have made up an increasing proportion of the total.²⁴ School-age children are considered to be the most at-risk group as they never received any formal mine/ERW risk education.²⁵ Other at-risk groups were said to include farmers and returning refugees.²⁶ In the past, the NDO reported that out of “the need of survival” people intentionally took risks.²⁷

Program Management and Coordination

Mine action and risk education

Rwanda does not have a civilian mine action authority. The NDO, created in 1995 and located near Kigali, manages and implements demining operations across the country, under the Ministry of Defense,²⁸ with assistance from Mines Awareness Trust (MAT) and Norwegian People's Aid (NPA). The NDO coordinates mine/ERW risk education and developed a summary plan for 2008,²⁹ but it had not been implemented as of May 2009 due to lack of funds.³⁰

Victim assistance

The NDO reported that it is not involved in victim assistance due to a lack of funds,³¹ and its mandate does not seem to include victim assistance.³² The Ministry of Local Government, Community Development and Social Affairs as well as the Ministry of Health are responsible for issues relating to persons with disabilities.³³

Data collection and management

In 2009, the NDO reported that “data is collected countrywide,” verified, and stored in the NDO’s Information Management System for Mine Action database.³⁴ However, information made available to Landmine Monitor was incomplete. In 2008, the NDO stated that casualties in remote areas go unreported.³⁵

Plans

Strategic mine action plan

A strategic plan to complete clearance of all known mined areas was drafted in 2006 with the assistance of MAT.³⁶ Rwanda sought to concentrate on developing the NDO’s capacity through training, hiring more staff and deminers, and by procuring new equipment. Rwanda’s operational priority has been to clear all known mined areas by its 2010 Article 5 deadline, which it was on course to meet.³⁷

In April 2008, the Ministry of Health finalized a National Plan for Rehabilitation of Physical Disabilities for 2009–2013. As of March 2009, however, the policy had yet to be implemented.³⁸

Integration of mine action with reconstruction and development

As food security is a government priority, Rwanda’s post-clearance plan is to give the cleared areas to landless families who can then use them for subsistence farming.³⁹

National ownership

Commitment to mine action and victim assistance

Rwanda has demonstrated a firm commitment to mine action through the establishment of the NDO under the Ministry of Defense, its secondment of army personnel to the clearance effort, and its positive collaboration with international NGOs to meet its Article 5 obligations in time.

National management

At the Ninth Meeting of States Parties, Rwanda stated they “were proud that our mine action program was locally managed.”⁴⁰ A major program asset is said to have been the quality of the deminers and NDO personnel and leadership.⁴¹ The government of Rwanda has also contributed a small amount to the overall mine action program (see Support to Mine Action section below).

Support for mine action implementation and management has come from MAT, which has been training and mentoring 230 NDO personnel, including 146 deminers, since April 2006. MAT has provided technical assistance for survey and clearance through two technical advisors, and has also been conducting post-clearance evaluation of clearance operations using three mine detection dog teams trained at the International Mine Action Training Centre (IMATC) in Nairobi, Kenya.

National mine action legislation and standards/Standing operating procedures

There is no national mine action legislation or standards in force. Since 2006, standing operating procedures have been based on those provided by IMATC.⁴²

Demining and Battle Area Clearance

As of July 2008, the NDO had 230 Rwanda Defense Forces (RDF) personnel consisting of three demining teams, three EOD teams, and two reserve demining teams.⁴³ From May 2006, when it began operations in Rwanda, MAT has helped the NDO to conduct technical survey on 16 mined areas.⁴⁴ Surveys identified six more hazardous areas totaling 93,145m², which have since been cleared.⁴⁵

In 2008, the mine problem was significantly reduced with the help of machines and technical assistance from NPA.⁴⁶ In August 2008, NPA redeployed a MineWolf machine from its Sudan program to prepare approximately 525,400m² of land in Kanombe minefield in Eastern province for manual clearance by NDO demining teams. At the end of the project in December 2008, NPA had released 520,192m², of which only 15,303m² (3% of the contaminated land) needed to be physically cleared. The rest of the area was released through cancellation and area reduction. Forty percent of the area was cancelled based on farmers having used the area for three farming seasons without incident or because the land had been in use by the Rwandan army or had been used as a cemetery.⁴⁷

In May 2008, MAT deployed three mine detection dog teams to Rwanda for quality management.⁴⁸ MAT used them with the NDO’s battle area clearance team to quality control (QC) the Kanombe minefield after clearance. Through April 2009, MAT had conducted QC on all cleared areas with the exception of Rubaya and Nyabihu in Western province. During the QC project, two landmines, four hand grenades, and one item of UXO were found.⁴⁹ MAT planned to complete QC in all cleared mined areas by October 2009.⁵⁰

⁴⁹ NPA, “Rwanda Project Report,” 12 December 2008, pp. 6–8.

⁵⁰ Response to Landmine Monitor questionnaire by MAT, 14 April 2009; and “Rwanda MDD,” www.minesawareness.org.

In February 2009, Mines Advisory Group signed a Memorandum of Understanding with Rwanda to provide technical assistance and training to the RDF in basic stockpile management and the destruction of surplus small arms and light weapons and munitions.⁵¹

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Rwanda is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 December 2010. In April 2008, Rwanda reiterated its commitment to meeting the deadline: “The government of Rwanda is continuing to contact her partners to continue support in the fulfillment of Article 5... We look forward to declare Rwanda mine free by December 2010.”⁵² As of June 2009, the Muhororo minefield in Northern province, measuring approximately 18,000m², was the sole remaining minefield, which the NDO had begun demining.⁵³

Demining from 2003–2008⁵⁴

Year	Mine clearance (m ²)	BAC (m ²)
2008	520,192	0
2007	101,240	0
2006	4,265	344,909
2005	1,295	0
2004	19,687	0
2003	26,752	0
Total	673,431	344,909

Though Rwanda may have fulfilled its Article 5 obligations by 2010, NPA believes there will remain a need for emergency/quick reaction teams to respond to discoveries of UXO and other spot tasks. In 2008, the NDO reported conducting two spot tasks per day.⁵⁵

Risk Education

In 2008, as in previous years, no formal mine/ERW risk education (RE) was provided in Rwanda. The NDO and MAT continued to provide basic community liaison in their area of operations in Eastern province and Kigali, in coordination with local leaders.⁵⁶

NDO staff delivered messages in Kinyarwanda and French using visual aids such as mine warning signs and free-from-explosive mines and ordnance. Awareness messages targeted children, farmers, and returning refugees; the total number of recipients is not known.⁵⁷

Formal RE was provided in Rwanda by the NDO from 1995 to 2001.⁵⁸ In cooperation with Rwanda’s Information Office (Office Rwandais d’Information, ORINFOR), UNESCO, and UNICEF, it conducted school-based RE and public dissemination activities. The total number

⁵⁷ Email from Dennis Felah, MAT, 3 March 2009.

⁵⁸ See *Landmine Monitor Report 2003*, p. 411.

of recipients is not known. Since 2002, no formal RE has been conducted due to lack of funds.⁵⁹ However, some activities were organized by the Mulindi Japan One Love Project in 2005, and community liaison has been provided since 2002 alongside demining operations. Rwanda used Form I of its annual Article 7 report to provide an update on RE activities in 2001, 2003, 2004, 2005, and 2006, and reported in Form J in 2008 that assistance was needed to continue RE.⁶⁰

It is believed that RE, combined with clearance activities, has contributed to casualty reduction and in teaching communities to report on suspected dangerous areas.⁶¹

Victim Assistance

The estimated number of survivors is unknown, but there could be at least 403 and up to 1,000.⁶² In 2004, Rwanda declared its commitment to support persons with disabilities, including mine survivors.⁶³ However, it has not made statements on victim assistance or reported on it in its annual Article 7 reports.⁶⁴

After suffering extensive damage and strain during the 1994 conflict, progress has been made in strengthening the health sector.⁶⁵ The number of health posts and hospitals increased, and Rwanda's improved road network ensured relatively quick transfer of patients.⁶⁶ A lack of health professionals remained an issue of concern.⁶⁷ By the end of 2008, 91% of the population was reported to have joined a medical insurance scheme (*mutuelle*).⁶⁸ Those who are in extreme poverty, including survivors, are said to be exempted from paying the insurance and receive free care.⁶⁹ However, Handicap International (HI) reported that most persons with disabilities cannot afford the high costs of continuing medical care, including surgery, physical rehabilitation, and prosthetic and orthotic devices.⁷⁰ A draft ministerial decree, stating that the government will cover rehabilitation expenditures for destitute persons with disabilities, was under discussion at the beginning of 2009.⁷¹

In the public sector, there are approximately 20 district hospitals that offer physiotherapy services and five hospitals that offer both physiotherapy and orthopedic services (in Butare, Cyangugu, Gahini, Kigali, and Ruhengeri).⁷² In 2008, support to the rehabilitation sector

⁵⁹ Ibid; *Landmine Monitor Report 2004*, p. 693; *Landmine Monitor Report 2005*, p. 501; and *Landmine Monitor Report 2006*, p. 616. Rwanda reported in its annual Article 7 reports that awareness campaigns were organized through media, but the NDO did not confirm this information.

⁶⁰ Article 7 Reports, Form I, April 2008, 1 June 2006, 15 June 2005, 1 April 2004, 22 April 2003, and 4 September 2001.

⁶¹ Email from Dennis Felah, MAT, 3 March 2009.

⁶² In July 2008, the NDO reported 696 total casualties (297 killed and 399 injured) recorded between 1991 and December 2008. It also reported that six mine casualties (two killed and four injured) were registered in 2008. In May 2009, the NDO reported that since the last reporting to *Landmine Monitor* there have been no new casualties in Rwanda. See *Landmine Monitor Report 2008*, p. 599; and email from Maj. Wilson Ukwishaka, NDO, 10 May 2009. ALSAR noted that it has 1,000 members. Email from Francis K. Karangwa, ALSAR, 7 March 2009.

continued to be provided by HI and Christoffel-Blindenmission (CBM).⁷³ Rehabilitation services are also provided by religious organizations.⁷⁴ The Association of Landmine Survivors and Amputees of Rwanda (ALSAR) reported that the quality and quantity of orthopedic services need to be improved and that it is difficult for survivors to obtain new orthopedic devices.⁷⁵

Since 2007, discrimination against persons with disabilities is prohibited by law (*Loi de Protection des Personnes Handicapées*). Provisions of the law were generally implemented in 2008.⁷⁶ A first step toward implementation was the creation of the National Federation for People with Disabilities. On 15 December 2008, Rwanda ratified the UN Convention on Rights of Persons with Disabilities and its Optional Protocol.

Victim assistance activities

In 2008, HI continued to support five orthopedic centers in the public hospital system. The centers provided 1,282 and repaired 120 orthopedic appliances and held 20,194 physiotherapy sessions. No distinction is made between mine/ERW survivors and other persons with disabilities. HI also supported local associations of persons with disabilities and conducted advocacy work.⁷⁷

In 2008, CBM supported two local institutions that provided community and center-based rehabilitation and produced orthopedic appliances: the Association of Inkuru Nziza Churches in Kigali (which fitted four mine survivors with prostheses) and the Gahini Hospital in northeastern Rwanda (which fitted five mine survivors with prostheses). CBM also supported the countrywide orthopedic and rehabilitative surgery project run by the Ministry of Health.⁷⁸

ALSAR is the only mine survivors' organization in Rwanda and has some 1,000 members. With limited funds, ALSAR carried out home visits, provided medical and material assistance, and conducted advocacy work.⁷⁹

In 2009, Survivor Corps, formerly known as Landmine Survivors Network, launched a new peer support program for survivors of genocide and former perpetrators. It estimated that 50% of genocide survivors are disabled.⁸⁰

Support for Mine Action

Landmine Monitor is not aware of any estimates for meeting future mine action needs, including victim assistance needs, in Rwanda.

National support for mine action

Rwanda did not report national funding in 2008. In June 2008, Rwanda reported contributing FRW30 million (\$56,400) to NDO salaries, clothing, food, and equipment, but did not specify the period covered by its contribution.⁸¹ The NDO's expenses are covered by the Ministry of Defense.⁸²

International cooperation and assistance

Germany reported contributing €300,000 (\$441,780) for mine action in Rwanda in 2008. The funding went to NPA for clearance of the Kanombe minefield.⁸³ No international funding for Rwanda was reported in 2007.

⁸³ "Germany Pledges 216 Million for Demining," *The New Times* (Kigali), 27 October 2008, allafrica.com.

SENEGAL

2008 Key Data

State Party since	1 March 1999
Contamination	Antipersonnel and antivehicle mines, UXO
Estimated area of contamination	No credible estimate
Casualties in 2008	24 (2007: one)
Estimated mine/ERW survivors	At least 570
Article 5 (clearance of mined areas)	Deadline: 1 March 2016 Original deadline: 1 March 2009
Demining in 2008	Not reported
Risk education recipients in 2008	Unquantified
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$47,560 (2007: \$7 million) National: \$337,000 (2007: \$960,000)

Ten-Year Summary

The Republic of Senegal became a State Party to the Mine Ban Treaty on 1 March 1999. It enacted national implementation legislation in August 2005. In March and April 2006, the Salif Sadio faction of the Movement of Democratic Forces of Casamance (MFDC), having fled Senegal, laid both antipersonnel and antivehicle mines in northern Guinea-Bissau. There were also credible allegations of use of antipersonnel mines by MFDC rebels in Senegal in 1999 and 2000.

Senegal has made limited progress in clearing mined and battle areas from the Casamance region since becoming a State Party to the Mine Ban Treaty. Humanitarian demining operations only started in 2008, with one Handicap International clearance team working under the auspices of the Senegalese National Mine Action Center (CNAMS). In November 2008, at the Ninth Meeting of States Parties, Senegal requested, and was granted, a seven-year extension to its Article 5 deadline to clear mined areas on its territory.

CNAMS and Landmine Monitor identified a total of 332 mine/explosive remnants of war casualties (47 killed and 285 injured) from 1999–2008 in Senegal. Risk education has been conducted in Casamance since 2000, initially through Handicap International and since 2008 through the Senegalese Association of Mine Victims. UNICEF was the *de facto* coordinator of risk education until CNAMS assumed this role in 2007, after which UNICEF continued to provide support.

Despite being one of 26 States Parties reporting significant numbers of survivors, Senegal's progress towards victim assistance aims was limited. Civil society reported a lack of government commitment. Victim assistance service provision decreased in 2008–2009.

Mine Ban Policy

Senegal signed the Mine Ban Treaty on 3 December 1997 and ratified it on 24 September 1998, becoming a State Party on 1 March 1999. On 3 August 2005, the president signed a law on the prohibition of antipersonnel mines.¹ The law makes production, purchase, sale,

¹ Article 7 Report, Form A, 30 April 2006. Previously, Senegal reported that violations of the Mine Ban Treaty were sanctioned by national constitutional law and the 2001 penal code.

stockpiling, transfer, and use of antipersonnel mines a criminal offense.² The president signed two implementation decrees on 18 August 2006, establishing a national mine action authority and a mine action center.

Senegal submitted its latest Article 7 report on 30 April 2009, covering calendar year 2008. It has submitted nine previous reports.³

Senegal attended the Ninth Meeting of States Parties in Geneva in November 2008, where it provided an overview of its request for an Article 5 clearance deadline extension and made statements on mine clearance and victim assistance. Senegal participated in the intersessional Standing Committee meetings in May 2009, where it made statements on mine clearance and victim assistance.

Senegal has rarely engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training). It has stated that it would not allow transit or stockpiling of antipersonnel mines on its territory.⁴

Senegal is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Senegal did not submit an annual transparency report as required under Article 13. Senegal is also party to Protocol V on Explosive Remnants of War.

Senegal signed the Convention on Cluster Munitions on 3 December 2008, but had not ratified it as of 1 July 2009.⁵

Production, transfer, stockpiling, and use

Government authorities claim that Senegal has never used antipersonnel mines inside or outside the country.⁶ With one exception, Senegal has consistently stated in its Article 7 reports that it has never produced, possessed, or stockpiled mines, even for training purposes.⁷

Sporadic armed conflict in the Casamance region of Senegal continued between government forces and the Movement of Democratic Forces of Casamance (Mouvement des Forces Démocratiques de Casamance, MFDC).⁸ There have continued to be civilian casualties caused by antipersonnel mines, but Landmine Monitor has not seen any direct allegations of new use of antipersonnel or antivehicle mines by the MFDC in this reporting period.

² Articles 5 and 6 of the law include penal sanctions of a prison term of five to 10 years, a fine of one to three million Senegalese francs for individuals, and a fine of 30 to 50 million Senegalese francs for legal entities. The law was submitted as an attachment to the Article 7 report submitted in 2006.

³ Senegal submitted a report in 2008 (for calendar year 2007), as well reports on 30 April 2007, 8 May 2006, 9 June 2005, 2 June 2004, 6 May 2003, 22 April 2002, 27 March 2001, and 1 September 1999.

⁴ Statement of Senegal, Fourth Meeting of States Parties, Geneva, 18 September 2002.

⁵ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 149–150.

⁶ However, it appears certain that Senegalese forces used antipersonnel mines in Guinea-Bissau in 1998, to support government troops against a self-proclaimed military junta. Such use would have occurred after Senegal signed the Mine Ban Treaty, but before its entry into force for the government. See *Landmine Monitor Report 1999*, pp. 76–79.

⁷ In April 2007, Senegal reported that 24 antipersonnel mines were used for training purposes before their destruction in August and September 2006. It stated that the mines were either taken from demining operations or discovered among rebel stockpiles, and that the defuzed mines were used to instruct deminers. The mines were 10 Mi AP DV, 10 Mi AP ID, two PMN, one M 969, and one PRB M35. It has not since reported the use or retention of mines for training purposes. Article 7 Report, Form D, 30 April 2007.

⁸ The MFDC has had at least three factions, with shifting leaders and some infighting. Some MFDC leaders signed a peace accord with the government in December 2004, but further negotiations on its implementation have not taken place. The agreement acknowledged the scourge of antipersonnel mines and called for humanitarian demining in Casamance. See *Landmine Monitor Report 2005*, p. 505.

An MFDC representative who claimed to speak on behalf of all factions told Landmine Monitor in March 2009, “For the time being we don’t need mines, but [possible future use] will entirely depend on the government. Mines are a defensive tool for us. The state has obliged us to use mines and to go to war.”⁹

In August 2008, the NGO Geneva Call and the Association pour la Promotion Rurale de l’Arrondissement de Nyassia–Solidarité, Développement, Paix (Association for the Promotion of the Rural Borough of Nyassia–Solidarity, Development, Peace, APRAN-SDP) met with senior commanders of two factions of the MFDC in São Domingos, Guinea-Bissau. Geneva Call reports that the MFDC military commanders declared themselves open to progressive humanitarian demining of the region of Casamance, undertaken by neutral NGOs, provided that there were consultations on targeted areas before demining began. Geneva Call said these MFDC factions claimed that they no longer use antipersonnel mines, but that they cannot fully renounce the weapon, or allow comprehensive demining of the region, particularly in areas close to their camps, until final settlement of the conflict.¹⁰ On 2 April 2009, Geneva Call and APRAN-SDP held a mine ban advocacy workshop with a “Contact Group,” comprised of representatives of several political wings of the MFDC.¹¹

In March and April 2006, the Salif Sadio faction of the MFDC, having fled Senegal, laid both antipersonnel and antivehicle mines in northern Guinea-Bissau.¹² There were also credible allegations of use of antipersonnel mines by MFDC rebels in Senegal in 1999 and 2000.¹³

Scope of the Problem

Contamination

Senegal is affected by landmines and explosive remnants of war (ERW), the result of fighting between the Senegalese army and the MFDC in Casamance, an area in the south of the country between the Gambia and Guinea-Bissau. The districts of Diattacounda, Niaguis, and Nyassia, situated between the Senegal river and the border with Guinea-Bissau, have been identified as the most contaminated.¹⁴

The precise extent of contamination remains unclear. An emergency landmine impact survey (ELIS) in 2005–2006 estimated that approximately 11km² of land and 63km of tracks¹⁵ and/or paths were suspected of being contaminated by mines, affecting more than 90,000 people. Senegal’s Article 5 deadline extension request, however, states that sizes of areas identified are indicative only and that the true nature of the challenge would only be known after technical survey of each area.¹⁶ In 2008, demining operations covered seven areas, of which three proved to have no explosive threat. The army also demined 11km of routes in March 2008, only some of which had been identified as hazardous by the survey.¹⁷

⁹ Interview with Daniel Diatta, Representative of the Secretary-General, MDFC, Ziguinchor, 20 March 2009. He further stated that they attacked Moroccan deminers in 2006 as a defensive measure. See *Landmine Monitor Report 2008*, p. 607.

¹⁰ Email from Anne-Kathrin Glatz, Program Officer, Geneva Call, 5 June 2009.

¹¹ Geneva Call, “Geneva Call Newsletter: Volume 7 – N° 1/May 2009,” Newsletter, May 2009, www.genevacall.org.

¹² For details, see *Landmine Monitor Report 2006*, pp. 463–464. In April 2006, Guinea-Bissau declared that it had ousted rebel forces from its territory. The ICBL condemned the antipersonnel mine use in northern Guinea-Bissau and noted that the MFDC in 1999 signed the Banjul Declaration, which among other things, committed the group to cease using landmines.

¹³ See *Landmine Monitor Report 2000*, p. 98.

¹⁵ Email from Camille Gosselin, Advocacy Project Officer on Landmines and Cluster Munitions, HI, 3 September 2009.

¹⁶ Article 5 deadline Extension Request, 2 April 2008, p. 9.

¹⁷ Article 7 Report, Form I, 30 April 2009; and interview with Ibrahima Seck, Chief of Operations and Information Management, CNAMS, Ziguinchor, 24 June 2009.

Senegal acknowledged in September 2008 that the ELIS “might have overestimated the number of affected areas.”¹⁸ At the same time, it was not possible to visit certain suspected areas during the ELIS (said to amount to 263 areas in November 2008),¹⁹ thus other areas may also require demining.²⁰ This number had “reduced” as of May 2009, thanks to general survey in Diouloulou district in 2008. A better idea of the total number of suspected hazardous areas (SHAs) across the Casamance was expected from general surveys being conducted during 2009.²¹

Casualties

In 2008, Landmine Monitor identified at least 24 mine casualties (one killed and 23 injured) in four incidents. One casualty was military and the other 23 were all civilians, of whom at least two were adult males and four were males of unknown age. The gender and age of 17 was not recorded. Activities at the time of the incident included travel (21), farming (one), security (one), and building a well (one). Most casualties (21) were caused by a bus driving over an antivehicle mine on the way to the Gambia on 1 May 2008.²² It appears that the incident was caused by a newly laid mine,²³ although the Senegalese National Mine Action Center (Centre National d’Action Antimines du Sénégal, CNAMS) was not able to confirm this.²⁴ The three other casualties were caused by antipersonnel mines. Two casualties were recorded in Ziguinchor region, 21 at the border with the Gambia, and another at the border with Guinea-Bissau.²⁵

The 2008 casualty rate is a sharp increase compared with 2007 (one injured casualty).

Casualties continued to be reported in 2009, with two mine casualties (both injured) as of July 2009. On 8 June 2009, a 36-year-old woman and a 60-year-old man were injured by an antipersonnel mine while looking for wood around the village of Kourin, in Ziguinchor region.²⁶

The total number of mine/ERW survivors in Senegal is unknown, and data verification is ongoing. As of 1 July 2009, CNAMS had data on 702 mine/ERW casualties (152 killed and 550 injured) from 1988–2009.²⁷ From 1999 to 2008, CNAMS recorded 311 casualties (46 killed and 265 injured) in Casamance.²⁸ These do not include the 21 additional casualties identified by Landmine Monitor in 2008.²⁹ Of the 332 total mine/ERW casualties (47 killed and 285 injured) identified by Landmine Monitor and CNAMS from 1999–2008, the majority (208) were civilians; 124 were military. Among civilian casualties, the largest casualty group was men (91), followed by women (42), boys (21), and girls (three). The age of 26 male and eight female casualties remains unknown; the gender and age of additional 17 casualties is also unknown.

Antivehicle mines caused 177 casualties, antipersonnel mines caused 143, ERW 11, and the device type for one casualty is unknown. The most common activities at the time of the incident were conducting military operations (114), collecting food/water/wood (96), and traveling (71), followed by agricultural activities (15), other everyday activities (10), tampering (seven), construction (four), herding (two), and fishing (one); the activity of 12 casualties is unknown.

²⁷ Landmine Monitor analysis of casualty data provided by email from Papa Omar Ndiaye, CNAMS, 1 July 2009.

²⁸ *Ibid.*

²⁹ Landmine Monitor media monitoring for calendar year 2008.

The highest casualty rates were recorded from 1997–1999; constant casualty decreases were recorded from 1999–2007, although the trend was broken in 2008. The downward trend is mainly due to the positive impact of risk education (RE) and the improved security situation since 2004.³⁰

The MFDC declined to provide casualty data, but acknowledged that there have been mine casualties among their combatants.³¹

The ELIS found 400 casualties of whom 17 had occurred in the two years prior to the community surveys.³² The number of persons with disabilities in Senegal is unknown,³³ but it is estimated that some 10% of the population is disabled.³⁴

Risk profile

At-risk groups include the military, people collecting food, water and wood, farmers, travelers, and schoolchildren.³⁵ With the improved security situation, movements of populations have been registered, increasing the risk to internally displaced persons and refugees.³⁶

Socio-economic impact

According to Senegal's Article 5 deadline extension request, the presence or suspected presence of mines impedes the provision of international assistance, affects economic development and trade, and serves as an obstacle to the application of Senegal's poverty reduction strategy and the attainment of its Millennium Development Goals.³⁷ As of June 2009, there was particular concern about the threat to returnees displaced by the fighting: many villages were completely abandoned, meaning that there is little or no local knowledge about the location and extent of any mine or ERW threat.

Program Management and Coordination

Mine action

On 18 August 2006, the National Commission for the Implementation of the Ottawa Convention was designated as the national mine action authority for Senegal by presidential decree.³⁸ The same day, a separate decree established CNAMS.³⁹ The CNAMS director was appointed in January 2007 and its center in Ziguinchor became operational in August 2007.⁴⁰ According to the director, the main difficulties encountered were “essentially difficulties of interpretation of the role of each actor; the responsibilities of each agency for implementation.” He claimed that “Today, everything is clear and the process is well underway.”⁴¹

⁴¹ Response to Landmine Monitor questionnaire by Papa Omar Ndiaye, CNAMS, 1 May 2009.

Risk education

CNAMS is responsible for managing, coordinating, and monitoring RE through its RE department.⁴² As CNAMS is new to this role, they reported that 2008 was a setting-up phase and they expected to become more operational in 2009.⁴³ Organizations have reported that coordination is poor and irregular, and that meetings are generally unproductive, as suggestions are not taken up by CNAMS. Information sharing was also said to be poor.⁴⁴ Previously, UNICEF was the *de facto* RE coordinator, however when CNAMS was established in 2007, this role was then assumed by CNAMS. UNICEF provided funds to CNAMS in 2008 to support the coordination and harmonization of RE activities.⁴⁵

Victim assistance

CNAMS is responsible for overall coordination, monitoring, and reporting of victim assistance (VA) activities.⁴⁶ CNAMS does not implement programs directly, but works through local and international partners.⁴⁷ In 2008, CNAMS' role in VA remained limited due to a lack of funds.⁴⁸ The VA sub-commission within the National Commission is responsible for defining a VA strategy.⁴⁹

VA is included in Senegal's mine action strategy of November 2007.⁵⁰ The strategy was reviewed and approved by the National Commission in May 2009.⁵¹ Reportedly, the revision did not modify CNAMS' VA responsibilities.⁵² CNAMS claimed that coordination with VA partners "works well" and noted that regular bilateral and sectoral meetings were held in 2008.⁵³ However, associations working with mine/ERW survivors reported that coordination is poor and that civil society involvement in VA planning was limited.⁵⁴

The Ministry of Family, Food Security, Women Entrepreneurship, Micro Finance and Early Childhood is responsible for disability issues.⁵⁵ It is unclear if the ministry coordinates with CNAMS.

Data collection and management

Casualty data collection remains incomplete in Senegal, but in 2009 CNAMS reported it started verifying existing data⁵⁶ and gathering additional information on survivors' needs.⁵⁷ In 2007, CNAMS unified casualty databases held by different organizations and the information

⁵⁶ Statement of Senegal, Standing Committee on Victim Assistance and Socio-Economic Reintegration, Geneva, 26 May 2009; interview with Seyni Diop and Diogoye Sene, CNAMS, Ziguinchor, 18 March 2009; and email from Papa Omar Ndiaye, CNAMS, 1 July 2009.

⁵⁷ Interview with Seyni Diop and Diogoye Sene, CNAMS, Ziguinchor, 18 March 2009.

was entered into the Information Management System for Mine Action (IMSMA) database.⁵⁸ IMSMA is operational and information is said to be shared with partner organizations.⁵⁹

Information is collected through the Senegalese Association of Mine Victims (Association Sénégalaise des Victimes de Mines, ASVM), Handicap International (HI), the National Agency for the Revival of Economic Activities in Casamance (Agence Nationale pour la Relance des Activités Economiques en Casamance, ANRAC), hospitals, army, local authorities, and RE committees.⁶⁰ Data collection has improved,⁶¹ but the data provided to Landmine Monitor has remained incomplete.⁶² MFDC casualties go unreported.⁶³

As of March 2009, ASVM had gathered information on the needs of 177 mine survivors. ASVM stated it wished to continue collecting data but was hampered by lack of funds.⁶⁴ In general, information collected by local organizations on recipients of VA services needs to be strengthened.⁶⁵

There is no systematic national collection of data on RE activities. Some national NGOs record the number of activities, but not the number of recipients. UNICEF passes its partners' data to CNAMS. In 2008, CNAMS gave RE IMSMA activity forms to implementing organizations. Nothing was entered into IMSMA in 2008, but data entry started in early 2009.⁶⁶

Plans

Strategic Mine Action Plan

In November 2007, the National Commission and CNAMS initiated a review of its mine action strategy. The resulting strategic plan, which covers 2007–2015, reaffirms the “civilian, neutral, and humanitarian character” of the program.⁶⁷ The plan provides that the areas with the highest priority include the abandoned areas in which the population is resettling and the areas where the socio-economic impact of the presence of mines is considered to be high.⁶⁸ The plan also provides for direct RE sessions in communities, community liaison in conjunction with clearance activities, and radio broadcasting.⁶⁹

⁶⁸ Article 5 deadline Extension Request, Executive Summary, 22 October 2008, p. 2.

⁶⁹ See *Landmine Monitor Report 2008*, p. 610.

The plan was revised in a process that involved all stakeholders. Thereafter, the document was the subject of a forum for exchange between members of the National Commission. A national workshop to confirm the plan took place in Ziguinchor in May 2009.⁷⁰

Integration of mine action with reconstruction and development

Senegal's Poverty Reduction Strategy includes priority actions for 2006–2010 that target persons with disabilities, including improving sanitation and mobility, promotion of education and training, and improved socio-economic reintegration.⁷¹

National ownership

Commitment to mine action and victim assistance

Senegal's commitment to mine action has been uneven since becoming a State Party. In granting Senegal's Article 5 deadline extension request, the Ninth Meeting of States Parties noted that it was "unfortunate" that after almost 10 years since becoming a State Party, Senegal was only "beginning to obtain clarity regarding the challenge it faces and has demined very little." It further noted, however, "some compelling circumstance [*sic*] that impeded any work from progressing until 2005."⁷²

National management

Senegal's demining program is managed by CNAMS, with UNDP support since 2007 under the Project for Assistance in Mine Action in Casamance (PALAC Project).⁷³ The former UNDP chief technical advisor left in June 2008 and had not been replaced by mid-2009.⁷⁴ UNDP had, however, hired a technical advisor for operations and quality control who took up the position on 30 June 2009.⁷⁵

National budget

Senegal has reported that it has committed a total of US\$1 million for CNAMS' work for 2007–2009. This amount covers all CNAMS operating costs and the salaries of staff implementing the PALAC Project.⁷⁶

National mine action legislation and standards

As noted above, decrees mandating the national mine action authority and setting up the national mine action center were adopted in August 2006. The Senegalese Mine Action Standards (Normes Sénégalaises d'Action antimines, NOSAM),⁷⁷ including RE standards,⁷⁸ were developed in 2008 and 2009 with the support of the Geneva International Centre for Humanitarian Demining (GICHD) and the participation of all stakeholders. A workshop to confirm the content of the standards was held in mid-May 2009 with GICHD support.⁷⁹ As of July 2009 they were in draft form and awaiting approval from the National Commission.⁸⁰ Organizations need to be accredited by CNAMS to conduct RE.⁸¹

Program evaluations

The first program evaluation was planned for the end of 2009.⁸²

Demining and Battle Area Clearance

HI was the only international demining operator in Senegal during 2008. Its single demining team was composed of eight deminers with basic training in mine clearance, one team leader, two medics, and two community liaison officers. An operations/quality control (QC) manager and an assistant supervised the local demining team. Additional training to Explosive Ordnance Disposal (EOD) Level 2 was provided to the team by the West African Center for Humanitarian Mine Action Training (CPADD) in Ziguinchor from September–October 2008.⁸³

Funding has proved an impediment to demining operations. In May 2008, HI had to suspend demining operations for one month as they were waiting for the task order from CNAMS.⁸⁴ HI again stopped demining in August 2008 as a result of lack of funding, only restarting in October 2008.⁸⁵ By then, the only humanitarian demining activities in Casamance had taken place in the area of Kandialang, near the town of Ziguinchor, and in Boutoute, Mandina Macagne, and Soucoute, all of which are within 6km of Ziguinchor.⁸⁶ HI started demining in Kandialang using standard mine clearance drills. After a few days and with the help of a technical survey, it was determined that the area was not mined but contaminated with UXO; the deminers then employed battle area clearance techniques.⁸⁷

Comprehensive results for demining in Casamance during 2008 were not available as of July 2009. Through 21 April 2009, Senegal reported that 63,252m² had been released in the districts of Bacounoum, Boutoute, Boutoute-St-Louis, Darsalam, Kandialang, Mandina Mancagne, and Mandina Manjack; 96 mines were found (95 antipersonnel mines and one antivehicle mine).⁸⁸

In parallel, from 10–15 March 2008 the army demined certain routes, releasing 11.4km of suspected track and roads. The routes were between Diagon and Mbissane bainouk, between Mbissane bainouk and Singuere, and between Mbissane bainouk and Mbissane Abondi-Niadiou.⁸⁹

Internal quality management of demining operations is carried out by the HI operations manager in accordance with the International Mine Action Standards. External quality management is a task that falls to CNAMS.⁹⁰ In April 2008, CNAMS visited the Kandialang site, and in June, personnel visited Boutoute, but without a formal QC process or trained personnel. Without a final QC procedure, the demined area cannot be officially handed over to the population. Therefore, the site at Kandialang, which had been cleared since November 2008, had still not been formally handed over as of May 2009, although a quality management process was being developed.⁹¹

Senegal hopes to have at least two demining operators and approximately 200 deminers supported by various mechanical means.⁹² As of June 2009, a tender process for the selection of demining operators with funding from the European Commission was still waiting to be initiated by UNDP.⁹³ This and QC were the top priorities for the UNDP technical advisor for operations, to be followed by setting up a quality management system.⁹⁴

Progress since becoming a State Party

Under Article 5 of the treaty, Senegal was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. On 2 April 2008, Senegal submitted a request for a seven-year extension to its Article 5 deadline (until 1 March 2016) to the President of the Eighth Meeting of States Parties. A revised request (dated 18 June) was submitted on 8 July 2008, but Senegal did not alter the extension period sought, which the ICBL criticized as excessive.⁹⁵ The extension request was granted by the Ninth Meeting of States Parties on 28 November 2008.⁹⁶

The Ninth Meeting of States Parties noted that Senegal “does not yet have a clear knowledge of size and location of areas that will actually warrant mine clearance, its estimates for time and money required appear to be based solely on clearance assumptions, and the commitment made by Senegal to undertake technical survey activities and to develop a cancellation procedure may result in implementation that proceeds much faster than that suggested by the amount of time requested and in a more cost-effective manner.”⁹⁷ Senegal pledged to use land release techniques in the 41 localities suspected of being “lightly contaminated” in order to confirm contamination or to delete them from the list of SHAs.⁹⁸

In October 2008, Senegal stated that since its demining program was “in its initial stages, it is not yet possible to make precise projections concerning the potential viability of the operations being conducted. It should also be pointed out that the objective can be achieved only if the peace process continues favorably and if security conditions improve in all the areas affected by the conflict, which are, of course, those most affected by the existence of mines.”⁹⁹ In November 2008, Senegal stated its intention not to seek a second extension period, except for “truly exceptional circumstances.”¹⁰⁰

As of mid-2009, the security situation in Casamance was generally improving. Geneva Call has reported positive talks with the MFDC on demining in the region. On 24 August 2008, Geneva Call and its local partner, APRAN-SDP, met with senior commanders of the Kassolol and Diakaye armed factions of the MFDC in São Domingos, Guinea-Bissau. At this meeting, the MFDC military commanders for the first time declared themselves open to progressive humanitarian demining of Casamance, undertaken by neutral NGOs and provided that consultations on targeted areas occurred prior to demining efforts. Previously, the MFDC had categorically refused demining.¹⁰¹

On 2 April 2009, responding to a request by the MFDC’s armed wing (Kassolol faction), Geneva Call and APRAN-SDP held a mine ban advocacy workshop with the MFDC’s Contact Group. The Contact Group committed to discussing the issue of mine action in detail with the

movement's military wings. The following day, Geneva Call facilitated a first exchange between the Contact Group and CNAMS on perspectives on mine action in the region.¹⁰²

Following the Geneva Call/APRAN-SDP workshop, CNAMS invited the MFDC Contact Group and Geneva Call to participate in a meeting from 29–30 April 2009 in Kabrousse to identify criteria to prioritize areas eligible for humanitarian demining. The workshop gathered more than 40 participants representing the government, security forces, the MFDC Contact Group, and NGOs. Security conditions and conflict parties' commitment to collaborate in mine action (and not re-mine) were among the eight criteria identified to prioritize areas that will be demined.¹⁰³

Risk Education

RE was implemented by national NGOs, with support from UNICEF from July to December 2008. ASVM was the only organization which had RE as a primary function. Other organizations implemented RE as part of wider programs, such as child protection, conflict prevention, and stress management. Radio programs were also delivered in several local languages.¹⁰⁴ RE was conducted in schools in Casamance in 2008 by teachers trained in 2007, but no monitoring took place by CNAMS.¹⁰⁵ Monitoring was done by Ministry of Education school inspectors and through the local UNICEF field office.¹⁰⁶ Funding for RE was provided by the UNICEF National Committee in Spain and United Kingdom's Department for International Development (DfID).¹⁰⁷

CNAMS organized two workshops in 2008 on the coordination of RE messages, with funding from UNICEF.¹⁰⁸ Fifteen NGOs and government RE stakeholders participated. The first workshop, held 14–15 July 2008, resulted in the development of unified RE messages. The second, held 16–17 December 2008, focused on sharing experiences¹⁰⁹ and also discussed target groups and geographic areas of work in order to avoid duplication.¹¹⁰ In June 2009, a workshop on RE planning was convened by CNAMS in Ziguinchor with GICHD support.¹¹¹

As RE has been conducted for several years there is a good level of awareness.¹¹² However, CNAMS considers RE important because clearance is at an early stage and data has shown a decrease in casualties which they attribute to RE campaigns.¹¹³ All the actors interviewed expressed the view that there was still a need of RE and some thought that it should continue until the last mine is cleared.¹¹⁴ Messages focused on avoiding unknown areas (for example, children taking short cuts to school) and not picking up unknown objects.¹¹⁵

¹¹⁵ Interview with Seyni Diop, CNAMS, in Geneva, 25 May 2009. Specific themes included: What are mines/UXOs; In what places are you likely to find mines/UXOs; How to identify mines/UXOs; What can mines/UXOs do to you and others; and, What should you do when you are in a minefield. Email from Christina de Bruin, UNICEF, 2 September 2009.

In May 2008, CNAMS, RE NGOs, and UNICEF held a mine action awareness day. CNAMS also conducted landmine safety training for local NGO staff traveling to remote areas.¹¹⁶

Risk education activities in 2008¹¹⁷

Organization	Type of activity	Geographical area	No. of recipients
ASVM	80 village mass awareness sessions; 119 radio programs with ASAPAD and CROSP; refresher courses; training of trainers; RE for refugees and internally displaced persons planning to return home	Ziguinchor region (departments of Niaguiss and Niassy); Sédhiou region (Diattacounda department); and radio messages in Ziguinchor and Kolda regions	80 communities, totaling 45,288 people; estimated 100,000 people reached through radio
ASAPAD	Training of trainers for community peace unit members; community RE presentations; 30 radio programs in partnership with AVSM (see above), covering both Ziguinchor and Kolda regions	Ziguinchor and Kolda regions	4,275 people through direct presentations; 180 peace unit members trained
CROSP	35 mine awareness panels with AVMS; 30 radio programs (see above); community presentations—RE with conflict prevention	Ziguinchor region	5,000 people through direct presentations
Kabonkétoor with UNICEF support	Limited RE activities integrated with conflict management program	Ziguinchor region	300 community-level women leaders trained
Inspection d'Academie (regional level of the Ministry of Education)	RE in schools	Ziguinchor region	262 principals and teachers
HI	Community liaison with demining activities	Ziguinchor region	Unknown

CNAMS has a budget for RE materials, and has designed RE materials, which organizations are required to use.¹¹⁸

CNAMS monitors the work of the implementing organizations.¹¹⁹ Yet local organizations reported that CNAMS's monitoring role remained limited in 2008.¹²⁰ ASVM and the Association of the Artisans of Peace and Development (Association des Artisans de la Paix et

¹²⁰ Observations during Landmine Monitor field mission, Senegal, 17–25 March 2009.

du Développement, ASAPAD) monitor RE conducted by their trainers; in addition, UNICEF, through its local field office in Ziguinchor, monitors the activities.¹²¹ ASVM reported that although they have a good network of contacts in communities to deliver RE, they suffer from a lack of funding to follow up and meet them.¹²²

UNICEF had not released funds for RE activities in 2009 as of July 2009, except for funding to CNAMS for the production of school exercise books containing RE messages.¹²³ HI conducted an exploratory mission in January 2009 to determine if there was a need to restart its RE program. It concluded that there was a need, focusing on the returning population to provide in-school and community-based RE.¹²⁴

The main RE provider in Senegal from 2000 to 2007 was HI, working with NGOs and hundreds of community volunteers, establishing community committees to conduct RE and marking, training school teachers to deliver RE through the school curriculum, and through regular radio broadcasts. By 2002, HI reported that RE had covered all of Casamance and each year the number of reported beneficiaries increased.¹²⁵ In 2002, UNICEF developed an awareness campaign using songs, murals, and notebooks.¹²⁶ An HI evaluation of RE in July 2002 found a lack of awareness and misinformation¹²⁷ but HI also reported that the large reduction in casualties from 1998 to 2004, when no humanitarian clearance was undertaken, was mainly due to effective RE.¹²⁸ HI stopped RE in Senegal in August 2007 reportedly because of a lack of commitment from the authorities.¹²⁹ Prior to 2000, limited RE had been conducted by the Senegalese Red Cross and the army.¹³⁰

A UNICEF RE evaluation in 2005 recommended that communication strategies be better adapted to the context and need of the communities. In 2008, UNICEF reported that it had acted on these recommendations.¹³¹ In 2006, community liaison projects were included as a part of peacebuilding and development programs. Additional efforts were also made to reach internally displaced persons (IDPs) after renewed fighting in north Casamance in August 2006.¹³²

Victim Assistance

The total number of survivors is unknown and under revision by CNAMS, who identified at least 550. Landmine Monitor has identified at least 570 survivors. In March 2009, the National Commission acknowledged that VA activities remain insufficient.¹³³ ASVM and survivors reported that VA is not high on the government's agenda.¹³⁴ In 2008–2009, projects aimed at assisting survivors were “winding down”¹³⁵ (particularly since the HI VA project ended in

August 2008)¹³⁶ and there were difficulties in mobilizing resources.¹³⁷ In May 2009, a new wave of insecurity was reported in Casamance, further hampering service provision and access to services for survivors.¹³⁸

There are two regional hospital centers capable of providing emergency and continuing medical care services in Casamance, one in Ziguinchor, and one in Kolda.¹³⁹ The majority of survivors are treated in Ziguinchor, as the hospital is better equipped and more incidents occur nearby.¹⁴⁰ There are two surgeons at the Ziguinchor hospital, of whom one is military, but who also treats civilian casualties.¹⁴¹ Emergency medical care is free in principle, but medicine and surgical kits need to be paid for by survivors or their families.¹⁴² Amputations can cost up to €500 (\$736),¹⁴³ which the majority of survivors find difficult to pay.¹⁴⁴ Military casualties are treated in military medical camps and then evacuated by plane to the Military Hospital in Dakar.¹⁴⁵ While military survivors are entitled to free medication, in reality, the only pharmacies accepting military prescriptions are in Dakar, while the majority of military survivors live in Casamance and cannot afford to travel to the capital.¹⁴⁶

At least 80% of survivors live in rural areas in the regions of Ziguinchor and Kolda, where services are more limited than elsewhere in Senegal.¹⁴⁷ The healthcare situation is “precarious” and poverty is widespread.¹⁴⁸ Access to healthcare, particularly emergency services, in rural areas remains problematic.¹⁴⁹ Ambulances and the road network are in poor condition.¹⁵⁰ Casualties are usually evacuated by the army, which has military posts spread all over Casamance.¹⁵¹ Yet many survivors reported that they had to be transported by their family or neighbors by cart or taxi.¹⁵² First-aid can be administered by the army¹⁵³ or by volunteers from the Senegalese Red Cross.¹⁵⁴ It usually takes about two hours to reach the first health post or hospital, or more if the incident is in a remote area.¹⁵⁵ Casualties among the MFDC are not transported to the health posts/regional hospitals due to “security reasons”¹⁵⁶—they fear arrest if they show up in a health facility.

Physical rehabilitation services, including physiotherapy and mobility devices, are available in Dakar, Kolda, and Ziguinchor.¹⁵⁷ Prosthetics can be repaired by mobile units in Bignona and Oussouye departments (Ziguinchor region).¹⁵⁸ Rehabilitation and orthopedic services are not sufficient and there is a lack of material and equipment.¹⁵⁹ At the Ziguinchor hospital, it takes an average of 45 days to get prosthetic devices, which are given at a “humanitarian cost.”¹⁶⁰ The orthopedic center at the Kolda hospital is in a poor state and lacks materials.¹⁶¹ Military survivors receive free rehabilitation and prosthetic devices in Dakar.¹⁶²

Psychosocial support services are provided by the government and NGOs, mainly in the framework of stress management and conflict resolution activities. Services are provided through peer-to-peer support and professional psychologists.¹⁶³ In November 2008, the Kenia Psychiatric Center (Centre Psychiatrique de Kénia) in Ziguinchor became operational, with support from ANRAC, the National Agency for the Revival of Economic Activities in Casamance,¹⁶⁴ but no survivors had been assisted as of April 2009.¹⁶⁵ With HI support, a psychiatrist from Dakar was paid to visit Casamance in 2007–2008 and mine/ERW survivors received free counseling, psychotherapy, and debriefing sessions.¹⁶⁶ Most mine survivors are unemployed or self-employed but socio-economic reintegration services remain largely inadequate.¹⁶⁷ Analysis of ASVM data shows that many survivors need vocational training and funds to start income generation projects.¹⁶⁸ Special education is limited.¹⁶⁹ Military survivors receive a modest pension.¹⁷⁰

The rights of persons with disabilities are protected in the constitution,¹⁷¹ but discrimination remains a problem.¹⁷² Legislation reserved 15% of new civil service positions for persons with disabilities, but an additional bill is needed to make the law operational.¹⁷³ Specific disability legislation (Loi d’orientation sociale relative aux droits des personnes handicapées) has been drafted, but was pending approval as of June 2009.¹⁷⁴ On 25 April 2007, Senegal signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol; neither had been ratified as of 1 July 2009.

Progress in meeting VA26 victim assistance objectives

Senegal is one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors.¹⁷⁵

Senegal presented its 2005–2009 objectives as part of its commitment to the Nairobi Action Plan at the Sixth Meeting of States Parties in 2005,¹⁷⁶ including: improving the effectiveness and analysis of data collection while amalgamating databases; reducing time to reach emergency care and enhancing capacities of medical staff and supplies; improving services, capacities, and coordination of rehabilitation centers; developing two public cells for psychological support and reinforcing social service capacity and teacher training; restarting economic activities in Casamance and reinforcing national development programs to increase access to credit and training for people with disabilities; and implementing legislation relative to disability and ensuring accessibility of schools and public buildings.¹⁷⁷ The objectives are not SMART (specific, measurable, achievable, relevant, and time-bound) and Senegal has not formally presented revised objectives or plans.¹⁷⁸

In April 2007, Senegal reported that a VA strategy had been developed, which included strengthening medical infrastructure and socio-economic reintegration in close cooperation with ASVM.¹⁷⁹ In June 2008, Senegal outlined planned VA activities under the national mine action strategy.¹⁸⁰ These included: updating the casualty database; technical support to AVSM; finding ways to produce and repair mobility devices; lobbying for healthcare cost coverage and education for mine/ERW survivors; and identifying means and partners to support income-generating activities. No clear timeframes or responsibilities were assigned.¹⁸¹ The objectives do not seem to provide for comprehensive VA, as issues are addressed very broadly (economic reintegration, education, and physical rehabilitation) or not addressed at all (psychosocial support, emergency medical care, and laws/public policies).¹⁸² In November 2008, Senegal announced its intention to develop a VA action plan.¹⁸³ The same statement was repeated in May 2009.¹⁸⁴ In May 2009, CNAMS reported that it will develop a 2009–2014 VA plan with SMART objectives based on the Nairobi Action Plan by the end of 2009.¹⁸⁵ On 9 May 2009, as part of the work of the VA focal point of the ICBL, a “VA reflection day” was organized to stimulate discussions around the development of a VA action plan.¹⁸⁶

Some achievements have been recorded in the fields of data collection, medical care, and psychological support. However, significant progress has been hampered by ongoing conflict, time needed to set up a mine action framework, and limited resources.¹⁸⁷ In May 2009,

¹⁸⁷ Interview with Seyni Diop and Diogoye Sene, CNAMS, Ziguinchor, 18 March 2009.

Senegal identified seven key VA challenges, including identifying survivors and their needs; setting up an incident surveillance system; simplifying replacement of prosthetic devices; making raw materials accessible to orthopedic workshops; equipping the psychiatric center in Kenia; facilitating access to employment for survivors and other persons with disabilities; and elaborating a VA national action plan.¹⁸⁸ In addition, Senegal reported two priorities for 2010–2014: setting up an inter-ministerial council on VA and establishing a fund for survivors to ensure free services, orthopedic devices, scholarships, and socio-economic reintegration.¹⁸⁹

In 2008, a process support visit was undertaken by the GICHD Implementation Support Unit on behalf of the co-chairs of the Standing Committee on Victim Assistance and Socio-Economic Reintegration.¹⁹⁰

Senegal participated in the workshop on advancing assistance to mine victims in Africa, in Nairobi in 2005.¹⁹¹ Senegal reported on its VA activities at meetings of States Parties from 2005–2008, and at the Standing Committee meetings from 2007–2009.¹⁹² It used the voluntary Form J to its annual Article 7 report to provide an update on VA activities for 2006–2008,¹⁹³ and to report on casualty data in 2009.¹⁹⁴ It also included a VA expert on its delegation to the intersessional Standing Committee meetings from 2007–2009 and at the Ninth Meeting of States Parties.¹⁹⁵

Victim assistance activities

It is unknown exactly how many mine/ERW survivors received assistance in 2008, but at least 318 received some services.¹⁹⁶ At the Standing Committee meetings in May 2009, CNAMS reported that from 2005–2009 some 29,972 persons with disabilities, including an unknown number of mine survivors, received assistance in Casamance (223 persons received medical care, 506 physical rehabilitation, 1,332 received walking appliances, 116 peer-to-peer support, 3,281 support to access education, and 24,514 food aid).¹⁹⁷

In 2008, ASVM, in cooperation with UNICEF, provided a wide range of services, including: psychological support and stress management to 183 mine survivors (86 men, 62 women, and 35 children) and 427 members of affected communities (157 men, 137 women, and 133 children) in 20 villages in Nyassia and Niaguiss, Ziguinchor region;¹⁹⁸ physical rehabilitation assistance through obtaining prosthetic devices for 28 survivors (of which one was a new survivor and seven were survivors never previously fitted with a prosthesis) and in repairing old devices for 70 survivors;¹⁹⁹ and support to child survivors through the delivery of 10 new bicycles and repair

of 12 bicycles in order to increase their participation, reintegration and mobility within the community, and the coverage of school fees and material to 19 children.²⁰⁰ ASVM also signed an agreement with one pharmacy to cover the costs of medicines for emergency treatment of mine/ERW survivors.²⁰¹ ASVM distributed rice and meat, received through private donations, among their most vulnerable members.²⁰²

In March 2008, the Senegalese Association for the Support of the Creation of Socio-Economic Activities (Association Sénégalaise pour l'Appui à la Création d'Activités Socio-économiques, ASAPAD) organized a fundraising event for mine/ERW survivors, reportedly collecting CFA35 million (\$85,750).²⁰³ Part of the money was used to build a new office for ASVM.²⁰⁴ The building was not completed as of March 2009.²⁰⁵

ASAPAD, with UNICEF support, provided psychological support/stress management to two new mine survivors in 2008 and organized 145 sessions to provide psychological support to victims of conflict and their families at the Ziguinchor hospital.²⁰⁶

The Regional Center for Educational and Professional Orientation (Centre Régional d'Orientation Scolaire et Professionnelle, CROSP) provided psychological support to one mine survivor and organized four refresher trainings in psychological support for ASVM members.²⁰⁷

The Ziguinchor hospital provided medical and physical rehabilitation assistance to 10 new mine survivors in 2008.²⁰⁸ The Kolda hospital did not assist any mine/ERW survivors in 2008.²⁰⁹

The ICRC covered the medical and transportation expenses of two new mine survivors in 2008.²¹⁰ It also supported three health centers in Casamance and the hospitalization of 34 weapon-injured people.²¹¹

From January to August 2008, HI provided direct and indirect assistance to conflict victims and persons with disabilities in Ziguinchor and Kolda regions through psychological assistance, promoting sport for persons with disabilities, and capacity-building for local organizations. The project started in 2006 and ended in 2008 due to lack of funding.²¹²

The Canadian university College Montmorency continued to receive support from Canada to provide VA in Senegal. In August 2008, they reported that since the project's beginning in 2004, 400 patients had received psychological and rehabilitation services. Moreover, Canadian specialists had trained more than 100 medical professionals involved in treating survivors.²¹³

CNAMS employed three mine survivors in 2008.²¹⁴

Support for Mine Action

Senegal has provided a cost estimate for completion of mine clearance obligations totaling \$32,070,000 (€21,777,808) for the period 2009–2015.²¹⁵ The estimate, reported in Senegal's June 2008 revised Article 5 deadline extension request, is provisional and based in part on a projection of clearing 20km² at a cost of roughly \$1.50 per meter.²¹⁶ The cost estimate includes \$3,350,000 for core costs, \$2,020,000 for mechanical demining, and \$26,700,000 for manual demining during the seven-year period. Total annual estimated costs are \$2.5 million in 2009, over \$5 million in 2010, \$6.1 million in 2011, and \$4.6 million annually from 2012 to 2015.²¹⁷ The National Commission has responsibility for allocating and managing resources to ensure the effective use of mine action funds.²¹⁸ In May 2009, Senegal reported among its mine action priorities for the period 2010–2014 the establishment of a fund to support mine victims with free healthcare, mobility assistance, scholarships, and support for rehabilitation.²¹⁹

National support for mine action

Senegal reported CFA150 million (roughly \$337,000) in national funding for mine action in 2008.²²⁰ Senegal reported providing \$960,000 in 2007.²²¹ In its Article 5 deadline extension request, it reported that a contribution had been made of \$1 million to cover the period 2007–2009.²²² In May 2008, Senegal stated that, although its Article 5 deadline extension request does not refer to an increase in national funding, such an increase may take place, and the level of national funding for the period 2009–2015 had not yet been determined. Senegal stated that during this period, national funding would “certainly not decrease but will most probably increase with the development and progress of the [demining] programme.”²²³ In September 2008, it reported that a submission had been made by CNAMS to the government to increase annual national funding to CFA250 million (roughly \$567,000).²²⁴

International cooperation and assistance

Canada was the sole reported donor to mine action in Senegal in 2008, contributing C\$50,698 (\$47,560) to College Montmorency to support rehabilitation services.²²⁵ Five countries and the European Commission (EC) reported contributing \$7,305,406 (€5,328,135) in 2007. Much of funding committed or allocated in 2007 was either applied to programming in 2008 or is intended for disbursement in support of future programs. In its Article 7 report submitted in 2009, Senegal reported conducting a pilot demining phase in 2008 based on funding from Belgium, and continued demining in 2008–2009 based on funding from France and Germany.²²⁶ Yet none of these donors reported funding allocations in 2008. In its Article 5 deadline extension request, Senegal reported EC funds committed in 2007 (€3.35 million) among “potential” or

“expected” funds. Although it seems the funds have been applied in multiyear timeframes, funding at 2008 levels appears to fall short of the amount required to meet the estimated annual costs of the 2009–2015 mine action plan of about \$4.6 million per year.²²⁷

In May 2008, Senegal reported that Spain had announced €4 million in new funding, but had not yet officially confirmed the contribution. In its Article 5 deadline extension request, Senegal again referred to expected funding by Spain, this time roughly €3 million.²²⁸ No such funding had been reported as of August 2009 by either Spain or Senegal. As of August 2008, HI also reported receiving €300,000 from Spain for VA in 2006–2008.²²⁹ Spain has not reported funding since 2006, to HI programs in Senegal.

SERBIA

2008 Key Data

State Party since	1 March 2004
Contamination	Antipersonnel and antivehicle mines, submunitions, other UXO
Estimated area of contamination	1.7km ² of mined areas (April 2009) 30km ² of cluster munition remnants (November 2008)
Casualties in 2008	Three (2007: two)
Estimated mine/ERW survivors	Up to 3,000
Article 5 (Clearance of mined areas)	Deadline: 1 March 2014
Demining in 2008	Mined area clearance: 0.95km ² Battle area clearance: 1.07km ²
Risk education recipients in 2008	None
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$2,831,668 (2007: \$2,713,610)

Ten-Year Summary

The Republic of Serbia assumed the treaty commitments of the former state union of Serbia and Montenegro, which became a State Party to the Mine Ban Treaty on 1 March 2004. Serbia's 2006 Criminal Code makes possession of antipersonnel mines a crime. Serbia destroyed its stock of 1.2 million mines in May 2007. It initially retained 5,565 mines for training purposes, but reduced that to 3,589 mines in 2008. Serbia served as co-rapporteur and then co-chair of the Standing Committee on Stockpile Destruction from 2006–2008. Until 2006, there were instances of discoveries of mines, and occasional mine incidents, but it was not clear if these represented new use of mines by irregular anti-Serbian forces.

Serbia has made slow but steady progress in clearing its mine contamination. A general survey of cluster munition remnants completed by Norwegian People's Aid (NPA) in November 2008 estimated that the residual threat from unexploded submunitions, including subsurface hazards, covered up to 30km².

Between 1999 and 2008, Landmine Monitor identified 113 mine/ explosive remnants of war (ERW) casualties (21 killed, 64 injured, and 28 unknown) from media reports and data provided by the Ministry of Internal Affairs and the ICRC. During the same period, the Department of Civil Protection, within the Ministry of Defense, identified 643 casualties (203 killed and 440 injured), 637 of which occurred in 1999. NPA collected data on 191 cluster munition casualties (31 killed and 160 injured) from 1999–2008. Lack of effective data collection prevents comparison between these different totals, or a consolidation of them.

No risk education (RE) has been conducted since 2006. Emergency RE was conducted in 1999, primarily by the army, the Ministry of Interior, and the ICRC.

Overall, little progress was noted in improving victim assistance (VA). Serbia had comprehensive medical and physical rehabilitation services for survivors prior to the conflict in the 1990s, but the quality of these services has declined as a result of the armed conflict, sanctions, and economic difficulties.¹ While there had been a government social and economic

¹ See *Landmine Monitor Report 1999*, pp. 837–839; and *Landmine Monitor Report 2000*, p. 857.

reintegration program available during the 1999 war,² there were few programs after it, although the national organization Dobra Volja worked with survivors to provide psychosocial support. Progress toward the achievement of VA objectives was limited in all areas except for some in the creation of laws and policy for all persons with disabilities. Serbia ratified the UN Convention on the Rights of Persons with Disabilities in May 2009 and the harmonization of national disability legislation was underway.

Mine Ban Policy

Serbia assumed the treaty commitments of the former state union of Serbia and Montenegro following the Republic of Montenegro's declaration of independence in June 2006.³ The former Serbia and Montenegro acceded to the Mine Ban Treaty on 18 September 2003, becoming a State Party on 1 March 2004. Kosovo declared independence from Serbia on 17 February 2008.⁴ Serbian President Boris Tadic has declared the declaration illegal and stated that "Serbia considers Kosovo as its southern territory."⁵

A new Criminal Code of the Republic of Serbia entered into force on 1 January 2006. Articles 376 and 377 make the use, production, stockpiling, trade, and transfer of antipersonnel mines a criminal offense. These two provisions also specify penal sanctions.⁶

Serbia submitted its third Article 7 report in 2009, covering calendar year 2008.⁷

Serbia attended the Ninth Meeting of States Parties in Geneva in November 2008, where it made statements on VA and mine clearance. As the outgoing co-chair of the Standing Committee on Stockpile Destruction, Serbia was one of eight vice-presidents of the meeting. Serbia also participated in the intersessional Standing Committee meetings in Geneva in May 2009, making statements on its experience with stockpile destruction, VA, and mine clearance.

Serbia has reconfirmed the view of the former state union of Serbia and Montenegro that "mere participation" in military activities with states not party to the treaty, which engage in activities prohibited by the treaty, is not a treaty violation.⁸ Serbia has not made other statements on issues of interpretation and implementation related to Articles 1, 2, and 3 of the treaty, including on acts prohibited by the ban on "assistance," antivehicle mines with sensitive fuzes, and the acceptable number of mines retained for training.

Serbia is party to the Convention on Conventional Weapons, but not Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. As of 1 July 2009, it had not signed the Convention on Cluster Munitions.⁹

² See *Landmine Monitor Report 1999*, pp. 837–839.

³ Following a referendum on independence on 21 May 2006, the Parliament of Montenegro declared independence on 3 June, and Montenegro was accepted as a member of the UN on 28 June. Montenegro deposited its instrument of accession to the Mine Ban Treaty on 23 October 2006.

⁴ William J. Kole and Nebi Qena, "Kosovo Declares Independence From Serbia," *Associated Press*, 17 February 2008; and see also report on Kosovo in this edition of *Landmine Monitor*.

⁵ "Serbia rejects Kosovo's new constitution–Tadic," *RIA Novosti*, 15 June 2008.

⁶ During the State Union before Montenegro's independence, each Republic had separate legislative authority to implement the treaty. See *Landmine Monitor Report 2006*, p. 633, for details on the penal code, articles 376 and 377, and the sanctions.

⁷ The previous two reports were submitted: covering calendar year 2007, and on 27 December 2006 (due 30 April 2006), covering the period 1 July to 1 December 2006.

⁸ In a 30 June 2006 letter to the UN Secretary-General, Serbia stated that "all declarations, reservations and notifications made by Serbia and Montenegro will be maintained by the Republic of Serbia until the Secretary-General, as depositary, is duly notified otherwise." Upon acceding to the treaty, Serbia and Montenegro made a Declaration that "it is the understanding of Serbia and Montenegro that the mere participation in the planning or conduct of operations, exercises or any other military activities by the armed forces of Serbia and Montenegro, or by any of its nationals, if carried out in conjunction with armed forces of the non-State Parties (to the Convention), which engage in activities prohibited under the Convention, does not in any way imply an assistance, encouragement or inducement as referred to in subparagraph 1 (c) of the Convention."

⁹ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 236–238.

Production, transfer, and stockpile destruction

In March 2007, Serbian officials reaffirmed that the former Serbia and Montenegro did not produce any type of landmine after 1990.¹⁰ Serbia has stated that old facilities for landmine production have been successfully transformed for production of resources for civilian purposes.¹¹ In the past, the former Serbia and Montenegro stated several times that mine exports halted in 1990.¹²

After Montenegro's declaration of independence, the two countries continued the stockpile destruction process initiated by the former Serbia and Montenegro in 2005 as a project of the Ministry of Defense and the NATO Maintenance and Supply Agency (NAMSA).¹³

On 7 May 2007, Serbia completed the destruction of 1,404,819 antipersonnel mines stockpiled by both Serbia and Montenegro. An additional 10 mines were found and destroyed shortly thereafter. Of the 1,404,829 mines destroyed, a total of 1,205,442 were held in the Republic of Serbia and 199,387 in the Republic of Montenegro.¹⁴ Destruction was completed well in advance of the treaty deadlines of 1 March 2008 for Serbia and 1 April 2011 for Montenegro.

Mines retained for training

When it completed stockpile destruction in May 2007, Serbia stated that it was retaining 5,565 antipersonnel mines for training and development purposes under Article 3 of the Mine Ban Treaty.¹⁵ In 2007, according to NAMSA, 1,839 of these 5,565 mines did not have fuzes.¹⁶ At the Standing Committee meetings in June 2008, Serbia informed States Parties that it still retained 5,565 mines, with 5,104 held by the Ministry of Defense and 461 by the Ministry of Interior.¹⁷

In its Article 7 report submitted in 2009, Serbia stated that it retained 3,589 mines, with 3,194 held by the Ministry of Defense and 395 held by the Ministry of Interior.¹⁸ This is a decrease of 1,976 mines from the end of 2007. Serbia further reported that it consumed five of these mines

¹¹ Statement by Col. Dr. Jugoslav Radulovic, Assistant Minister for Material Resources, Ministry of Defense, Ceremony on the Occasion of Closing the Project for Destruction of Antipersonnel Landmines in Serbia, Belgrade, 16 May 2007.

¹² Letter from Maj.-Gen. Dobrosav Radovanovic, Assistant Minister of Defense, Sector of International Military Cooperation and Defense Policy, Ministry of Defense, 29 January 2003; and see also, *Landmine Monitor Report 2002*, p. 789.

¹³ Interview with Zoran Dimitrijevic, Local Representative, NAMSA, Belgrade, 5 March 2007; and "Last Balkan mine stockpiles destroyed under NATO-supported project," *NATO News*, 16 May 2007.

¹⁴ The mines destroyed included: 294,823 PMA-1; 169,400 PMA-2; 307,969 PMA-3; 580,411 PMR-2A; 4,787 PMR-3; 44,083 PROM-1; and 3,356 VS-50. See *Landmine Monitor Report 2007*, p. 608.

¹⁵ A Ministry of Defense official told Landmine Monitor in March 2006 that the General Staff "would probably" order all retained mines to be destroyed at the end of the stockpile destruction program. In its December 2006 Article 7 report, Serbia reported that only 5,307 mines would be retained for training, all by the Ministry of Interior. In its Article 7 report submitted in 2008, Serbia reported that same number and types of mines as being transferred for training by the Ministry of Interior (presumably to the Ministry of Defense). See *Landmine Monitor Report 2008*, pp. 618–619.

¹⁶ This includes all 629 PMA-1 mines and all 1,210 PMA-3 mines. Email from Zoran Dimitrijevic, NAMSA, 25 May 2007; and email from Graham Goodrum, Technical Officer, NAMSA, 25 June 2007.

¹⁷ Presentation by Serbia, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008. It stated the mines are stored at three locations, two belonging to the Ministry of Defense and one to the Ministry of Interior. The Ministry of Defense retained: 500 PMA-1; 1,050 PMA-2; 1,050 PMA-3; 504 PMR-2A; 1,000 PMR-3; and 1,000 PROM-1 (PROM-1: 800 and PROM-1P: 200). The Ministry of Interior retained: 129 PMA-1; 80 PMA-2; 160 PMA-3; 40 PMR-2A; 12 PMR-3; and 40 PROM-1. Email from Zoran Dimitrijevic, NAMSA, 25 May 2007; email from Graham Goodrum, NAMSA, 25 June 2007; and statement by Col. Dr. Jugoslav Radulovic, Ministry of Defense, Ceremony on the Occasion of Closing the Project for Destruction of Antipersonnel Landmines in Serbia, Belgrade, 16 May 2007.

¹⁸ Article 7 Report (for calendar year 2008), Form D. The Ministry of Defense retains 510 PMA-1, 615 PMA-2, 560 PMA-3, 509 PMR-2A, 500 PMR-3, and 500 PROM-1. The Ministry of Interior retains 129 PMA-1, 60 PMA-2, 160 PMA-3, 16 PMR-2A, and 30 PROM-1.

in training activities, and destroyed another 1,940 mines.¹⁹ The difference of 31 mines (1,976 versus 1,945) is not explained, apart from a remark in the report stating “Differences of APMs due to the administrative mistake.”²⁰ The report notes that a total of 1,070 mines are without fuzes (510 PMA-1 and 560 PMA-3).²¹

In May 2009, Serbia told States Parties that 1,389 of the mines held by the army were without fuzes. It also specified that the 1,940 mines were sent to the Technical Repair Facility (Kragujevac) in April 2008, and were disassembled and disposed of during November 2008. It said that the retained mines “are foreseen for personnel training for possible engagement in UN peace operations, protection equipment testing and mine detectors.”²²

In June 2008, Serbia similarly told States Parties that the retained mines would be used for those same purposes, but it also informed delegates, “Currently, there are no plans or projects for the use of retained APM for this purpose.” It also said, “Retained mines have not been used or are not being used for the mine detection, clearance or destruction techniques.... They have not been used for any training [or] for any other reason.”²³

The former Serbia and Montenegro acknowledged that it possessed an unspecified number of MRUD (Claymore-type) directional fragmentation mines, but stated that the mines were only used in command-detonated mode, and therefore were not covered by the Mine Ban Treaty.²⁴ It is not known how many, if any, of these now belong to Serbia.²⁵

Scope of the Problem

Contamination

Serbia is contaminated with mines and also has extensive areas affected by ERW, particularly UXO, including unexploded submunitions. The extent of mine contamination is relatively small, a legacy of the armed conflict associated with the break-up of the former Socialist Federal Republic of Yugoslavia in the early 1990s.²⁶ Minefields with a mixture of antipersonnel and antivehicle mines are located on the border with Croatia, in Jamena and Morovic villages in Sid municipality.²⁷

¹⁹ Article 7 Report (for calendar year 2008), Form D. Five PMA-3 mines were used for testing deminers’ boots in February 2009. A total of 450 PMA-2, 490 PMA-3, 500 PMR-3, and 500 PROM-1 were transferred for destruction in April 2008 and destroyed in November 2008.

²⁰ Article 7 Report (for calendar year 2008), Form D.

²¹ Ibid.

²² Statement of Serbia, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009. In a letter to the ICBL Australian Network, Serbia elaborated that a plan is in place to test the protective characteristics of landmine boots, and mines will also be used for training “in detecting and destroying and demonstrating the effects of certain types of mines. Testing will also be conducted on the protective properties of the equipment for defusing” mines. Letter No. 882-1/08, from Lepsa Stulic, Charges d’Affaires, Embassy of Serbia, Canberra, to Mark Zirnsak, ICBL Australian Network, 18 March 2009.

²³ Presentation by Serbia, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008. The statement notes that some training has been carried out, including a Basic Demining and Battle Area Clearance Course for 35 participants, “using different types of exercise mines and ammunition,” but apparently not the retained mines. Similar information was conveyed to Landmine Monitor in an interview with Capt. Marko Mojasevic, Arms Control Inspector, Ministry of Defense, in Geneva, 4 June 2008.

²⁴ See *Landmine Monitor Report 2004*, p. 714. Claymore-type mines that are used in victim-activated mode, with tripwires, are banned by the treaty. Those used in command-detonated mode are not. States Parties have been urged to report on what steps they have taken to ensure that any such mines that are retained cannot be used in victim-activated mode.

²⁵ In its initial Article 7 report, Montenegro stated that it had 23,826 MRUD directional fragmentation mines in stock. Montenegro Article 7 Report, Forms B and H, October 2007. It states that the “detonator is electrical capsule.”

²⁶ See *Landmine Monitor Report 2008*, p. 619.

²⁷ Email from Sladana Košutić, International Cooperation Advisor, SMAC, 28 April 2009; and for more details, see *Landmine Monitor Report 2007*, p. 609.

Serbia reported 6km² of mine-affected areas in its Article 7 report submitted in 2004²⁸ but demining operations since reduced the figure to 2.5 km² by the end of 2007,²⁹ and during the first five months of 2008 it fell further to 1.8km².³⁰ By November 2008, the Serbian Mine Action Centre (SMAC) reported a mine-affected area of 1.3km² but new minefield discoveries since then pushed the estimate back up to 1.7km² as of April 2009.³¹

In addition, UXO from previous wars, mainly unexploded submunitions from NATO air strikes in 1999, remain a significant problem. SMAC estimated the total area affected by cluster munition remnants at 30km² based on the database developed as a result of a general survey by NPA which completed field activities in November 2008.³² Serbia reports that 28 communities in 16 municipalities (excluding Kosovo) are affected.³³ SMAC expects additional (non-technical) survey will reduce the suspected area to about 16km².³⁴

NATO air strikes in 1999 also scattered unexploded bombs across Serbia. At the June 2008 Standing Committee meetings in Geneva, Serbia stated that some 60,930kg of air-dropped bombs and other large items of UXO are present in 43 locations at depths of up to 20m, as well as in the Danube and Sava rivers.³⁵

An explosion at the Ministry of Defense ammunition storage area in Paracin on 19 October 2006 resulted in contamination of surrounding areas with UXO and led to classification of Paracin and Cuprija as suspected hazardous areas (SHAs) estimated to total 8km².³⁶ Landmine Monitor was informed that at the time of explosion approximately 700 PROM-1 antipersonnel mines were stored in the facility, which may now be scattered around the area.³⁷

Serbia also has to deal with large quantities of naval mines and other items of UXO that were aboard German World War II-era vessels which sank in the Danube river, in the vicinity of Prahovo, in 1944. The position of the sunken vessels and UXO was pinpointed in a general survey of the area in 2006.³⁸ The survey identified 22 war vessels and on four it found naval mines and other items of UXO.³⁹

Casualties

In 2008, Landmine Monitor identified three ERW casualties, one killed and two injured, through Serbian media reports. On 30 June, an adult and a child were injured in Belgrade by a victim-activated booby-trap made from a grenade.⁴⁰ On 5 July, one man was killed by an unidentified explosive fragmentation device while burning rubbish.⁴¹ This is a slight increase from the two ERW casualties identified in 2007.⁴² There is no comprehensive data collection mechanism, and it is likely that casualties are unreported.

⁴² See *Landmine Monitor Report 2008*, p. 623.

The Ministry of Defense's Department of Civil Protection and SMAC did not report mine/ERW or submunition casualties in 2008 or in 2009 through 13 July.⁴³

Between 1999 and 2008, Landmine Monitor identified 113 casualties (21 killed, 64 injured, and 28 unknown), including nine Albanians (four killed and five injured) in 2001.⁴⁴ Landmine Monitor data was gathered from the Ministry of Internal Affairs, ICRC, and media reports. Between 1999 and 2008, the Department of Civil Protection identified 643 casualties (203 killed and 440 injured), 637 of which occurred in 1999.⁴⁵ Due to incomplete data collected by the Ministry of Defense, it is suspected that incidents were caused by both victim-activated devices and bombing strikes or other attacks. As part of its general survey on the impact of submunitions, NPA collected data on 191 casualties caused by the weapons, 31 killed and 160 injured, between 1999 and 2008.⁴⁶

The lack of data also makes comparisons between these casualties and those reported by other sources unreliable. Therefore, neither the casualties recorded by NPA or the Ministry of Defense have been included in the total casualty figure.

The total number of mine/ERW casualties in Serbia is unknown.⁴⁷ Estimates of the total number of survivors range from 1,110 to more than 3,000.⁴⁸

While the lack of a comprehensive data collection mechanism makes it difficult to confirm trends since 1999, available data and perceptions of those working in mine action indicate that casualties peaked in 1999 and 2000, during and immediately after the deployment of NATO air forces, and have declined since, with very few casualties in the last six years.⁴⁹ The last confirmed mine and submunition casualties were reported in 2005.⁵⁰

Risk profile

NPA found that risky behavior occurred in more than 90% of surveyed contamination areas. Over half of the cases involved adults and children entering dangerous areas.⁵¹

NPA's analysis indicates that people in affected communities assume that surface-level removal of unexploded submunitions has been undertaken. When entering suspected areas, adults take children with them or go in groups rather than individually.⁵²

NPA concluded that clearance operations had reduced but not eliminated the hazard: "The likelihood of fatalities has been reduced but the number and frequency of incidents is such that the probability of activating unexploded submunitions will rise with the growing needs of the population to use the blocked land."⁵³

⁴³ Email from Petar Mihajlovic, SMAC, 29 April 2009; and email from Srecko Gavrilovic, Assistant to the Director, Department for Civil Protection, Ministry of Defense, 13 July 2009.

⁴⁴ Due to improvements in data collections, some casualties reported by both the Ministry of Internal Affairs and the ICRC in 1999, 2000, and 2001 were later consolidated to avoid duplicates. *Landmine Monitor Report 2002* reported 32 casualties (11 killed and 21 injured) in 2001, but *Landmine Monitor Report 2004* reported 33 casualties total. Therefore, for this report, Landmine Monitor has counted 33 casualties (11 killed, 21 injured, and one unknown) for 2001. *Landmine Monitor Report 2001* reported 27 casualties (five killed and 22 injured) in 2000, but *Landmine Monitor Report 2004* reported 48 casualties total. Therefore, for this report, Landmine Monitor has counted 48 casualties (five killed, 22 injured, and 21 unknown) for 2000. Likewise, *Landmine Monitor Report 2001* reported eight casualties (three killed and five injured) in 1999, but *Landmine Monitor Report 2004* reported 14 casualties total. Therefore, for this report Landmine Monitor has counted 14 casualties (three killed, five injured, and six unknown) in 1999.

⁴⁵ Casualty data provided by Srecko Gavrilovic, Ministry of Defense, 13 July 2009.

⁵² *Ibid.*, p. 45.

⁵³ *Ibid.*, pp. 28, 48.

Socio-economic impact

Mine/ERW contamination in Serbia still affects agricultural land and forested areas, but the principal contamination is found on roads through forests and in rivers and canals.⁵⁴ Affected areas include the country's ski resorts and national parks, which affects tourism, wildlife, and the environment.⁵⁵

According to the 2009 survey by NPA, a total of 162,000 people 28 local communities are affected by cluster munition remnants and 88,000 people living near suspected areas are exposed to daily risk. Of these, two-thirds live in Duvaniste, a suburb of the city of Niš.⁵⁶ NPA found that unexploded submunitions mostly block access to agricultural land (one-third of the total suspect area), inhibit reconstruction of infrastructure and utilities (19.9%), and prevent renovating or restoring housing (14.2%).⁵⁷

Program Management and Coordination

Mine action

SMAC was established on 7 March 2002.⁵⁸ The Law of Alterations and Supplementations of the Law of Ministries passed in August 2004 identified the center as a legal independent entity (not part of a ministry), with responsibility for humanitarian demining, collection and management of mine/UXO-related information (including casualty data), and surveying of suspected areas. SMAC also has the mandate to plan demining projects, conduct quality control and monitor operations, ensure implementation of international standards, issue licenses to demining organizations, and warn the population about mine/UXO dangers.⁵⁹

SMAC does not conduct demining directly or employ deminers, but undertakes quality management of demining operations carried out by others. Demining is conducted in accordance with international standards by commercial companies and NGOs, after being selected through public tender procedures, which are executed by the International Trust Fund for Demining and Mine Victims Assistance (ITF).⁶⁰

Due to the global financial crisis and cost-saving measures implemented by Serbia's government, SMAC deferred plans to increase its staff in 2008.⁶¹

Risk education

There is no RE program in Serbia, although SMAC is responsible for warning the population about mine/UXO dangers.⁶²

Victim assistance

SMAC is not involved in VA.⁶³ The Special Hospital of Rehabilitation reports on VA at international meetings, but has no other coordinating functions. Responsibility for the provision of services to persons with disabilities, including mine/ERW survivors, is shared among several government agencies, primarily the Ministry of Health (MoH), Ministry of Social Welfare (MSW), and the Republic Health Insurance Institute (RHII).⁶⁴

⁶⁴ Ibid; and *Landmine Monitor Report 2008*, p. 627.

Data collection and management

SMAC has responsibility for the collection and management of mine/UXO-related information (including casualty data). Although SMAC installed the Information Management System for Mine Action (IMSMA) in December 2004 and partially used it, SMAC reported in 2008 that it was not using IMSMA to support its operations.⁶⁵

Since 2004, Landmine Monitor has reported on Serbia's plans to establish a casualty database as part of its commitment to the Nairobi Action Plan.⁶⁶ As of May 2009, no such database existed. In 2008, Serbia proposed the establishment of a team of government experts to manage casualty data to facilitate the preparation of a VA strategy,⁶⁷ but no progress was reported as of May 2009. As in past years, in 2009, Serbia again reported that the lack of casualty data was a "large obstacle for [a] holistic model of development and monitoring of policy" related to VA.⁶⁸

Both the Department of Civil Protection and the Ministry of Internal Affairs collect information on mine/ERW incidents, but information is not shared between ministries. Casualties are believed to go unregistered and the Department of Civil Protection has acknowledged that it lacks the capacity to identify all incidents or to verify data on registered casualties.⁶⁹

The MoH, MSW, and RHII collect incident information when treating survivors. As of May 2009, information collection was ongoing, but data was not consolidated in one place, nor was it available to be shared across government agencies or with NGOs.⁷⁰

Data from NPA's survey in Serbia was provided to SMAC in January 2009.⁷¹

As of May 2009, plans announced by Serbia in September 2006 to engage the NGO Dobra Volja (Goodwill) to collect casualty data and undertake a survivor needs assessment had not progressed.⁷² Dobra Volja ceased operations in 2009 due to insufficient funding and lack of "support from the state."⁷³

⁷³ Telephone interview with Dusan Vukojevic-Mars, President, Dobra Volja, 21 May 2009.

Plans

Strategic mine action plan

SMAC has not drawn up a long-term demining plan or strategy, but bases its work on annual demining programs adopted by the government that are implemented if funding is available.⁷⁴

Serbia has no VA plan, but mine/ERW survivors are included in the National Strategy for Enhancement of Status of Persons with Disabilities 2007–2015, which was drafted with input from disabled people’s organizations.⁷⁵ As of May 2009, the government had not yet formed a council as planned to monitor the implementation and achievements of the National Strategy.⁷⁶

National ownership

SMAC is fully nationalized. As it does not have its own demining teams, SMAC engages Serbian and regional specialized companies and organizations.⁷⁷ The government’s contribution to mine action and VA is mainly through the provision of office space, operating costs, and the salaries of government employees working in mine action.⁷⁸

VA for mine/ERW survivors, mostly medical care and physical rehabilitation services, is provided through the state health system, supported through national funds. Socio-economic reintegration needs have not been addressed with national funds.⁷⁹ Since 2004, Serbia has called on the international community to support psychological support and socio-economic reintegration services for survivors, estimated in 2004 to cost €900,000 (US\$1,325,340) over three years.⁸⁰ As of May 2009, the only international support specifically for VA was the training of one prosthetics and orthotics technician.⁸¹

National mine action legislation and standards

Serbia does not have national mine action legislation, but SMAC reports that mine action is implemented in accordance with the International Mine Action Standards.⁸²

Demining and Battle Area Clearance

Mine and battle area clearance (BAC) in Serbia is carried out by specialized companies and other organizations accredited by SMAC. For donor-funded clearance, the ITF calls for tenders and issues contracts to selected demining organizations. For commercial clearance, investors select the demining organization.⁸³

Five commercial companies and one international NGO were actively demining in Serbia in 2008 using manual and mechanical assets. They included PMC Inženjering, DOK-ING Demining, and DETEKTOR and UXB Balkans from Bosnia and Herzegovina; the Russian state demining agency EMERCOM; and NPA.⁸⁴ The armed forces continue to undertake clearance of contaminated areas of military facilities but these operations are not monitored or recorded by SMAC.⁸⁵

NPA completed its mine clearance project on 31 May 2008, but continued its survey of cluster munition remnants with four teams of two surveyors and a community liaison officer until November 2008. NPA seconded four surveyors to SMAC until the end of 2009.⁸⁶

Identification of hazardous areas

NPA's general survey of submunition contamination, conducted between 9 November 2007 and 30 November 2008, identified 105 "deployment zones" where cluster munitions were used and 390 polygons or suspect areas covering a total of 30.7km². These affected 28 communities in 16 municipalities. The survey found that 67 polygons classified as "higher hazard" (including six "extremely high," 17 "very high," and 44 "high" hazards) covering 6.6km², 186 "middle hazard" polygons covering 11.77km², and 137 "low hazard" polygons covering 12.77km². The classification depended on the distance from the drop zone and the number of bombs used.⁸⁷

The survey found that four of the 16 affected municipalities in central Serbia (Krveni Crst, Kraljevo, Medijana, and Sjenica) accounted for nearly 60% of the SHA. According to the survey, police and civil defense conducted surface clearance of UXO in the past but no records of this clearance exist and subsurface contamination remains.⁸⁸

NPA survey teams marked strike impact zones as part of the survey and for that purpose developed a warning sign in both Serbian and Albanian.⁸⁹

In May 2008, Sogelma of Italy, working under the supervision of Mull and Partner Ingenieuresellschaft of Germany started to implement the "Survey and Search for UXO removal in the Inland Waterway Transport System in Serbia," to locate large UXO from by 1999 NATO bombing along the Sava and Danube rivers.⁹⁰ The survey covered 3.9km² and resulted in SMAC finding and destroying seven aircraft bombs of between 250 and 930kg.⁹¹ On the basis of the survey, SMAC prepared project documents for clearance of UXO, including bombs and missiles, and expected to invite tenders later in 2009. SMAC planned to survey 12 more locations along the two rivers covering a total area of 6.6km², also starting later in 2009.⁹²

Mine clearance in 2008

Serbia reported mine clearance and BAC in 2008 on a total of 2.15km², an increase of 45% compared to 2007 (1.48km²) made possible by increased donor support that resulted in part from NPA's survey. The clearance resulted in destroying a total of 289 antipersonnel mines, 74 antivehicle mines, 450 items of UXO, and 25 unexploded submunitions.⁹³

NPA cleared two projects on the border with Croatia. It started work on the Blata 1 project in 2007 and cleared 132,100m² of land in 2007. The remaining 38,600m² was completed in early 2008. NPA's Neprečava 1 project, lasting from February to May 2008, resulted in clearance of 176,200m².⁹⁴

Mine clearance and BAC in 2008⁹⁵

Demining operators	Mine clearance (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	BAC (m ²)	UXO destroyed
DETEKTOR	439,000	89	31	0	0
DOK-ING	227,400	120	23	0	0
EMERCOM	0	0	0	737,000	450
NPA*	214,600	45	20	0	0
PMC Inženjering	71,980	35	0	0	0
UXB BALKANS	0	0	0	331,990	25
Total	952,980	289	74	1,068,990	475

*NPA's results as reported by SMAC equaled 346,700m², but included tasks completed in 2008, which it had started in 2007. NPA's clearance in 2008 amounted to 214,600m.

Battle area clearance in 2008

In 2008, EMERCOM cleared unexploded submunitions at Niš airport funded by the Russian government. From August to the end of December, it cleared an area of 737,000m² and found and destroyed 450 items of UXO, mostly unexploded submunitions.⁹⁶ EMERCOM continued operations in 2009 supporting construction of a gas pipeline.⁹⁷ Since 2003, five operators have cleared 4km² to a depth of 50cm, destroying 745 submunitions and other items of UXO.⁹⁸

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Serbia is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2014. Serbia stated in 2007 that it intended to complete clearance by the end of 2008 but at the Standing Committee meetings in May 2009 and the Ninth Meeting of States Parties in November 2008, Serbia postponed completion until the end of 2009. It said "this can be impeded only by the lack of funds."⁹⁹

Mine and Battle Area Clearance from 2003–2008¹⁰⁰

Year	Mine clearance (km ²)	BAC (km ²)	Area released by survey (km ²)

Risk Education

No mine/ERW risk education has been reported in Serbia since 2006. However, SMAC reported that during 2008, all areas suspected of submunition contamination were marked with 600 new warning signs¹⁰¹ placed by NPA survey teams as part of its general survey.¹⁰²

RE activities have been confined to southern Serbia. In 1999, emergency RE was provided in response to thousands of refugees flooding into Macedonia. The NGO CARE conducted RE, UNICEF trained teachers, and the Office of the UN High Commissioner for Refugees handed out pamphlets to refugees returning to Kosovo.¹⁰³ From 2002, RE was conducted by the army and Ministry of Interior coordination body.¹⁰⁴ The ICRC operated an RE program from late 2000 to 2005, training a network of volunteers and delivering RE through lectures and theater in Presevo and Bujanovic. It stopped its activities due to the low number of casualties. RE was also delivered through mass media and billboards.¹⁰⁵ In 2006, emergency RE was delivered by the Serbian Red Cross Society in response to the ammunition depot explosion in Paracin.¹⁰⁶

Victim Assistance

The total number of survivors is unknown, but estimates range from 1,110 to 3,000.¹⁰⁷ In May 2009, Serbia stated that “the situation for landmine survivors is much better now than before” although there was little evidence of concrete improvements in 2008, apart from the strengthening of Serbia’s legal framework for persons with disabilities.¹⁰⁸

Mine/ERW survivors who are Serbian citizens are treated within the state health system, including free emergency medical care and physical rehabilitation.¹⁰⁹ Many survivors are refugees who would not be entitled to free services if their status was not regularized. It was not known how many survivors are in this situation.¹¹⁰ Government representatives acknowledged that, while emergency care was available, it was more difficult to address survivors’ ongoing medical needs.¹¹¹

Serbia has rehabilitation centers and prosthetic and orthotic workshops where survivors can receive basic prosthetic and orthotic services. However, Serbia recognized the need to improve the quality of services through licensed education and ongoing training.¹¹² Government officials also recognized that the quality of prosthetics had declined since the wars of the 1990s because of reduced government resources.¹¹³ Many survivors are treated at the Special Hospital of Rehabilitation (SHROP) in Belgrade, where there were long waiting lists for services and no technicians with internationally recognized credentials.¹¹⁴ From 2008–2009, one technician

from SHROP was enrolled in a distance training program to receive International Society for Prosthetics and Orthotics level II accreditation.¹¹⁵

Despite recognizing that many survivors suffer from post-traumatic stress as a result of their injury,¹¹⁶ psychotherapeutic assistance was not covered by health insurance and the overall quality of care was inadequate.¹¹⁷ In 2009, Dobra Volja, the only association of mine survivors that provided peer psychosocial support, ceased operations due to a lack of funding.¹¹⁸

Government officials called high unemployment the “biggest problem” for mine/ERW survivors, but acknowledged that no was funding available.¹¹⁹ Seventy percent of persons with disabilities live in poverty.¹²⁰ In November 2008, the National Employment Service, which has responsibility for training and job placement, found that just 21,000 out of 700,000 persons with disabilities were employed.¹²¹ A lack of workplace accommodation combined with high unemployment makes economic reintegration difficult for persons with disabilities. In May 2009, the Law on Professional Rehabilitation and Employment of Persons with Disabilities was passed, specifying employment quotas for persons with disabilities.¹²²

Serbia has several laws protecting the rights of persons with disabilities that were generally enforced. Yet public transportation and older buildings were not physically accessible.¹²³ Serbia stated that disability laws were not harmonized with relevant international laws and regulations but that, as of May 2009, a harmonization process was ongoing.¹²⁴ On 29 May 2009, Serbia ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol.¹²⁵

Progress in meeting VA26 victim assistance objectives

As one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate attention to survivors,¹²⁶ Serbia presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005. It then presented revised objectives in 2006 and 2007,¹²⁷ although, as of May 2009, a plan to achieve these objectives had not been made available. As of May 2009, while Serbia stated that the situation for survivors had improved since 2004, little progress could be identified towards achieving VA objectives. According to Dobra Volja’s president, “there is no evidence on any progress in achieving any of the VA 24 [VA26] objectives.”¹²⁸

No progress had been made towards the establishment of a survivor database, which is a prerequisite for planning and measuring progress in other areas. Four of Serbia’s eight objectives refer to actions that would be carried out “based on” information gathered for the

¹²⁸ Telephone interview with Dusan Vukojevic-Mars, Dobra Volja, 21 May 2009.

survivor database or the VA plan to be established using the same information.¹²⁹ While Serbia noted that all survivors received basic medical and rehabilitation services, no progress was made toward objectives to improve training and education of the prosthetic/orthotic team.¹³⁰ In 2008, no progress was identified in achieving Serbia's two economic reintegration objectives. A national strategy for improving the quality of life of persons with disabilities and their families was developed, but not based on the needs of survivors, as planned, again due to the lack of progress on a survivor database.

Serbia included a disability expert on its delegation to the intersessional Standing Committee meetings in 2006, 2007, and 2009, and meetings of States Parties held from 2005–2008, who reported on progress in achieving VA aims at all of these meetings. Statements mostly repeated similar information, stating the goals of the National Strategy for persons with disabilities and the ongoing obstacles preventing progress in data collection, physical rehabilitation, and socio-economic reintegration and calling on the international community to support efforts to improve the quality of life of survivors.¹³¹ Economic hardship and increasing poverty levels, caused by the “transition period,” along with the global financial crisis, were cited as reasons for needing international assistance.¹³² Serbia has not used the voluntary Form J attachment to its Article 7 report since 2005 to provide details on VA activities.

Victim assistance activities

In 2008, before it closed, the national survivors' organization Dobra Volja provided school supplies and clothing to an unspecified number of children of landmine/ERW survivors.¹³³ No other programs providing services specifically to mine/ERW survivors were identified in 2008.

Support for Mine Action

Serbia has not published comprehensive long-term cost estimates for fulfilling mine action needs (including RE and VA) but has projected the cost of mine and submunition clearance and explosive ordnance disposal at \$51,541,000 (€35 million) based on projected clearance of mined areas by 2009.¹³⁴ Serbia has not developed a mine action or resource mobilization strategy.

National support for mine action

Serbia did not report national funding to mine action in 2008. SMAC reported RSD13,193,000 (\$232,197) in national funding in 2007.¹³⁵

International cooperation and assistance

In 2008, five countries and the European Commission (EC) reported providing \$2,831,668 (€1,922,904) to mine action in Serbia, 3% more than reported funding for 2007. Most mine action funding prior to 2006 did not distinguish between Serbia and Kosovo. Funding at 2008 levels is inadequate to meet the budget requirements reported by Serbia to complete mine clearance by the planned 2009 deadline, and as in 2007, does not directly address RE or VA needs.

Ten-Year Summary

The Republic of the Sudan ratified the Mine Ban Treaty in October 2003 and became a State Party on 1 April 2004. Sudan has drafted but not enacted national implementation legislation. Sudan served as co-rapporteur and then co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration from 2005–2007. Sudan completed destruction of its stockpile of 10,566 antipersonnel mines in March 2008. Additional mines were later discovered and destroyed. From 1999–2004, there were serious allegations of use of antipersonnel mines by government forces, the Sudan People's Liberation Movement/Army (SPLM/A), and other rebel groups; the government denied any use.

Sudan is contaminated with mines and explosive remnants of war (ERW), primarily as a result of more than 20 years of armed struggle between the government of Sudan and non-state armed groups in the south, mainly the Sudan People's Liberation Movement/Army. A Landmine Impact Survey was completed in 16 Sudanese states in June 2009, with the UN Mine Action Office (UNMAS) estimating that total residual contamination covered 107km². UNMAS began mine action operations in 2002 in the Nuba Mountains with international and local NGOs carrying out demining and risk education. More than 44km² of land have since been released and a further 29,000km of road verified. Mine action centers have been set up in Khartoum in the north and in Juba in the south.

There have been at least 4,213 mine/ ERW casualties in Sudan, including 1,748 casualties between 1999 and 2008, but data collection has been incomplete and not nationwide. Mine/ ERW risk education was undertaken from 1999–2008 by an increasing number of operators and with increasing effectiveness, but some areas remained uncovered. Activities were also organized for refugees from other countries as well as Sudanese refugees in countries such as Kenya.

Despite an increase in activities due to long-term funding for victim assistance (VA) since 2007, service provision has remained limited both in terms of geographic coverage and the types of services provided. The situation of survivors and persons with disabilities was hampered by a general lack of capacity, infrastructure, ongoing conflict, and poverty. Government interest in VA/disability action has increased since 2007, but this has not yet been matched with increased financial commitments or better implementation by government ministries.

Background

Following a three-year peace process, the government of Sudan and the southern-based rebel Sudan People's Liberation Movement/Army (SPLM/A) signed a Comprehensive Peace Agreement (CPA) on 9 January 2005. An interim implementation period of six years will last until July 2011, when a referendum on self-determination for the south will be held. Sudan is now ruled by the Government of National Unity (GONU)—an entity containing the former ruling party, the National Congress, SPLM/A, and others—and a semi-autonomous Government of Southern Sudan (GOSS).

Mine Ban Policy

Sudan signed the Mine Ban Treaty on 4 December 1997 and ratified on 13 October 2003, becoming a State Party on 1 April 2004. The CPA incorporates previous agreements between the government and SPLM/A that explicitly prohibit use of all landmines. An agreement reached on 31 December 2004 states that the “laying of mines, explosive devices or booby traps of whatever type shall be prohibited.”¹

Sudan submitted its annual Article 7 report on 13 April 2009, covering calendar year 2008. It has submitted five previous Article 7 reports.² In its Article 7 report covering 2008, Sudan reported that draft national implementation legislation had been cleared by the GONU Ministry of Justice and “endorsed by the concerned committee of the National Assembly responsible for the validations of humanitarian laws.” The legislation is expected to pass into law during 2009.³

Sudan participated in the Ninth Meeting of States Parties in Geneva in November 2008, where it made a statement during the general exchange of views, as well as statements on mine clearance, VA, and cooperation and assistance. Sudan participated in the intersessional Standing Committee meetings in Geneva in May 2009, where it made statements on stockpile destruction, mine clearance, risk education (RE), and VA.

Sudan has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Sudan signed the Convention on Conventional Weapons on 10 April 1981, but has never ratified it. Sudan has not signed the Convention on Cluster Munitions.⁴

¹ See *Landmine Monitor Report 2006*, p. 652. Under a previous memorandum of understanding on cessation of hostilities reached in October 2002, both parties agreed to “cease laying of landmines.” The government and SPLM/A also agreed to stop using mines in the January 2002 Nuba Mountains cease-fire agreement. Prior to these agreements, the SPLM/A signed the Geneva Call Deed of Commitment in October 2001.

² Sudan prepared an initial Article 7 report, dated 1 October 2004; the period covered was not stated. The Mine Ban Treaty Implementation Support Unit received this initial report, but Sudan apparently never officially submitted it to the UN. Sudan submitted a second Article 7 report dated 30 April 2005, but the date of submission is listed by the UN as 17 February 2006, covering the period from 1 October 2004 to 30 April 2005. Sudan submitted a third, undated, Article 7 report, listed by the UN as submitted on 20 May 2006, covering 1 May 2005 to 31 December 2005. Sudan submitted a fourth Article 7 report, dated 30 April 2007, after August 2007, covering calendar year 2006, and a fifth report in August 2008, covering calendar year 2007. Prior to the submission deadline of 30 April 2008, Sudan submitted an interim letter to the treaty's Implementation Support Unit regarding completion of its stockpile destruction obligations. Letter to GICHD from the Permanent Mission of the Republic of the Sudan to the UN, Geneva, 4 April 2008.

³ Article 7 Report, Form A, 13 April 2009.

⁴ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 243–244.

Production, transfer, and use

Sudan has repeatedly stated that it has not produced or exported antipersonnel mines.⁵ Landmine Monitor has not received any serious allegations of use of antipersonnel mines by the government, the SPLA, or other forces anywhere in Sudan since early 2004.⁶

The UN has reported one suspected mined area in Darfur region. It is not known when the mines may have been laid.⁷ Many groups remain outside the May 2006 Darfur Peace Agreement, which prohibits mine use.⁸

Stockpiling and destruction

Sudan completed destruction of its stockpile of 10,566 antipersonnel mines on 31 March 2008, ahead of its 1 April 2008 treaty-mandated deadline. The reported size and composition of Sudan's stockpile, as well as the number of mines to be retained for training purposes, have varied in accounts by Sudan leading up to and following stockpile destruction events in 2007 and 2008.

In its Article 7 report submitted in February 2006, Sudan declared a total of 14,485 antipersonnel mines of eight types held in army and SPLA stockpiles, and stated that 5,000 mines of various types would be retained for training purposes by the Engineer Corps of the Sudan Armed Forces.⁹ In its Article 7 reports submitted in May 2006 and April 2007, Sudan declared a total of 4,485 stockpiled antipersonnel mines of 18 types, all under the control of GONU, and an additional 10,000 mines of unspecified types to be retained for training purposes, with GONU and GOSS each retaining 5,000 mines.¹⁰

Sudan carried out an initial stockpile destruction event on 30 April 2007 in northern Sudan, during which 4,488 mines were destroyed. On 31 March 2008, a second destruction event took place in Southern Sudan, during which an additional 6,078 mines were destroyed, bringing the total number of mines destroyed to 10,566.¹¹ In an April 2008 letter to the Geneva International Centre for Humanitarian Demining (GICHD), Sudan stated that, of a total stockpile of 15,566 antipersonnel mines, it had destroyed 10,566 and retained 5,000. Sudan stated that the adjusted figure of 15,566 mines (rather than the 14,485 mines previously reported) was the result of additional mines stockpiled by SPLA forces not being previously included in inventories.¹²

In its Article 7 report covering 2008, Sudan revised its number of mines retained for training purposes, this time reporting a total of 1,938 mines of six types (see Mines retained for training purposes section below).¹³ In a presentation during the May 2009 intersessional Standing

⁵ Previous editions of Landmine Monitor have noted no evidence of production of antipersonnel mines by Sudan, but have cited allegations of transfer to militant groups in neighboring countries prior to Sudan becoming a State Party. See, for example, *Landmine Monitor Report 2001*, p. 223.

⁶ Landmine Monitor received allegations of use of antipersonnel mines by government-supported militias in Upper Nile state as late as April 2004. A Sudan Liberation Army (SLA) commander in Northern Darfur state said the SLA had captured a Sudanese government cache of landmines when it overran a government army position in early 2004. See *Landmine Monitor Report 2004*, pp. 753–755. For descriptions of past use and denials of use, see previous editions of Landmine Monitor.

⁷ UNMAO information sheet on Darfur, provided by Christina Greene, Program Officer, UNMAO, 26 March 2008.

⁸ Darfur Peace Agreement, Abuja, 5 May 2006, www.unmis.org. Other factions and non-state armed groups have rejected the Abuja agreement. Previously, the SLA and the Justice and Equality Movement signed a humanitarian cease-fire for Darfur with the Government of Sudan in April 2004. This agreement required a halt in mine use and required the marking of any mined areas. "Agreement on Humanitarian Ceasefire on the Conflict in Darfur," (N'Djamena Agreement), Articles 2, 4, and 6, N'Djamena, Chad, 8 April 2004. The UN has identified 30 armed parties, classified into different groups. Email from Ida Margarita Hyllested, Assistant Project Officer, UNICEF, 30 March 2008.

For details of the composition of the stockpiles destroyed, see *Landmine Monitor Report 2008*, pp. 633–634.

¹² Letter to GICHD from the Permanent Mission of the Republic of the Sudan to the UN in Geneva, 4 April 2008.

¹³ Article 7 Report, Form D, 13 April 2009.

Committee meetings, Sudan revised its total number of stockpiled mines, reporting that in spite of its original declaration of 14,485 stockpiled mines, only 12,513 were “accounted for” during physical stock-taking.¹⁴ It is likely that number is supposed to be 12,504 (the 10,566 destroyed mines plus the 1,938 retained mines).¹⁵ Sudan noted, “As no proper records have been maintained, determining the exact number and types of APMs [antipersonnel mines] was a challenge.”¹⁶

In its Article 7 report for 2008, Sudan stated, “In addition to the destruction of known stockpiles of APMs, caches of APM were discovered in various locations of Southern Sudan which contained 523 APM. All these mines were destroyed in 2008. The destruction took place in various parts of Blue Nile State, Southern Sudan during October–December 2008.”¹⁷

Mines retained for training purposes

As noted above, in recent years Sudan has reported differing numbers of mines retained for training purposes, based on varying estimates of overall stockpiles. In April 2008, shortly after the completion of stockpile destruction, Sudan reported retaining 5,000 mines of unspecified types “for the purposes of research and [the] demining training process.”¹⁸ In June 2008, it reported retaining 4,979 mines, again without specifying types.¹⁹ In August 2008, Sudan reported retaining 4,997 mines of 18 types, without specifying numbers retained for each type. The list provided was evidently provisional, as Sudan stated that “Details of each type of mine and the quantities are being sorted out and will be reported in the next report.”²⁰ The same number of mines retained was repeated in a statement by Sudan at the Ninth Meeting of States Parties in November 2008.²¹ However, in its Article 7 report covering 2008, Sudan reported retaining only 1,938 mines, consisting of PMN (178), Type 14 (130), “Desert plastic” (85), Type 35 (1,194), Valmara (46), and PPM mines (307).²² This number was confirmed in a presentation by Sudan at the intersessional Standing Committee meetings in May 2009.

Sudan has not reported in any detail on the intended purposes or actual uses of its retained mines, as agreed by States Parties at the First Review Conference in 2004.

In June 2008, the head of the Southern Sudan Demining Authority (SSDA) stated that all mines retained by Sudan for training and research purposes are held under the authority of GONU and are not accessible to mine action authorities or operators in Southern Sudan. Mines required for training purposes in Southern Sudan must be obtained from sources other than GONU stocks, at least until the 2011 referendum on the status of Southern Sudan, at which time common access to stocks may result from the establishment of a joint government.²³

¹⁴ Presentation by Sudan, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

¹⁵ In looking at the presentation, it appears the extra nine mines were the result of incorrectly counting the March 2008 destruction as 6,087 instead of 6,078.

¹⁶ Presentation by Sudan, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

¹⁷ Article 7 Report, Form G, 13 April 2009. The mines were 283 No. 4; 121 TS-50; 80 Type 69; 19 M14; 17 M35; 11 PoMZ-2; and one PMN. At the Ninth Meeting of States Parties in November 2008, Sudan said that it had found “additional abandoned caches” of mines and would destroy them. Statement of Sudan, Ninth Meeting of States Parties, Geneva, 24 November 2008. In March 2008, Sudan indicated that it expects additional stockpiled antipersonnel mines will be identified and destroyed, given the difficulties of doing a comprehensive inventory and collection of all the stockpiled antipersonnel mines belonging to all former combatants in Sudan. At the March 2008 destruction event, the GOSS Minister of Interior expressed his hope to “gather again to destroy even bigger number of mines than today.” A UN official told Landmine Monitor that on 1 April 2008, one day after the destruction event, a stock of 10 boxes of Type 69 antipersonnel mines was found. See *Landmine Monitor Report 2008*, p. 634.

²³ Interview with Jurkuc Barac Jurkuc, Chairperson, SSDA, in Geneva, 4 June 2008.

Scope of the Problem

Contamination

Sudan is contaminated with mines and ERW, primarily as a result of more than 20 years of armed struggle between the Government of Sudan and non-state armed groups in the south, mainly the SPLA. The struggle ended with the signing of the CPA on 9 January 2005, although continued violence raised fears of a return to conflict.²⁴

Of Sudan's 25 states, 19 have previously been suspected to be mine-affected,²⁵ although survey has discounted Sennar in central Sudan. (See Identification of hazardous areas section below). To better determine the scope of contamination in Sudan, in 2005 the UN launched the Landmine Impact Survey (LIS) with the Survey Action Center (SAC). In the 16 states where the LIS was conducted, of an estimated 5,445 villages the survey identified 296 as impacted by landmines—a prevalence rate of 5.4%. As a comparison, the prevalence rate across Angola and Afghanistan was 8%.²⁶

With little evidence of a mine problem in Darfur region, it was planned to survey the region for UXO sites but the UN Mine Action Office (UNMAO) decided not to proceed after 13 international NGOs were expelled from Darfur in March 2009. As of August 2009, the survey had not started.²⁷

Prior to the LIS, the Sudanese government considered the five states of Gezira, Khartoum, Northern, Northern Kordofan, and White Nile as not being affected, and they were not surveyed as a result, although the borders with Libya and Egypt in Northern and Nile states may be contaminated with mines laid during World War II.²⁸

A more complete view of the mine/ERW problem in Sudan may be contained in UNMAO records, which covered 5,511 "hazardous areas" across 18 states in 2002 through June 2009. Hazardous areas are classified in three ways: a dangerous area (DA), a (confirmed) mined area, or a suspected hazardous area (SHA). DAs represent 85% of all hazardous areas, of which more than half are designated as UXO spot-clearance tasks. Almost half of the DAs are associated with roads and open land while approximately one in five are located inside buildings, including military installations. As of June 2009, DAs in buildings represented approximately 12% of the DAs awaiting clearance.²⁹ In Darfur region, 148 hazardous areas—all classified as DAs—had been identified, but as of June 2009 only 37 sites with a residual UXO threat remained to be released.³⁰

Of the 5,511 identified hazardous areas, 3,467 have been "closed" (i.e. released by clearance, cancelled, or changed to a SHA or minefield³¹), mainly through the retrofit of DAs found by the LIS, leaving 2,044 for release. Of these 2,044 areas, 192 were confirmed mined areas and 364 were SHAs (see table below).³² The confirmed mined areas were estimated to cover 26km² of land and as of June 2009 the SHAs remaining from the LIS cover an estimated 94km² for a total estimated area of contamination of 119km².³³

Hazardous areas as of June 2009³⁴

State	No. of hazardous areas	No. of DAs	No. of mined areas	No. of SHAs
Central Equatoria	524	387	4	133
South Kordofan	334	175	88	71
Eastern Equatoria	213	172	34	7
Western Bahr el Ghazal	196	191	0	5
Blue Nile	139	78	29	32
Western Equatoria	135	118	0	17
Kassala	112	44	18	50
Subtotal	1,653	1,165	173	315
Percentage	80.87%	70.48%	10.47%	19.06%
Other 11 affected states	391	323	19	49
Total	2,044	1,488	192	364

Data on the type of munitions found indicates more of a UXO/ERW problem than a landmine problem. As of September 2009, UNMAO reported that 15,217 antipersonnel mines and 3,050 antivehicle mines had been found compared to 834,112 ERW and 1,098,828 pieces of small arms ammunition.³⁵

Casualties³⁶

In 2008, there were at least 65 new mine/ERW casualties, including 19 people killed and 46 injured. Of these, UNMAO recorded 61 casualties and Landmine Monitor identified four additional casualties. Three casualties were military and one was a Bangladeshi deminer. At least 29 casualties were children (25 boys and four girls), 17 were adults (13 men and four women), and for the remainder the age was unknown. Antipersonnel mines caused seven casualties, antivehicle mines 12, cluster munitions eight, and other ERW 15. One casualty was caused by a fuze and for 22 casualties the device type was unknown. For 17 casualties the activity at the time of the incident was unknown.

Tending animals was the main cause of casualties where the activity was known (13), followed by tampering (12). Casualties occurred in 12 states, mostly in Kassala (18), followed by Unity (10), and Northern Darfur and Western Bahr el Ghazal (seven each). Just two of the casualties in 2008 reported receiving mine/ERW RE (39 said no and the remainder was unknown), and seven reported knowing the area they entered was dangerous.

The casualties recorded in 2008 decreased in comparison to 2007, when 91 casualties (28 killed and 63 injured) were recorded. Ultimately, the 2008 casualty figures are likely to be higher due to slow data collection and the lack of a universal data collection system. Further reasons noted were the varying presence and absence of mine action operators in certain areas, decreased survey activity, and the impact of RE activities.³⁷

³⁴ UNMAO, "IMSMA Monthly Report," June 2009, Table 1.1, p. 1, www.sudan-map.org.

³⁵ Ibid, Table 2.5, p. 5, www.sudan-map.org; and email from David McMahon, UNMAO, 6 September 2009.

³⁶ Unless noted otherwise, casualty data (1964–June 2009) provided by Mohammad Kabir, UNMAO, 4 June 2009; and Landmine Monitor media analysis from 1 January 2008 and 2 June 2009.

³⁷ Email from Mohammad Kabir, UNMAO, 2 July 2009.

Casualties continued to be reported in 2009, with at least 41 casualties as of 14 July 2009, including six people killed and 35 injured. UNMAO recorded 40 casualties until the end of May and Landmine Monitor identified one boy injured on 14 July 2009.³⁸ At least 22 casualties were civilian, one was a Pakistani military deminer, and four were military. The status of the others was unknown. For 30 casualties the device causing the incident was not known, cluster munitions caused six casualties, other ERW three, and a fuze two. Incidents occurred in 11 states, mostly in Lakes (10) and Northern Darfur (seven).

Ten-year summary

To July 2009, UNMAO recorded 4,213 mine/ERW casualties, including 1,402 people killed and 2,811 injured.³⁹ Of these, 1,748 occurred between 1999 and the end of 2008 (553 killed and 1,195 injured). Most casualties from 1999–2008 were male (1,441) and 234 were female (70 unknown). For 631 casualties, their status was unknown; 503 were civilians, 257 military, five mine action personnel (four demining casualties), and 352 “others.” Casualties occurred in 18 states, mostly in Western Bahr el Ghazal (564) followed by Southern Kordofan (328), Kassala (239), and Central Equatoria (183). When known, the most common activity at the time of incident was traveling (422), followed by military activity (198), and playing/recreation (117).

By July 2009, the LIS identified 104 casualties in 16 states within the two years preceding the survey (37 killed and 67 injured), including 92 civilians. Most casualties (86) were male.⁴⁰ At least 1,158 less recent casualties (664 killed and 494 injured) were also recorded. Most recent casualties occurred in Kassala (32), Eastern Equatoria (28), and Central Equatoria (20) states. Most of the less recent casualties were recorded in Eastern Equatoria (498), Central Equatoria (320), and Kassala (227) states.⁴¹

Landmine Monitor also identified at least seven casualties from 1999–2008 not included in the Information Management System for Mine Action (IMSMA) database, including five deminers and two Eritrean children (one killed and six injured).⁴²

Risk profile

The majority of casualties are male and a significant proportion are children. The most common activities by civilians at the time of incident are traveling, collecting food, water, and wood, playing and recreation, and farming.⁴³ Where information was available, a significant proportion of casualties (850) reported that they had not received RE, and only 22 casualties had received RE. However, for the majority of casualties (1,188) this information was not available.⁴⁴

Socio-economic impact

In addition to causing casualties, mines and ERW contaminate agricultural land, livestock-grazing areas, land used for collecting firewood and producing charcoal, access routes, and roads.⁴⁵ A GICHD evaluation in 2007 concluded that mine contamination in Sudan was modest but the fear of landmines constrained recovery and development efforts.⁴⁶ Fear of mines and ERW has resulted in extensive road closures including key logistical/supply routes that hamper

movement, the return of internally displaced persons and refugees, trade, and humanitarian interventions.⁴⁷

According to a study conducted by the World Food Program (WFP), its combined demining and road rehabilitation program has yielded significant socio-economic benefits. Based on interviews with local residents, verifying and clearing roads has reduced travel time by 50% and the cost of transportation by 40%. In one location, the WFP noted a 65% increase in the number of businesses following the opening of a road. It has also greatly reduced the WFP's costs for moving food. According to the study, opening up the major roads to traffic, commerce, and the return of refugees is mine action's signal achievement in Sudan, an achievement the WFP said should be given more credence. The study also concluded that the benefits of demining outweighed the costs: although it was quite expensive to open the roads, perhaps it could have been done for less money.⁴⁸

A research paper by Professor Dawood H. Sultan of Indiana University on the impact of landmines in the Nuba Mountains in Sudan's Kordofan region found that mines limited access to water and land-based resources, causing socio-economic, psychological, public-health, and ecological problems. The author argued that mines have disrupted ancient tribal land patterns, thereby affecting agriculture and food security, and he questioned whether targeting high- and medium-impacted communities for clearance is the correct strategy unless clearance includes also farmland, pasture, and water.⁴⁹

The LIS identified 48 communities with 98 SHAs in South Kordofan. Of the 98 SHAs, 62 were reported to cause agricultural blockages. However, with only 11 of the communities classified as high- or medium-impacted, just 32 SHAs are scheduled for clearance before 2011,⁵⁰ leaving 66 SHAs for clearance afterwards.

Program Management and Coordination

Mine action

The National Mine Action Authority (NMAA) is the institution responsible for coordination and management of mine action in Sudan. The NMAA⁵¹ includes a National Mine Action Committee; a General Secretariat; the National Mine Action Center (NMAC), based in Khartoum; and the Southern Sudan Demining Authority (SSDA), based in Juba.⁵² With support from UNDP, the authorities in the north and the south of the country have also established field offices in Kassala, Malakal, and Wau, with plans to set up new offices in Kadugli and Ed Damazin in 2009.⁵³

UNDP and UNMAS provide technical assistance through UNMAO,⁵⁴ which is mandated by UN Security Council Resolution 1590 and the CPA to coordinate, facilitate, accredit, and conduct quality assurance of all mine action activities in Sudan. Following the 1 January 2008 establishment of the UN-African Union Hybrid operation in Darfur (UNAMID) to support the effective implementation of the Darfur Peace Agreement, UNMAO opened offices in Al Fasher, Nyala, and El-Geneina in Darfur region.⁵⁵

⁵⁵ UNMAS, "UNMAS Annual Report 2008," p. 1, provided to Landmine Monitor by email from Severine Flores, Program and Public Information Officer, UNMAO, 17 March 2009.

UNMAO operations consist of three regional offices and 9 suboffices and its headquarters in Khartoum. The North Regional Mine Action Office is in Kadugli, South Kordofan state, supported by three suboffices in Kadugli, Ed Damazin in Blue Nile state, and Kassala in eastern Sudan. The South Regional Mine Action Office in Juba has suboffices in Juba, Malakal in Upper Nile state and Wau in Western Bahr el Ghazal state. The suboffice in Rumbek was closed in 2008. The Western Regional Mine Action Office in Al Fasher, in Northern Darfur state, coordinates its work with suboffices in Al Fasher for Northern Darfur state, in Nyala for Southern Darfur state, and in El-Geneina for Western Darfur.⁵⁶

Risk education

Within the UNMAO framework, UNICEF is responsible for the management and coordination of RE. However, a transition process for mine action is working towards responsibility for RE passing to the respective authorities in the north (NMAC) and south (SSDA, also called the South Sudan Demining Commission, SSDC). The transition process should be completed in 2011, prior to the referendum on independence for south Sudan.⁵⁷ In the north, the NMAC is more involved in coordination than in the south, and their RE staff chair the coordination meetings.⁵⁸

UNICEF supported the planning, implementation, and management of RE activities at the national and regional levels through advisory and coordination groups. Sudan reported that in 2008 there was enhanced and broadened coordination and collaboration between the UN, government officials, and NGOs at the national and local levels.⁵⁹

Victim assistance

Under the NMAA, NMAC coordinates VA activities in the northern part of the country. For Southern Sudan, a July 2008 workshop decided that the Ministry of Gender, Social Welfare and Religious Affairs would be the VA focal point. Both these “VA coordination platforms” hold monthly meetings with all stakeholders⁶⁰ and were considered effective.⁶¹ But meetings between the two platforms are infrequent, in part due to logistical challenges, and information-sharing between government bodies responsible for north and south was not satisfactory; however, it was noted that a number of communications were exchanged between NMAA and SSDC.⁶²

UNMAO provides technical assistance to both coordination platforms.⁶³ The National Council for Disability is in charge of implementing and monitoring disability legislation.⁶⁴

Data collection and management

UNMAO manages mine action data using IMSMA software. Data is entered in the UNMAO regional offices and sent to Khartoum each month for quality assurance purposes. The updated database is then sent back to the regional offices. UNMAO provides the NMAC and the SSDA

with monthly read-only copies of the database. The database in Khartoum includes maps and is a major source of information for most stakeholders.⁶⁵

Although the number of actors collecting data increased, there was no nationwide casualty data collection mechanism in Sudan as of July 2009. Data was collected by operators and authorities present in a specific area.⁶⁶ The speed at which data is collected was considered to be satisfactory and all VA partners used the standard IMSMA form. The quality was said to be adequate. UNMAO also provided refresher training for data collectors. LIS data was integrated into IMSMA and checked for duplicates.⁶⁷

However, some other bodies (e.g. ICRC, local authorities) also collected data in their own formats, which were not always compatible with IMSMA, and could not be integrated with the IMSMA database. This was reported to be “a serious challenge in terms of optimization of resources, geographical coverage and creation of a common understanding about data collection for mine action and disability.”⁶⁸

Casualty data was used for RE and VA planning, but was not the only source of information, partly because many survivors move to areas with more opportunities or better services. RE activity data is collected by implementing organizations and entered into IMSMA.⁶⁹

All VA operators and UNMAO partners had a contractual agreement to collect and share information on mine/ERW casualties and persons with disabilities.⁷⁰ Survivor information was also collected through needs assessments and surveys by NGOs and authorities in Southern Sudan.⁷¹

UNMAO maintains casualty data in the central IMSMA database: three regional modules and seven read-only versions have been installed.⁷² The Khartoum office provides detailed casualty data analysis on request.⁷³

A UNICEF assessment of data collection in Southern Sudan in 2008 recommended: more analytical use of IMSMA data in designing, developing and implementing RE/VA; wider circulation of IMSMA reports; establishment of a comprehensive injury surveillance mechanism of which mine/ERW injuries are a part; and making existing data collection efforts more systematic and including the Ministry of Health and Police in the process.⁷⁴

Plans

Strategic mine action plan

The National Mine Action Strategic Framework for 2006–2011, adopted in 2006, serves as the key strategic planning document for mine action in Sudan. Strategic goals for mine action include:

- continued emergency mine/ERW clearance and survey in high-priority areas;
- mapping of SHAs;
- strengthening national mine action institutions;
- expanding national mine action operational capacities;
- national mine action planning and budgeting;
- mobilizing national and international funding;
- planning and implementing the transition of mine action management from the UN to national authorities;
- integration of mine action into national recovery and development plans; and
- ensuring that Sudan honors its obligations under the Mine Ban Treaty and other relevant treaties.⁷⁶

By 2011 Sudan plans to clear 80% of the high- and medium-impacted communities identified by the LIS.⁷⁷ This represents 88 of the 110 high- and medium-impacted communities.⁷⁸

In 2008, UNMAO developed a plan in consultation with the authorities to transfer ownership of the mine action program to the government in 2011.⁷⁹ The plan involves the transferring of 10 core management responsibilities to the NMAC and SSDA. They are to:

1. coordinate all aspects of mine action;
2. prioritize, task, and authorize all mine action activities;
3. accredit mine action organizations in accordance with National Technical Standards and Guidelines;
4. ensure quality management of all mine action activities;
5. revise the national standards according to in-country needs and conditions;
6. maintain the integrity of the national mine action database;
7. mobilize necessary funds from national and international sources;
8. coordinate and manage the implementation of RE;
9. coordinate and manage assistance to survivors; and
10. ensure that Sudan meets its obligations under the Mine Ban Treaty.⁸⁰

The Mine Action Multi-Year Plan covering the period 2009–2011 is the implementation plan of the National Strategic Framework and the transition to national ownership. It is reviewed quarterly with adjustments made as necessary. The plan calls for annual revisions and the first is scheduled for release in late 2009.⁸¹ Transition implementation began in January 2009.⁸² UNMAO, in turn, will implement an exit strategy while placing key national and international staff among national authorities' technical advisors.⁸³

The National Victim Assistance Strategic Framework 2007–2011 was approved in July 2007.⁸⁴ It has six main lines of action: improving information management; ensuring medical and physical rehabilitation assistance; developing programs for social reintegration and

economic empowerment; strengthening advocacy and policy programs; mobilizing resources; and streamlining coordination mechanisms at various levels.⁸⁵

The subsequent Victim Assistance Work Plan September 2007–August 2009 was finalized in September 2007. It set clear objectives, targets, responsible agencies, timeframes, and budget. Several objectives were drawn from earlier workplans and have been postponed continuously since early 2005, and had not been completed as of May 2009,⁸⁶ such as the establishment of a nationwide data collection mechanism by December 2005.⁸⁷ Progress under the 2007–August 2009 plan had been reviewed, but results were not scheduled for release until August 2009.⁸⁸

The strategic framework and the workplan are integrated into the Transitional Plan towards National Ownership for Mine Action. After a national workshop on 4–5 February 2009, a workplan for the second phase of implementation was integrated into the Multi Year Plan for the mine action sector (2009–2011) at an estimated cost of US\$4.3 million. As with the previous workplan, the 2009–2011 plan also contains targets, timeframes, and responsible agencies.⁸⁹ Both the VA workplan and the Multi Year Plan were due to be finalized by August 2009.⁹⁰ Some NGO representatives complained that the delay in obtaining the plan was hampering their activities.⁹¹

Integration of mine action with reconstruction and development

The UN and national authorities are trying to integrate mine action with relief, reconstruction, and development efforts through a joint priority-setting process with GONU and GOSS.⁹² Previously, it was reported that “slow progress” had been made towards integration with development efforts⁹³ but, according to UNMAO, support for the delivery of humanitarian assistance has occurred through the opening of primary and secondary transportation routes.⁹⁴

Verification and clearance of roads linking remote regions in the south, and linking the south and north, as well as roads leading to international borders has been a major achievement of the mine action program in Sudan. Several examples illustrate the impact of clearing the roads. Roads have opened linking Wau to its surrounding areas and creating links to the west, towards Southern Darfur and to the southwest.⁹⁵ The opening of routes linking Kenya, Uganda, and the Democratic Republic of the Congo with major towns in the south has reportedly enabled commerce to flourish. The opening of the road from Kassala to Hameshkoreib in eastern Sudan has provided critical access to a community cut off for several years due to fear of mines.⁹⁶ At the request of the Office of the UN High Commissioner for Refugees (UNHCR), UNMAO verified the Maban–Chali route, from Ethiopia to facilitate refugee returns, while the Malakal–Kodok–Malut–Kosti route has created a valuable link between the north and south.

UNMAO also receives a growing number of requests to widen roads, particularly in the south, in order to enable pedestrians to better cope with the increased traffic as a result of growing economic demand.⁹⁷ The extensive road verification and assessment has also resulted

in more internally displaced persons (IDPs) and refugees returning home, safer travel, faster and less costly travel, and a significant decrease of the costs of delivering humanitarian aid.⁹⁸

National ownership

Commitment to mine action and victim assistance

Sudan has demonstrated a growing commitment to mine action through the establishment of mine action centers in the north and south and the adoption of national mine action legislation. Sudan included mine action in its national budget for the first time in 2006, but operations remain heavily dependent on foreign support.

In May 2009, Sudan stated that “The main priorities of the VA program in Sudan are to progressively transition the VA Program to the Government and to ensure that all relevant ministries will include the support to mine survivors in their annual financial and work plans and that [they] will use the available resources accordingly.”⁹⁹ VA coordination capacity was deemed to be stronger in northern Sudan, where NMAC proactively organized coordination meetings and project monitoring visits. In Southern Sudan continuous UNMAO support for coordination was needed and a staff member of the Ministry of Gender, Social Welfare and Religious Affairs was seconded to UNMAO for capacity-building in 2009. Coordination between ministries remained sporadic.¹⁰⁰

Government involvement in VA coordination meetings and planning, which was boosted in 2007 and early 2008, continued to develop, though at a slower pace, in the second half of 2008 and in 2009. In several states, awareness was raised with the local authorities due to the increased number of small-scale VA projects that were being carried out. Yet the government still largely depended on NGOs and international organizations for VA implementation and further capacity building was needed.¹⁰¹ In 2008, national NGOs continued to be more involved in VA/disability issues and strengthened their capacities, partly sustained by the availability of multi-year funding through to 2011. Nevertheless, they were in need of constant technical guidance (see below).¹⁰² One NGO also noted that NGO coverage remained limited and variable depending on the sector, adding that associations of persons with disabilities were increasingly active, particularly on income-generating activities.¹⁰³

National management

Mine action remains under UN management in Sudan, while the NMAA, NMAC, and the SSDA continue to develop their capacities to take over management of mine action.¹⁰⁴ Five UN agencies have been involved in mine action activities within the unified framework of UNMAO, namely: the UN Mission in Sudan (UNMIS), in cooperation with UNMAS, which conducts demining and provides coordination and technical advice in support of the UNMIS mandate and the CPA; UNDP, which provides support to national authorities in building national mine action capacities and which is coordinating the transition of the mine action program to national ownership; UNICEF, which coordinates and undertakes RE; the WFP, which conducts clearance of key supply and access routes as part of the road reconstruction process; and UNHCR, which provides RE to returning refugees and IDPs.¹⁰⁵

¹⁰⁴ Article 7 Report, Form A, 13 April 2009.

¹⁰⁵ UNMAO, “Sudan Mine Action Sector, Multi Year Plan,” pp. 15-35, www.sudan-map.org.

In 2008, UNDP provided two technical advisors and three consultants to work with the two national mine action centers for the transition to national ownership in 2011.¹⁰⁶ It was scheduled to completely nationalize the mine action program by 2011 and a transition plan was prepared in 2008. According to UNMAO, the transition plan became fully operational during 2009, with “ongoing work placements” since April.¹⁰⁷ However, it had been decided that VA will be transitioned to NMAC in the north and to the Ministry of Gender, Social Welfare and Religious Affairs in the south by 2011. The transition will be the main focus and challenge for 2010, but had started in the north in 2009. In the south “no significant activities” were undertaken due to the slow response from the government, the recent reshuffle of ministers, and financial difficulties.¹⁰⁸

National budget

During 2007 and the first half of 2008, GONU reported contributing \$5.5 million to mine action, while GOSS contributed \$1.5 million. Funds covered the cost of local personnel in the national mine action centers and the field operations of the national demining teams (Joint Integrated Demining Units, JIDUs, see Demining and Battle Area Clearance section below).¹⁰⁹ VA projects were to be included in the budgets of relevant ministries, but no funding was allocated by any in 2008–2009.¹¹⁰ It was estimated that GOSS spent some 8% of its annual budget on healthcare.¹¹¹

National mine action legislation

Mine action in Sudan operates within a variety of legal frameworks. The CPA, signed in January 2005, provides the overall legal framework for mine action in Sudan including the NMAC and the SSDA. It is supplemented by the May 2006 Darfur Peace Agreement, presidential decrees in December 2005 which set up the NMAA, and the 1 January 2008 mandate of the UN peacekeeping mission which authorizes peacekeepers to conduct humanitarian demining.¹¹²

Sudan has not passed specific national legislation regulating mine action in Sudan. In April 2009, Sudan reported that a draft national mine action law had been cleared by the GONU Ministry of Justice and endorsed by the relevant committee of the National Assembly, and was expected to be formally adopted in 2009.¹¹³ A mine action framework specific to Southern Sudan has been drafted with support from UNDP and the GOSS Ministry of Legal Affairs, which was to be finalized in 2009 and then presented to the Southern Sudan Legislative Assembly for approval.¹¹⁴ As of April 2009 the legislation had not been approved.¹¹⁵

National mine action standards/Standing operating procedures

National Technical Standards and Guidelines (NTSG) were originally developed in 2003 by the UN in English and as of August 2009 had been translated into Arabic in full collaboration with the national authorities.¹¹⁶ Additionally, UNMAO had not received feedback on the NTSGs from

¹¹⁵ Interview with Qadeem Khan Tariq, UNDP, Khartoum, 18 March 2009. Presidential Decree No. 45/2006 issued by GOSS, which appoints the chairperson and members of the SSDA, states: “The Authority shall collaborate with the Ministry of Legal Affairs and Constitution Development in the formulation of its Draft Act and determination of the terms and conditions of service and the regulations that shall govern its work.”

¹¹⁶ Email from David McMahon, UNMAO, 6 September 2009.

the NMAC and the SSDA.¹¹⁷ Organizations operating in Sudan are reported to be accredited according to the International Mine Action Standards and national standards.¹¹⁸

Program evaluations

In 2007, an evaluation of the UNDP mine action program's development and capacity-building project, conducted by GICHD, emphasized the important contribution of mine action to broader processes and programs in Sudan. It found that mine action was one of the fields in which GONU and GOSS cooperated most effectively with one another as well as with the international community. At the time of the evaluation, however, GICHD found no clear vision of the future composition and functions of the mine action program in Sudan post-2011. Sudan lacked a long-term plan that clarified the mine action capacities that would be required following the departure of UNMIS, and how to build those capacities.¹¹⁹ Since the evaluation, UNDP has developed a detailed plan to transition from the UN-led mine action program to national ownership in 2011.¹²⁰

VA projects are monitored regularly through the VA focal point in the north or through UNMAO: GOSS and SSDC were involved less frequently. Evaluation visits were intended to guide organizations in the implementation of their projects or to provide technical support, as it was noted that the national implementers needed continuous technical capacity reinforcement. Another aim was to carry out semi-structured interviews with beneficiaries. Some of the findings from these missions were that:

- data collection conducted only in rural areas missed a large target group as many survivors relocate to trading centers looking for economic opportunities;
- the needs of survivors remained poorly addressed and documented, partly because they were not organized into associations;
- local authorities were interested in VA/disability issues, but lacked knowledge and resources;
- economic reintegration activities were usually understood to mean just training opportunities, not assistance in finding employment or setting up a business;
- the programs did not discriminate against persons with disabilities due to causes other than mines/ERW; and
- a concerted effort was put in place to address the identified gaps.¹²¹

Demining and Battle Area Clearance

As of June 2009, Sudan had 16 national and international mine clearance operators. These included a network of JIDUs (see below), operating under the NMAC, three international NGOs (DanChurchAid, Norwegian People's Aid, and Mines Advisory Group); five UN peacekeeping battalions (from Bangladesh, Cambodia, Egypt, Kenya, and Pakistan); the local NGO Sudan Integrated Mine Action Service (SIMAS); and six commercial demining companies (ArmorGroup, Mechem, MineTech International, RONCO, Mine Wolf, and The Development Initiative). Through 31 December 2008, eight of the 16 mine action operators were responsible for three-quarters of the total area cleared. In the first six months of 2009 the distribution of available assets for clearance narrowed further as ArmorGroup and MineTech International alone cleared 76.5% of the 9.5km² reported as having been cleared.¹²²

¹²² UNMAO, "IMSMA Monthly Report," June 2009, Table 2.2, p. 3, www.sudan-map.org; and email from David McMahon, UNMAO, 6 September 2009.

Sudan has posed several challenges to effective demining. Although the implementation of the CPA is proceeding, security issues have hampered clearance in some locations. For example, in May 2008, fighting erupted between the Sudan Armed Forces and the SPLA in Abyei, an oil-rich area at the heart of a longstanding dispute between north and south. The fighting forced up to 50,000 people to flee the area, and there was new ERW contamination.¹²³ In the south, activity by the Lords' Resistance Army along the Ugandan border delayed clearance, while in Darfur all movements had to be accompanied by armed escorts. Other impediments to demining operations in 2008 included a longer than usual rainy season in most regions of the south, and difficulties in importing equipment.¹²⁴ Complicated logistics and local labor law can also affect operations.¹²⁵ Another constraint is that contractors are responsible for securing their own explosives for demolition, which is time consuming and difficult.¹²⁶

There remains concern about the effectiveness of the national demining assets, the JIDUs. Although they continue to make significant progress in releasing SHAs,¹²⁷ they are still not accredited for mine action operations.¹²⁸ A GICHD evaluation of mine action stated that allowing the JIDUs to engage in demining in support of infrastructure reconstruction without being accredited in accordance with the IMAS could have "serious repercussions."¹²⁹ Nonetheless, the JIDUs, which have mechanical clearance assets as well as manual deminers, represent the bulk of the local demining capacity in Sudan.¹³⁰ In 2008, a further 120 deminers, to add to the 110 already employed, were trained at the International Mine Action Training Centre in Nairobi, Kenya.¹³¹ The main responsibilities of the JIDUs are assessment, land release, and quality assurance.¹³²

Identification of hazardous areas

The three-year-long LIS, managed by SAC with Mines Advisory Group (MAG), Handicap International (HI), and JASMAR as implementing partners was completed in June 2009. It covered 16 states, of which only Sennar in central Sudan, was found not to be affected (although Red Sea had a very limited problem). During the Preliminary Opinion Collection stage of the survey 1,727 communities had been identified as possibly impacted by mines or UXO. Community visits confirmed 296 were impacted. In total, 605 SHAs were identified covering an area of 106km².¹³³ The results show that the mine problem is heavily concentrated in Central Equatoria, South Kordofan, Eastern Equatoria, Blue Nile, Kassala, and Jonglei states where 77% of the impacted communities and 84% of the SHAs identified are in these five states. Of the 605 SHAs, incidents involving victims occurred in 58. In addition, 423 UXO spot clearance tasks had been identified. Sennar had no impacted communities and three others had only one each.

Mine clearance in 2008

In 2008, international commercial companies, and national and international NGOs cleared 4.07km² of mined areas. Approximately three-quarters of all clearance since 2002 has been conducted in only three states: Central Equatoria, Kassala, and South Kordofan.¹³⁵ During clearance in 2008, 4,400 antipersonnel mines and 258 antivehicle mines were destroyed.¹³⁶

* UNMAO does not disaggregate between mine clearance and BAC in detailed reporting.

** No distinction is made between AXO and UXO in demining reporting by UNMAO.

NR=not reported

Battle area clearance in 2008

For 2008, UNMAO reported battle area clearance (BAC) over almost 5.74km² of land in nine states, of which 80% occurred in Upper Nile and Central Equatoria.¹³⁸ Through June 2009, of the 54km² of all clearance in Sudan, more than 40km² was from BAC. Unexploded submunitions were reported to have been found in Blue Nile state and Kadugli in South Kordofan, but UNMAO does not distinguish between different types of UXO in their reporting.¹³⁹

Progress since becoming a State Party

In accordance with Article 5 of the Mine Ban Treaty, Sudan is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 April 2014.

The precise extent of the problem remains unknown as new hazardous areas were still being identified each month according to UNMAO reports from 2007–2009.¹⁴⁰ Nevertheless, it is clear that the known mine problem is much smaller than originally believed and operations have

¹³⁸ Email from Mohammad Kabir, UNMAO, 3 August 2009. NMAC claims 18.26km² of BAC, which is not included in these statistics as it has not been possible to verify the figures.

¹³⁹ Email from Mohammad Kabir, UNMAO, 3 August 2009.

¹⁴⁰ UNMAO, "Recording Data," www.sudan-map.org.

greatly reduced the threat and the level of risk in the last six years. As of the end of 2008, more than 44km² of land had been cleared (see table below).¹⁴¹

Demining from 2003–2008¹⁴²

Year	Mine clearance (km ²)	BAC (km ²)	Total
2008	4.07	5.74	9.81
2007	5.91	18.40	24.31
2006	1.34	6.44	7.78
2005	0.71	0.56	1.27
2004	0.29	0.17	0.46
2003	0.47	0	0.47
Total	12.79	31.31	44.10

In terms of an annual budget for mine clearance, Sudan was second only to Afghanistan in 2008. While much has been achieved, particularly in opening roads and allowing for more movement of people, a key development in achieving its Article 5 obligations will be the success of the planned transition to national ownership in 2011 and whether significant international support will continue for several more years.

Risk Education

In 2008, extensive RE was provided to at least 691,464 people. In Southern Sudan the plan to reach 250,000 people was exceeded, with 396,772 people reached.¹⁴³ RE focused on IDPs, returnees, and local communities.¹⁴⁴ It was conducted through the training of community volunteers, direct presentations, training of teachers for school-based RE, and mass media. Community liaison (CL) was conducted by MAG, Danish Demining Group (DDG), and Operation Save Innocent Lives (OSIL).¹⁴⁵

Twelve local and international organizations, as well as UN agencies, were engaged in RE activities, through the deployment of a total of 47 RE teams.¹⁴⁶ The number of teams in the south fluctuated throughout 2008, while 18 teams were active in the north including three teams in Darfur.¹⁴⁷ In the south only international NGOs were operational until June 2008, when three local NGOs, OSIL, Sudan Landmine Response (SLR) and South Sudan Development and Relief Agency (SSDRA), were funded by the European Commission (EC) through UNMAO.¹⁴⁸ DDG's RE and explosive ordnance disposal (EOD) teams collected information on RE activities undertaken by the community volunteers in subsequent visits to these communities.¹⁴⁹

¹⁴⁸ Interview with Bojan Vukovic, UNMAO, Juba, 24 March 2009.

¹⁴⁹ Article 7 Report, Form I, 13 April 2009.

To support the building of local capacity and UNMAO's plans for transition to government ownership of mine action, 18 participants, including government, NGO, and UNMAO staff, were provided with advanced RE training in December 2008 in Nairobi organized by UNMAO and conducted by Cranfield University.¹⁵⁰

National prioritization of RE activities was based on UNMAO's analysis of secondary data sources (IMSMA data, LIS, etc). Needs assessments were also undertaken by implementing organizations in RE which collected primary data in the field. Once deployed, RE organizations conducted field-level needs assessments to target exact locations and audience, and to develop RE strategies.¹⁵¹ MAG started household surveys at the end of 2008 and developed an impact assessment tool kit to measure the baseline situation before the RE session to monitor the impact of RE. The analysis of the results was due to be released in late 2009.¹⁵²

Efforts to include RE in the school curriculum by UNMAO and UNICEF through the Ministry of Education, with the NMAC taking the lead in coordination, increased in 2008 with the training of 862 teachers.¹⁵³ These activities took place in the Nuba Mountains, Western and Southern Darfur, and Southern Sudan. A monitoring system was set up in each state.¹⁵⁴ A total of 535 teachers were trained in the north.¹⁵⁵ UNMAO conducted the training in the south where three training courses were organized for 327 teachers in Arapi-Nimule (Eastern Equatoria state), Rumbek (Lakes state), and Juba (Central Equatoria state). The training will continue throughout 2009, for teachers and for inspectors to monitor the work of teachers.¹⁵⁶ Other RE organizations also conducted RE in schools, at the request of individual schools and communities.¹⁵⁷

Public information campaigns were conducted in collaboration with UNMIS in the north and south, consisting of the distribution of posters and other materials, open air presentations, and radio interviews. In the south two sets of RE radio messages were broadcast, on Radio Miraya, a UN radio station, and local radio station Liberty, and were ongoing since June 2008.¹⁵⁸ In the north, three public information campaigns were organized in White Nile state at Kostitown, a transitional point for refugees, in Kadugli, capital of South Kordofan, and in Kassala.¹⁵⁹

More than 400,000 copies of various RE materials (including "Safe Way Home" materials) were distributed in 2008.¹⁶⁰ A review of RE materials was conducted in two workshops organized in 2008, in Juba in March and in Khartoum in May. As a result of the workshop, an additional 150,000 copies of "Safe Way Home" leaflets were reprinted for refugees both in the south and north.¹⁶¹ Further discussion was focused on design and production of materials for teachers, peer education, IDPs, and general and direct presentations for people at risk.¹⁶²

War Child Holland	Direct RE presentations and use of youth groups for different activities within the communities	Central Equatoria	Project started end-2008 so no data yet

RE has been conducted in Sudan for more than 10 years by international and national NGOs, UN agencies, and the government.¹⁶⁴ By 2007, the number of NGOs involved had reached 19.¹⁶⁵ The number of beneficiaries has also risen each year, and the total recorded in IMSMA prior to 2009 was 2,673,870.¹⁶⁶ RE has been conducted through public awareness campaigns, direct presentations, in schools, through child-to-child methodology, radio, and the distribution of materials.¹⁶⁷ In 2003, Landmine Monitor reported that RE in Southern Sudan was at a standstill.¹⁶⁸ Yet by 2006 only Wau was considered to be underserved, and this was addressed by MAG in 2007.¹⁶⁹

Needs assessments conducted in 2003 and 2004 by DanChurchAid (DCA), the Sudanese Red Crescent Society, and Save the Children USA showed that the most at-risk groups were adult men and children, and the most dangerous activity was farming.¹⁷⁰ From 2005, the RE focus was IDPs and returnees.¹⁷¹ Since late 2007, the RE sector has also dispatched teams to Darfur region to deliver emergency RE sessions to IDPs and civilians in impacted communities.¹⁷² In 2007, LIS results were used to inform the RE program, but a lack of adequate casualty data affected the

ability to target appropriately.¹⁷³ In 2007, the program started to evolve from emergency RE by NGOs to a more sustained approach through existing structures such as schools and community centers.¹⁷⁴ Implementation is gradually being nationalized with the number of national NGOs growing over the last few years.¹⁷⁵

Since January 2005, coordination was done by UNICEF through UNMAO, while it also provided technical and financial support.¹⁷⁶ International RE experts have been provided by UNMAO and UNICEF since 2002,¹⁷⁷ when provisional guidelines and standards were developed.¹⁷⁸

Victim Assistance

The total number of mine/ERW survivors is not known. Sudan's health and social services have been severely damaged by years of conflict, particularly in Southern Sudan. Increased conflict in Southern Sudan in 2008–2009, and the expulsion of 13 international NGOs and the closure of three national NGOs in March 2009, further decreased the availability of services.¹⁷⁹ Services are spread unevenly, with most service providers located in Khartoum and, to a lesser extent, in Juba. The main challenges were a lack of skilled organizations working on VA/disability, a lack of decentralized services, and a lack of financial commitments from the government. These were further compounded by poverty, long distances between clients and services, and an unstable security situation.¹⁸⁰ Service provision and capacity in the south were generally weaker than in the north.

Health services were lacking throughout the country and often lacked skilled staff.¹⁸¹ In Southern Sudan, general health coverage was estimated at 40%, and 86% of basic health services were carried out by NGOs, usually with international funding.¹⁸² Patients often need to travel long distances, resulting in many mine/ERW casualties dying on the way. Follow-up care and referral systems were virtually non-existent.¹⁸³ Fear of crossing frontlines and the lack of surgical resources to treat people severely injured by weapons¹⁸⁴ exacerbated the situation.

In northern Sudan, the National Authority for Prosthetics and Orthotics (NAPO) is the main actor in physical rehabilitation, a state body linked to the Ministry of Social Welfare.¹⁸⁵ Its main rehabilitation center is in Khartoum and satellites exist in some state capitals. To improve services in 2008, NAPO signed agreements with state authorities to share responsibilities and better coordinate service provision.¹⁸⁶ NAPO also started operating mobile workshops in late 2008.¹⁸⁷ In Southern Sudan, physical rehabilitation was mainly provided by GOSS in Juba where the ICRC finished construction of the referral center for Southern Sudan in December 2008.¹⁸⁸ Small-scale NGO services existed in some other states, but they lacked qualified staff, materials, and good-quality assistive devices.¹⁸⁹

Psychosocial support activities were virtually non-existent. In 2008, Sudan noted that the ministries of social welfare in the north and south were responsible for psychosocial support, but stated, “this area of VA is still to be empowered and needs more technical and financial support.”¹⁹⁰ In 2008–2009 psychosocial support was increasingly incorporated into projects carried out by national NGOs.¹⁹¹ In November 2008, the Federal Ministry of Health acknowledged that mental health problems due to war-related causes were a priority issue and announced its decision to establish a National Mental Health Council and a National Center for Mental Health.¹⁹²

In May 2009, Sudan reiterated that three survivor associations had been established,¹⁹³ in Ed Damazin, Kadugli, and Kassala with the support of the Sudan Campaign to Ban Landmines. However, these organizations were not well organized or active. In the south, there were no survivor initiatives.¹⁹⁴ Economic reintegration was also included more systematically in NGO VA projects, but these projects remained small and often limited to pilot projects.¹⁹⁵ Broader economic and employment programs were often not adjusted to the needs of survivors or not accessible to them. Awareness was lacking among employers.¹⁹⁶

Sudan has legislation to protect the rights of persons with disabilities, but this is not consistently implemented or monitored. In late 2008, new disability legislation was approved by the government of Sudan; it includes mine/ERW survivors as a specific target group.¹⁹⁷ Sudan ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol on 24 April 2009.¹⁹⁸ In Southern Sudan, GOSS was still in the process of developing a disability policy which would better fit into the context of the southern states as of July 2009,¹⁹⁹ this process started in 2007.²⁰⁰

Progress in meeting VA26 victim assistance objectives

Sudan is one of 26 States Parties with significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors.²⁰¹ Sudan presented its 2005–2009 objectives in November 2005,²⁰² and revised them considerably in 2007, in extensive coordination with relevant stakeholders. While the objectives for economic reintegration remained weak, additional objectives on increased survivor inclusion, resource mobilization, and strengthening coordination mechanisms were added. Responsibilities were clearly defined, and involvement of governmental bodies was increased.²⁰³

This resulted in progress, especially in establishing coordination mechanisms, information provision, monitoring of activities, and advocacy. Broadly, implementation was on track and a review was to be completed by the end of August 2009. Even though UNMAO noted that

stakeholders used the objectives and the 2007–2009 plan less than expected, NMAC and a few NGOs used the objectives/plan for coordination and, mainly, resource mobilization purposes.²⁰⁴ One NGO noted that a lot of work had been done but that more efforts were needed to achieve the objectives, as well as better monitoring, not of project implementation per se but of the long-term impact of the activities.²⁰⁵

In 2006–2007, Sudan co-chaired the Standing Committee on Victim Assistance and Socio-Economic Reintegration. At least one VA/disability expert attended the intersessional Standing Committee Meetings in 2006–2009 and all meetings of States Parties, making statements at every meeting. Sudan also reported on VA in its annual Article 7 reports submitted from 2006–2009.²⁰⁶

Victim assistance activities

Many organizations provide VA/disability services in Sudan, including an increasing number of national organizations. Only those providing updated information for 2008 have been included below.

Under the Human Security Trust Fund (HSTF) project, Sudan received \$1.7 million from Japan for RE and VA to be implemented over 18 months to the end of June 2008. Some \$680,000 was dedicated to the implementation of five VA projects in the south and five in the north: eight economic reintegration projects, one psychosocial support project, one health project, and one awareness-raising project. In total, 669 of the targeted 719 survivors (267 women) were reached.²⁰⁷

The overall evaluation of the 11 projects was positive, although several organizations faced challenges working in difficult to access or insecure areas and under tough security restrictions (particularly in eastern Sudan). Three projects were not successful due to a lack of management capacity and staff turnover. An evaluation noted that in some areas the projects were the first of their kind and thus provided much-needed information about the needs of survivors (for example in Kadugli) or tested new approaches (such as the radio awareness raising and a project designed by beneficiaries in Yei county).²⁰⁸

Some organizations were able to secure international funding under a 2008–2011 \$3 million Canadian International Development Agency (CIDA) grant. Under this framework 15 VA/disability projects (six in the north and nine in the south) started in the second half of 2008 and were scheduled to run until the end of 2009.²⁰⁹ The program aimed to reach some 2,400 direct beneficiaries (survivors and other persons with disabilities).²¹⁰

UNMAO noted that the sustained international funding, together with improved coordination had resulted in the involvement of a larger number of national organizations, many of whom had not been involved in VA/disability before.²¹¹

Elsewhere, ABRAR provided health insurance coverage, economic reintegration, and awareness-raising for 170 survivors. It also conducted workshops and information dissemination through the media.²¹² Rufaïda provided income-generating activities to 55 military survivors and war disabled soldiers in cooperation with the Disarmament, Demobilization and Reintegration Commission.²¹³

²¹² Email from Nagat Salih, ABRAR, 16 July 2009.

²¹³ Response to Landmine Monitor questionnaire by RUFAlDA staff, 15 July 2009.

With funding provided by Switzerland, the NMAC revised and distributed 18,000 copies of a leaflet on first-aid and trauma care among community health workers and NGOs in 2008.²¹⁴ In 2009, the United Arab Emirates started a mobile hospital providing assistance to underprivileged people in Southern Sudan.²¹⁵

In Southern Sudan, the GOSS Ministry of Health took over management of the Juba Teaching Hospital from the ICRC in 2008.²¹⁶ An ICRC evaluation conducted one year after the handover concluded that, “the hospital was providing acceptable and appropriate care” and noted that the hospital “is able to stand on its own and function properly.”²¹⁷

NAPO mobile workshops assisted some 425 persons with disabilities in 2008 (and 888 to May 2009) and NAPO also completed construction of a new workshop in its Khartoum complex with ICRC support.²¹⁸ Physiotherapy departments were established in Kadugli (with HI support) and in Kassala.²¹⁹

Construction of the ICRC rehabilitation center in Juba was completed in December 2008 and the center became fully operational in 2009. In 2008, the ICRC also continued its support to NAPO, including resuming its support to three NAPO satellite centers and renovating two satellite centers. A second group of 15 prosthetic and orthotic technicians started their ICRC-supported diploma course in 2008, and 17 others were sponsored for training abroad. In 2008, ICRC-supported centers assisted 3,158 people (slightly fewer than the 3,945 in 2007) and produced 1,172 prostheses (171 for survivors) and 1,227 orthoses (112 for survivors).²²⁰ An ICRC mobile surgical team also provided assistance to 128 weapon-injured people in Darfur region, south and central Sudan, and three war surgery seminars were organized.²²¹

Medical Care Development International (MCDI) provided physical and socio-economic rehabilitation for disabled war victims in Rumbek and extended its outreach activities to all of Bahr el Ghazal state in 2008. MCDI works with the state Ministry of Social Development on transitioning its rehabilitation center to the authorities. In 2008, it directly assisted 111 persons with disabilities with rehabilitation services (14 survivors) and two with educational support.²²²

HI provided basic physiotherapy training to nurses and other healthcare providers in Southern Sudan and assisted NAPO in developing a physical therapy curriculum in 2008.²²³

Support for Mine Action

The Sudan mine action sector multi-year plan for 2009–2011 provides a cost estimate totaling roughly \$245 million for mine action programs in all sectors from 2009 to 2011, including \$122.5 million for clearance and survey in Southern Sudan; \$41 million for impact survey; \$37.6 million for RE; \$20.6 million for clearance and survey in Darfur; \$10.8 million for coordination and technical assistance; \$8.3 million for capacity development of the NMAA; and \$4.3 million for VA.²²⁴ The plan includes broad resource mobilization strategies to anticipate and respond to

risk factors impacting international funding.²²⁵ The National VA Strategic Framework 2007–2011 also includes resource mobilization goals among its strategic objectives.²²⁶

The NMAA and NMAC, along with the Ministry of Humanitarian Affairs, are responsible for reviewing and updating resource mobilization strategies on behalf of GONU.²²⁷ GONU and GOSS coordinate with each other and with UNDP to develop the resource mobilization strategy and raise funds for mine action, as well as to allocate resources for mine action from the national budget.²²⁸ UNMAO conducts donor liaison and resource mobilization activities in support of mine action program implementation.²²⁹ In June 2008, NMAC reported a resource mobilization strategy based on lobbying efforts to include mine action within the government's budget, seeking provision of funds for mine action programs, operational support to NMAC, and capacity-building.²³⁰

National support for mine action

Combined reported national funding by GONU and GOSS in 2008 totaled \$4,927,019. NMAC reported GONU funding to mine action in 2008 totaling \$3,345,000, including contributions to personnel salaries, operational costs of the mine action center and field offices, equipment purchase and rental, and staff expenses for mine clearance operations in the field. The largest contribution was reportedly \$1,737,000 to make partial payments on two flails and two water tankers for clearance operations.²³¹ Sudan reported GONU contributions totaling roughly \$6.8 million in 2007.²³²

The SSSA reported national funding totaling SDG3,233,890 (\$1,582,019) in 2008, including funding for SSSA personnel, equipment and running costs, insurance, and logistical and other operational costs. The projected budget for mine action in Southern Sudan during 2008 was SDG3,551,000 (\$1,737,149), including a supplemental budget request made in June to cover various operating expenses. The SSSA reported that not all 2008 disbursements were spent during the year.²³³ GOSS was reported by UNDP to have contributed roughly \$700,000 to mine action in 2007.²³⁴

During 2007 and the first half of 2008, GONU reported it contributed \$5.5 million to mine action, while GOSS contributed \$1.5 million. Funds covered the cost of local personnel in the national mine action centers and field operations of the national demining teams.²³⁵

In June 2009, UNDP reported that while 2009 national funding by GONU roughly matched 2008 funding levels, national funding by GOSS might decline in 2009 because of fluctuating oil prices. UNDP and UNMAO were reportedly working jointly with GONU and GOSS to secure as much funding as possible from state budgets.²³⁶ The SSSA reported that “this issue is likely to continue as long as the economy of Southern Sudan is reliant on oil revenues.”²³⁷

International cooperation and assistance

In 2008, 13 countries and the EC reported providing \$39,077,807 (€26,536,607) to mine action in Sudan. Reported mine action funding in 2008 was 37% higher than reported in 2007.

²³⁷ Response to Landmine Monitor questionnaire by Jurkuc Barac Jurkuc, SSSA, 9 June 2009.

As of October 2008, UNMAO reported receiving \$23,934,225 in donor funding for mine action compared to a requirement of \$70,400,407. Assessed mine action budgets for UNMIS and UNAMID totaled \$49,403,610.²³⁸ As of May 2009, it was reported that international funding for 2009 had reached \$31,045,632. Combined assessed and donor funds totaled \$68,813,582, compared to a requirement for 2009 of \$91,510,634.²³⁹

2008 International Mine Action Funding to Sudan: Monetary²⁴⁰

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Japan	WFP	Mine clearance	\$12,677,900 (¥1,307,000,000)

TAJIKISTAN

2008 Key Data

State Party since	1 April 2000
Contamination	Antipersonnel mines, submunitions, other UXO
Estimated area of contamination	Full extent not determined, but at least 8.42km ²
Casualties in 2008	13 (2007: 19)
Estimated mine/ERW survivors	Unknown but at least 448
Article 5 (clearance of mined areas)	Deadline: 1 April 2010
Demining in 2008	Mined area clearance: 0.7km ² Battle area clearance: 0.2km ² Area cancellation/reduction: 24.83km ²
Risk education recipients in 2008	Unquantified
Progress towards victim assistance aims	Improved
Support for mine action in 2008	International: \$1.9 million (2007: \$1.25 million) National: \$574,000 (2007: \$565,000)

Ten-Year Summary

The Republic of Tajikistan became a State Party to the Mine Ban Treaty on 1 April 2000. It has not enacted national implementation legislation. Tajikistan declared a stockpile of 3,084 mines inherited from the former Soviet Union, and finished destroying these in March 2004. In 2005, Tajikistan took control of more than 49,000 additional stockpiled mines, which were destroyed in 2006 by Russia. It initially retained 255 mines for training purposes, but consumed the last of these in 2007. Tajikistan is the only State Party to declare antipersonnel mines stockpiled on its territory by a state not party by declaring approximately 18,200 antipersonnel mines of various types are stockpiled with Russian forces there. Tajikistan hosted a regional workshop on the Mine Ban Treaty in July 2009.

Tajikistan is contaminated with mines and explosive remnants of war (ERW), primarily as a result of civil war from 1992–1997 and mine-laying along its borders by Soviet and Uzbek forces. Contamination includes a problem of unexploded submunitions. In March 2009, limited funding, climate, and slow progress in demining led Tajikistan to request a 10-year extension to its Article 5 deadline for clearance of 1 April 2010.

From 1999 to 2008, the Tajikistan Mine Action Center (TMAC) identified 318 mine/ERW casualties (132 killed and 186 injured). The Tajikistan Red Crescent Society (TjRCS) has conducted community-based mine/ERW risk education (RE) since 2001. From 2005–2007, UNICEF supported RE in schools. In 2005, TMAC became responsible for managing RE, and from 2007 worked with the TjRCS and Ministry of Education to continue school- and community-based RE.

Tajikistan is one of the group of 26 States Parties reporting responsibility for a significant number of survivors and has shown dedication towards implementing the Nairobi Action Plan. Progress in victim assistance (VA) has been recorded, with the majority of the objectives achieved or in progress. Yet challenges remained, including improving medical personnel training, ensuring national ownership, provision of psychological and economic reintegration services, and raising awareness of the rights of persons with disabilities. Funding for VA remained inadequate.

Mine Ban Policy

Tajikistan acceded to the Mine Ban Treaty on 12 October 1999, becoming a State Party on 1 April 2000. In 2007, TMAC coordinated a project with the Tajik NGO Harmony of the World to make recommendations for amendments to harmonize national laws with the requirements of the Mine Ban Treaty. In late 2007, TMAC submitted three draft amendments to the national parliament for consideration.¹ Tajikistan has not reported any progress in 2008 or 2009. In the past, the government said that new legislation to implement the treaty domestically was unnecessary, as it relied on its criminal code to punish violations of the treaty.²

Tajikistan submitted its seventh Article 7 report, dated 30 April 2009, covering calendar year 2008.³

Tajikistan attended the Ninth Meeting of States Parties in Geneva in November 2008, where it made statements on mine clearance and VA, as well as announced that it would host a regional workshop in advance of the Second Review Conference. Tajikistan also attended the intersessional Standing Committee meetings in May 2009, where it spoke on VA and gave a presentation on its newly submitted Article 5 clearance deadline extension request.

Tajikistan hosted the Dushanbe Workshop on Progress and Challenges in Achieving a Mine-Free Central Asia on 7 and 8 July 2009, the third in a series of regional conferences held in the lead-up to the Second Review Conference. Five states from the region participated along with eight donor states and several international and national NGOs. The workshop also included a parallel program for VA experts from Tajikistan and Afghanistan. The ICBL praised Tajikistan for its VA efforts and its transparency on stockpile issues. It was, however, critical of Tajikistan's Article 5 deadline extension request.⁴

Tajikistan has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Tajikistan is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Tajikistan is also party to CCW Protocol V on Explosive Remnants of War. It has never submitted annual national reports as required under Article 13 and Article 10.

Tajikistan had not signed the Convention on Cluster Munitions as of 1 July 2009.⁵

Production, transfer, use, stockpiling, and destruction

Tajikistan has reported that it never produced or exported antipersonnel mines.⁶ The most recent use of mines in Tajik territory occurred in 2000 and 2001, when Russian and Uzbek forces placed mines at various border locations inside Tajikistan.⁷

¹ Interview with Jonmahmad Rajabov, Director, TMAC, Dushanbe, 5 February 2008. The amendments are to the following laws: "On State Armaments Order," "On Circulation of Explosive Materials for Civil Purposes," and "On Arms." The ICRC provided funding for the project, but did not review the recommendations. Email from Eve La Haye, Legal Adviser, Arms Unit, ICRC, 29 July 2008. The project was initiated in 2006. See *Landmine Monitor Report 2006*, p. 691.

² Article 7 Report, Form A, 14 March 2005; and email from Peter Isaacs, Chief Technical Advisor, UNDP/TMAC, 15 September 2004. The 1996 Law on Weapons expressly regulates all issues related to the registration, shipment, transport, acquisition, transfer, and storage of armaments and munitions on the territory of Tajikistan. Article 7 Report, Form A, 3 February 2003.

³ Earlier reports, all covering the preceding calendar year, were submitted on 3 February 2008, 12 March 2007, 14 March 2006, 14 March 2005, 4 February 2004, and 3 February 2003 (due 28 September 2000).

⁵ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 244–245.

⁶ Article 7 Report, Forms E and H, 3 February 2003.

⁷ *Ibid.*, Form C.

Tajikistan destroyed its stockpile of 3,084 antipersonnel mines inherited from the Soviet Union between 5 May 2002 and 31 March 2004, finishing just ahead of its treaty-mandated deadline.⁸

Tajikistan is the only State Party to declare antipersonnel mines stockpiled on its territory by a state not party to the treaty. In 2003, it reported that approximately 18,200 antipersonnel mines of various types are stockpiled with Russian Ministry of Defense units deployed in Tajikistan.⁹ These stockpiles are not under the jurisdiction or control of Tajikistan.¹⁰ In its Article 7 reports submitted since 2003, Tajikistan has reported that intergovernmental talks are “currently underway” to clarify and complete data collection regarding these Russian mines.¹¹

Newly discovered stockpiled mines

In its Article 7 report submitted in 2008, Tajikistan provided information on antipersonnel mines discovered and destroyed after completion of its stockpile destruction program.¹² Sometime in 2006, a total of 49,152 PFM-1S remotely-delivered blast mines¹³ and 100 “blocks” of POM remotely-delivered fragmentation mines¹⁴ were transferred by Tajik border protection forces to Russian forces in Tajikistan for destruction. These stocks were destroyed in October 2006 by the order of the Russian Federation Federal Border Service.¹⁵

In response to questions about where these mines came from, TMAC told Landmine Monitor that in 2005 the State Border Protection Committee of Tajikistan took control of Tajikistan’s international border with Afghanistan and received all border facilities and equipment—including the mines—from the border guards of the Federal Security Service of Russia. According to TMAC, the Tajik border authorities did not provide the information in time to include it in Tajikistan’s earlier Article 7 reports.¹⁶

In addition to reporting on the large stocks of remotely-delivered mines, the Article 7 report submitted in 2008 provided information about two other cases where mines were “confiscated or detected” by Tajik armed forces.¹⁷

Mines retained for training

Tajikistan retains no mines for training or development purposes, as it used the last of these in 2007. Tajikistan initially retained 255 antipersonnel mines for training purposes, and had indicated it would use these until 2010 when their shelf life expired.¹⁸

⁸ Article 7 Report, Form G, 14 March 2005. The text in Forms A, D, and F cite a total of 3,029 mines destroyed, but the detailed listing in Form G adds up to 3,084. This includes: 1,591 POMZ-2; 633 PMN; 436 OZM-72; and 424 MON-100 mines.

⁹ Article 7 Report, Form B, 3 February 2003.

¹⁰ Interview with Jonmahmad Rajabov, then-Deputy Head of the Board of Constitutional Guarantees of Citizens Rights, Executive Board of the President, in Geneva, 5 February 2003. In another interview in Geneva on 13 May 2003, Rajabov stated that Tajik forces are under a separate command-and-control structure and would refuse orders by Russian forces to lay mines.

¹¹ Article 7 Reports, Form B, 30 April 2009, 3 February 2008, 12 March 2007, 14 March 2006, 14 March 2005, 4 February 2004, and 3 February 2003.

¹² Article 7 Report, Form B, 3 February 2008. Tajikistan used the optional form B2.

¹³ TMAC has confirmed that this is the number of individual mines. It likely represents 768 canisters each containing 64 individual mines.

¹⁴ According to the form “each block [of POM mines] has several clusters [canisters] and each cluster has several mines. We have not determined the number of clusters that each block includes. This means, that each block has several mines.” Typically, a KPOM-2 canister has four mines, but it is unclear how many canisters are in a block.

¹⁵ Order #21/6/8-5609, dated 1 September 2006. Article 7 Report, Form B2, 3 February 2008.

¹⁶ Telephone interview with Jonmahmad Rajabov, TMAC, 18 July 2008. TMAC said that the border authorities did not provide information on the locations where the mines were discovered.

¹⁷ Article 7 Report, Form B2, 3 February 2008. In the first case, a total of two MON-100, 17 POMZ-2, and one OZM-72 mine were “confiscated or detected...as a result of counter-terrorism activity.” The date of discovery or detection is not provided nor is the ultimate disposal of these 20 antipersonnel mines. The second reported case noted that in 2007, two YM-1 and 13 M18A1 Claymore mines, and one MON-50 mine were “transferred from the stockpiles of the force structures of the Republic of Tajikistan to TMAC for destruction.” The mines were confiscated or found by security forces as a result of counter-terrorism activities.

¹⁸ The numbers and types of mines initially retained were: POMZ-2M (100); PMN (50); OZM-72 (50); MON-100 (50); and MON-200 (5). Tajikistan consumed 30 mines in 2005, 120 mines in 2006 and 105 mines in 2007. The mines were used for refresher training of survey and demining personnel. See *Landmine Monitor Report 2008*, p. 662.

Scope of the Problem

Contamination

Tajikistan is contaminated with mines and ERW, including a residual problem of unexploded submunitions. Tajikistan has not reported a problem with other ERW, although items of UXO continue to be found.

Tajikistan's central region was contaminated by mines, unexploded submunitions, and other ERW in the 1992–1997 civil war.¹⁹ Russian forces emplaced landmines on the Tajik-Afghan border in 1992–1998 to protect the border and their border posts from armed groups attempting to enter Tajikistan from Afghanistan. In 2000–2001, Uzbek forces laid mines on the Tajik-Uzbek border (Tajikistan's western and northern borders, primarily in Sugd province), seeking to prevent non-state armed groups from entering Uzbekistan from Tajikistan. Uzbekistan has claimed that 95% of its minefields along the border with Tajikistan have been demined, but Tajikistan has stated that mine records were not provided by its neighbor. Some 3% of the border remains to be defined between the two countries.²⁰ Mines have also been found on Tajikistan's border with Kyrgyzstan.²¹

In 2006, Russian border forces handed over responsibility for the protection of Tajikistan's border with Afghanistan to Tajikistan, but TMAC has stated that it did not receive all minefield records until February 2008. The records were for 384 minefields, identifying 607 mined areas with an approximate total size of 8.57km² and containing more than 260,000 PFM-1, PFM-1S, POM, and POM-2S antipersonnel mines. An ongoing resurvey of the areas (see Identification of hazardous areas section below) has found that most of the mined areas have since been “destroyed” due to flooding of the Panj river and activation of the mines' self-destruct mechanisms.²²

An earlier impact survey carried out in 2003–2005 by TMAC's main demining partner, the Swiss Foundation for Mine Action (FSD), identified 146 suspected hazardous areas (SHAs) covering almost 50km² across the country. Subsequent requests for clearance and technical survey from the government, local authorities, and ministries added 13 SHAs covering an estimated 0.86km² of land while during clearance operations an additional 0.17km² of hazardous areas were identified. Thus, the original total of 159 SHAs in Tajikistan covered an estimated 50.67km².²³ During re-survey operations through the end of 2008, 18 SHAs were cancelled while 92 additional mined areas with an approximate size of 2.93km² were identified.²⁴ As of the end of July 2009, TMAC estimated the extent of the residual problem at 8.42km² along the border with Afghanistan and in the Central Region, with survey still being conducted along an additional 6km², and had still to assess contamination along the border with Uzbekistan.²⁵

The FSD survey and TMAC found evidence that cluster munitions had dispersed PFM-1 and PFM-1S antipersonnel mines, and ShOAB-0.5, AO-2.5 RT, AO-0.5, and AO-1SCh submunitions, but as of August 2009, and as a result of clearance operations, the residual submunition threat was considered to be mainly in the central region.²⁶

²⁶ Telephone interview with Parviz Mavlonkulov, TMAC, 18 August 2009.

Casualties

In 2008, TMAC identified 13 mine/ERW casualties (four killed and nine injured) in eight incidents.²⁷ There were eight civilian casualties; three military and two deminers. Adult males were the biggest casualty group (eight), followed by boys (four), and one girl. Activities at the time of the incident included tampering (five), demining (three), conducting military activities (two), grazing cattle (two), and collecting wood (one). Antipersonnel mines caused the majority of casualties (eight) and ERW caused five. Casualties were recorded in Khatlon province (five in Vose district and two Shahrtuz district), followed by Sugd province (one in Isfara district and one in Panjakent district), Gorniy Badakshan Autonomous Province (two in Vanj district and one in Darvoz district) and the Region of Republican Subordination (one in Tavildara district). All casualties were Tajik, except one deminer who was reported to be a resident of Kabul, Afghanistan.

The 2008 casualty rate is a decrease compared to 2007, when there were 20 recorded casualties, and is the lowest recorded since 1999.²⁸ The decrease is attributed to the positive impact of RE.²⁹

Casualties continued to occur in 2009 at a decreased rate, with six mine/ERW casualties (one killed and five injured) in four incidents, as of 17 June 2009.³⁰ Three casualties were civilians, and three military. On 2 March, two military personnel were injured by ERW while on duty in Dushanbe. On 30 March, a man was killed by an antipersonnel mine while grazing cattle in Isfara district, in Sugd province. On 27 April, a man and a woman, both aged 18, were injured while playing with an ERW in Rasht district, in the Region of Republican Subordination. On 17 June, a military deminer was injured by an antipersonnel mine during clearance activities in Darvoz district, Gorniy Badakshan Autonomous Province.

On 1 April 2009, TMAC reported that a Tajik man was killed by an antipersonnel mine while in Uzbek territory, looking for his missing cows.³¹ The casualty was not added to TMAC's database or to the above total, as it occurred in Uzbekistan.

Despite significant TMAC efforts, the total number of mine/ERW casualties in Tajikistan remains unknown, but TMAC has information on 802 casualties (354 killed and 448 injured) between 1992 and 2009.³² From 1999 to 2008, TMAC identified 318 mine/ERW casualties (132 killed and 186 injured).³³ Of the 315 casualties with detailed records, the vast majority were civilians (285), but 24 were military and six deminers (it is unknown if these were civilians or military, but one was a French national). Most of these casualties were men (200), followed by boys (75), women (19), girls (nine), males of unknown age (11), and females of unknown age (one). Antipersonnel mines caused 226 casualties, ERW caused 34 (of which, at least five were submunitions), and unknown devices caused 55. The activities at the time of the incident of 135 casualties remain unknown, but 67 were herding, 37 collecting wood/food/water, 22 conducting military activities, 17 traveling, 13 playing, eight engaging in clearance activities, seven handling/tampering with devices, six fishing/hunting, and three conducting agricultural activities. While historic data remains incomplete, information collected shows that casualty rates have decreased or remained at similar levels since 2000.

²⁷ TMAC, "List of the Victims of Landmine and ERW in 2008," provided by email from Reykhan Muminova, Victim Assistance Officer, TMAC, 8 June 2009; and Landmine Monitor media monitoring from 1 January 2008–31 December 2008. TMAC does not distinguish simply between military and civilian casualties; it separates them into deminers, military, and civilians. In the raw data, one of the three military casualties was reportedly a deminer. It is unknown if the other two deminers were civilian or military, so they are reported here in a separate category.

²⁸ TMAC has revised its 2007 casualty rate from 19 (nine killed, 10 injured) to 20 (nine killed, 11 injured). Email from Reykhan Muminova, TMAC, 13 July 2009; and *Landmine Monitor Report 2008*, p. 667.

³² Email from Reykhan Muminova, TMAC, 13 July 2009.

³³ Landmine Monitor analysis of data provided by email from Reykhan Muminova, TMAC, 13 July 2009; and email from Abdulmain Karimov, IMSMA Database Management Officer, TMAC, 21 June 2008.

Risk profile

Inhabitants of 24 districts³⁴ are at risk from landmines, cluster munition remnants, and other ERW. Typical high-risk activities include collecting firewood, tending livestock, and using unfamiliar paths.

Socio-economic impact

Almost half a million people are believed to live in mine-affected areas, largely in hills or mountains where most villages are located. Contamination blocks the reconstruction of roads, power lines, and access to agriculture pasture and potable water. It is also reported that contamination denies access to land needed for geological research in the mountains.³⁵

Program Management and Coordination

Mine action and risk education

The interministerial Commission on the Implementation of International Humanitarian Law (CIHL) is Tajikistan's national mine action authority. The CIHL is chaired by the Deputy Prime Minister for Security.³⁶

TMAC was established on 20 June 2003 and functions as an executive body of the CIHL³⁷ in accordance with an agreement between Tajikistan and UNDP. TMAC is responsible for the coordination and monitoring of all mine action activities in Tajikistan including mine clearance, RE, and VA. TMAC also develops the national mine action plan and standards, tasks operations, and presents certificates of cleared sites to local authorities.³⁸

Two RE coordination meetings were held in 2008 with the TjRCS and ICRC. Technical and financial support was provided by UNDP from August 2008.³⁹

Victim assistance

The mine action strategy for 2004–2008 acknowledged TMAC's role in VA, as does the amended strategy for 2006–2010. TMAC's role includes coordinating with the Ministry of Labor, Social Protection and Population (MLSP), which is responsible for disability issues, and other stakeholders. TMAC's VA department has been operational since 2006. It is staffed by a VA officer (who is both a medical doctor and psychologist) and an assistant (a survivor) and is responsible for assisting the government in developing a VA strategy, coordinating meetings and activities among VA operators, updating casualty data and mobilizing donor support.⁴⁰

The national Victim Assistance Working Group, created in 2006, coordinates VA and is composed of TMAC, the Ministry of Health, MLSP, National Orthopedic Center, National Research Institute for Rehabilitation of Disabled People, National Union of Disabled People, TjRCS, Harmony of the World, and mine/ERW survivors.⁴¹ It met regularly in 2008 to discuss VA challenges, coordinate activities, and integrate VA in broader governmental projects.⁴²

The MLSP has primary responsibility for persons with disabilities in Tajikistan and works with the relevant government bodies in charge of protecting their rights.

Data collection and management

The latest version of the Information Management System for Mine Action (IMSMA) software was installed at TMAC in June 2008. The program was updated in May 2009 but, due to technical problems, TMAC decided in July 2009 to move back to an earlier version.⁴³

TMAC acknowledged that nationwide data collection in Tajikistan had not fully been achieved,⁴⁴ but geographic coverage was expanded in 2008 to seven additional districts, mainly in the south, near the border with Afghanistan.⁴⁵ As a result of this expansion, it is believed that recent casualties are adequately reported, although some casualties that occurred during and immediately after the civil war may not have been recorded.⁴⁶ Progress in data collection continued to be reported in 2008, with information on demographics, geography, activity at time of incident, and device type available for recent casualties.⁴⁷

TMAC is responsible for casualty data collection and works in cooperation with the TjRCS, MLSPP, Ministry of Health, and local authorities. In 2008, the ICRC continued to support the TjRCS. Data is collected by requesting information from official sources and interviewing people in mine-affected communities.⁴⁸ TMAC has maintained casualty data in IMSMA since 2003.⁴⁹ Casualty information is shared with relevant actors on request.⁵⁰

In March 2008, TMAC, the Ministry of Health, the MLSPP, and TjRCS completed a VA needs assessment, begun in 2006. The assessment covered Tajikistan's five regions and collected data in 30 districts (including 24 mine-affected districts). Thirty previously unreported casualties were identified.⁵¹ The data was compared with the IMSMA database to fill gaps and remove duplicates.⁵² Information gathered is used to plan, prioritize, and monitor VA activities.⁵³

The Ministry of Health collects service provision data from all healthcare facilities, but the information was not centralized or used for planning.⁵⁴ In 2007, TMAC and the Ministry of Health reached an agreement to use the IMSMA form at hospitals and health centers. In 2008, TMAC continued to work in close cooperation with the ministry to continue collecting and verifying data from local hospitals.⁵⁵

RE data is entered into IMSMA but this does not include information from the Ministry of Education.⁵⁶

Plans

Strategic mine action plans

In 2006, a national mine action strategy was formulated for 2006–2010 and approved by the government. The goal is to eliminate the economic impact of mines and ERW in Tajikistan, with a primary objective being to strengthen TMAC's capacity "to create a sustainable national institution to plan, coordinate and implement comprehensive mine action." A new strategic plan was expected to be developed in accordance with Tajikistan's Article 5 deadline extension request, which will cover 2010–2020, probably broken down into two five-year phases.⁵⁷

For RE, the strategy seeks to broaden geographical coverage, and improve links between RE and other mine action pillars, such as casualty/injury surveillance.

Integration of mine action with reconstruction and development

According to a June 2006 directive from the Deputy Prime Minister, relevant ministries must share reconstruction and development project budgets with TMAC and allocate funds, where necessary, for mine clearance within these budgets.

Tajikistan's Poverty Reduction Strategy Paper stated that mainstreaming VA into existing infrastructure is crucial in achieving the UN Millennium Development Goal of poverty reduction. The strategy aims to improve health, rehabilitation, vocational training employment, and pension services for persons with disabilities.⁵⁸ The RE strategy also aims to integrate RE activities into "broader humanitarian, human rights and development activities."

National ownership

Commitment to mine action and victim assistance

A 2008 UNDP evaluation (see Program evaluation section below) found limited government ownership of the mine action program, little or no government funding, and insufficient discussion with donors.⁵⁹ For its part, TMAC believes that over the past three years it has promoted greater national ownership of mine action and supported its integration into the government's development plan. Tajikistan has supported the program with in-kind contributions. With UNDP support, TMAC believes it has also been able to increase the effectiveness of the national mine action program, but acknowledges that the process of full nationalization of TMAC will need more time and further external support.⁶⁰

TMAC has reported that "the government of Tajikistan tries to do its best within the framework of the Tajik legislation to provide assistance for victims' families and survivors."⁶¹

National management

Since its creation, TMAC has operated with UNDP support, including chief technical advisors (CTA) from 2003 to 2007. At the end of 2007, the CTA position was eliminated and, since March 2008, a local project analyst has been employed to support TMAC's director with planning, resource mobilization, and treaty reporting obligations. However, in order to train the project analyst, an institutional capacity development consultant was hired for six months (April–September 2008). TMAC is gradually taking over full responsibility as the sole mine action entity in Tajikistan. UNDP has also been playing an important role mobilizing donor resources for mine action.⁶²

⁶² Email from Jonmahmad Rajabov, TMAC, 23 June 2009.

National mine action legislation and standards/Standing operating procedures

Mine clearance in Tajikistan is managed in accordance with its National Mine Action Standards, adopted in March 2008 based on the International Mine Action Standards. FSD's standing operating procedures are approved by TMAC.⁶³ In February 2009, a National Mine Action Standard on land release was approved by TMAC.⁶⁴

Program evaluation

From November–December 2008, TMAC hosted a UNDP evaluation mission. The mission concluded that “the TMAC project is going well and has achieved much of the goals that might be expected of a mine action coordinating body.” The evaluation criticized a lack of government ownership (see Commitment to mine action and victim assistance section above), as well as the lack of a long-term explosive ordnance disposal capacity, poor access to external technical assistance, and deteriorating relations with the Organization for Security and Cooperation in Europe (OSCE).⁶⁵

Demining and Battle Area Clearance

In 2008, the mine action program had 126 national operational staff with two demining teams, two technical survey teams, two battle area clearance (BAC) teams, and six mine detection dog teams.⁶⁶ In early 2009, the OSCE provided support for the creation of a third technical survey team under the Ministry of Defense. This team operates only in the area along the border with Afghanistan.⁶⁷

In 2008, FSD reportedly cleared 0.74km² of mined areas, with the destruction of 5,366 antipersonnel mines and 375 items of UXO.⁶⁸ A further 24.83km² of SHAs were released by TMAC through survey. FSD also cleared 158,258m² of battle areas in 2008, with the destruction of 66 unexploded submunitions, 32 other items of UXO, and five antivehicle mines. No BAC operations were carried out in 2009 to May.⁶⁹

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Tajikistan is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 April 2010. Progress in meeting this obligation has been slow and Tajikistan has still to determine the extent of its mine contamination. Since the program started in 2004, Tajikistan has cleared only 1.83km² of mined areas (see table below).

On 31 March 2009, Tajikistan submitted a request for a 10-year extension of its Article 5 deadline. Tajikistan cited a series of factors that explain its failure to meet its 2010 deadline, including limited funding as well as its own delays in initiating a demining program. Many of its SHAs are located in the mountains, which makes operations difficult. Also, severe weather conditions in some areas restrict operations to only three or four months a year.⁷⁰ In 2009, for example, mine clearance operations started only in April.⁷¹

⁶³ Article 5 deadline Extension Request, 31 March 2009, p. 2.

⁷¹ Email from Parviz Mavlonkulov, TMAC, 5 August 2009.

Mine and battle area clearance from 1999–2008⁷²

Year	Mine clearance (km ²)	BAC (km ²)	Area released by survey (km ²)
2008	0.74	0.16	24.83
2007	0.56	0.18	17.58
2006	0.33	0	0
2005	0.13	0	0
2004	0.07	0	0
2000–2003	0	0	0
Total	1.83	0.34	42.41

In May 2009, during the presentation of Tajikistan's extension request to the Standing Committee meetings, the ICBL called the duration of the request excessive and suggested that Tajikistan request a five-year extension to its clearance deadline.⁷³

Risk Education

RE was conducted in 22 mine-affected districts in the north, northwest, south, and southeast of the country. Communities were actively involved in RE through district officials, district emergency situation committees, district and village women's councils, teachers, community members, and branches of the TjRCS. Activities consisted of roundtable meetings, workshops, community meetings, and RE in schools.⁷⁴ Billboards were displayed for shepherds, while local government buildings and schools also displayed information, and materials were distributed.⁷⁵ The national media also broadcast RE messages through television advertisements and interviews with RE practitioners in Tajik and Russian languages.⁷⁶ Additionally, RE materials are produced and disseminated in the Uzbek language, as a significant number of ethnic Uzbek people live in the contaminated areas.⁷⁷ Representatives from the two contaminated districts not covered in the RE program participated in events in neighboring districts.⁷⁸ A lack of funding limited RE activities.⁷⁹

Contamination and casualty data are used to define the target group for RE, and to prioritize activities, but there were no formal needs assessments in 2008.⁸⁰

Although UNICEF support to the schools program ended in August 2007, TMAC continued to support RE in 290 schools in all contaminated districts, training teachers and using materials left over from the program.⁸¹

⁷² Ibid, 23 June 2009. The information in this table differs from previous Landmine Monitor reporting. Landmine Monitor reported 0.54km² for mine clearance in 2007; 0.31km² for mine clearance in 2006; 0.06 for BAC in 2006; and 17.7km² for area released by survey in 2007.

⁷⁹ Ibid.

⁸⁰ Ibid.

⁸¹ Ibid.

The TjRCS continued its program based on a participatory community-based approach developed by the ICRC. They trained 66 volunteers from remote communities in 22 districts to deliver RE in 331 villages. Training included courses on “Development communication in [mine risk education] MRE” and “Gender Equity in MRE”.⁸² It has nine safe play areas, the first established in 2005.⁸³

Harmony of the World has included RE in its annual summer camps since 2006, training landmine survivors to deliver RE.⁸⁴

Since 2001, the TjRCS has been the main RE provider, using a community-based approach, with ICRC support, following a needs assessment conducted by the TjRCS, ICRC, and Ministry of Emergency Situations and Civil Defense. Prior to this, ICRC conducted some awareness activities and distributed materials.

In September 2005, UNICEF conducted a knowledge, attitudes and practice (KAP) survey that found children “had a relatively good knowledge of safety behavior, but needed encouragement and reminders to follow safety roles.” UNICEF also broadcast some children’s advertisements in 2005. It ran a pilot project from May 2005 to August 2007, training teachers and other educators to become RE focal points, and producing teaching guides. Despite an overall positive evaluation, the project was not continued, and the activities were incorporated into the TMAC program.

TMAC started to coordinate RE in 2005, and hired an RE officer in late 2006. RE expanded significantly in 2006 and in 2007 to reach areas that had previously been underserved. In 2007 a new program was launched, building on the participatory approach implemented by the TjRCS, and the Ministry of Education increased its involvement. Casualty and contamination data were used increasingly to prioritize RE and target groups.

Victim Assistance

The total number of mine/ERW survivors in Tajikistan is unknown, but at least 448.⁸⁵ In 2009, TMAC reported progress in VA but acknowledged that challenges remained, including resource mobilization, long-term sustainability, capacity development, and adopting a holistic approach to survivor rehabilitation.⁸⁶

The 2006–2008 VA needs assessment showed that 90% of survivors were in need of economic assistance or income-generating projects; 85.5% needed long-term medical care and rehabilitation; 81% psychological support; 60% social support; and 57% training and education.⁸⁷ TMAC’s priorities for 2010–2014 are physical and economic rehabilitation, accessibility to services, training rehabilitation specialists, capacity development, psychosocial support, data collection, resource mobilization, and long-term sustainability.⁸⁸

All Tajik nationals have the right to free emergency medical services and all casualties resulting from incidents in 2008 received emergency medical assistance.⁸⁹ Casualties can be transported to hospitals and community health clinics by ambulance or other vehicles;

on average this journey takes between 30 minutes and three hours.⁹⁰ While basic first-aid is available at clinics, they lack sufficient equipment and medicine.⁹¹ Overall, there is a lack of personnel trained in first-aid and emergency pre-hospital response in mine-affected areas.⁹² The specialized facilities nearest to the mine-affected areas are the Central District Hospitals (CDH), which have surgical and trauma departments, and an average of four or five surgeons.⁹³ Local specialists are in need of training.⁹⁴ There are no trauma specialists in the CDH in the mine-affected Tavildara district, although there are general surgeons.⁹⁵ The cost of medicines in Tajikistan remains high.⁹⁶ In 2008, the Ministry of Health received six mobile hospitals from the Swiss Agency for Development and Cooperation, which were distributed to the main hospitals in Sugd, Khatlon, Rasht, Gorniy Badakshan Autonomous Province and the National Medical Center in Dushanbe. A three-day training course on mobile hospitals for medical personnel was organized in August 2008.⁹⁷

Most mine/ERW survivors have access to physical rehabilitation services and orthopedic appliances.⁹⁸ Services are available at the National Orthopedic Center (NOC) in Dushanbe or its three satellite workshops in Khujand (in the north), Kulob (in the center) and Khorugh (in the southeast).⁹⁹ The satellite workshops are in poor condition, however, and lack capacity.¹⁰⁰ Transportation, accommodation and meals for survivors receiving treatment at the workshops are provided free of charge.¹⁰¹ Physical rehabilitation is also available at the 60-bed National Research Institute for Rehabilitation of Disabled People (NRIRD).¹⁰² After a gradual transition, the ICRC handed over the NOC to the MLSPP on 31 December 2008.¹⁰³ The ICRC Special Fund for the Disabled (SFD) started supporting the NOC as of January 2009.¹⁰⁴ In 2008, the NOC had a waiting list, due to the lack of technicians.¹⁰⁵ Training for prosthetic technicians is not available in Tajikistan.¹⁰⁶ In May 2008, TMAC, the Ministry of Health, and the International Trust Fund For Demining and Mine Victims Assistance (ITF) organized a six-day training on “Rehabilitation of Patients with Upper Limb Amputation” for 20 doctors from mine-affected districts and Dushanbe in May 2008.¹⁰⁷

Psychological support and socio-economic reintegration programs need to be expanded. Psychological support at the CDH level is limited.¹⁰⁸ Assistance can be obtained at the NRIRDP and through the National Union of Disabled People.¹⁰⁹ TMAC annual summer camps provide psychological support for a limited number of survivors.¹¹⁰ Socio-economic opportunities for survivors remain limited, although some income-generation activities were organized in 2008.¹¹¹ Unemployment is a problem for the whole population and particularly for survivors.¹¹² In 2008, the government increased pensions for persons with disabilities, including survivors and families of those killed by mines/ERW, raising the minimum pension to US\$17 per month.¹¹³ Some 24% of survivors received the pension in 2008.¹¹⁴ Other benefits (including reduction of electricity and telephone bills) are granted to certain categories of persons with disabilities.¹¹⁵

Tajikistan has legislation protecting the rights of persons with disabilities, but implementation was not adequate because of lack of resources.¹¹⁶ Progress toward a new Law on Social Protection of Persons with Disabilities was reported in 2009.¹¹⁷ As of 29 June 2009, Tajikistan had not signed the UN Convention on the Rights of Persons with Disabilities. The convention was discussed at a roundtable organized by TMAC and the MLSPP on 30 May 2008.¹¹⁸ The International Forum of Organizations of the Disabled of Central Asian countries and Islamic Republic of Iran appealed to governments of the region to join the convention in August 2008.¹¹⁹ In June 2009, TMAC reported that the convention was under consideration by the government.¹²⁰

Progress in meeting VA26 victim assistance objectives

Tajikistan is one of the 26 States Parties with significant numbers of mine survivors, and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors.¹²¹ Tajikistan presented its 2005–2009 objectives as part of its commitment to the Nairobi Action Plan at the Sixth Meeting of States Parties in 2005.¹²² It revised its objectives, and presented plans to achieve them, in 2006 and 2008.¹²³

Tajikistan’s revised VA action plan for 2006–2009 was discussed at the Second National Victim Assistance Workshop held in Dushanbe in April 2008.¹²⁴ It was approved by the government in October 2008 and presented at the Ninth Meeting of States Parties in November 2008. The plan

aims to achieve “the best possible quality of life for landmine survivors and for all persons with disabilities”¹²⁵ and includes 21 revised SMART (specific, measurable, achievable, relevant, and time-bound) objectives and specific plans to achieve them.¹²⁶

Tajikistan has made progress towards its VA aims. Most of Tajikistan’s objectives (as revised in 2006) were achieved or in progress. Progress was noted on objectives under all components of VA.¹²⁷ The least amount of progress was made on training of healthcare workers to improve pre-hospital emergency response capacity, disseminating the directory of economic reintegration services, providing psychological support, and raising awareness of the rights and capacities of persons with disabilities.¹²⁸ Funding for VA was overall inadequate, and in 2009 Tajikistan reported that it still needs international support.¹²⁹

Tajikistan reported on its VA activities at all meetings of States Parties and intersessional Standing Committee meetings from 2005–2009. Tajikistan used the voluntary Form J in its annual Article 7 report to provide an update on VA activities in 2006–2009. Tajikistan included a VA expert on its delegation to the meetings of States Parties from 2005–2008 and to the intersessional Standing Committee meetings from 2007–2009.¹³⁰

Victim assistance activities

In 2008, at least 157 mine/ERW survivors received assistance in Tajikistan (compared with 160 in 2007). The total number of survivors that received assistance between 1999 and 2008 is unknown, but at least 367 survivors received prosthetics, 110 survivors received psychological assistance, and 177 survivors received economic assistance.¹³¹ All new nine survivors in 2008 were provided with free treatment in national medical facilities.

In 2008, the NOC, with support from the ICRC, assisted 1,068 persons with physical rehabilitation and delivered 320 prostheses, 137 orthoses, 238 crutches, and two wheelchairs.¹³² Twenty-four mine/ERW survivors received prosthetics, including nine survivors injured in 2008.¹³³ NOC staff received physiotherapy training from the ICRC and new manufacturing guidelines for trans-tibia and trans-femoral prostheses were translated into Tajik.¹³⁴ The ITF reported among its training initiatives in 2008 a five-day workshop in Tajikistan on rehabilitation of patients with upper or low limb amputations. The workshop took place in May 2008, run by Slovenia’s Institute for Rehabilitation.¹³⁵

The NRIRD provided physical rehabilitation to 22 mine survivors.¹³⁶

TMAC provided psychosocial support through summer camps to 34 survivors and support for educational activities for four survivors. Income-generating activities were organized for 56 survivors in the framework of a bee-keeping project in Tavildara and Sagirdasht districts implemented by

local authorities with funding provided by Canada. Eight family members of mine/ERW survivors received income generation support as part of a TjRCS project in Isfara and Panjakent districts.¹³⁷

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates for fulfilling mine action needs including RE and VA in Tajikistan. Tajikistan submitted an Article 5 clearance deadline extension request in March 2009 including a cost estimate of \$36,270,000 (€24,629,906) for resurvey, manual demining, mechanical demining, mine detection dogs, and capacity-building from 2009 to 2019, averaging \$3.8 million per year for completion of mine clearance, of which \$550,000 is to be provided by Tajikistan. Annual international funding required for the plan ranges from a high of \$3.7 million in 2009 to a low of \$3.1 million from 2017 to 2019.¹³⁸ The plan states that Tajikistan will hold donor consultative meetings at least twice per year to support resource mobilization.¹³⁹

National support for mine action

Tajikistan reported providing \$574,000 in national funding to mine action in 2008.¹⁴⁰ Tajikistan reported to Landmine Monitor that it provided in-kind support valued at \$565,000 in 2007.¹⁴¹ It did not report whether the funding was monetary or in-kind; in June 2008, however, TMAC reported that “there was no commitment for providing the [mine action] program with actual funds from the Government of Tajikistan.”¹⁴²

International cooperation and assistance

In 2008, five countries reported providing \$1,863,366 (€1,265,358) to mine action in Tajikistan. Reported mine action funding in 2008 was approximately 49% more than reported in 2007. Funding at 2008 levels is not sufficient to meet mine clearance funding requirements reported in Tajikistan’s Article 5 deadline extension request, nor does it cover Tajikistan’s VA needs.

As of June 2008, TMAC reported an overall funding target for 2008 of \$4,059,330.¹⁴³

2008 International Mine Action Funding to Tajikistan: Monetary¹⁴⁴

Donor	Implementing Agencies/Organizations	Project Details	Amount
Germany	FSD	Mine clearance	\$1,079,444 (€733,019)
Canada	UNDP	Mine clearance, capacity-building	\$435,392 (C\$464,121)
United Kingdom	UNDP	Mine clearance, capacity-building	\$200,416 (€108,070)
Belgium	UNDP, FSD	VA, survey, capacity-building	\$122,226 (€83,000)
Switzerland	TjRCS, UNDP	RE, VA	\$25,889 (CHF28,000)
Total			\$1,863,367 (€1,265,359)

THAILAND

2008 Key Data

State Party since	1 May 1999
Contamination	Antipersonnel mines, ERW
Estimated area of contamination	562km ² (July 2009)
Casualties in 2008	26 (2007: 19)
Estimated mine/ERW survivors	Unknown but estimated 1,252
Article 5 (clearance of mined areas)	Deadline: 1 November 2018 Original deadline: 1 May 2009
Demining in 2008	Mined areas: 1.56km ²
Risk education recipients in 2008	At least 37,180
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$0 (2007: \$1.6 million) National: Unspecified (2007: \$2.7 million)

Ten-Year Summary

The Kingdom of Thailand became a State Party to the Mine Ban Treaty on 1 May 1999 and served as co-rapporteur and then co-chair of the Standing Committee on the General Status and Operation of the Convention from 2000 to 2002. It hosted regional landmine conferences in 2001, 2002, and 2009. It completed destruction of its stockpile of 337,725 antipersonnel mines in April 2003. Thailand hosted and served as President of the Fifth Meeting of States Parties in September 2003. It was co-rapporteur and then co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration from 2007 to 2009.

Thailand put in place a mine action structure supported mostly by its own financial resources in 1999 but the sector attracted little interest from political or military leaders: without adequate financial support it made little progress in either accurately defining or clearing mine contamination. Thailand set ambitious targets in its 2008 request for an extension to its Article 5 deadline but in 2009 neither the financing nor human resources needed to achieve them materialized, and clearance continued at a slow pace.

From June 1998 to 2008 Landmine Monitor recorded 555 mine/explosive remnants of war (ERW) casualties in Thailand (26 killed, 169 injured, and 360 of unknown status). This total includes some casualties injured in Myanmar and recorded in Thailand which could not be separated from the data. Since 2001, mine/ERW risk education activities reached at least 1,018,632 beneficiaries, mostly conducted by personnel from the Thailand Mine Action Center Humanitarian Mine Action Units.

Data collection on survivors and their needs improved with a national survey in 2008–2009, despite the lack of a comprehensive national surveillance system. Thailand's progress in victim assistance was slow in 2005–2007, after which significant advances were made in increasing the level of emergency and continuing medical care. Despite improvements in psychological support and economic reintegration, these services have not adequately addressed the specific needs of survivors, most of whom live in rural communities. Improved public policy enforcing the rights of persons with disabilities has been supported by Thailand's ratification of the UN Convention on the Rights of Persons with Disabilities.

Mine Ban Policy

Thailand signed the Mine Ban Treaty on 3 December 1997 and ratified it on 27 November 1998, becoming a State Party on 1 May 1999. Thailand has not enacted domestic legislation to implement the Mine Ban Treaty. In April 2009, the Director General of the Thailand Mine Action Center (TMAC) said that Thailand was in the process of passing an executive measure, the Office of the Prime Minister Regulations Governing the Implementation of the Convention, to ensure that the military, the police and other domestic agencies do not violate the treaty. The Sub-committee on Administration and Evaluation is responsible for this, and in early 2009 was in the process of submitting the draft regulation to the National Committee for Humanitarian Mine Action for consideration.¹

Thailand submitted its 11th Article 7 report on 30 April 2009, covering calendar year 2008.²

Thailand participated in the Ninth Meeting of States Parties in Geneva in November 2008, where it formally requested an extension of its Article 5 mine clearance deadline. It also delivered a statement as the incoming co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration after serving as co-rapporteur the previous year. In addition, it made interventions during the general exchange of views, and during sessions dealing with mine clearance deadline extension requests, victim assistance (VA), and compliance (for the latter, see Use section below).

At the intersessional Standing Committee meetings in May 2009, in addition to its role as co-chair on Victim Assistance and Socio-Economic Reintegration, Thailand made statements during the sessions on universalization, VA, clearance deadline extensions, risk education (RE), and the Second Review Conference.

Thailand hosted the Bangkok Workshop on Achieving a Mine Free South-East Asia from 1–3 April 2009. This was the second in a series of regional meetings convened in the lead-up to the Second Review Conference. Eighteen countries, including all non-signatory states in the Association of Southeast Asian Nations (ASEAN), participated. Thailand also hosted a parallel Chiang Mai/Bangkok workshop on VA.

Thailand has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Thailand is not party to the Convention on Conventional Weapons. Thailand had not signed the Convention on Cluster Munitions as of 1 July 2009.³

Production, transfer, stockpile destruction, and retention

Thailand states that it has never produced or exported antipersonnel mines. Thailand formerly imported antipersonnel mines from China, Italy, the United States, and the former Yugoslavia. It completed destruction of 337,725 stockpiled antipersonnel mines on 24 April 2003.

The Royal Thai Army, Navy, Air Force, and the Thailand National Police Department initially retained a total of 4,970 antipersonnel mines for training. The number of retained mines did not change from 2001 to 2004. In 2005–2006, Thailand reduced the number of mines retained by

¹ Oral intervention by Lt.-Gen. Tumrongsak Deemongkol, Director-General, TMAC, Bangkok Workshop on Achieving a Mine-Free Southeast Asia, Bangkok, 3 April 2009; and interview with Lt.-Gen. Tumrongsak Deemongkol, TMAC, in Bangkok, 19 March 2009. TMAC also told Landmine Monitor in February 2008 that this draft measure, which would amend existing laws, was in the process of being submitted to NMAC. The draft was first developed by TMAC in 2002. Thailand's Article 7 reports submitted in 2007, 2008, and 2009 all stated, "The issuing is still in progress." Thailand has reported that the draft regulation has been pending approval of various entities each year, including the Armed Forces Supreme Command, the Ministry of Defense, and the Cabinet. The Ministry of Foreign Affairs stated that it would be in place by the Review Conference in 2004. See previous editions of Landmine Monitor.

² Previous Article 7 reports were submitted on 30 April 2008, 25 April 2007, 25 April 2006, 25 April 2005, 3 May 2004, 22 July 2003, 30 April 2002, 17 April 2001, 2 May 2000, and 10 November 1999.

³ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 245–246.

257.⁴ In 2007, it reduced the number by another 1,063 mines. It appears that 63 of the mines retained by the National Police Department were consumed during training activities, and all of the 1,000 mines retained by the navy were simply destroyed, presumably because they were no longer deemed necessary.⁵

In its latest Article 7 report covering 2008, Thailand reported that at the end of 2008, it retained 3,638 antipersonnel mines, a reduction of 12 from the previous year.⁶ It reported that 12 mines retained by the National Police Department (nine M14 and three M16) were destroyed for unknown reasons.⁷ No mines were reported as transferred for use in training. At the end of 2008, the army retained 3,000 mines, the Royal Thai Air Force retained 581 mines, and the National Police Department retained 57 mines.⁸ The total of 3,000 mines under the control of the army has not changed since 2001. Thailand has not provided details on the intended purposes and actual uses of its retained mines, as agreed by States Parties in 2004.

While Thailand has not undertaken physical modifications of its Claymore mine stockpile to ensure use only in command-detonated mode, officials have stated that all units have received orders that Claymore mines are to be used only in command-detonated mode.⁹ The Director General of TMAC told Landmine Monitor in March 2009 that Thai forces have not used the Claymore mines.¹⁰

Use

The insurgency in southern Thailand has seen extensive use of command-detonated improvised explosive devices (IEDs). There have apparently also been isolated instances of use of homemade landmines or victim-activated IEDs.¹¹ In February 2009, a police officer was seriously wounded in Yala province by what was reported to be an explosive booby-trap.¹²

On 6 October 2008, a Thai paramilitary ranger stepped on an antipersonnel landmine while on patrol in disputed territory between Thailand and Cambodia, near the World Heritage Site of Preah Vihear. A second ranger stepped on an antipersonnel mine while attempting to aid the first injured. Both lost their legs. This took place three days after an exchange of gunfire between Thai and Cambodian military units at the same location.¹³

Thai authorities maintain that the area was previously clear of landmines. TMAC sent a team to investigate which found some PMN2-type antipersonnel mines. TMAC stated that the mines were newly placed. The sequence of the discovery was detailed on the Thailand Ministry of Foreign Affairs website.¹⁴

Cambodian authorities stated that the Thai investigation of the incident site was a unilateral incursion on Cambodian territory undertaken without their consent or participation, and denounced the action. The Cambodian Ministry of Foreign Affairs stated that the Thai

⁴ There were discrepancies in the reporting on the number of mines. See *Landmine Monitor Report 2007*, p. 665.

⁵ See *Landmine Monitor Report 2008*, p. 678.

⁶ Article 7 Report, Form D.1a, 30 April 2009.

⁷ Ibid, Form D.3. These were listed under Form D.3 as transferred for the purpose of destruction, and under Form D.1a as no longer being retained.

⁸ Article 7 Report, Form D.1a, 30 April 2009. TMAC previously stated to the Landmine Monitor that Thailand does not retain mines under the control of a single service because each has its own training program, and because a central repository would be more complicated in terms of management. Interview with Lt.-Gen. Tumrongsak Deemongkol, TMAC, Bangkok, 22 February 2008.

⁹ Interview with Lt.-Gen. Tumrongsak Deemongkol, TMAC, Bangkok, 19 March 2009. TMAC stated this in 2007 and 2008 as well. In its Article 7 report for 1999, Thailand reported that it had 6,117 M18 and M18A1 Claymore mines in stock.

¹⁰ Interview with Lt.-Gen. Tumrongsak Deemongkol, TMAC, Bangkok, 19 March 2009.

¹¹ Incidents were reported in 2006, 2007, and early 2008. See *Landmine Monitor Report 2008*, pp. 677–678, and *Landmine Monitor Report 2007*, p. 665.

¹⁴ Ibid.

paramilitary rangers had entered Cambodian territory in an area known to contain antipersonnel mines and were injured by mines laid during previous armed conflicts.¹⁵

The Coordinator of the Thailand Campaign to Ban Landmines (TCBL) visited the site at the invitation of TMAC and Thailand's Ministry of Foreign Affairs and observed, "The mines which were displayed as recovered from the site showed no rust on their metal parts. Identification numbers on the mines were clearly visible, and did not appear to have been exposed to the elements very long. Local villagers informed me that they regularly used the path where the incidents took place."¹⁶

Thailand stated that the Royal Thai Army has never possessed PMN2 mines.¹⁷ Cambodia's annual transparency reports indicate that PMN2 mines are commonly found during mine clearance operations.¹⁸ It has also reported stockpiling PMN2 mines in the past.¹⁹

On 17 October 2008, representatives of the Thai Ministry of Foreign Affairs, Ministry of Defense, and TMAC met with an ICBL/TCBL mission and presented information from Thailand's investigations into the incident. Subsequently Thailand made this information available to the Ninth Meeting of States Parties in Geneva in November.²⁰

Both Thailand and Cambodia made statements on the incident at the Ninth Meeting of States Parties. Thailand said it was "compelled to bring to the attention of States Parties the facts relating to an incident which, in our view, constitutes a clear violation of the Convention...[A] process of clarification must be set up and conducted in a constructive way within the framework of the Convention...Thailand has no intention of accusing any state party or politicizing this matter. Thailand has exercised utmost restraint to avoid jumping to conclusion. Rather, we have taken the appropriate step to request clarification from Cambodia via bilateral channel in accordance with Article 8(1) of the Convention. At this stage, Thailand is still ready to consider any options within the framework of Article 8(1) that would allow us to shed light on the 6 October incident, including the setting up of an international fact finding mission..."²¹

It would appear from available evidence that this incident involved new use of antipersonnel mines, but Landmine Monitor is not able to determine who was responsible for the use. To Landmine Monitor's knowledge, other States Parties have not pursued a resolution to this issue with Cambodia and Thailand.

On 1 April 2009, another Thai soldier was reportedly wounded by an antipersonnel mine at the same location during further armed conflict between the two countries.²²

Scope of the Problem

Contamination

Thailand is affected by landmines and ERW, both abandoned explosive ordnance (AXO) and UXO, the result of conflicts on its borders with Cambodia, the Lao People's Democratic Republic (Lao PDR), Myanmar, and Malaysia. The 2001 Landmine Impact Survey (LIS) identified 530 communities in 27 of 76 provinces and more than 500,000 people as mine-affected.

The LIS estimated the total area of mine/ERW contamination at 2,557km².²³ Thailand's revised Article 5 deadline extension request claimed Thailand had released 1,354.75km² leaving a total of 1,202.25km² of suspected area to be tackled, including an estimated 528.2km² of "real minefield" requiring manual demining.²⁴ TMAC revised those estimates in 2009 and as of July had increased the estimated area of mined areas to 562km² (see Identification of hazardous areas section below).²⁵

Thailand's 700km border with Cambodia, used as a base by Cambodian guerrilla factions in the 1980s and 1990s, is worst affected, accounting for three-quarters of the LIS estimate and 51 of 69 high-impacted communities.²⁶ More than half of the mine incidents in Thailand have occurred on this border.²⁷ The Cambodian border is also contaminated by artillery and mortar shells fired by Vietnamese and Cambodian government forces and caches of abandoned mortars, rocket-propelled grenades, and ammunition left by Cambodian guerrilla groups.²⁸

On the border with Myanmar, the LIS identified 139 affected communities and 240 contaminated areas.²⁹ Periodic spillover into Thailand of fighting between Myanmar government forces and Burmese non-state armed groups has deterred efforts either to survey or clear affected areas on the border.³⁰ Contamination on the border with Lao PDR is limited and on the border with Malaysia it is negligible.³¹

Casualties

Landmine Monitor identified 26 mine/ERW casualties in Thailand in 2008; three people were killed and 23 injured.³² TMAC's Humanitarian Mine Action Units (HMAU) recorded some 18 of these casualties (two killed and 16 injured). This was supplemented with data from hospitals (six injured) and the Epidemiology Office of the Ministry of Public Health (MoPH) (one killed and one injured). Of the total, 25 casualties were male and one was female (adult). At least four casualties were boys and the age of another three male casualties was unknown. Eighteen casualties were civilian, five casualties were military or security personnel and three were deminers (injured in two incidents).

³² Email from Lt. Pongpol Sutthibenjakul, Database Officer, TMAC, 5 May 2009; fax from Duangrudee Chanchareon, Nurse, Mae Sot Hospital, 28 April 2009; fax from Supanit Dhammawong, Nurse, Si Sang Wal Hospital, 28 April 2009; data from the Epidemiology Office of the MoPH provided by fax from the Division of Operation Coordination, TMAC, 29 April 2009; and Landmine Monitor media monitoring from January–December 2008.

Activities of civilians at the time of the incident, when known, included collecting wood or food (five), herding (four), and agriculture (three). Casualties mostly occurred on the Thai-Cambodian border, in the provinces of Si Sa Ket (eight), Trat (six), Surin (two), Ubon Ratchathani (two), Buriram (one), and Chanthaburi (one). Another six casualties occurred in Tak province on the Thai-Myanmar border. This represents an increase from 19 new mine/ERW casualties identified for 2007 (all injured). Three casualties were citizens of Myanmar.³³

In 2008, at least two Thai citizens were injured by mines/ERW in Myanmar, close to the Thai border. Both received treatment in Thailand.³⁴ In addition, in February 2008, 14 Myanmar nationals were injured when an unidentified device exploded at a garbage dump while they searched for scrap metal. The device was variously reported in the media as a mine, an item of UXO, a homemade bomb, or a Molotov cocktail. Due to uncertainty about the device type, these casualties have not been included in the total for 2008.³⁵

Casualties continued to be reported in 2009 with at least four casualties (all injured) resulting from three incidents, as of 28 July. Two soldiers were injured on the Thai side of the disputed border area around Preah Vihear Temple. In Trat province, a husband and wife were both injured while collecting forest products: the man had previously stepped on a mine in 1993.³⁶

In March 2009, a Thai farmer was injured in Israel by a mine while looking for mushrooms.³⁷

From June 1998 to 2008 Landmine Monitor recorded 555 casualties in Thailand: 26 killed, 169 injured, and 360 of unknown status. This total includes some casualties injured in Myanmar and recorded in Thailand, which could not be separated from the data. It was not possible to separate out individual years for the data from June 1998 to May 2001. There has been no discernable decrease in the annual number of casualties since 2002.³⁸

The most comprehensive casualty data collection for Thailand, including casualties both killed and injured, remains the LIS, which identified at least 3,468 casualties to May 2001 (1,497 people killed and 1,971 injured).³⁹ In 2008–2009, a retrospective data collection survey recorded a total of 1,252 mine/ERW survivors in 22 provinces of Thailand. Some three-quarters of all mine/ERW survivors were registered as physically disabled. Of the total 1,252 survivors identified, 1,246 provided detailed information: 1,157 (93%) were male and 89 (7%) female. The highest numbers of survivors were in the provinces of Sa Kaeo, 256 people (20 % of total); Nan, 139 people (11%); and Si Sa Ket, 109 people (9%).⁴⁰

³⁶ Landmine Monitor media monitoring from January–July 2009.

³⁷ Eilan Kidman, “Went to pick up mushrooms and stepped on a landmine,” *Local*, 1 March 2009, www.local.co.il.

³⁸ See previous editions of *Landmine Monitor*. *Landmine Monitor Report 2006* reported 51 casualties for 2005, however, details were provided for only 43. The others included may be erroneous or may have occurred in Myanmar and have not been included in the cumulative total. The LIS recorded 346 new casualties between June 1998 and May 2001, in addition, Landmine Monitor recorded two killed in December 2001. See *Landmine Monitor Report 2002*, p. 492.

³⁹ See *Landmine Monitor Report 2007*, p. 672.

⁴⁰ Although the retrospective survivor survey identified fewer than the total number of injured identified by the LIS, the difference may be attributed to different methodologies used: the survey targeted only Thai survivors and excluded non-Thai survivors, including those from neighboring countries injured in their country receiving medical care and rehabilitation in Thailand or survivors living in temporary shelters inside Thailand’s borders. Furthermore, landmine survivors who had died since the incident were not included in the data. Email from Shushira Chonhenchob, Disability and Development Manager, HI, 13 April 2009; and HI, “Mine Victim Survey and Situation Analysis: Findings, Analyses and Recommendations,” Bangkok, June 2009, p. 3.

Risk profile

Casualty data indicates that livelihood activities are the main activities at the time of the incident: tending animals, agriculture, farming, hunting, fishing, and collecting wood, water, or food.⁴¹ Most incidents are caused by mines along the border with Cambodia, and most of the casualties are male. People are prohibited from entering land within 3km of the border by law. However, in the surrounding villages some people do enter mined areas to get food from the forest.⁴² People also have incidents crossing the border between Myanmar and Thailand.

Socio-economic impact

The main impact of mines and ERW has been to deny border communities the use of forest resources and, to a lesser extent, cropland, pasture, and water resources. Residential areas, roads, and other major infrastructure are rarely affected. Thailand's Article 5 deadline extension request noted that economic growth since the LIS had lessened communities' dependence on forest resources but mine and UXO contamination continued to cause casualties and pose barriers to local socio-economic development.⁴³

Program Management and Coordination

Mine action

Responsibility for overseeing mine action lies with the National Committee for Humanitarian Mine Action (NMAC), set up in 2000. It is chaired by the Prime Minister and includes representatives of all major ministries and government departments. Its duties include coordinating national and international support for demining, monitoring Thailand's progress towards meeting its Mine Ban Treaty obligations, and monitoring implementation of the law banning landmines. NMAC's mandate expired in January 2005 but was renewed in November 2006 after a military *coup d'état*.⁴⁴ Abhisit Vejjajiva took office on 17 December 2008, as Thailand's third prime minister since the 2006 *coup*, but as of July 2009 had not chaired a meeting of NMAC.

TMAC was established in 1999 under the Armed Forces Supreme Command to coordinate and implement mine action, including survey, clearance, RE, and VA. Since 2005, TMAC has pressed for a change in its status to a civilian organization, prompted by the slow progress of demining and the armed forces' limited budget for operations.⁴⁵ NMAC accepted the restructuring in principle in February 2007 but as of April 2009 had not decided on the new structure. The proposal that TMAC becomes a foundation but remains under the Armed Forces is still pending.⁴⁶ The February 2007 meeting also decided to set up five sub-committees for VA, coordination with foreign organizations, demining, RE, and monitoring and evaluation. Each sub-committee met at least once in 2007 and 2008.⁴⁷

Risk education

TMAC is responsible for coordinating RE and supporting training, and it also implements RE through the HMAUs. All RE activities along the borders have to be coordinated with TMAC because they are a military body and the army controls the border areas.⁴⁸ TMAC monitors its own activities, but not those of other organizations. RE activity data is entered into the TMAC database.⁴⁹

Victim assistance

The National Sub-Committee on Victim Assistance (VA sub-committee), established under NMAC, is the coordinating body for VA. The VA sub-committee, chaired by the MoPH, meets at least twice a year and includes the Ministry of Social Development and Human Security (MoSDHS), Ministry of Interior, Ministry of Labor, TMAC, and relevant NGOs.⁵⁰

Data collection and management

TMAC upgraded the Information Management System for Mine Action (IMSMA) database to Version 5 in November 2007 but has experienced difficulties storing and accessing some data. TMAC signed a memorandum of understanding with Norwegian People's Aid (NPA) in February 2009 to provide technical assistance to develop its information management capacity as well as its technical survey and land release procedures.⁵¹

An NPA assessment of the database in February 2009 noted that “lack of consistency in available data and TMAC’s current status as an ad hoc unit within the [Ministry of Defense] greatly hampers its functioning as staff rotate annually.” The assessment observed that the database unit’s five staff had no terms of reference or guidelines, clearance data was recorded in the Geographic Information System but undated, land release data was incomplete, and incident data existed in paper format only.⁵²

Thailand does not have a complete national data collection mechanism. The total number of mine/ERW casualties, both killed and injured remains unknown and, for 2008, Landmine Monitor continued to identify a few casualties not recorded in the existing data collection system. TMAC HMAUs collect new incident reports in areas of operation in mine-affected provinces, mainly along the Thai-Cambodian border. Details of the casualty and incident are entered into local log books. In 2008, TMAC continued to receive data directly from 16 mine-affected provinces through four HMAUs. In 2008, TMAC also received casualty data collected by the Epidemiology Office of the MoPH from all 76 provinces in Thailand. TMAC compiled data from both sources, concentrating on the 27 mine-affected provinces. TMAC shares information with the VA sub-committee, the MoPH, and relevant NGOs.⁵³

The most significant improvement in data collection and management from 2008–2009 was the completion of Thailand’s retrospective survivor data collection survey from June 2008 to April 2009. The project was the first comprehensive survey of mine/ERW survivors and established a database for future use in planning and implementation of services. The survey was conducted by Handicap International (HI) in Thailand in cooperation with Peace Road Organization Foundation (PRO), the Catholic Office for Emergency Relief and Refugees (COERR), and Jesuit Refugee Services (JRS) with the financial support of the Ministry of Foreign Affairs and the cooperation of the VA sub-committee including the MoPH, MoSDHS, and the Ministry of Labor.⁵⁴ An online database containing information from the survey will be maintained by the MoPH and TMAC.⁵⁵

Plans

Strategic mine action plans

Thailand's Master Plan on Humanitarian Mine Action No. 2 (2005–2009), drawn up by TMAC, set out general objectives of mine action in the country, emphasizing the integration of mine action into the National Socio-economic Development Plan. In view of the large estimate of contaminated area produced by the LIS and the slow progress of clearance operations, TMAC has increasingly focused on area reduction.⁵⁶

TMAC's current strategy is set out in Thailand's Article 5 deadline extension request. The request identifies "Area Reduction Survey" as the "primary method of land release," focusing particularly on its "Locating Minefield Procedure" (LMP). However, the request also "assumes" 528.2km² remains to be manually cleared, calling for annual clearance rising from 43km² in 2009 to 64.7km² in 2016 before dropping back to 63.5km² in 2019.⁵⁷

The request envisaged total expenditure of THB17.4 billion (US\$527.2 million). To achieve this target, TMAC also planned administrative reorganization and a major expansion in personnel, including a rise in the number of deminers from 546 in 2007 to around 900, making up 90 ten-person teams, and the acquisition of new equipment, including vehicles and detectors.⁵⁸

Thailand has a Master Plan for Mine Risk Education 2007–2011, approved in February 2007. The plan notes which government agencies share responsibilities for RE, and mentions the role of NGOs, but lacks detailed planning and timeframes.⁵⁹

The Master Plan for Mine Victim Assistance 2007–2011, allocates responsibility for VA services to various ministries in conjunction with the work of NGOs and other relevant bodies.⁶⁰

National ownership

Commitment to mine action and victim assistance

Thailand's institutional framework for managing mine action provides for engagement of the Prime Minister and senior ministers as well as the Armed Forces Supreme Command, directly responsible for TMAC. In practice, Thai political and military leaders have paid little attention to mine action which, as a result, remained severely under-funded in the past decade. Thailand's Article 5 deadline extension request acknowledged TMAC had experienced "some organizational disadvantages" as an organization under military control and that it had been seeking to become a civilian organization to increase its flexibility and "administrative effectiveness."⁶¹

⁶¹ Article 5 deadline Extension Request (Revision), 7 August 2008, p. 25.

In 2009, Thailand reported that “Thailand has always been committed to assisting victims of landmines.” Management of VA is carried out through national bodies and coordinated by NMAC’s VA sub-committee. Thailand has no specific VA legislation, but uses existing disability legislation for its VA planning. Except for the assistance to Myanmar refugees by HI, ICRC, and Clear Path International (CPI), all funding for VA was national (see Services for non-Thai nationals section below).⁶²

National management

TMAC has operated with an entirely national management and staff, mostly on two to three year rotation from regular service with the armed forces.⁶³ A UNDP project officer started work in TMAC in mid-2009 to provide support for strategic planning and identifying provincial mine action priorities, to provide support for VA and enhance cooperation with NGOs. UNDP also agreed to provide an international technical advisor to lead the project but as of August 2009 had not finalized the appointment.⁶⁴

National budget

TMAC has been financed exclusively from the national budget since it was set up in 1999, although it has received some in-kind support from foreign governments, notably army surplus vehicles from the US. National funding has accounted for nearly 60% of total mine action expenditure between 1999 and 2008, the balance coming in the form of donor support to NGOs.⁶⁵

National mine action legislation and standards/Standing operating procedures

Thailand has no national legislation on mine action, other than government orders setting up NMAC and TMAC.⁶⁶ TMAC’s humanitarian mine action units operate according to Thai national standards which TMAC says are based on the International Mine Action Standards.⁶⁷ There are no national RE standards.⁶⁸

No standing operating procedures are known to exist for data management. TMAC reached an agreement with NPA in February 2009 to provide technical support, including development of land release procedures and ensuring they met international standards.⁶⁹

Program evaluations

The reporting of the retrospective survivor survey completed in 2009 included assessment of existing services and structures, together with general recommendations for improving VA.⁷⁰

Demining and Battle Area Clearance

TMAC operates four HMAUs: three army units reporting to army task forces and one unit of marines reporting to the navy. Three of the units work on the border with Cambodia while the fourth works on the border with Lao PDR. In fiscal year 2009 (October 2008 to September 2009), the units had 426 staff out of TMAC’s total staff of 498, which was down from a total of 546 in fiscal 2008.⁷¹

⁷¹ Interview with Lt.-Gen. Tumrongsak Deemongkol, TMAC, Bangkok, 22 February 2008; and email from Lt. Pongpol Sutthibenjakul, TMAC, 23 July 2009.

In 2008, demining was also conducted by two NGOs: the Peace Road Organization Foundation (PRO) with 35 field staff and the Mekong Organization for Mankind (MOM), which had about 50 staff, including 40 deminers, operating with some of its own equipment and some provided on loan by TMAC.

Identification of hazardous areas

In 2008 and early 2009, TMAC continued the LMP that began in October 2007. TMAC's reporting, however, left considerable uncertainty about the dimensions of Thailand's residual mine threat.

The LIS had identified a total of 2,557km² as suspected hazardous area (SHA). In its revised Article 5 deadline extension request submitted in 2008, Thailand reported it had released a total of 1,611.2km² of land through the LMP and clearance. The extension request further estimated Thailand still had 528.2km² of "real minefield."⁷² In March 2009, TMAC said that out of a total SHA of 2,417.6km², it had identified 531.5km² of minefields through LMP and 1,886.1km² as safe. It also reported 55.9km² as demined land and 77.6km² as "dangerous land" needing to be checked by LMP.⁷³ In July 2009, TMAC estimated the area of minefield at 562km².⁷⁴

MOM started a two-year Integrated Area Reduction Survey (IARS) project in November 2007 as part of TMAC's LMP initiative. TMAC assigned MOM to survey 219.5km² in the provinces of Buriram, Chanthaburi, Sa Kaeo, Si Sa Ket, Surin, Trat, and Ubon Ratchathani on the border with Cambodia. The project covered four main activities: LMP; posting warning signs around SHAs; informing the community about the location of minefields; and spot demining. MOM deployed about 40 staff in the field for the project and received \$1.28 million from Japan through the Japan-ASEAN Integrated Fund.⁷⁵ MOM completed fieldwork in April 2009 leaving a further six months to check data and undertake spot clearance tasks.⁷⁶

Demining in 2008

TMAC nearly tripled the area it demined in 2008 to 1.3km² from the previous year, when its four units cleared less than 0.5km² and a total of 51 mines.⁷⁷ The main focus of its efforts was implementing its LMP, which resulted in area reducing 805km² of land identified by the LIS as suspect. But the 2008 and initial 2009 results underlined the highly, perhaps unrealistically, ambitious targets Thailand set in its Article 5 deadline extension request. This proposed that Thailand would clear 43km² of mined area in 2009. In the first half of 2009, TMAC reported provisionally that it cleared 1.3km².⁷⁸

PRO continued mine clearance in the Pra Wiharn Sanctuary area in Si Sa Ket province and completed the project at the end of December 2008. As of April 2009, PRO no longer had funding and was not conducting any demining.⁷⁹ MOM conducted spot demining as part of its IARS project.⁸⁰

Demining in 2008⁸¹

Operator	Mine clearance (km ²)	Antipersonnel mines destroyed*	Antivehicle mines destroyed	Area released by survey (km ²)
MOM	0.22	0	0	10.31
PRO	0.04	0	0	0.21
TMAC	1.30	208	3	804.79
Total	1.56	208	3	815.31

* Unconfirmed clearance data indicates that TMAC also cleared 579 items of UXO in 2008.

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Thailand was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 May 2009. Thailand's limited progress in clearance since 2003 is reflected in the table below.

Demining from 2003–2008⁸²

Year	Mine clearance (km ²)	Area released by survey (km ²)
2008	1.56	815.3
2007	0.88	75.8
2006	0.97	10.17
2005	0.86	5.01
2004	1.05	0.96
2003	0.72	0
Total	6.01	907.24

In April 2008, Thailand applied to extend its Article 5 deadline, and submitted a revised request in August 2008. It asked for an extension to its deadline of 9.5 years, to 1 November 2018.⁸³ The request estimated Thailand had 528.2km² of “real minefield” requiring clearance by “traditional landmine clearance method [sic].” Although Thailand has cleared on average less than 1km² a year, the request suggests annual clearance will climb from 43.07km² in 2009 to 64.71km² in 2016 before falling back to 63.51km² in 2018.⁸⁴

The Ninth Meeting of States Parties in Geneva granted the requested extension but called the 9.5 year timeframe “ambitious” and noted that achieving it was “contingent upon maintaining a sizeable increase in State funds dedicated to implementation and obtaining external support at a level that is at least 10 times greater than Thailand's recent experience in acquiring such support.” The Meeting of States Parties further noted that significant progress was expected, through Thailand's LMP, to overcome impeding circumstances such as the manner in which it said the LIS “had hindered implementation efforts” by its overestimate of contamination.⁸⁵

⁸¹ Article 7 Report, Form C, 30 April 2009. Destruction of antivehicle mines in 2008 was not reported in Thailand's Article 7 report, but was recorded in TMAC's monthly report, October 2008.

⁸² Results from 2003–2007 are taken from Landmine Monitor reports based on TMAC reporting, and the results for 2008 come from Thailand's latest Article 7 report, submitted 30 April 2009.

⁸³ Article 5 deadline Extension Request (Revision), 7 August 2008, p. 7.

⁸⁴ Ibid, pp. 18–23.

⁸⁵ Decision on Thailand's Article 5 deadline Extension Request, Ninth Meeting of States Parties, Geneva, 28 November 2008.

By mid-2009, Thailand was already having difficulty meeting the goals set in its extension request. The rate of demining by TMAC in the first half of 2009 (1.3km²) was well behind what was needed to achieve the projected annual rate (43km²) while the estimated area of contamination had actually increased (from 528km² to 562km²).

To achieve its clearance targets, TMAC had envisaged increasing the number of deminers to 800 by the end of April 2009.⁸⁶ As of June, however, TMAC's HMAUs had 426 deminers. TMAC's expansion was also dependent on receiving a big increase in its budget. In fiscal year 2008 (October 2007 to September 2008) TMAC's budget rose to THB107.4 million (\$3.3 million), 20% more than the previous year and more than double the annual budget received through much of the last decade.⁸⁷ In August 2008, the government pledged THB1.4 billion (\$42.4 million) for mine action for fiscal 2009 in line with the budget need set out in Thailand's Article 5 deadline extension request. However, a new government took office in December 2008. As of July 2009, TMAC had not received the budget and was still uncertain of what funding was available for the year.⁸⁸

Risk Education

In 2008, RE was carried out by the HMAUs, HI's Burmese Border Program, and COERR. HI's Disability and Development Program, which included RE, ceased activities in February 2008 due to changes in its internal strategy and a lack of funding.⁸⁹ At least 37,180 people received direct RE in 2008, in 11 of 27 the mine-affected provinces, all near the borders with Cambodia and Myanmar.⁹⁰ This is a significant decrease from 2007, when some 63,911 people received RE.⁹¹ RE implemented by NGOs has decreased due to lack of funding, although TMAC activities continued at the same level.⁹² There are female RE staff in HI, but not in the HMAUs.⁹³

Casualty data is used to plan activities.⁹⁴ TMAC RE teams go to villages and gather information about the locations of mines, then deliver RE.⁹⁵ Messages delivered depended on the target group and geographical areas, and mainly consist of "do not touch, do not get close," "do not go to the forest in mine-affected areas," "do not go to unknown places."⁹⁶

On completion of HI's Disability and Development Program, HI handed the materials and curriculum over to the RE sub-committee members, so that it could be used by schools, landmine survivors, HMAUs, border patrol police, and other NGOs. The supervisors at the educational area offices monitor school activities but, without follow-up, activities are decreasing.⁹⁷

Each organization developed their materials for their specific uses and needs, but also collaborated to produce and share materials.⁹⁸

In the first two months of 2008, there were some radio broadcasts (i.e. provincial radio, community) by HI in Chanthaburi and Trat, which continued from 2007.⁹⁹

Activities in 2008¹⁰⁰

Organization	Type of activity	Geographical area (provinces)	No. of beneficiaries
COERR	RE for schoolchildren	Sa Kaeo and Surin	No beneficiaries in 2008. Since the project started in October 2008, COERR has not trained any students. The total target is 2,500 students in 12 schools, to be covered by the end of September 2009.
HI	Burmese Border Program (BBP): Training in refugee camps, home visits by 58 RE volunteers, and school-based RE. Public event/exhibition on International Day for Mine Awareness and Assistance in Mine Action. Disability and Development Program (DDP): School-based teacher training in project provinces	BBP: Tak, Mae Hong Son, Kanchanaburi and Ratchaburi DDP: Trat province and Soi Dao district of Chanthaburi province	BBP: 63,567 (including 23,274 children) DDP: 32 schools
TMAC HMAUs	RE for communities and schoolchildren, displaying exhibitions at important events, posters, dissemination of information leaflets	HMAU1: Sa Kaeo HMAU2: Chanthaburi, Trat HMAU3: Buriram, Si Sa Ket , HMAU4: Chiang Rai	At least 12,131 in 42 villages (no beneficiaries recorded in at least two villages by HMAU3)
PRO	Mine awareness—showing exhibitions in Si Sa Ket and Bangkok at relevant events	Kanthalak district, Si Sa Ket province, Thai-Cambodian border	Two phases in 2007–2008, reaching a total of approximately 3,500

RE in Thailand has been mainly conducted by HMAUs and up to five NGOs in any one year. The NGOs were: the Asian Disaster Preparedness Center (ADPC), HI, COERR, the General Chatichi Choonhavan Foundation (GCCF), and JRS.¹⁰¹ A training center for mine awareness was established in 1999 by TMAC and ADPC.¹⁰² The HMAUs mainly worked near the borders with Cambodia and Lao PDR.¹⁰³ RE was conducted by military officers, who spent up to two weeks in a community conducting marking, giving RE sessions, and sessions on other subjects including agriculture and drugs.¹⁰⁴ The NGOs mainly worked along the borders with Cambodia and Myanmar with affected communities, and in refugee and displaced persons

camp. ¹⁰⁵ The ADPC conducted training for government officials and teachers, and provided RE to schoolchildren, including child-to-child training. HI conducted RE integrated with other programs, including emergency RE in refugee camps and training of teachers. COERR focused on training of school teachers and children. ¹⁰⁶ In 2005 a local RE curriculum was developed and integrated into schools near the border areas. ¹⁰⁷ GCCF posted mine warning signs and disseminated RE messages through its deminers. ¹⁰⁸ Since 2001, RE activities have reached at least 1,018,632 beneficiaries, the majority reached by HMAUs. ¹⁰⁹

Victim Assistance

The total number of mine/ERW survivors is unknown, but is estimated to be 1,252. ¹¹⁰ In 2009, Thailand reported significant improvements in VA, specifically regarding healthcare services, but also noted that challenges remain. ¹¹¹ In 2008, Thailand expanded its emergency medical service system to cover local communities in every province, supplemented by local health volunteers. A network of emergency response teams had access to most areas, while service times for emergency care, transport to primary health centers and referrals to hospital were significantly reduced. ¹¹² However, no system was in place for securing safe access of emergency personnel to casualties in mined areas. ¹¹³ In 2008 and 2009, local healthcare centers and hospitals in many mine-affected regions were being upgraded and made accessible for persons with disabilities. ¹¹⁴

Physical rehabilitation services are provided by military hospitals, public hospitals, and private institutions. Persons with disabilities registered with the government are entitled to free medical examinations and mobility devices. ¹¹⁵ Provincial general hospitals in Thailand offer prosthetic and rehabilitation services, but not all services are available locally at community hospitals. Prosthetics are provided to persons with disabilities, including mine/ERW survivors, through public hospitals, with the support of the Sirindhorn National Medical Rehabilitation Center or through the national health insurance reimbursement system.

The recent retrospective survivor survey indicated that overall coverage for mobility devices was efficient, as 96% of respondents reported receiving services. But 43% of respondents cited repair or replacement of devices as key problems, due to the distance to centers and transportation costs. ¹¹⁶ The national NGO, Prostheses Foundation in Chiang Mai, continued to establish workshops linked to medical centers in hospitals; some 11 workshops were in operation in 2008, as well as a mobile unit. ¹¹⁷ The Sirindhorn Center and the Prostheses Foundation provide services in prosthetics and orthopedics free of charge to persons with disabilities, including mine/ERW survivors, in remote areas throughout the country. ¹¹⁸

¹¹⁸ See *Landmine Monitor Report 2008*, p. 687.

The MoSDHS ran a volunteer-implemented, community-based rehabilitation (CBR) program providing social support for persons with disabilities, including mine/ERW survivors, primarily by assisting them to register for disability benefits, but including other support services. By 2008, the CBR network covered all 75 provinces of Thailand, including provinces heavily affected by landmines.¹¹⁹ Social workers in hospitals also assisted patients who were disabled by their injuries, including mine/ERW survivors, to register for official disability status and benefits. But little psychological support outside the family is available to most survivors, although in rare cases, institutional psychiatric assistance may be available for particular issues.¹²⁰

According to the recent retrospective national survivor survey, almost three-quarters (72%) of mine/ERW survivors reported having employment: just over half worked on farms and another 30% in the home. Seven out of ten survivors have very low incomes and live in poverty.¹²¹ In 2008, many persons with disabilities reportedly faced wage discrimination and some state enterprises had discriminatory hiring policies. An employment quota system of 0.5% persons with disabilities in the workplace for private businesses was not adequately enforced. In 2009, the Ministry of Labor was in the process of taking over responsibility of the quota system from the MoSDHS.¹²²

Thailand's Master Plan for Victim Assistance states that the Ministry of Education should ensure 12 years of education for mine survivors and access to vocational training.¹²³ The survivor survey indicated, however, that almost three-quarters of survivors have not completed primary school education.¹²⁴ Government, private, and NGO training centers for persons with disabilities exist.¹²⁵ In 2009, Thailand reported that less than 30% of survivors have received vocational training and that training was seen as incompatible with the needs of agricultural occupations.¹²⁶ In 2008, the Ministry of Education provided specialized materials to students with disabilities.¹²⁷ The government provides a monthly allowance of THB500 (approximately \$15) to persons with severe disabilities, including mine/ERW survivors and other amputees.¹²⁸ The amount is insufficient to cover living costs, but survivors report it is vital for supplementing their meager incomes.¹²⁹

Thailand has legislation protecting the rights of persons with disabilities and its 2007 constitution prohibits discrimination against persons with disabilities and provides for access to services. Other laws continued to allow discrimination against persons with disabilities in employment.¹³⁰ Some amputee landmine survivors reported that they were denied driving

licenses because of their disabilities.¹³¹ In December 2008, a policy on the eradication of all forms of discrimination against persons with disabilities and promotion of employment, education and suitable social welfare was announced in parliament by the Prime Minister.¹³² Strategic plan documents include specific projects for implementing the UN Convention on the Rights of Persons with Disabilities.¹³³

On 29 July 2008, Thailand ratified the UN Convention on the Rights of Persons with Disabilities, but as of 1 August 2009 had not signed its Optional Protocol.

Progress in meeting VA26 victim assistance objectives

Thailand is one of the 26 States Parties with significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation and reintegration of survivors.¹³⁴ Thailand presented its 2005–2009 VA objectives to the Sixth Meeting of States Parties in November–December 2005.¹³⁵ The objectives have not been revised since and they did not meet SMART (specific, measurable, achievable, relevant, and time-bound) criteria. No plans to implement the objectives were reported.¹³⁶ Thailand adopted the Master Plan for Mine Victim Assistance 2007–2011 on 26 February 2007, which assigned responsibility for implementation to relevant ministries and bodies. It set few specific targets and left the setting of individual plans and objectives to each actor. The Master Plan was used in place of Thailand’s 2005–2009 VA objectives.¹³⁷

Thailand reported progress towards the achievement of VA objectives in 2008–2009. There was improvement in mine/ERW survivor data collection with the completion of the retrospective survivor survey, needs analysis, and database on survivors. Emergency and continuing medical care capacity improved due to a nationwide emergency response network with increased coordination and enhancement of infrastructure in rural areas. Progress was also made in developing physical rehabilitation capacity. Some progress was reported in providing psychological support to mine/ERW survivors, particularly through the CBR program. More vocational training centers were reportedly established in some mine-affected areas. More persons with disabilities, including mine survivors, received monthly disability pensions and benefits, including free medical care and rehabilitation. Thailand ratified the UN Convention on the Rights of Persons with Disabilities and made improvements in long-term disability policies.¹³⁸

Thailand included a VA or disability expert on its delegations to the intersessional Standing Committee meetings in 2007 and 2009, and to the Eighth Meetings of States Parties; three VA experts attended the Ninth Meeting of States Parties. Thailand reported on VA at all the intersessional Standing Committee meetings since 2005 and at all meetings of States Parties since 2006 and used the voluntary Form J attachment to its annual Article 7 report to provide details on VA activities in all years since 2005. In its Article 7 report covering 2008, Thailand reported on the results of the retrospective national survivor survey and the activities of HI for refugees on the Thai-Myanmar border.

Victim assistance activities

Services for Thai nationals

The Sirindhorn Center provided prostheses, assistive devices, wheelchairs and other aids for persons with disabilities to 97 hospitals in 19 of 22 mine-affected provinces with survivors. The center also provided training in prosthetics and rehabilitation. In 2008, the center's mobile units provided services to patients with mobility disabilities.¹³⁹

In 2008, the Prostheses Foundation provided prostheses to beneficiaries, including mine/ERW survivors, through its satellite centers and mobile services.¹⁴⁰ In cooperation with HI, the Prostheses Foundation also provided free foot components to a group in Kantharalak sub-district, Si Sa Ket, for future repairs for 30 landmine survivors.¹⁴¹ The volunteer group, Single Drop of Sea Water, provided THB3,000 (\$91) to the group for coordination expenses.¹⁴²

JRS and COERR both continued to provide assistance to mine/ERW survivors as part of their broader programs in 2008. Five mine survivors in Aranyaprathet district received support packages from COERR in 2008.¹⁴³

Services for non-Thai nationals

Landmine survivors from Myanmar seeking assistance in Thailand received medical care at hospitals in refugee camps and public district hospitals in the Thai-Myanmar border provinces. Physical rehabilitation is available at the Mae Sot General Hospital, Mae Tao Clinic Prosthetic Center, and within refugee camps at prosthetic workshops run by HI.¹⁴⁴

Thai hospitals reported at least 60 mine/ERW survivors from Myanmar (58 injured in Myanmar and two in Thailand) receiving medical care in 2008.¹⁴⁵ The ICRC continued its War Wounded program and covered the costs of 71 mine/ERW survivors from Myanmar receiving medical care in Thailand in 2008 (63% of 111 weapon-wounded patients from Myanmar in Thai hospitals assisted through the program in 2008).¹⁴⁶ The ICRC also supported repairs to the surgical ward of the Mae Tao Clinic in Mae Sot, which assists injured refugees from Myanmar. ICRC, with the Thai Red Cross, held seminars on treating weapon wounds in Bangkok and southern Thailand for some 300 civilian and military medical staff in 2008.¹⁴⁷

CPI continued to assist mine/ERW survivors along the Thai-Myanmar border. In 2008, CPI built a new prosthetics workshop for survivors in Pang Mapha, Mae Hong Son province; in 2008, it produced 22 prosthetics. The Peng Lo workshop near the Khung Jor refugee camp, in cooperation with the Shan Health Committee, produced 16 prosthetics in 2008. In 2008 and 2009, CPI expanded the development of farm projects providing income generation for amputee residents. CPI supported the Mae La Care Villa residence for some 20 blind amputee mine/ERW survivors. It also coordinated with the Mae Tao Clinic in Mae Sot to provide support and training to medics and counselors in physical therapy and psychosocial support.¹⁴⁸ In 2008, 188 landmine survivors from Myanmar received prostheses from the Mae Tao Clinic Prosthetic Center.¹⁴⁹

HI's Burmese Border Program assisted non-Thai citizens with physiotherapy through refugee camp workers under the guidance of trained physiotherapists. The program also provided prosthetic, orthotic, and other assistive devices and accessibility to buildings and camp structures (the number of mine/ERW survivors assisted was unknown).¹⁵⁰

In 2008, at least 11 Cambodian mine/ERW survivors received free emergency treatment, continuing medical care, and physical rehabilitation in Thai government-run hospitals along the border with Cambodia.¹⁵¹

Support for Mine Action

Thailand has estimated the total cost for completion of its Article 5 obligations by 2018 at THB17.4 billion (\$527.2 million). Thailand's Article 5 deadline extension request includes annual cost estimates for clearance activities and specifies annual funding amounts projected for the government of Thailand and international donors.¹⁵² From 2009 to 2013 Thailand has committed to contributing THB1 billion (\$30.3 million) for mine clearance, and THB1.5 billion (\$45.5 million) from 2014 to 2018, for a total contribution of THB12.5 billion (\$378.8 million) or approximately 72% of its total Article 5 extension budget. Unspecified donors are projected to cover the remaining costs, totaling about THB 4.9 billion (about \$149 million) and ranging from THB421.3 million (\$12.8 million) in 2009 to THB635.4 million (\$19.3 million) in 2016 before falling back to THB595.8 million (\$18.1 million) in 2018.¹⁵³ Thailand has not given a cost estimate for fulfilling RE or VA obligations during this period.

The request does not provide detailed resource mobilization strategies but calls for mobilization of funds from all levels of government, as well as state enterprises, European Union pre-accession funds, the World Bank, and national and international donors.¹⁵⁴

National support for mine action

In its revised Article 5 deadline extension request, Thailand reported a national commitment to TMAC of THB106 million (\$3.2 million) for 2008.¹⁵⁵ Thailand reported THB88.3 million (\$2.75 million) in funds contributed to TMAC from the national budget in 2007. In August 2008, the Prime Minister approved a budget of THB1.4 billion (\$42.4 million) for the first year of the requested extension period (April 2009 to March 2010), which covers 2009 budget estimates under the Article 5 extension plan but as of July 2009 TMAC was unsure what funding would be available (see Progress since becoming a State Party section above).¹⁵⁶

The Ministry of Defense allocates funds for mine action from its own budget, and must compete for its own funding with budget demands from other ministries. Thailand has reported that mine action has received less national funding in recent years as a result of other national humanitarian emergencies and priorities.¹⁵⁷

The government did not report the cost of the monthly subsistence allowance provided for persons with "severe disabilities," the cost of vocational training for disabled persons¹⁵⁸ or the number of landmine victims receiving these benefits.

International cooperation and assistance

In 2008, no international donors reported assistance for mine action in Thailand. In 2007, reported funding totaled \$1,611,071 (€1,175,021). In October 2008, within its Article 5 extension plan, Thailand reported THB50 million (\$1.5 million) in international funding to mine action NGOs

in Thailand in 2008, but did not specify when allocations had been made or which donors had provided the money.¹⁵⁹ The lack of international funding in 2008 calls into question Thailand's ability to meet the long-term costs of mine clearance or VA under its Article 5 extension plan.¹⁶⁰

TUNISIA

2008 Key Data

State Party since	1 January 2000
Contamination	Residual antipersonnel and antivehicle mines, UXO
Casualties in 2008	0 (2007: 0)
Estimated mine/ERW survivors	Unknown but at least 15

Ten-Year Summary

The Republic of Tunisia became a State Party to the Mine Ban Treaty on 1 January 2000 and regards existing legislation as sufficient to implement the treaty domestically. Tunisia has actively participated in the Mine Ban Treaty process, and hosted regional seminars on the treaty in January 2002 and September 2007. In September 2003, Tunisia completed destruction of its stockpile of 18,259 antipersonnel mines. In 2009, it reported a total of 4,980 mines retained for training.

In May 2009, Tunisia announced that it had successfully completed its Article 5 obligations on the clearance of antipersonnel mines from mined areas under its jurisdiction or control in advance of its 1 January 2010 deadline. Tunisia has shown significant commitment to mine action by this feat and using its own resources. Explosive remnants of war (ERW) and a residual mine threat from World War II remain.

Between 1999 and 2008 Landmine Monitor identified at least 16 mine/ERW casualties (one killed and 15 injured). There has been no formal risk education program, but the National Guard and police provided awareness to the local population. Services for persons with disabilities including mine/ERW survivors are in place and the government supports the disability sector.

Mine Ban Policy

Tunisia signed the Mine Ban Treaty on 4 December 1997 and ratified on 9 July 1999, becoming a State Party on 1 January 2000. Tunisia has in previous years stated that existing laws, which include penal sanctions, are sufficient to implement the Mine Ban Treaty, citing three laws dated 1969, 1970, and 1996.¹ In 2008, Tunisia cited an additional three laws, dated 1986, 2000, and 2003.²

Tunisia attended the Ninth Meeting of States Parties in Geneva in November 2008 and made a statement regarding fulfilling its Article 5 obligation. At the intersessional Standing Committee meetings in Geneva in May 2009, Tunisia made a statement on mine clearance.

¹ Interview with Maj. Beji Salah, Ministry of Defense, at the Dead Sea, 21 November 2007. Tunisia cites Laws 69-33 (of 1969), 70-60 (of 1970), and 96-63 (of 1996). Article 7 Report, Form A, 24 April 2006.

² Article 7 Report (for the period April 2007 to April 2008), Form A. The same information was provided in the Article 7 report submitted in 2009. Form A cites three previously unreported measures: "Law No. 1986-69 dated 19-07-1986 relating to the accord of Republic of Tunisia retraction [sic] to the convention on prohibitions or restrictions on the use of certain conventional weapons which may be deemed to be excessively injurious or to have indiscriminate effects and the annexed protocols notified in Geneva at 10 October 1980; Law No. 2000-1443 dated 07-06-2000 fixing the conditions and the procedures of granting to the legal entity or individual of the authorization to carry out the whole or part of the operations of manufacture, importing, exporting, transporting, stocking, use and marketing of the explosives products used at civil purposes; and Law No. 2003-1266 dated 09-06-2003 relating to the creation of a national committee for the follow-up and implementation of the convention on the prohibition of the use, stockpiling, production and transfer of anti-personnel mines and on their destruction." In addition, Form A reports on laws on the approval of adherence to CCW Amended Protocol II on landmines and Protocol V on Explosive Remnants of War.

In 2009, Tunisia submitted its tenth Article 7 report covering April 2008 to April 2009.³

Tunisia has not participated in the discussions States Parties have had on interpretation and implementation of Articles 1, 2, and 3, with respect to the issues of joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training.⁴

Tunisia is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It has never submitted an annual report as required under Article 13. On 7 March 2008, Tunisia adhered to CCW Protocol V on Explosive Remnants of War, but has not provided a national report.

Tunisia signed the Convention on Cluster Munitions on 12 January 2009 but had not ratified it as of 1 July 2009.⁵

Production, transfer, stockpile destruction, and retention

Tunisia has never produced or exported antipersonnel mines, but imported them in the past.⁶ Tunisia completed the destruction of 18,259 stockpiled antipersonnel mines in September 2003.⁷

In its initial declaration in July 2000, Tunisia reported retaining 5,000 antipersonnel mines (4,000 PMA-3 and 1,000 PROM-1) for purposes permitted under Article 3 of the Mine Ban Treaty.⁸ In its Article 7 report submitted in 2009, Tunisia reported consuming 20 antipersonnel mines for training and reported a total of 4,980 mines retained for training.⁹ However, the number remaining may be 4,975, as in its previous Article 7 report (for the period from April 2007 to April 2008), Tunisia for the first time officially reported that it had consumed five mines for training purposes, leaving 4,995 mines.¹⁰

In its 2008 and 2009 reports, Tunisia did not specify the type of mines destroyed. Tunisia has not reported on the intended purposes and actual uses of retained mines, as agreed by States Parties in 2004.

Scope of the Problem

Contamination

As of May 2009, Tunisia had only a small residual threat from antipersonnel and antivehicle landmines following a successful clearance operation, but it remains contaminated with significant quantities of ERW, primarily UXO, as a legacy of World War II.¹¹

Tunisia laid nine minefields in 1976 and 1980 in the south and southeast of the country, along the border with Libya (at Bir Zar, M'chiguig, M'guisem, and Ras Jedir,) and at Borj El-Khadhra where the borders of Tunisia, Algeria, and Libya meet. The minefields, which initially contained 5,750 antipersonnel mines and 1,958 antivehicle mines, were in sandy ground where wind

³ Previous reports were submitted in 2008 and 2007 (both undated), as well as on 24 April 2006, 29 April 2005, 5 May 2004, 8 September 2003, 7 May 2003, 4 October 2002, and 9 July 2000.

⁴ A Tunisian official told Landmine Monitor that Tunisia had not participated in the discussions on Article 1 because it was not engaged in joint operations, or foreign stockpiling and transit. Interview with Maj. Beji Salah, Ministry of Defense, at the Dead Sea, 21 November 2007.

⁵ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 171.

⁷ See *Landmine Monitor Report 2004*, p. 821.

⁸ Article 7 Report, Form D, 9 July 2000.

⁹ Article 7 Report (for the period April 2008 to April 2009), Form D.

¹⁰ Article 7 Report (for the period April 2007 to April 2008), Form D. During an interview on 21 November 2007 during the Eighth Meeting of States Parties at the Dead Sea, Maj. Beji Salah of the Ministry of Defense told Landmine Monitor that mines had been consumed during 2007. In 2005, a Tunisian official told Landmine Monitor that some retained mines were used to train troops that cleared mines on the border with Libya. Interview with Col. Salem Ridiefi, Ministry of Defense, in Zagreb, 30 November 2005.

¹¹ See, for example, Article 7 Report (for the period April 2008 to April 2009), Form C; statement of Tunisia, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009; and *Landmine Monitor Report 2008*, p. 691.

causes sand dunes to form and disappear. By April 2009, however, Tunisia reported that all the minefields it had laid had been “totally cleared and all the mines were removed and destroyed.”¹²

There are also other regions suspected to contain ERW (mostly UXO) and some mines as a result of combat in World War II: in the south (El Hamma, Mareth, and Matmata regions); the center (Faïedh and Kasserine regions); the north (Cap-Bon); and the northwest (Medjez El Bab).¹³ According to Tunisia, all casualties reported in recent years are a result of ordnance from these areas, and the army is called upon to deal with items of UXO “on an almost daily basis.”¹⁴

Casualties

There were no reports of new mine/ERW casualties in Tunisia in 2008 or 2009, as of 31 May.¹⁵ The last reported mine incident occurred in January 2002, when two shepherds were injured by an antipersonnel mine that exploded in a fire in the Kairouan area. In its Article 7 report submitted in 2009, and in its statement at the Ninth Meeting of States Parties in November 2008, Tunisia reiterated that the rare incidents reported in recent years were due to ERW.¹⁶

The total number of mine/ERW casualties in Tunisia is unknown. Between 1999 and 2008, Landmine Monitor identified at least 16 mine/ERW casualties (one killed and 15 injured). Fourteen of these casualties were the result of ERW, two of a mine.¹⁷ Six of these casualties occurred in Kairouan, two around Tunis, two in Sfax, two in Kasserine, one in Bizerte, and one in al-Kef. Landmine Monitor was only able to obtain more details on six of the casualties (all injured, all civilians) in four incidents. Three of these casualties were children of unknown gender, one was a man, and the gender/age of the remaining two casualties is unknown. Three casualties occurred while herding, two when a mine exploded in a fire, and one while farming. In total since 1991, Landmine Monitor was able to identify 21 casualties (one killed, 15 injured, and five unknown); seven the result of mines and 14 the result of ERW.¹⁸ The Tunisian delegation to the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies reported that no accidents occurred during clearance operations.¹⁹ An unknown number of livestock losses due to mines/ERW have been reported over the years.²⁰ On 4 April 2004, a Tunisian man was killed in a minefield while attempting to cross the border between Turkey and Greece.²¹

Program Management and Coordination

There is no national body in charge of management, coordination, and planning of mine action in Tunisia. The army is the only body authorized to undertake activities related to landmines or ERW.

²¹ See *Landmine Monitor Report 2005*, p. 580.

The limited number of casualties in Tunisia does not warrant specific victim assistance (VA) programs.²² The Ministry of Social Affairs, Solidarity, and Tunisians Abroad is responsible for disability issues. It cooperates with the ministries of public health, education and youth, sports, and physical education.

Data collection and management

The results of clearance activities are stored in an information database managed by the army. Casualty data, which is collected by the Ministry of Defense and the Ministry of Interior, is also stored in the database and includes civilian as well as military casualties. The ministry declined to provide a copy of the database to Landmine Monitor.²³

National ownership

Commitment to mine action and victim assistance

Tunisia has shown significant commitment to mine action by clearing all known mined areas of all ordnance in advance of its Article 5 deadline and by using its own resources. In May 2009, Tunisia noted that the only international assistance it had received was the gift of 60 mine detectors, some personal protective equipment, and a number of GPS units.²⁴

National mine action legislation and standards/Standing operating procedures

No national mine action legislation was adopted in Tunisia. The army is said to follow operational procedures that meet international standards.

Demining and Battle Area Clearance

All demining in Tunisia has been carried out by its army. Tunisia has reported that of 5,750 antipersonnel mines it had recorded as having been laid in 1976 and 1980 along the border with Libya, by April 2009 and the closure of operations it had removed and destroyed 5,606 from a total area of 0.5km².²⁵ It had also cleared all 1,943 antivehicle mines recovered from the minefields out of a total of 1,958 recorded. It believes that the remaining mines were destroyed by animals.²⁶ In 2008, army explosive ordnance disposal teams were called out 346 times, resulting in the destruction of 950 items.²⁷

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Tunisia was required to clear all antipersonnel mines from mined areas under its jurisdiction or control as soon as possible, but not later than 1 January 2010. As noted above, on 27 May 2009, Tunisia declared to the Standing Committee on mine clearance that it had fulfilled its Article 5 obligations.

Between 1991 and March 2001, 6,997 mines and items of UXO were reported cleared. In November 2004, Tunisia started to clear the Ras Jedir minefield, which represented 70% of known mined areas on its territory. A UN Mine Action Service (UNMAS) assessment mission, undertaken in January 2003, had concluded that clearing the nine minefields would take approximately six months and cost around US\$1 million.²⁸ Demining operations were completed at the end of March 2009.²⁹

²² Interview with Col. Ali Tlili, Ministry of Defense, in Geneva, 26 November 2008.

²⁹ Statement of Tunisia, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009.

Risk Education

In 2008, as in previous years, there was no formal risk education program. Tunisian authorities reported that before clearance of all known mined areas was completed, suspected areas were fenced, marked, and regularly maintained by the army.³⁰ The National Guard and the police are responsible for warning the population about the dangers of ERW and mines.³¹ They do so if an incident occurs, or when unidentified objects, including ERW, are discovered by civilians. A 2003 UNMAS assessment suggested there should be a national risk education campaign conducted “delicately,” to avoid civilian panic; it suggested the Tunisian Red Crescent could be in charge of this. The recommendation remained unimplemented.

Victim Assistance

The total number of mine/ERW survivors is unknown but there are at least 15.³² Tunisia has a reasonably well-developed health system, although there are regional disparities in the distribution of resources, with the west and southern parts of the country being the worst-affected. Almost the whole population—90%—lives less than 5km from the nearest healthcare center. Specialized care is available at regional hospitals, usually located in the main city of each governorate. Lack of specialized health personnel is a problem.³³

Persons with disabilities, including mine/ERW survivors, are entitled to free public services.³⁴ Disability grants provide several benefits including priority medical services and consumer discounts.³⁵ There are 269 centers specialized in different types of disability services in Tunisia.³⁶ Survivors are entitled to socio-economic reintegration activities and some have received financial compensation.

NGOs working with persons with disabilities received strong governmental support.³⁷ In 2008, they received financial support of approximately TND15 million (\$12,373,500).³⁸

Tunisia has legislation protecting the rights of persons with disabilities, but in 2008 some discrimination was reported.³⁹ At least 1% of public and private sector jobs must be reserved by law for persons with disabilities, though in practice not all employers were aware of this provision.⁴⁰ On 2 April 2008, Tunisia ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol. On 29 May 2009, Tunisia celebrated the National Day of Persons with Disabilities, which focused on the reintegration of persons with disabilities and human rights.⁴¹

TURKEY

2008 Key Data

State Party since	1 March 2004
Contamination	Antipersonnel and antivehicle mines, UXO, IEDs
Estimated area of contamination	Unquantified
Casualties in 2008	21 killed (2007: 28) 79 injured (2007: 73)
Estimated mine/ERW survivors	Unknown, at least 2,317
Article 5 (clearance of mined areas)	1 March 2014
Demining in 2008	Area cleared not reported, 999 mines reported destroyed
Risk education recipients in 2008	Unknown
Progress towards victim assistance aims	None

Ten-Year Summary

The Republic of Turkey became a State Party to the Mine Ban Treaty on 1 March 2004. It has not enacted domestic legislation, but has indicated that existing measures give effect to the treaty obligations. Turkey failed to destroy its stockpile of nearly three million antipersonnel mines by its 1 March 2008 deadline, and as of April 2009 still had more than 1.3 million mines in stock. Turkey decided to retain 16,000 mines for training and research purposes and at the end of 2008 still had 15,125 left. Turkey has regularly accused the Kurdistan Workers Party (Partiya Karkerên Kurdistan) of using landmines.

Turkey is affected by mines and explosive remnants of war (ERW). It has started clearance of mines along its border with Syria, but at a slow pace and without sufficient transparency. Turkey still needs to set out concrete plans for clearance of all affected areas under its jurisdiction or control to meet the requirements of Article 5. This includes its responsibilities for areas under its control in northern Cyprus.

Landmine Monitor has reported 831 victim-activated mine/ERW casualties in Turkey between 1999 and 2008, including 250 killed and 581 injured. Little progress has been made on developing a sustainable risk education (RE) program in Turkey over the past 10 years, despite the government reaffirming its commitment to building awareness of the risks. NGOs have conducted only limited RE, predominantly due to lack of funds.

Services to assist mine/ERW survivors in Turkey remained inadequate. In October 2008, the parliament established a new social insurance system that should enable some persons with disabilities to access more services, although it would not cover total costs. There is no government coordination of victim assistance in Turkey, nor a national strategic plan. Physical rehabilitation is available to military personnel injured by mines/ERW and a limited number of civilian survivors through military and government rehabilitation centers.

Mine Ban Policy

Turkey acceded to the Mine Ban Treaty on 25 September 2003, becoming a State Party on 1 March 2004. Turkey has not enacted domestic implementation legislation, but has indicated that its constitution and criminal code, and directives from the army general staff, give legal effect to the treaty's provisions.¹

¹ Article 7 Reports, Form A and Annexes A, B and C, 1 October 2004 and 10 May 2005. Article 174 of the criminal code includes penal sanctions regarding explosives.

Turkey submitted its sixth Article 7 report in 2009, covering calendar year 2008.² The report includes voluntary Form J with information on casualties and victim assistance (VA).

Turkey attended the Ninth Meeting of States Parties in Geneva in November 2008, where it made remarks during the general exchange of views and also made statements on universalization, stockpile destruction, mine clearance, and VA. At the meeting, Turkey was named co-rapporteur of the Standing Committee on Victim Assistance and Socio-Economic Reintegration. At the intersessional Standing Committee meetings in Geneva in May 2009, it made statements on mines retained for training, stockpile destruction, mine clearance, and VA.

With respect to key matters of interpretation and implementation related to Articles 1 and 2, Turkey has stated, “Turkey does not use mines with sensitive fuses and/or anti-handling devices.”³ It has also stated that Turkey considers the stockpiling or transit of foreign antipersonnel mines on its territory as a breach of the Mine Ban Treaty, and that it will not permit the use of antipersonnel mines in Turkey by other states during joint military operations.⁴

With respect to Article 3, in May 2009 Turkey said that, “We agree with the rationale of Article III which recognises specific and different needs of States Parties by not fixing numbers or ceilings for training purposes.”⁵ In a similar statement on the issue in 2006, Turkey stated that “countries with varying geographies, incongruous terrain, different sizes of armed forces, more mines emplaced than others and countries that are simply in parts of the world where there are more anti-personnel mines, which would require more training, should not have artificial numbers or ceilings imposed on them for the number of mines to be retained under Article 3.”⁶

Turkey is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Turkey submitted its annual report required by Article 13 on 12 November 2008. Turkey is not party to CCW Protocol V on Explosive Remnants of War.

Turkey has not signed the Convention on Cluster Munitions.⁷

At Turkey’s invitation, the ICBL and Landmine Monitor undertook a mission to Turkey from 22–23 May 2008, following Turkey’s failure to meet its stockpile destruction deadline on 1 March 2008 (see Stockpiling and destruction section below).⁸

In July 2006, the NGO Geneva Call reported that the Kurdistan People’s Congress (Kongra Gel) and its armed wing, People’s Defense Forces (Hezen Parastina Gel, HPG), also known as the Kurdistan Workers Party (Partiya Karkerên Kurdistan, PKK) and formerly as the Kurdish

² The report is not dated. Previously, Turkey submitted Article 7 reports in 2008 (for calendar year 2007), on 23 April 2007, 30 April 2006, 30 April 2005, and 1 October 2004 (due 28 August 2004).

³ Letter No. 649.13/2005/BMCO DT/8805 from Vehbi Esgel Etensel, Counselor, Permanent Mission of Turkey to the UN in Geneva, to Landmine Monitor (HRW), 3 October 2005. It went on to say that “bearing in mind that some of Turkey’s neighbours have anti-vehicle mines placed on their border with Turkey, Turkey in principle, is in favour of a prohibition also of anti-vehicle mines, provided that these neighbours also share the same view.”

⁴ Turkey’s additional response to Landmine Monitor questionnaire, Permanent Mission of Turkey to the UN in Geneva, 30 May 2004. The response said Turkey “will never permit stockpiling or transfer of any type of antipersonnel landmine on its territory,” and denied that, as previously reported, the US has a stockpile of 1,100 Air Force Gator antipersonnel mines in Turkey. See *Landmine Monitor Report 2000*, p. 848. In 2005, Turkey said, “With respect to joint military [operations], Turkey has committed herself to act in conformity with the spirit of the Ottawa Treaty, under all circumstances.” Letter No. 649.13/2005/BMCO DT/8805 from Vehbi Esgel Etensel, Permanent Mission of Turkey to the UN in Geneva, to Landmine Monitor (HRW), 3 October 2005.

⁵ Statement of Turkey, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 May 2009.

⁶ Statement of Turkey, “Article 3 Update,” Standing Committee on the General Status and Operation of the Convention, Geneva, 12 May 2006. A similar statement was made in 2005, see Letter No. 649.13/2005/BMCO DT/8805 from Vehbi Esgel Etensel, Permanent Mission of Turkey to the UN in Geneva, 3 October 2005.

⁷ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 246–249.

⁸ Representatives of the ICRC and the Mine Ban Treaty’s Implementation Support Unit also participated in the mission. The group visited the new disposal facility and held discussions with officials from the ministries of defense and foreign affairs and General Staff officers, as well as the Prime Minister’s office, regarding the missed deadline and mine action issues. They also visited a rehabilitation center. Email from Tamar Gabelnick, Treaty Implementation Director, ICBL, 25 May 2008; and ICBL, “Internal Mission Report,” provided by email from Tamar Gabelnick, ICBL, 25 May 2008.

Freedom and Democracy Congress (Kongreya Azad z Demokrasiya Kurdistan, KADEK), had unilaterally halted antipersonnel mine use by signing the Geneva Call Deed of Commitment.⁹ Turkey stated that the “signing took place without the prior information and consent of the State Party concerned, the Republic of Turkey. Consequently, it contradicts the understanding of a number of States Parties, including Turkey... and, therefore, is inappropriate and unacceptable.”¹⁰

Production and transfer

Turkey halted production of antipersonnel mines concurrently with a moratorium on the sale and transfer of antipersonnel mines in January 1996.¹¹ Turkey’s production facilities for antipersonnel mines were then gradually phased out of service.¹² Turkey is not known to have exported antipersonnel mines. Turkey appears to have imported mines from Germany and the United States.

Use

The Chief of General Staff issued a directive banning the use of antipersonnel mines by the Turkish armed forces on 26 January 1998.¹³ There have been no confirmed instances of use of antipersonnel mines by Turkish forces since that time.¹⁴

According to Turkey’s latest Article 7 report covering calendar year 2008, 37 military personnel and civilians were killed and 121 were injured in 2008 by landmines used by the PKK/KADEK/Kongra Gel. The report does not differentiate between casualties caused by antipersonnel mines, antivehicle mines or improvised explosive devices (IEDs), nor between victim-activated and command-detonated mines/IEDs.¹⁵ In its Article 7 report covering calendar year 2007, Turkey reported that 53 military personnel and civilians were killed and 204 injured by landmines used by the PKK/KADEK/Kongra Gel.¹⁶

The Turkish General Staff reported that in 2008 it recovered 55 antipersonnel mines, one antivehicle mine, and 85 other explosive devices from separatist groups in 2008. It also reported 27 incidents in 2008 where separatist groups set off munitions or mines.¹⁷ The General Staff reported that between January and July 2009, it seized 30 mines (the type was not identified)

⁹ The PKK/KADEK/Kongra Gel is listed as a terrorist organization by the European Union, NATO, the US, Canada, United Kingdom, and Australia. As a matter of practice, Landmine Monitor does not apply the term “terrorist” to any individual or organization except within an attributed quotation.

¹⁰ “Turkey’s Views on the Universalization of the Mine Ban Convention and the Complementary Role of Non-Governmental Organizations,” APLC/MSP.7/2006/MISC.4, 16 January 2007. This paper was introduced as an official document of the Seventh Meeting of States Parties, Geneva, 18–22 September 2006. According to Geneva Call, it informed Turkey about its engagement with Kongra Gel/HPG. Email from Katherine Kramer, Program Director, Geneva Call, 25 August 2008. For several years, Turkey has expressed concern about what it characterizes as NGO activities to engage non-state armed groups deemed to be terrorist organizations in the effort to ban antipersonnel mines, without the knowledge or consent of the concerned State Party. At the Eighth Meeting of States Parties, Turkey stated that it welcomes “all non-legitimising efforts to ensure that these indiscriminate weapons are not used by anyone,” but that NGOs “have the obligation to conduct their work in a responsible and acceptable manner... Otherwise, this will not only diminish their credibility and tarnish their own reputation, but also place countries that support them in an inappropriate position.” Statement of Turkey, Eighth Meeting of States Parties, Dead Sea, 18 November 2007.

¹¹ The export moratorium was renewed in 1999 and made permanent in March 2002.

¹² Letter No. 649.13/2005/BMCO DT/8805 from Vehbi Esgel Etensel, Permanent Mission of Turkey to the UN in Geneva, 3 October 2005. Previously, Turkey had produced both antipersonnel and antivehicle mines. The Turkish company, Makina ve Kimya Endustrisi Kurumu (MKEK), produced copies of two US antipersonnel mines (M14 and M16). See Turkey’s additional response to Landmine Monitor questionnaire, Permanent Mission of Turkey to the UN in Geneva, 30 May 2004.

¹³ Statement of Turkey, Fifth Meeting of States Parties, Bangkok, 17 September 2003.

¹⁴ There have been a number of allegations over the years, but no concrete evidence of use has ever been produced.

¹⁵ Article 7 Report (for calendar year 2008), Form J. The Mine Ban Treaty does not prohibit the use of antivehicle mines/IEDs, or command-detonated antipersonnel explosive devices.

¹⁶ Article 7 Report (for calendar year 2007), Form J.

¹⁷ Turkish General Staff, “The cases of usage of explosives and mines by the separatist terrorist group in 2008 (01 January–31 December 2008),” tsk.mil.tr.

and that there had been 44 incidents involving IEDs.¹⁸ During the ICBL's May 2008 mission to Turkey, army officials showed photos of VS-50 antipersonnel mines they said were seized by the army as recently as March 2008.¹⁹

Landmine Monitor has not been able to obtain from Turkey specific dates and locations, or other concrete details, of PKK/KADEK/Kongra Gel use of antipersonnel mines, or of incidents that led to casualties from antipersonnel mines. The PKK/KADEK/Kongra Gel has admitted to use of command-detonated mines, but denied any use of mines or other explosive devices which can be activated by a person or a vehicle.²⁰ In 2008, Geneva Call submitted to the PKK/KADEK/Kongra Gel a list of reported mine incidents in areas where it operates, and requested a response. In late 2008, the HPG, the armed wing of the PKK, repeated that it uses only command-detonated explosive weapons in attacks on security personnel. It admitted that this has resulted in some civilian casualties. The HPG invited Geneva Call to send a verification mission. Geneva Call said this did not occur as the Turkish government in July 2008 refused Geneva Call's request for such a mission.²¹

In this reporting period, there were at least three incidents reported in the media that appear to have involved use of antipersonnel mines, all attributed to the PKK. Landmine Monitor has not been able to verify who laid the mines or when. In July 2008, it was reported that two Turkish soldiers died when they stepped on landmines while patrolling a mountainous rural area in Tunceli province.²² In August 2008, a Turkish soldier reportedly died when he stepped on a landmine near the town of Semdinli in Hakkari province.²³ In September 2008, a Turkish soldier reportedly died when he stepped on a mine in the Beytussebap district of Sirmak province.²⁴

Stockpiling and destruction

Turkey did not meet its 1 March 2008 treaty-mandated deadline to complete destruction of its antipersonnel mine stockpile. Turkey is therefore in violation of the Mine Ban Treaty and will remain so until stockpile destruction is completed. Turkey's latest Article 7 report stated that it had 1,702,982 antipersonnel mines in its stockpiles at the end of 2008.²⁵

In early 2006, Turkey indicated it had a stock of 2,866,818 antipersonnel mines to destroy.²⁶ It subsequently destroyed 94,111 mines in 2006, 250,048 mines in 2007, 913,788 mines in 2008, and 377,573 mines in January–April 2009, for a total of 1,635,520 destroyed. At the end of April 2009, Turkey said it had 1,325,409 mines left to destroy.²⁷ In September 2009, Turkey informed Landmine Monitor that as of 26 August 2009, it had destroyed 1,765,779 mines and had 1,195,069 left to destroy.²⁸

¹⁸ Turkish General Staff, "The number of IED and mine incidents perpetrated by the members of the terror organization in 2009: 1 January–31 July 2009," 31 July 2009, www.tsk.tr.

²⁵ Article 7 Report (for calendar year 2008), Form B. At the end of 2008, the stockpile consisted of the following mines: 584,742 DM-11; 974,040 M14; 96,173 M2; 25,239 M16; and 22,788 ADAM.

²⁶ Turkey reported different numbers and types in its stockpile, prior to the start of destruction, at different times. See *Landmine Monitor Report 2006*, p. 733, and *Landmine Monitor Report 2007*, p. 688.

²⁷ Article 7 Reports, Form G, (for calendar year 2008), (for calendar year 2007), and 23 April 2007; and Government of Turkey, "Stockpile Destruction Carried Out at the Turkish Armed Forces Munitions Disposal Facility During 2007–2009 (As of 30 April 2009)," document distributed at the intersessional Standing Committee meetings, Geneva, 25–29 May 2009.

²⁸ Email from Malike Selçuk Sancar, Counselor (Disarmament), Permanent Mission of Turkey to the UN in Geneva, 9 September 2009.

As of April 2009, it had still not destroyed any of its ADAM mines.²⁹

Throughout 2007 Turkey had assured States Parties that it would meet its deadline. As late as 19 November 2007, Turkey said that “unless unforeseen technical difficulties occur due to the operation of the Turkish Armed Forces Munitions Disposal Facility, we hope to be able to fulfill our obligation under Article 4, using if necessary other available methods.”³⁰ In April 2007, Turkey told States Parties that “we are confident that we will be able to fulfill our obligation by destroying stockpiled APMs by 2008.”³¹ It also reported in April 2007 that the disposal facility would become operational on 4 July 2007, and run at full capacity as of that date.³²

Turkey first announced its plans for the disposal facility in 2005.³³ In mid-July 2007, Turkey informed Landmine Monitor that the facility was “finished as planned,” and that “qualification/certification activities are continuing.”³⁴ It was not officially inaugurated until 8 November 2007.³⁵

In a note verbale dated 28 February 2008 (two days before its deadline), and addressed to the “Presidency” of the Eighth Meeting of States Parties, Turkey stated, “At present it is difficult to make an estimate on when the destruction of all stockpiled anti-personnel mines could be accomplished. However, this process will be pursued with the utmost care.” It noted that the Turkish Munitions Disposal Facility was inaugurated on 8 November 2007, and that the “certification and qualification process took longer than foreseen.” The other explanation offered for missing the deadline was the following: “With a view to meet the deadline, other ways and means to destroy the stockpiled anti-personnel mines have also been considered. However, bearing in mind their negative impact on the environment, as well as the risks they pose for human life, these methods were disregarded.” The note requested that the Presidency circulate the information to States Parties and interested organizations.³⁶

Turkey began destroying its stocks at the Turkish Munitions Disposal Facility in Yahsihan in Kirikkale province in November 2007, and by its 1 March 2008 deadline had destroyed 35,488 mines there, in addition to 319,276 mines destroyed by open detonation in 2006 and 2007.³⁷

In June 2008, Turkey told States Parties that it had removed and destroyed the fuzes of all remaining mines.³⁸ It said, “Those remnant parts of the anti-personnel mines cannot be used. This is an important and irreversible step accomplished within the destruction process, the

²⁹ During the ICBL visit in May 2008, officials at the destruction facility said they were still working with engineers to see if it would be possible to destroy the ADAM mines there. Email from Tamar Gabelnick, ICBL, 25 May 2008; and ICBL, “Internal mission report,” provided by email from Tamar Gabelnick, ICBL, 25 May 2008.

³⁰ Statement of Turkey, Eighth Meeting of States Parties, Dead Sea, 19 November 2007.

³¹ Statement of Turkey, Standing Committee on Stockpile Destruction, Geneva, 24 April 2007.

³² Article 7 Report, Form F, 23 April 2007.

³³ Statement of Turkey, Standing Committee on Mine Action, Mine Risk Education and Mine Action Technologies, Geneva, 13 June 2005. This cited a target date of 2006 for completion of construction. See also Article 7 Report, Form F, 30 April 2005. In May 2006 Turkey stated “a company has been awarded the contract for the...facility. An agreement was signed between the NATO Maintenance and Supply Agency (NAMSA)—through which this facility will be established, albeit with Turkey’s own resources—and the successful company on the 20th of December 2005. Efforts are continuing to get the facility up and running by July 2007, so that stockpiled mines can be disposed of by the 1st of March 2008 deadline.” Statement of Turkey, Standing Committee on Stockpile Destruction, Geneva, 11 May 2006.

³⁴ Email from Malike Selçuk Sancar, Advisor, Ministry of Foreign Affairs, 17 July 2007.

³⁵ Statement of Turkey, Eighth Meeting of States Parties, Dead Sea, 19 November 2007.

³⁶ Note Verbale Ref. 649.13/2008/BMCO DT/1764, from the Permanent Mission of Turkey to the UN in Geneva, to the Presidency of the Eighth Meeting of States Parties, 28 February 2008.

³⁷ Government of Turkey, “Stockpile Destruction Carried Out at the Turkish Armed Forces Munitions Disposal Facility During 2007–2009 (As of 30 April 2009),” document distributed at the intersessional Standing Committee meetings, Geneva, 25–29 May 2009.

³⁸ Statement of Turkey, Standing Committee on Stockpile Destruction, Geneva, 2 June 2008. It said this again in November 2008, noting that the fuzes had all been destroyed by April 2008. Statement of Turkey, Ninth Meeting of States Parties, Geneva, 26 November 2008. Turkish officials also told the ICBL delegation in May that all of the fuzes for stockpiled mines had been destroyed “a few months ago.” Email from Tamar Gabelnick, ICBL, 25 May 2008; and ICBL “Internal mission report,” provided by email from Tamar Gabelnick, ICBL, 25 May 2008.

stockpiled landmines are not useable.”³⁹ It went on to note, “However, the whole destruction process has not yet been completed.” It was unable to give a timetable for completion, saying, “At this stage, I will refrain from making any predictions for the completion of the destruction of the remaining parts...When we have an accurate estimate of our daily average destruction capacity, we will be able to give you an accurate time-frame for the completion of the process.”⁴⁰

Turkey told the ICBL in August 2008 that it could not estimate a completion date because the munitions disposal facility was still not operating at full capacity, since procedures were still being perfected. Further, a new static furnace to destroy DM11 and M14 mines to address a capacity shortfall had been added, but was not yet operational.⁴¹

In November 2008, Turkey told States Parties that it hoped to finish the destruction by early 2010. It also said it was working on increasing the productivity of its disposal facility, but that safety and environmental considerations were constraining elements.⁴²

In the past Turkey also reported possession of 18,236 M18 Claymore mines, but in its Article 7 report submitted in April 2007 Turkey stated that “M18 Series APM were removed from destruction list, due to their specific technical features. Turkey has already declared that M18 series APMs will not be used as victim activated.”⁴³ In May 2008, officials told the ICBL that the tripwires for M18s had been destroyed and the mines were only used in command-detonated mode.⁴⁴

Mines retained for research and training

In 2004, Turkey initially retained 16,000 antipersonnel mines for training and research purposes.⁴⁵ In its Article 7 report submitted in 2009, Turkey indicated it was retaining 15,125 mines.⁴⁶ This constituted the highest total of retained mines among States Parties. The total includes DM-11, M2, M14, and M16 mines. Turkey for the first time specified the exact number of each type of mine.⁴⁷

Turkey consumed 25 of its retained mines in 2008, although it did not identify the types.⁴⁸ In the previous two years the number of retained mines was unchanged at 15,150 mines.

In its Article 7 report submitted in 2009, Turkey also for the first time used the expanded Form D on retained mines agreed by States Parties in 2004. It indicated that the mines had been used in training 1,834 people in four different courses, as well as for research (a modification project for mine-proof boots).⁴⁹

³⁹ Statement of Turkey, Standing Committee on Stockpile Destruction, Geneva, 2 June 2008.

⁴⁰ Ibid.

⁴¹ Email from Tamar Gabelnick, ICBL, 25 August 2008.

⁴² Statement of Turkey, Ninth Meeting of States Parties, Geneva, 26 November 2008.

⁴³ Article 7 Report, Form B, 23 April 2007. Use of victim-activated Claymore mines is prohibited by the Mine Ban Treaty, but use of command-detonated Claymore mines is permitted. In May 2006, Turkey stated that “the victim activation components of M18 Claymore mines have recently been added to the list of mines to be destroyed and the necessary steps have been taken to stock only command detonated M18 Claymore mines.” Statement of Turkey, Standing Committee on Stockpile Destruction, Geneva, 11 May 2006.

⁴⁴ Email from Tamar Gabelnick, ICBL, 25 May 2008; and ICBL, “Internal mission report,” provided by email from Tamar Gabelnick, ICBL, 25 May 2008.

⁴⁵ Article 7 Report, Form D, 1 October 2004. This included 4,700 each of DM-11 and M14, and 2,200 each of M16, M18, and M2 mines. In 2006, Turkey reported the number of mines retained for training had decreased to 15,150 “because 850 mines have been used for mine detection, mine clearance and mine destruction programmes carried out to train military personnel involved in mine action, as well as for related training at various military training institutions.” Statement of Turkey, Standing Committee on Stockpile Destruction, Geneva, 11 May 2006. This information was also indicated in Article 7 Report, Form D, 30 April 2006. However, neither document specified how many of each type of mine were destroyed, and how many remained.

⁴⁶ Article 7 Report (for calendar year 2007), Form D.

⁴⁷ Article 7 Report (for calendar year 2008), Form D. The retained mines consist of 3,897 DM11; 5,815 M2; 3,697 M14; and 1,716 M16.

⁴⁸ Ibid, Form D; and statement of Turkey, Standing Committee on the General Status and Operations of the Convention, Geneva, 25 May 2009.

⁴⁹ Article 7 Report (for calendar year 2008), Form D. It provided this information during the May 2009 intersessional meetings as well. This included 867 people in the Mines and Booby-Traps Course, 603 people in the Mines and IED Course, 322 people in the Engineer Corps Basic Course, and 42 people from 21 countries in the Mines and EOD Course.

Turkey stated in May 2009, “The large size, as well as the different types of mine action units necessitate the Turkish Armed Forces to retain a certain number of APLMs [antipersonnel landmines] for training purposes.... Besides Turkey has been facing a terrorist threat which includes the use of APLMs. Mines laid by terrorists have to be seized and secured as they are detected.”⁵⁰

In May 2006, Turkey stated that “after covering some more ground in mine clearance, Turkey may review the number of mines retained for training purposes.”⁵¹ In June 2005, Turkey said, “This figure [16,000 mines] may be reassessed as the process of downsizing the armed forces progresses.”⁵²

Scope of the Problem

Contamination

Turkey is contaminated with antipersonnel and antivehicle mines, and ERW, primarily UXO, as well as IEDs. Mines were laid from 1956–1959 along 510km of the border with Syria, and on some sections of the borders with Armenia, Iran, and Iraq to prevent illegal border crossings, and around security installations.⁵³ It has been stated that all the mines laid on the Turkish side of Turkey’s borders with Greece, Bulgaria,⁵⁴ and Georgia have been cleared.⁵⁵

Landmines were also emplaced by government forces during the 1984–1999 conflict with the PKK in the southeast of the country. According to the Ministry of Foreign Affairs, these mines have been progressively cleared since 1998.⁵⁶ New contamination may result from use of mines and IEDs by the PKK from 2007–2008 (see Use section above).⁵⁷

Turkey reported in 2009 that a total of 981,778 mines remained emplaced on its territory as of the end of 2008, of which 817,312 were antipersonnel mines, and 164,466 were antivehicle mines.⁵⁸ This represents a small reduction on the figures given in the report covering calendar year 2007 (818,280 antipersonnel mines and 164,497 antivehicle mines). Turkey did not report on the locations of these mines or mined areas.⁵⁹

During the 1974 occupation of northern Cyprus, antipersonnel and antivehicle mines were used extensively by Turkish armed forces to create the buffer zone which divides the island, and in areas adjacent to the buffer zone.⁶⁰ Most of the minefields have been maintained since then.⁶¹

Casualties

Landmine Monitor analysis of 2008 media reports collected by the Initiative for a Mine-Free Turkey (IMFT) identified at least 100 new casualties due to mines, ERW, and victim-activated IEDs, including 29 people killed and 71 injured.⁶² Of these, 72 were members of security forces

⁵⁹ *Ibid.*

⁶⁰ *Landmine Monitor Report 2004*, p. 826.

⁶¹ See report on Cyprus in this edition of Landmine Monitor.

⁶² Unless otherwise stated, data supplied by Muteber Öğreten, Coordinator, IMFT, 29 June 2009. IMFT also reported 63 casualties (25 killed and 38 injured) by command-detonated devices. These are not included in Landmine Monitor’s totals.

and 28 were civilians. Of the civilians, there was one female adult, four boys, six children of unknown gender, 12 males of unknown age, one female of unknown age, and four of unknown gender and age. Of the civilian casualties, five were traveling, five were bystanders, three were herding, one was farming, and one collecting firewood, water, or food. The activities of the 13 remaining civilian casualties at the time of the incident were unknown.

The number of casualties in 2008 was very similar to that collected by the IMFT in 2007 (101 casualties; 28 people killed and 73 injured).⁶³ The media did not consistently identify the device type, often incorrectly identifying command-detonated IEDs as landmines. News reports also focused more on military casualties than civilians, resulting in possible under-reporting of civilian casualties.⁶⁴

Turkey reported 158 antipersonnel mine casualties in 2008 (37 killed and 121 injured). It was not specified how many of the casualties were civilian, or if any civilians were “village guards” or members of other security forces.⁶⁵ This total represented a significant decrease from 257 casualties (53 killed and 204 injured) reported for 2007. It was a return to similar casualty numbers reported in 2006 (155 casualties; 24 killed and 131 injured).⁶⁶

Casualties continued to occur in 2009 with at least 48 new casualties of victim-activated devices (27 killed and 21 injured), as of 29 June 2009. All but one of the casualties were male (the gender of one casualty was unknown). The 47 male casualties included 42 men, one boy, and four casualties of unknown age.

The total number of mine casualties in Turkey is unknown. Landmine Monitor has reported 831 victim-activated mine/ERW casualties in Turkey between 1999 and 2008, including 250 killed and 581 injured.⁶⁷

Turkey has reported that between 1993 and 2003 landmines caused 2,905 casualties, including 588 people killed and 2,317 injured. It was reported that more than 3,000 people (mostly civilians) have been killed and another 7,000 injured by mines along the Turkish-Syrian border since the 1950s. There are no recent or comprehensive statistics on persons with disabilities and questions on disability were not included in the most recent national census in 2007.⁶⁸

Risk profile

Turkey reports that all mined areas are fenced and clearly marked according to international standards.⁶⁹ However local authorities and civil society groups have reported unmarked areas with no fencing, particularly in mountainous areas. They report that children regularly enter these areas to tend to animals.⁷⁰

Casualty data collected by the IMFT indicate that rural populations living near the mined border areas are most at-risk and in urgent need of risk education.⁷¹

Socio-economic impact

Most land near the Turkish-Syrian border falls under legal category of “Forbidden Military Zone in the First and Second Degrees” (i.e. public land administered by the Turkish military). Some of it is formerly privately owned farmland which was nationalized during the 1956 border

⁶³ *Landmine Monitor Report 2008*, p. 703.

⁶⁴ Email from Muteber Öğreten, IMFT, 21 July 2009.

⁶⁵ Article 7 Report (for calendar year 2008), Form J.

⁶⁶ *Landmine Monitor Report 2008*, p. 703.

⁶⁷ *Ibid*; *Landmine Monitor Report 2007*, p. 694; *Landmine Monitor Report 2006*, p. 741; *Landmine Monitor Report 2005*, p. 590; and *Landmine Monitor Report 2004*, p. 828. The figures for 2003 reported in *Landmine Monitor Report 2004* are somewhat unclear—no total figures were reported. For this report, Landmine Monitor used the figures reported by Geneva Call and the Turkish Human Rights Association for 2003 (22 killed and 45 injured). For 2002, the higher Geneva Call figures of 15 killed and 25 injured, rather than the lower Landmine Monitor figures, were used in this report. See *Landmine Monitor Report 2004*, p. 828.

⁶⁸ See *Landmine Monitor Report 2008*, p. 705.

⁶⁹ Article 7 Report (for calendar year 2008), Cover page; and see *Landmine Monitor Report 2007*, p. 692.

⁷⁰ See *Landmine Monitor Report 2008*, p. 702; and *Landmine Monitor Report 2007*, p. 692.

⁷¹ Data supplied by Muteber Öğreten, IMFT, 29 June 2009.

demarcation. The Syrian military has reportedly cleared mines on the Turkish side of the border and in the buffer zone totaling 250km², where they have planted cotton and olive trees.⁷²

Program Management and Coordination

As of July 2009, there was no national mine action authority or mine action center in Turkey,⁷³ despite earlier pronouncements that steps were underway to create mine action management structures.⁷⁴

While the government of Turkey stated in 2008 that it “remains determined to end the suffering” of mine/ERW casualties,⁷⁵ there was no coordination of VA or RE activities. The Administration for Disabled People, under the Prime Minister, is responsible for protecting the rights of persons with disabilities, but lacks resources.⁷⁶

Data collection and management

There is no comprehensive casualty data collection system in Turkey, though the government has provided annual casualty figures in its Article 7 reports.⁷⁷

The IMFT maintains a database of casualties identified in national media reports and by volunteers and partner institutions in affected areas.⁷⁸ Since 2006, the IMFT has differentiated casualties from mines, ERW, and victim-activated and command-detonated devices more systematically. This remains difficult, however, as the media often do not provide sufficient detail on the devices causing the incidents or incorrectly identify command-detonated devices as landmines.⁷⁹ Due to a lack of funding, the IMFT did not expand its casualty data and needs assessment pilot project from 2007–2008, so figures might be under-reported.⁸⁰

Plans

Strategic mine action plans

Turkey and Syria reportedly agreed in 2003 to demine their common borders.⁸¹ According to Turkey’s mine action plan,⁸² the 510km-long minefield on the Syrian border will be cleared under the supervision of the Directorate General for National Real Estate Affairs of the Ministry of Finance.⁸³ According to information provided to Landmine Monitor in 2005, Turkey’s mine action plan also includes clearing the minefield along 42km of the border with Iraq (containing 75,115 mines), the minefield along 109km of the border with Iran (containing 191,428 mines) and the minefield along 17km of the border with Armenia (containing 21,984 mines).⁸⁴

National ownership

Commitment to mine action and victim assistance

Turkey has been slow to implement its obligations under Article 5 of the Mine Ban Treaty and is currently not on course to meet its 2014 deadline for clearance of all antipersonnel mines from mined areas under its jurisdiction or control. Turkey reaffirmed its commitment to victim assistance at the Ninth Meeting of States Parties⁸⁵ but it has made minimal progress in providing assistance to survivors of mine/UXO over the past 10 years and there are few resources and opportunities available.

National mine action legislation and standards

On 16 June 2009, the President of Turkey ratified Law No. 5903 on demining of minefields along the Syrian border. The law stipulates that initially the Ministry of National Defense will invite tenders for demining, and if this process does not work the Ministry of Finance will have the minefields cleared through the “service procurement method” (the meaning of this is not clear). If this method also fails, according to the law, the government will invite companies to tender for demining, in exchange for the right to cultivate lands suitable for agriculture for up to 44 years.⁸⁶

Demining and Battle Area Clearance

In the past, demining in Turkey has been conducted by the Specialized Mine Clearance Unit of the Turkish army.⁸⁷ In addition to its manual demining teams, the unit has mine detection dogs and machines available. In 2008, a commercial company was awarded a demining contract by tender.⁸⁸ A Turkish company, Tusan Corporation, together with its German partner Tauber, initiated demining operations in June 2008 in an area near Nusaybin, where a new border crossing into Syria will be built.⁸⁹ The estimated area of contamination was 200,000m².⁹⁰

Turkey’s latest Article 7 report stated that 999 mines were cleared in 2008.⁹¹ The locations and area cleared were not specified. Turkey has not included in its Article 7 reports the destruction of antipersonnel mines replaced by the PKK/KADEK/Kongra Gel, but the Turkish General Staff website has reported clearance of IEDs. In 2008, the Turkish General Staff reportedly destroyed 55 antipersonnel mines and in 2009 it reportedly destroyed a further 27 antipersonnel mines.⁹²

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Turkey is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2014. At the June 2008 Standing Committee meetings, Turkey stated that, “The mine clearance obligation of Article 5 is one of the central provisions of the Convention and Turkey will spare no effort in order to meet her 2014 deadline.”⁹³ In May 2009, Turkey stated that it continued its efforts to comply with the obligation under Article 5.⁹⁴ Yet Turkey still needs to set out concrete plans for clearance of all affected areas under its jurisdiction or control to meet the requirements of Article 5. This includes its responsibilities for areas under its control in northern Cyprus.

⁹⁴ *Ibid*, 28 May 2009.

Risk Education

RE in Turkey was reported to be very limited and inadequate in 2008, as in previous years. The government reported that their efforts to increase the awareness of the population regarding the dangers of mines and ERW remained “unchanged” since 2007.⁹⁵ When asked in a parliamentary question in December 2007 what was being done in the mine/ERW affected region of Iğdır to protect civilians, the Minister of Internal Affairs responded that “the citizens in the region are being warned periodically that they should inform the security forces when they encounter suspicious things”.⁹⁶ This is the extent of the information Landmine Monitor was able to source regarding government RE activities in Turkey.

In 2008, the IMFT hosted meetings in Batman, Gaziantep, Mardin, and Urfa with the participation of NGOs, parliamentary representatives, and mine survivors on the problems of mines and dangers to civilians. The IMFT also organized an educational workshop in January 2009 in Diyarbakir with the assistance of the Diyarbakir Branch of the Human Rights Association that was attended by some 15 people.⁹⁷

In 2008, Landmine Monitor reported that the Turkish Grand National Assembly had announced RE messages were to be screened on national television in 2008 but general elections in 2008 led to personnel changes in government and it is unclear if the messages were aired.⁹⁸

Victim Assistance

The total number of mine/ERW survivors in Turkey is unknown, but is at least 2,317.⁹⁹ Despite the government reaffirming its commitment to the principles of VA at the Ninth Meeting of States Parties in November 2008, the government made little progress in the provision of services for mine/ERW survivors in 2008.¹⁰⁰ There were few facilities and opportunities available to persons with disabilities, including mine/ERW survivors. Available services were inadequate to address the needs of persons with disabilities.¹⁰¹ There was also a lack of awareness of available services among survivors. Access was limited due to physical and financial barriers.¹⁰² The government does not distinguish between mine/ERW survivors and other persons with disabilities in the provision of services or in laws.¹⁰³ The European Commission criticized the government of Turkey for its lack of research and data on the situation of persons with disability which had reportedly resulted in uninformed government policymaking.¹⁰⁴

There was some progress in government provision of healthcare, through the creation of a new social security system in Turkey under the Social Insurance and General Health Insurance Law which entered into force in October 2008. The new law provides basic healthcare services to those who pay the insurance premium. Persons with disabilities and those who cannot afford the premium remain eligible for a “green card,” qualifying them for government coverage of the cost of their insurance premium.¹⁰⁵ People under the age of 18 receive free healthcare under the new law.¹⁰⁶ However, the Law of Central and Local Administrations Budget, passed by the National Assembly in 2009, stated that those eligible for the green card should pay for part of

their medical expenses.¹⁰⁷ Thus survivors who are unable to afford any financial contribution to their medical care cannot access the services.¹⁰⁸

Through the new social insurance law, all have the right to access free first-aid services at public and private healthcare centers. However, the number of healthcare centers equipped with the trained staff and material supplies required to provide emergency care in the case of severe injuries, such as those caused by mines and ERW, was very limited.¹⁰⁹ Adequate emergency transport only exists in the cities, not in rural areas where the majority of incidents occur.¹¹⁰

Disability groups in Turkey reported no progress in 2008 in the improvement of rehabilitation services.¹¹¹ Services remain insufficient and inadequate medical treatment continues in rehabilitation centers. Community-based rehabilitation continued to receive much fewer financial and human resources than institutional care for persons with disabilities.¹¹²

The Gulhane Military Medical Academy and the Turkish Armed Forces Rehabilitation and Care Center (TAF-RCC) in Ankara have specialized facilities to assist mine/ERW survivors. In its Article 7 report, Turkey noted that rehabilitation was ongoing at military centers for 121 antipersonnel mine survivors throughout 2008. The number of civilians among those receiving treatment was not specified.¹¹³ Turkey reported that TAF-RCC reserves 30% of its quota for civilian patients (including police) and accepts applications for additional civilian casualties if regional hospitals have insufficient capacity to address the patients' needs. The service is free but the cost of travel is not covered and is beyond the means of some survivors.¹¹⁴

The Orthopedics and Traumatology Center and the Prosthetic Center of the Dicle University Research Hospital in Diyarbakir both provided prosthetics (below-knee only) to survivors in 2008 free of charge. Eight civilian landmine survivors were fitted with prosthetics at the Dicle Prosthetic Center in 2008.¹¹⁵ Many mine survivors are not aware that prosthetics are provided at the Dicle University Research Hospital. Only survivors with a green card were eligible for services.¹¹⁶

Only limited psychological support was available to people affected by mines and ERW, and no psychosocial programs were run for mine/ERW survivors or families of victims of mines/ERW.¹¹⁷

Turkey noted in its Article 7 report that 152 military personnel had received indemnities, 15 had received salaries, and 48 had been assisted in finding employment in 2008.¹¹⁸

Healthcare reform includes a policy that exempts employers from paying insurance premiums for persons with disabilities as the government will pay the premiums.¹¹⁹ It is too early to determine if this has increased employment with people with disabilities.¹²⁰ Previous government quotas remained in effect, with employment quotas stipulating that 3% of employees in the public sector and 4% in the private sector should be persons with disabilities. Neither of these quotas was met in 2008. In the public sector, less than 20% of the employment quota for persons with disabilities was filled in 2008.¹²¹

From 7 July 2004 until it expired on 30 July 2008, 341,429 people applied for financial compensation under Law 5233 (on the Compensation of Losses Resulting from Terrorist Acts and the Measures Taken Against Terrorism). At the end of the program, one-third of the applications had been processed. Data on the number of mine/ERW survivors who applied for or obtained compensation was not provided.¹²² Mine/ERW survivors were also able to apply for compensation through the Damage Detection Commissions. However, the financial compensation the law prescribes does not cover the full financial cost of permanent injury. The amount of compensation is determined by the degree to which the survivor lost the ability to work. The maximum compensation payment is €5,000 (US\$7,363).¹²³

The new social security system provides a monthly payment to persons with disabilities who are unable to work or who have not been able to find employment. The payment given in 2009 has been TRY250 (\$155.40) a month. According to Turkish disability groups, the required monthly income for a family of four for food and basic goods was TRY953 (\$592.38) at the beginning of 2009.¹²⁴

As of July 2009, the Disability Act, which came into force in 2005¹²⁵ and related regulation on the rights of persons with disabilities have not been fully implemented. Disabled people's organizations have criticized the Act as weak, and inadequate in the provision of social reintegration and healthcare services.¹²⁶ Discrimination against persons with disabilities is illegal in Turkey, with regards to employment, education, access to health care, and the provision of other state services. The government reportedly enforced the law relatively effectively. The law does not mandate disability access to public transport and public buildings.¹²⁷

The Turkish Grand National Assembly ratified the UN Convention of the Rights of Persons with Disabilities on 3 December 2008. It had not signed the convention's Optional Protocol as of 1 July 2009.

Victim assistance activities

In 2008, the IMFT worked with limited funding to raise awareness of the needs of mine/ERW/IED victims.¹²⁸ In 2008, the IMFT organized prosthetic services for four survivors at the Prosthetic Center of the Dicle University Research Hospital.¹²⁹ The Disabled People's Association of Turkey supported awareness-raising activities on VA.¹³⁰

Support for Mine Action

Turkey did not report national funds allocated to mine action in 2008.

During 2008 and 2009, Turkey has remained the lead nation in the NATO Partnership for Peace project to clear mines and ERW from a former military base at Saloglu village in Agstafa district in Azerbaijan.¹³¹ The total budget for the project from 2005 to 2011 is estimated to be €3.1 million (\$4.6 million).¹³² Turkey contributed to the first phase of the project in 2006, budgeted at €1.16 million (\$1,708,216), and was reported by Azerbaijan to have provided an

UGANDA

2008 Key Data

State Party since	1 August 1999
Contamination	Scattered antipersonnel and antivehicle mines, ERW
Estimated area of contamination	Unquantified
Casualties in 2008	16 (2007: 23)
Estimated mine/ERW survivors	Unknown but approximately 1,000
Risk education recipients in 2008	171,497
Article 5 (clearance of mined areas)	Deadline: 1 August 2009
Demining in 2008	No mine clearance; 434 EOD tasks
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$783,506 (2007: \$1.84 million) National: Unknown (2007: \$300,000)

Ten-Year Summary

The Republic of Uganda became a State Party to the Mine Ban Treaty on 1 August 1999. Uganda has not enacted national legal measures to implement the treaty. Uganda completed destruction of 6,383 stockpiled mines in July 2003. It retained 1,764 mines for training purposes. There were credible allegations of Ugandan use of antipersonnel mines in the Democratic Republic of the Congo (DRC) in June 2000. The government consistently accused Lord's Resistance Army rebels of using antipersonnel mines in Uganda until 2004.

Uganda's mine and explosive remnants of war (ERW) problem is the result of decades of armed conflict and civil strife. Evidence from re-survey and clearance records has indicated that the mine problem was far smaller than previously thought, but Uganda did not complete clearance by its Article 5 deadline of 1 August 2009. This put it in violation of the treaty until it either completes clearance or is granted an extension to the deadline by the other States Parties, whichever occurs sooner. A mine action program was established only in 2005, with the support of UNDP.

Between 1999 and 2008, the International Service Volunteers Association recorded 354 mine/ERW casualties in Uganda; more than 1,400 casualties have been recorded since 1986. Since 1999, risk education has been delivered by government bodies and international and national NGOs. The level of risk education provided has increased over the years, although it has remained inadequate, in part due to conflict and lack of funding. In 2008, national standards for risk education were approved.

Services for survivors and persons with disabilities remained largely inadequate. As a result of the so-called VA26 process, the government took more ownership over victim assistance service provision, and survivor groups became increasingly involved. Implementation of Uganda's victim assistance plan for 2008–2012, as part of its commitment to the 2005–2009 Nairobi Action Plan, only started in mid-2009, reportedly due to a lack of resources.

Mine Ban Policy

Uganda signed the Mine Ban Treaty on 3 December 1997 and ratified it on 25 February 1999, becoming a State Party on 1 August 1999. National implementation legislation has reportedly been under development for six years, but as of July 2009 had still not been enacted.¹

Uganda submitted an undated Article 7 report covering the period from 2 April 2008 to 2 April 2009. Uganda has provided six previous reports.²

Uganda participated in the Ninth Meeting of States Parties in Geneva in November 2008, as well as the intersessional Standing Committee meetings in May 2009. At both meetings, Uganda made statements on mine clearance and victim assistance.

Uganda has not expressed its views on key issues of interpretation and implementation related to Articles 1 and 2 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, and antivehicle mines with sensitive fuzes or antihandling devices).

Uganda is party to the Convention on Conventional Weapons and its original Protocol II on landmines, but not Amended Protocol II or Protocol V on Explosive Remnants of War. Uganda signed the Convention on Cluster Munitions in December 2008, but had not yet ratified as of 1 July 2009.³

Production, transfer, use, stockpile destruction, and retention

Uganda produced antipersonnel mines until 1995 when the state-run facility was decommissioned. Uganda has stated that it has never exported antipersonnel mines.⁴

In 2000 and 2001, there were serious and credible allegations indicating the strong possibility of Ugandan use of antipersonnel mines in the DRC, particularly in the June 2000 battle for Kisangani. The government denied any use, but pledged to investigate; the results were never made known.⁵

The government consistently accused Lord's Resistance Army (LRA) rebels of using antipersonnel mines in Uganda until 2004, and regularly reported the seizure or recovery of stockpiled antipersonnel mines from the LRA until 2005.

In July 2003, Uganda completed destruction of its stockpile of 6,383 antipersonnel mines. This figure was considerably higher than Uganda initially indicated would be destroyed, apparently because of additional mines captured from rebel forces and a decrease in the number of mines kept for training purposes.⁶

Uganda has discovered or seized and destroyed additional antipersonnel mines in recent years.⁷ In its Article 7 report submitted in 2009, Uganda reported destroying 120 Type 72 mines. It did not note where the mines came from or who had possession of them before their

¹ The draft law is titled "1997 Mine Ban Implementation Bill 2002." In May 2002, Uganda reported the act was before parliament. In May 2004, officials told Landmine Monitor that a revised draft was due to be presented to the cabinet for approval before going to parliament. In May 2005, Uganda reported, "An implementation act is ready to be presented before Parliament." In December 2005, Uganda reported that national implementation legislation was "ready for parliamentary debate." In May 2007, an official told Landmine Monitor that the bill still had to be approved by the cabinet before being sent to parliament. No further update has been provided.

² Uganda submitted undated reports covering the periods from 2 April 2008 to 2 April 2009, 2 April 2007 to 1 April 2008, and from 1 May 2006 to 1 April 2007. Previous reports were submitted on 5 December 2005, 11 May 2005, 24 July 2003, and 24 May 2002. The initial report was due in January 2000. Uganda did not submit annual reports in 2004 or 2006.

³ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 171.

⁴ In January 2005, a UN report said that landmines had been supplied from a UPDF camp to a rebel group in the DRC in violation of a UN embargo. The report did not specify if the mines were antipersonnel or antivehicle. Uganda strongly denied the allegation as "patently false and inflammatory." See *Landmine Monitor Report 2005*, p. 596.

⁵ See *Landmine Monitor Report 2004*, pp. 834–835.

⁶ Article 7 Report, Form G, 5 December 2005. See *Landmine Monitor Report 2006*, p. 746.

⁷ See *Landmine Monitor Report 2008*, p. 711, for details on destruction in 2007.

destruction.⁸ In August 2008, a Uganda People's Defence Forces (UPDF) spokesperson said that during a month-long exercise many tons of obsolete ordnance collected from armories around the country, or captured from rebels, were to be destroyed, including "landmines, which have been banned internationally."⁹ Also in August 2008, the UPDF stated that 75 landmines (type unspecified) and other weapons had been recovered from the Acholi, Lango, and West Nile sub-regions, indicating the arms had been abandoned by the LRA.¹⁰ In December 2008, the UPDF reportedly recovered four antipersonnel mines, among other weapons, during a raid on an LRA camp in the DRC.¹¹

In its Article 7 report covering 2008, Uganda reported retaining 1,764 Type 72 mines for training purposes.¹² This is the same number Uganda has been reporting since it completed stockpile destruction.¹³ Uganda has not yet reported in any detail on the intended purposes and actual uses of its retained mines—a step agreed by States Parties at the First Review Conference in 2004. In 2004, Uganda declared that it "supports the position already taken by African states which have called for a minimum number of retained mines to be of a bare minimum and not in thousands."¹⁴

Scope of the Problem

Contamination

Landmines and ERW in Uganda are the result of armed conflict and civil strife over the past four decades.¹⁵ The main problem is in the north of the country, following many years of conflict with the non-state armed group, the LRA, and includes mines, UXO, and abandoned explosive ordnance.¹⁶ However, based on evidence from re-survey and clearance records, the mine threat appears to have been far smaller than previously thought.¹⁷ The UPDF reportedly laid mines in 2000 and 2002 to seal the border from intrusions by the LRA. But much of the area it fenced and marked as minefields was later determined to be dummy minefields designed to fool the LRA.¹⁸

In July 2009, the director of the Uganda Mine Action Center (UMAC) stated that Uganda had two mined areas remaining, containing a total of six suspected hazardous areas (SHAs).¹⁹ The mined areas are all in Kitgum along the border with Sudan: five SHAs are at Lomwaka in Agoro sub-county, and the sixth is at Ngomoromo in Lokung sub-county.²⁰ In Agoro, the last known casualty was in 1999, and the last mine incident occurred on 24 November 2008, when an animal strayed into the mined area on Mica hill.²¹ At Ngomoromo, the mined area is reportedly 4km long. The last known mine casualties in this area were two members of the UPDF during

clearance operations in 2007.²² Both mined areas were under technical survey as of May 2009.²³ Danish Demining Group (DDG) has reported that all of the SHAs are partially fenced.²⁴

Even after clearance of these two mined areas is completed, Uganda faces a potential residual threat as small numbers of mines were laid over a large area, and explosive ordnance disposal (EOD) operations in 2008 continued to find mines. In 2008, EOD teams found 13 antipersonnel and six antivehicle mines in 18 different locations in Gulu, Pader, Kitgum, and Amuru districts.²⁵

Additionally, Uganda reported that as of May 2009 they had cleared 244 SHAs containing UXO, with clearance ongoing in 40, while 35 had been discredited, and 107 remained to be cleared. Deminers in Gulu found RBK-250/275 cluster bombs and AO-ISCh submunitions, although Uganda could not provide the year they were found.²⁶ It is uncertain who used the cluster munitions, but the Minister of Defence claimed it was non-state armed groups such as the LRA and the Allied Democratic Forces and not the Ugandan army.²⁷ A 2006 survey of landmine and UXO casualties in Gulu district determined that 3% of casualties were caused by submunitions.²⁸ UMAC cleared 121 AO-ISCh submunitions and two M42 series submunitions in 2008.²⁹

Casualties³⁰

In 2008, Landmine Monitor identified at least 16 new mine/ERW casualties (six killed and 10 injured) in five incidents in Uganda. This data is incomplete as it only contains information from the media and from the International Service Volunteers Association (AVSI), which only collects data in Gulu and Amuru districts. UNDP, UMAC, and the Ministry of Gender, Labour and Social Development (MoGLSD) confirmed they were incapable of collecting casualty data.³¹ No data was collected by the Ministry of Health (MoH), due to a lack of resources, despite it being in charge of the National Surveillance Network.³²

AVSI recorded three of the casualties and Landmine Monitor the rest. All casualties were civilians, including at least nine children (two girls and seven of unknown gender) and two men. The age of four males and one female was unknown. ERW caused 15 casualties and an unknown device the sixteenth. The children became casualties while playing with ERW, including two girls while playing near an army site in Amuru. Five casualties occurred during scrap metal processing, and two men were digging in their fields. Three casualties occurred in Amuru, eight in Gulu, and the scrap metal incident occurred in Kampala.³³ The decrease in casualties was

²⁹ Interview with Richard Wakayinja, Operations Manager, UMAC, Kampala, 3 October 2008.

³⁰ Unless noted otherwise, analysis based on AVSI casualty data 1986–2009, provided by email from Femke Bannink, Project Coordinator, AVSI, 5, 18, and 26 June 2009; and Landmine Monitor media monitoring from 1 January 2008 to 25 June 2009.

³¹ "Official Common Country Response" to Landmine Monitor questionnaire, 15 June 2009, provided by email from Jose Neil A.C. Manzano, Programme Specialist, UNDP, 17 June 2009. This response combines information from UMAC, UNDP, DDG, and the MoGLSD. Separately, DDG confirmed that no casualty data was collected at the government level. Email from Elina Dibirova, RE/VA Specialist, DDG, 22 June 2009.

³² "Official Common Country Response" to Landmine Monitor questionnaire, 15 June 2009; and email from Elina Dibirova, DDG, 22 June 2009.

³³ Martin Ssebuyira and Andrew Bagala, "Two killed, three injured in city blast," *New Vision* (Kampala), 8 November 2008. The article mentions a second scrap metal incident in Kampala, but insufficient detail about the device causing the incident and the number of casualties was available to include it.

ascribed to limited movement by internally displaced persons (IDPs), increased risk education, and successful clearance.³⁴

In 2007, AVSI recorded 23 casualties (10 killed and 13 injured); 14 of those occurred in one ERW transportation incident. In 2007, Landmine Monitor was unable to identify casualties in the west of the country. UMAC was not able to provide data in 2007 either.³⁵

Casualties continued to occur in 2009 with at least four fatal casualties to 25 June. AVSI recorded one man killed while collecting building materials in the forest in Gulu. Landmine Monitor identified three children killed while playing with ERW in Pader. It is possible that three more boys were killed in neighboring Adjumi district, but insufficient information was available to include them.³⁶

The total number of mine/ERW casualties is not known, and figures between 900 and 3,000 have been cited. Uganda confirmed that these figures are incomplete and unreliable.³⁷ It is expected that the actual figure will be closer to the low estimate.³⁸

AVSI remains the most complete source for northern Uganda. AVSI recorded 1,414 casualties between 1986 and June 2009 (538 killed, 864 injured, and 12 unknown). This includes survey results for 1986–2006, when 1,387 casualties were recorded, and subsequent annual updates; 1,278 of the casualties occurred in Gulu and Amuru. The remaining casualties included nine in Sudan. Most casualties occurred between 1995 and 1997 (39% or 542), with 302 casualties in 1996 (21%). At least 357 casualties occurred between 1999 and 2008 (138 killed, 216 injured, and three unknown), with rapid decreases starting in 2002.

Almost all casualties in Uganda were civilian (1,287 or 92%), 47 were security forces, and 71 were of unknown status. Some 68% of casualties were male: 538 men, 190 boys, and 230 of unknown age. Women accounted for 232 casualties, girls 79, and 107 females of unknown age. For 29 people, gender and/or age were unknown. More than half of the casualties occurred while traveling on foot (38%), in a vehicle (12%), and by bicycle (4%).

Mines caused 70% (977) of casualties, ERW 315 casualties, improvised explosive devices (IEDs) 11, and unknown devices 102.³⁹ AVSI attributed this high percentage of mine casualties to the fact that, at the height of the northern insurgency, people came in contact with mines more regularly than ERW despite significant ERW contamination; 427 mine casualties (44%) occurred between 1995 and 1997. AVSI added that interviewees might wrongly call all explosive devices mines and confirmed that ERW are now the main cause of casualties and an obstacle to the return of IDPs.⁴⁰

Program Management and Coordination

Mine action

Uganda's national mine action authority is its National Mine Action Steering Committee (NMAC), which is located at the Office of the Prime Minister in Kampala. A mine action policy drafted in early 2006 was formally adopted in October 2006 by the committee, but was still pending cabinet approval in April 2009.⁴¹ The policy laid down the aims of the program and clarified the responsibilities of the program's main institutions and other actors.⁴²

³⁷ "Official Common Country Response" to Landmine Monitor questionnaire, 15 June 2009.

³⁸ Email from Samuel Paunila, Program Manager, DDG, 28 May 2009; "Final Report of the Meeting of States Parties/Zagreb Progress Report," Part II, Annex V, Zagreb, 28 November–2 December 2005, p. 211; and MoGLSD, "Status of Victim Assistance in Uganda," Geneva, 3 June 2008. The government has been reporting 900 survivors in northern Uganda and 200 in western Uganda since 2005.

³⁹ AVSI affirmed that 61% of casualties were due to antipersonnel mines and 3% due to cluster submunitions, but this could not be derived from data provided.

⁴¹ See *Landmine Monitor Report 2007*, p. 701; and email from Vicent Woboya, UMAC, 29 April 2009.

⁴² Government of Uganda, "Uganda National Policy on Mine Action," 2006 Draft, provided by UNDP, 22 May 2008.

Mine action is integrated in the government of Uganda's Peace, Recovery, and Development Plan (PRDP). The plan is the main framework for peace, recovery, and development in northern Uganda, and mine action is indicated as one of the activities to facilitate the protected return and resettlement of former IDPs.⁴³ The Office of the Prime Minister, through UMAC, is responsible for the management and coordination of mine action in the country, with the exception of victim assistance, which falls under the MoGLSD and the MoH.⁴⁴ UMAC, which was set up in Kampala in 2006, is responsible for quality management of demining operations, risk education (RE), and accreditation of operators.⁴⁵ A regional mine action center was established in Gulu in 2008.⁴⁶

Risk education

UMAC is responsible for managing and coordinating RE, although there was no RE coordinator in place in 2008. However, regular coordination meetings were held at the regional mine action centers.⁴⁷ In January 2009, a DDG advisor joined UMAC, and UMAC planned to recruit an RE coordinator in early 2009.⁴⁸ There was no RE strategy in 2008.⁴⁹

Victim assistance

Under Uganda's Comprehensive Plan of Action on Victim Assistance 2008–2012, it was stated that the Office of the Prime Minister is responsible for coordination and that reporting is to the NMASC.⁵⁰ In 2009, UMAC noted that it is responsible for all parts of mine action with the exception of victim assistance (VA).⁵¹

The lead ministry for VA coordination is the MoGLSD.⁵² The other main ministry is the MoH, but coordination between the two ministries is not optimal.⁵³ Responsibilities are delegated to district and local offices of both ministries.⁵⁴

The Uganda Landmine Survivors' Association (ULSA) was planned to be an umbrella organization for survivor groups, but could not fulfill this role as the legal process was stalled in late 2007.⁵⁵ As of 2009, ULSA was *de facto* playing its coordinating role, but this was not formalized and required support was lacking.⁵⁶

Data collection and management

UMAC uses the Information Management System for Mine Action (IMSMA) for its mine action data. After facing numerous problems, including a lack of reliable data, the mine action database at UMAC was completely reconstructed in 2008 to include only remaining SHA reports and clearance data. An IMSMA database is also located at the regional mine action center in Gulu.⁵⁷

⁵⁷ See *Landmine Monitor Report 2008*, p. 714; and response to Landmine Monitor questionnaire by Vicent Woboya, UMAC, 29 March 2009.

In 2008, DDG worked with UMAC to develop its capacity to enter RE activity data into IMSMA, and submission of activity data is a requirement for accredited organizations under the new standards.⁵⁸

In 2008, the MoH was mandated to establish the National Surveillance Network. But due to staff challenges and a lack of resources, no progress was made,⁵⁹ and it was noted that the lack of data hampered victim assistance progress.⁶⁰ At a mine action meeting at the MoGLSD in May 2009, it was confirmed that neither government nor non-governmental agencies had comprehensive casualty data. Additionally, there is no formal procedure for reporting new casualties.⁶¹ Regional data collection is not proactive or complete.⁶² In 2009, community development officers and other actors were given questionnaires developed by the MoGLSD in an attempt to create baseline information in four affected districts in northern Uganda. The data was considered to be insufficient, as it lacked sufficient quantitative information,⁶³ probably because the community development officers were not well-prepared to collect this information.⁶⁴

As of June 2009, no casualty information had been entered into IMSMA, due to a lack of up-to-date information on older casualties, no standard reporting mechanism for new casualties, delays at UMAC due to staffing issues, and the departure of trained staff at other organizations.⁶⁵ Additional reasons mentioned were incomplete data collection and duplication of previously collected data (due to population movements), and the inclusion of casualties not caused by mines/ERW. In October 2008, with DDG assistance, a database officer was recruited and trained at UMAC and a standard form developed.⁶⁶

In May 2009, Uganda said that it had insufficient resources to generate comprehensive data on mine/ERW survivors and other persons with disabilities.⁶⁷

Plans

In 2008, Uganda set strategic objectives to reduce mine and ERW incidents by 80% in 2009 and prepare for a residual mine action response capacity, while integrating mine action needs into national humanitarian, development, and reconstruction plans and budgets.⁶⁸ In coordination with UNDP, it planned in 2009 to incorporate the national mine action program into the National Emergency Coordination and Operations Center. This would allow the Office of the Prime Minister to coordinate all disaster risk reduction efforts.⁶⁹

The Comprehensive Plan of Action on Victim Assistance 2008–2012 is the basis of VA implementation and contains a situational analysis, detailed objectives and plans, clear responsibilities, and funding requirements (US\$2.95 million).⁷⁰ The National Mine Action Policy also contains provisions for VA, and the draft national mine action standards were said to include VA provisions.⁷¹

The National Council for Disability (NCD) is to monitor the extent to which government, the private sector, and NGOs “include and meet the needs of [persons with disabilities] in their planning and service delivery.”⁷² Mine/ERW survivors are included in this council.⁷³ The NCD was appointed to monitor the VA plan, but only receives UGX2 million (less than \$1,000) per year for this.⁷⁴

Integration of mine action with reconstruction and development

Mine action in Uganda is implemented within the policy framework of broader government planning, which includes the Internally Displaced Persons’ Policy 2004, the National Policy on Rights of People with Disabilities 2006, and the 2008 draft Policy for Disaster Preparedness and Management.⁷⁵

National ownership

Commitment to mine action and victim assistance

Uganda has demonstrated a commitment to mine action through its establishment of a mine action coordination and management structure, though it missed its Article 5 deadline and failed to submit an extension request to the relevant meeting of States Parties.

Through the appointment of the MoGLSD as the focal point for VA and the involvement of relevant ministries, Uganda is increasingly showing national ownership of VA, which has since 1999 evolved from being a “mere NGO program” to a government responsibility supplemented by partner activities.⁷⁶ However, the MoGLSD continues to lack sufficient funding or capacity to undertake or support planned activities.⁷⁷

National management

The mine action program was established as a UNDP direct execution project supported by international funding and technical advisors. In April 2007, Uganda had announced that it would move to a nationally executed program during the course of the year, but as of March 2009 the transition had not been finalized.⁷⁸ UMAC and DDG have had a Memorandum of Understanding since July 2007 whereby DDG undertakes to operate within UMAC, establish a base in Gulu

district (the office which later became the regional MAC), and have a technical advisory role and oversee demining.⁷⁹

The 2008–2012 VA plan aims to integrate VA into the larger disability sector and is linked to existing strategies in the health and social sectors as well as the poverty eradication strategy. But, as of May 2009, it is unclear how implementation of activities is divided between the different strategies. One operator expressed concerns that a program similar to the VA plan was under development for victims of war in general without taking the VA one into account.⁸⁰

Uganda is heavily dependent on external funding for VA. The departure of the VA technical advisor to UMAC and a blockage of UNDP funding were, as of June 2009, major setbacks to implementation of the 2008–2012 plan.⁸¹ Uganda acknowledged that “different NGOs have played a big role in victim assistance” and continued to do so.⁸² A VA/RE officer was deployed again in late 2008 (by DDG with UNDP funding),⁸³ and UNDP funds for implementation of the VA plan in 2007–2008 were released at the end of March 2009.⁸⁴ It is unclear how much national funding was dedicated to VA/disability,⁸⁵ but it was noted by one operator that the government was “reluctant” to spend money on disability.⁸⁶

National mine action standards/Standing operating procedures

The Uganda National Mine Action Standards were approved by the NMASC in November 2007. The document was published on 1 December 2008. UMAC uses standing operating procedures developed with the technical assistance of DDG. A land release model and standard is explained in Chapter 10 of the National Mine Action Standards (NMA).⁸⁷

Program evaluations

An external evaluation of Uganda’s mine action program took place in March–April 2007.⁸⁸ The results have never been made public, but, according to UMAC, one of the recommendations was to ensure the transition to a nationally executed program.⁸⁹

Demining and Battle Area Clearance

UMAC is in charge of personnel from the Ugandan army and police who were trained in demining and EOD and seconded to it.⁹⁰ As of 2008, there were 12 national demining teams, with a total of 60 demining personnel.

To date, the vast majority of clearance operations have been spot-task EOD. Indeed, Uganda did not conduct any formal mine clearance operations in 2008. Clearance teams completed 434 EOD tasks in 442 villages in Amuru, Bundibugyo, Gulu, Kasese, Kitgum, and Pader districts. During operations in 2008, 13 antipersonnel mines, six antivehicle mines, and 2,635 items of UXO were found, as well as 18,471 pieces of small arms ammunition.⁹¹

Identification of hazardous areas

In 2007–2008, UMAC, with technical assistance from DDG, re-surveyed the country after UNDP and UMAC questioned the results of a baseline survey conducted by Mines Awareness Trust in 2005–2006. The re-survey found a total of only 24 landmines located over a wide area.⁹²

In late 2008, the national demining teams with assistance from DDG conducted a general survey in Kitgum and found the two mined areas referred to above. In March 2009, a base camp had been built in preparation for the technical survey and clearance had begun. These followed a delay of several months as a result of the difficult logistics involved in supplying the remote base camp, which was four hours walk from Gulu.⁹³ UMAC planned to apply land release principles on the remaining suspected areas.⁹⁴

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Uganda was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 August 2009. Uganda was slow to initiate a mine action program—clearance operations did not start until 2006—and it failed to clear all known remaining mined areas by the expiry of its Article 5 deadline.

In November 2007, at the Eighth Meeting of States Parties, UMAC's director had asserted Uganda's intention "to clear all identified mined areas in Uganda... by August 2009. There is strong will and support by Government of Uganda to ensure this is achieved."⁹⁵ As recently as May 2009, at the Standing Committee meetings, Uganda reiterated it would meet its Article 5 clearance obligation by the deadline while at the same time stating only that it would be "mine impact free," which is not equivalent to full compliance with treaty obligations.⁹⁶

In July 2009, however, Uganda declared that it had underestimated the complexity of clearing its known remaining mined areas and the time required to clear them. As a result, it would not meet the 1 August deadline and would seek an extension at the Second Review Conference.⁹⁷ Missing the deadline placed Uganda in violation of Article 5 of the Mine Ban Treaty until it either completed clearance or was formally granted an extension by the other States Parties, whichever occurred sooner.

Risk Education

In 2008, RE was conducted by NGOs through training focal points in communities to conduct peer education, especially teachers and members of local drama clubs, and through conducting some direct presentations in schools and communities. They made efforts to ensure women and youth were represented. IDP camps were a focus for RE because of their inhabitants' anticipated return to their communities that might be mine/ERW-affected. RE was also conducted through radio and the media.⁹⁸ At least 171,497 people were reported to have received direct RE in 2008 (not including those who received RE through the mass media). This is a reduction from 2007, when at least 241,919 people were reported to be reached with some form of RE, which was double that of 2006.⁹⁹

⁹⁹ See *Landmine Monitor Report 2008*, p. 718.

RE was implemented by international NGOs and several community-based organizations.¹⁰⁰ DDG started activities in June 2008.¹⁰¹ Canadian Physicians for Aid and Relief (CPAR) reduced their activities in 2008 due to insufficient funding.¹⁰²

NMAS were passed and approved in December 2008. They include a chapter on RE, and all organizations are required to be accredited by UMAC. The standards provide for the RE/VA coordinator, once appointed, to monitor implementation of activities against the standards.¹⁰³

UMAC organized training courses for NGOs in 2008, with the support of DDG. It also organized meetings to synchronize messages, shifting focus from landmines to UXO.¹⁰⁴ Communities were provided with a hotline number to report contamination. Requests for clearance were responded to by UMAC.¹⁰⁵

UMAC and UNDP conducted several monitoring visits in 2008. The main issues they found were that NGOs were slow to adopt the new UXO-focused messages, and they did not always report their activities to UMAC to be entered into IMSMA, usually because RE was only one part of their activities and they did not have time to do so.¹⁰⁶

Rick education activities in 2008¹⁰⁷

Organization	Type of activity	Geographic area	No. of beneficiaries
AVSI	Drama sensitizations, training of trainers, and community awareness training sessions	Gulu, Amuru, Kitgum, and Lira	30,676
CPAR	RE integrated with youth peace-building project through Youth Coalition for Peace	Gulu, Amuru, Pader	Approximately 20,000
World Vision International (WVI)	School-based RE, RE through drama groups, radio broadcasts	Kitgum, Pader, Gulu, and Amuru	All population of northern Uganda through broadcasts, 100,460 through direct presentations, and all schools in area of operations
DDG	RE training to national staff and other NGOs, development of materials, RE school clubs, provision of RE to communities at risk	Gulu	19,689 (18,639 children and 1,058 adults)
Anti Mine Network-Rwenzori	RE on scrap metal collection to school children in four schools	Around Kasese town	672 primary school children

¹⁰⁶ *Ibid.*

¹⁰⁷ Response to Landmine Monitor questionnaire by Elina Dibirova, DDG, 27 February 2009; email from Walter Mwaka, Project Coordinator, World Vision International, 26 June 2009; interview with Komakech Henry Banya, Team Leader (Gulu/Amuru), CPAR, 26 June 2009; and emails from Wilson Bwambale, Coordinator, Anti-Mines Network-Rwenzori, 25 June 2009; Michael Ocan, Mine Risk Education Program Officer, AVSI, 25 June 2009; and from Anne Miller, Director of Programs, CPAR, 22 July 2009.

Since 1999, RE has been delivered by government bodies and international and national NGOs. Methods have consisted of training of trainers (NGO staff, school teachers, health workers, and community leaders), community awareness activities including the use of dance and drama, mass media, and distribution of materials. The level of RE has increased over the years, though it has remained inadequate, in part due to conflict and lack of funding. It has mainly been focused on the north and to a lesser extent, the west of the country.¹⁰⁸ From 2005, there was a focus on IDPs, with an increase in RE activities in 2007 in response to IDP resettlement in the north.

A mine action assessment in 1999 in Gulu district found a low level of mine awareness.¹⁰⁹ Later evaluations found that RE had resulted in improved knowledge and behavior related to mines and UXO, and it was noted that reporting of contamination has increased.¹¹⁰ However, in 2006 it was reported that some RE was substandard and messages were not coordinated. From 1999, RE was coordinated by the Ministry of Health,¹¹¹ although in 2004 it was reported that RE was not centrally coordinated.¹¹² Monthly RE meetings were started in 2005, and UMAC became responsible for coordination.¹¹³ In 2006, UMAC planned to recruit a national coordinator, although this still had not happened by mid-2009. National standards started to be developed in 2006.¹¹⁴

Victim Assistance

The total number of survivors is unknown but is estimated at around 1,000. In November 2008, Uganda reported, as in previous years, that it was still facing “many challenges” in implementing VA due to competing priorities, inadequate technical support for capacity-building in ministries, local authorities, and local survivors groups, and lack of funding.¹¹⁵ In May 2009, Uganda repeated that resources were lacking to provide assistance to survivors in all mine/ERW affected districts.¹¹⁶ This seems to be affecting survivors in Kasese in particular.¹¹⁷ The NCD noted that the “situation remained appalling.”¹¹⁸

One improvement noted in the lives of survivors since 1999 was their increased participation in decision-making processes and their organization into survivors’ associations, as well as these associations’ increased competence and resource mobilization skills.¹¹⁹ One representative of a survivors’ group in Gulu noted some improvements in physical rehabilitation, attitudes, and grassroots survivor initiatives compared to 1999.¹²⁰

Most hospitals in Uganda are in bad condition and services inadequate, due to rapid population growth, increasing fuel/medication prices not accompanied by increased government budgets, and a brain drain.¹²¹ Most existing facilities lacked the capacity to effectively handle trauma, first-aid responders needed training, and post-emergency care was considered “quite weak” in government hospitals.¹²²

Uganda has a network of 14 physical rehabilitation centers under the responsibility of the MoH and one training center which is not recognized by the International Society for Prosthetics and Orthotics.¹²³ A large number of amputees, particularly in western Uganda had not received physical rehabilitation.¹²⁴ Survivors often needed to cover the cost of transport and accommodation. Centers lacked staff, raw materials, and capacity to follow up after fitting.¹²⁵

Psychosocial support was considered the weakest component and in need of strengthening and expansion into remote areas. The MoGLSD carried out psychosocial support through its community development officers, but for NGOs it was difficult to obtain funding for this type of activity. Stigma prevented survivors from accessing services,¹²⁶ but survivors' groups were being trained in peer support.¹²⁷

Since 1999, the economic status of survivors has not improved significantly, reportedly in part because many survivors have low education levels. Even when people receive training, very few employment opportunities existed, and there was no system to track employment after training.¹²⁸ Representatives of disabled persons' organizations noted that survivors were not included in program design and that implementers showed little "positive discrimination" for survivors.¹²⁹ The government's vocational training centers lack resources and are essentially defunct.¹³⁰ Economic reintegration activities are mostly carried out by NGOs.¹³¹

Uganda has legislation to protect the rights of persons with disabilities, who have representatives at various government levels. Nevertheless, discrimination remained, and the Uganda Human Rights Commission received complaints of discrimination in employment and access to transport and public services.¹³² On 28 September 2008, Uganda ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol.

Progress in meeting VA26 victim assistance objectives

Uganda is one of 26 States Parties with significant numbers of mine survivors and therefore "the greatest responsibility to act, but also the greatest needs and expectations for assistance" in providing adequate services for the care, rehabilitation, and reintegration of survivors. As part of its commitment to the implementation of the Nairobi Action Plan, Uganda presented its 2005–2009 objectives at the Sixth Meeting of States Parties in 2005. Revised objectives and plans to achieve the objectives were presented in November 2007 under the form of the Comprehensive Plan of Action on Victim Assistance 2008–2012 (see above).¹³³ All actors saw the development of this plan as a key achievement between 2005 and 2009,¹³⁴ even if actual implementation only started in June 2009. Additionally, many of the objectives with the earliest deadlines pertained to needs assessment, capacity building, and strengthening of structures, rather than actual activity implementation.¹³⁵

¹³⁴ "Official Common Country Response" to Landmine Monitor questionnaire, 15 June 2009; responses to Landmine Monitor questionnaire by AVSI, 18 June 2009 and GALMSG, 17 June 2009; email from Muhamud Mudaki, KLSA, 17 June 2009; and interview with Herbert Baryayebwa, MoGLSD, in Geneva, 29 May 2009.

¹³⁵ MoGLSD in collaboration with the OPM and the MoH, "Comprehensive Plan Landmine Victim Assistance," Kampala, undated but 2007, pp. 18–44.

AVSI noted that the 2008–2012 plan helped to guide its actions and avoid duplication. It reported progress under several objectives, including addressing inequality and exclusion through awareness-raising, support to survivor groups, skills training, and income-generating activities to decrease social vulnerability; continued support to the physical rehabilitation center in Gulu; and the development of psychosocial services.¹³⁶

Overall, objectives to be achieved in 2008–2009 have been delayed due to funding and capacity challenges, even though work has been carried out.

- **Data collection:** Reliable data on casualties and services was not expected before the end of 2009, data collection mechanisms were not functioning adequately, and newly collected information was deemed insufficient (see Data collection and management section above).
- **Medical care:** No progress was made on improving emergency care mechanisms.
- **Physical rehabilitation:** No progress was reported on integrating physiotherapy services and developing outreach services. Most objectives have deadlines for 2012.
- **Psychosocial support:** The objectives related to awareness-raising campaigns and activities were only reported by AVSI. NGOs also provided support to survivor groups and peer support training.
- **Economic reintegration:** There are no major improvements to the actual situation of survivors, but preparatory steps were taken in accordance with some objectives, such as the development of accessibility guidelines, strengthening of community/family support networks through the adoption of the community-based rehabilitation strategy, and a needs assessment (albeit inadequate).
- **Laws and public policies:** Ratification of the UN Convention on the Rights of Persons with Disabilities, capacity-building for VA implementers, and work to operationalize the national disability policy were reported. No progress was reported on monitoring the 2008–2012 plan, activities under the African Decade for the Disabled (2000–2009), or decreasing stigma.

In May 2009, Uganda did not provide a detailed progress update on its achievements for 2008 because it was preparing its report “on the status of victim assistance for presentation at the Second Review Conference.”¹³⁷ Some achievements and challenges detailed in past statements were listed. Uganda participated in a regional VA workshop in 2005, held a national planning workshop in August 2007, and included a VA expert on its delegation for each intersessional Standing Committee Meeting and each meeting of States Parties between 2005 and 2009. Three times this expert was the Minister of State for Elderly and Disability Affairs (2006–2007). Uganda reported on VA at each of these meetings, but did not use voluntary Form J of its annual Article 7 report.¹³⁸

Victim assistance activities

MoGLSD activities largely related to coordination, policy, and guideline development and, to a lesser extent, data collection and psychological support, as explained above.

The Gulu Amuru Landmine Survivors Group (GALMSG) had 286 members as of 2009, and its main activities were capacity-building, psychosocial support, socio-economic reintegration, and rights advocacy. In 2008, 35 survivors received small business management training and loans, 20 were trained in solar panel assembly and provided with solar panels for income-generating purposes, 100 received counseling, 11 were trained to provide peer support, and five received material support. GALMSG’s main challenge was obtaining funding to support

¹³⁶ Response to Landmine Monitor questionnaire by Femke Bannink, AVSI, 18 June 2009.

¹³⁷ Statement by Herbert Baryayebwa, MoGLSD, Standing Committee on Victim Assistance and Socio-Economic Reintegration, Geneva, 26 May 2009.

¹³⁸ Co-Chairs of the Standing Committee on Victim Assistance and Socio-Economic Reintegration (Cambodia and New Zealand), “Status of Victim Assistance in the Context of the AP Mine Ban Convention in the 26 Relevant States Parties 2005–2008,” Geneva, 28 November 2008, p. 17.

the return and reintegration of IDP survivors in their home villages. GALMSG is supported by AVSI and Humanist Action for Human Rights.¹³⁹

In 2008, the Kasese Landmine Survivors Association was still facing difficulties after UNDP funding earmarked to support its activities in 2007 was blocked.¹⁴⁰ With individual donations it was able to complete its registration as a national NGO as advised by the MoGLSD, to cover some costs for its banana rope-making project and to provide a sewing machine to one survivor in 2008. In April 2009, it received some of the blocked UNDP funding for the rope-making project and office materials.¹⁴¹

In 2008, AVSI continued its physical rehabilitation activities and expanded socio-economic reintegration and capacity-building. It provided support to several survivors' groups in northern Uganda. AVSI's main challenges were the cost of sustaining the Gulu rehabilitation center and working towards its sustainability. Other challenges were the increased demand for services at the center and the inability of the local government to provide transport for clients as agreed. AVSI provided physical rehabilitation to 308 persons with disabilities (53 survivors), psychosocial support to 589 (43 survivors), and socio-economic reintegration and business training to 610 (582 survivors); 38 survivors also received material support. Since 1999, AVSI's support has evolved from direct physical rehabilitation provision into socio-economic reintegration and capacity-building activities for survivors' groups (leadership, accountability, transparency, and monitoring).¹⁴²

CPAR faced challenges to continue its VA and RE programs after funding ended in March 2008. Some activities were still conducted through an integrated youth peace-building program.¹⁴³

After an assessment in March 2008, the ICRC resumed its technical and financial assistance to physical rehabilitation in Uganda in October 2008.¹⁴⁴ Support provided to the Fort Portal Rehabilitation Center in West Uganda focused on structural and organizational improvements and orthopedic supplies. The ICRC also supported Mbale Rehabilitation Center in eastern Uganda and assisted the MoH in developing a standard list and logistics chain for prosthetic/orthotic supplies.¹⁴⁵ Between 1998 and 2002, the ICRC had already provided assistance to three physical rehabilitation centers (Fort Portal, Gulu, and Mbarara). The Mbarara center ceased operations in 2006 due to a lack of partners supporting the center in supplies and managerial issues.¹⁴⁶

Support for Mine Action

The NMASC is responsible for development and coordination of budgets, resource mobilization, and donor relations for all areas of mine action in Uganda.¹⁴⁷ The Uganda Comprehensive Plan of Action on Victim Assistance 2008–2012 includes a cost estimate for the period from 2008–2012 totaling \$2,954,684 (€2,154,973), including \$212,404 for research and monitoring, \$378,320 for medical care, \$787,000 for physical rehabilitation, \$323,000 for psychological support and social reintegration, \$686,460 for economic reintegration, and \$567,500 to support laws and public policies.¹⁴⁸

¹⁴⁸ *Ibid.*, p. 15.

National support for mine action

In a submission to the Eighth Meeting of States Parties, Uganda stated that negotiations had begun to initiate a new national budget line for mine action.¹⁴⁹ UNDP reported that the budget line had been opened and funds allocated from it.¹⁵⁰ In May 2009, Uganda stated that an increase of funds from the mine action budget line was being sought, but did not report on the amount contributed from national funds in 2008 or 2009.¹⁵¹

International cooperation and assistance

In 2008, Canada and Denmark reported providing \$783,506 (€532,056) to mine action in Uganda. Reported mine action funding in 2008 was approximately 57% less than that reported for 2007. In spite of the steep decline after several years of stable funding, funding levels appear sufficient for Uganda to complete its mine clearance obligations. However, Uganda has stated a need for continued international assistance to address ERW, including cluster munition remnants, and to continue RE and VA programming.¹⁵²

2008 International Mine Action Funding to Uganda: Monetary¹⁵³

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Denmark	DDG	Integrated mine action	\$461,775 (DKK2,350,000)
Canada	AVSI, DDG, CPAR	RE, VA	\$321,731 (C\$342,960)
Total			\$783,506 (€532,056)

At the Standing Committee meetings in May 2009, Uganda reported its donors as Austria, Australia, Canada, Denmark, Germany, Ireland, Norway, Sweden, and the United Kingdom.¹⁵⁴ It did not specify in which years each donor provided funds.

¹⁴⁹ "Summary of Information Provided by States Parties on the Implementation Of Article 5 in the Context of Questions Posed by the co-chairs at the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies," 21 November 2007, APLC/MSP.8/2007/MISC.3/Rev.1, p. 16. According to UNDP, there was a UGX50 million (\$26,000) budget line item for 2006–2007, but it was not fully used by the OPM/UMAC. Email from Lydia Good, Mine Action Programme Specialist, Conflict Prevention and Recovery Team, Bureau for Crisis Prevention and Recovery, UNDP, 11 August 2008.

UKRAINE

Ten-Year Summary

Ukraine became a State Party to the Mine Ban Treaty on 1 June 2006. Ukraine informed States Parties in May 2009 that it was unlikely that it would be able to meet its 1 June 2010 stockpile destruction deadline. It still possesses 5.95 million PFM-type mines and 149,096 POM-2 mines. It destroyed 101,088 PFM-1 mines in 1999 and 404,903 PMN-type mines in 2002 and 2003, as well as more than 254,000 other antipersonnel mines.

Ukraine has stated that it has no known mined areas on its territory although mines from World War II continue to be found, albeit in small numbers. A much greater problem comes from explosive remnants of war (ERW) left from WWII and from former Soviet bases and military training areas.

Between 1999 and 2008, Landmine Monitor identified at least 115 mine/ERW casualties (55 killed, 57 injured, and three unknown) in Ukraine. Due to lack of comprehensive data collection, these figures may not represent the full scope of the problem. Risk education was provided on an *ad hoc* basis to emergency personnel and civilians in affected areas. There are no specific victim assistance programs, but war veterans are provided with financial support for medical, rehabilitation, and social services. Access to services remains difficult.

Mine Ban Policy

Ukraine signed the Mine Ban Treaty on 24 February 1999 and ratified on 27 December 2005, becoming a State Party on 1 June 2006. Ukraine has not reported any steps taken to implement the treaty domestically, as required by Article 9.

Ukraine submitted its fourth Article 7 report on 20 April 2009, for the period 20 April 2008 to 20 April 2009.¹

Ukraine participated in the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings held in May 2009. At both meetings, Ukraine made statements on stockpile destruction.

Ukraine has not made known its views on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Ukraine is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines.² It submitted a national annual report as required by the protocol's Article 13 on 12 April 2009. Ukraine is also party to CCW Protocol V on Explosive Remnants of War; it submitted a national report as required by the protocol's Article 10 on 24 April 2009.

Ukraine has not signed the Convention on Cluster Munitions.³

¹ Ukraine submitted previous Article 7 reports on 12 December 2006, 11 April 2007, and 20 April 2008.

² At the time of adherence on 15 December 1999, Ukraine deferred compliance with Amended Protocol II's requirements for self-destruction and self-deactivation of remotely-delivered antipersonnel mines for nine years. The deferral became irrelevant when Ukraine became a State Party to the Mine Ban Treaty, which prohibited it from using antipersonnel mines and obligated complete destruction of stocks by June 2010.

³ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 249–250.

Production, transfer, stockpiling, and destruction

Ukraine has repeatedly stated that it has not produced antipersonnel mines since its independence.⁴ Ukraine is not known to have exported antipersonnel mines. Its 1999 moratorium on the export of antipersonnel mines was formally in place through 2003, and in practice stayed in effect until the Mine Ban Treaty entered into force for Ukraine.⁵

Ukraine's treaty-mandated deadline for the destruction of all stockpiled antipersonnel mines is 1 June 2010. Ukraine informed States Parties in May 2009 that it was unlikely that it would be able to meet the deadline.

Ukraine's Article 7 reports have presented different information on the quantities and types of stockpiled antipersonnel mines, which in turn are different from previously revealed information, as detailed in the following table.⁶

Antipersonnel Mines Stockpiled by Ukraine⁷

Mine Type	Landmine Monitor Report 2006	Art 7 (2006)	Art 7 (2007)	Art 7 (2008)	Art 7 (2009)	May 2009
PFM	5,947,596	5,950,684	5,950,684	5,950,684	5,950,540	5,950,372
POM-2	148,696	149,144	0	149,096	149,096	149,096

POMZ-2M	204,021	0	0	0	0	N/R
Total	6,664,342	6,405,800	6,304,907	6,454,003	6,453,859	6,099,468

N/R= not reported

Even prior to ratifying the Mine Ban Treaty, Ukraine destroyed 101,088 PFM-1 mines in 1999 and more than 400,000 PMN-type mines in 2002 and 2003.⁸

⁴ Most recently, in May 2009, Ukraine said it "did not produce APL in the past, doesn't produce at present, and will not produce them in the future." Presentation by Ukraine, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

⁵ See *Landmine Monitor Report 2006*, p. 764.

⁶ Landmine Monitor has previously reported that it appears that Ukraine inherited a stockpile of 7.17 million antipersonnel mines from the Soviet Union, including 716,746 of various types of hand-emplaced mines, 404,903 PMN-type mines, and 6,048,684 PFM-type mines. See *Landmine Monitor Report 2006*, p. 764. However, those totals did not include 8,060 PMD-6 mines Ukraine has more recently reported as destroyed.

⁷ With respect to the numbers cited in the *Landmine Monitor Report 2006* column, the PFM number was provided by Ukraine in November 2000 to a stockpile assessment mission funded by Canada. The other numbers are from an August 2005 EC tender for destruction of non-PFM mines in Ukraine.

⁸ Ukraine initially reported destroying 404,903 PMN and PMN-2 antipersonnel mines from July 2002 to May 2003 under a joint project with the NATO Maintenance and Supply Agency, funded primarily by Canada. See *Landmine Monitor Report 2003*, pp. 546–547. In November 2008, it reported it had destroyed 400,927 PMNs, and still had 223 more to destroy. Presentation by Ukraine, Ninth Meeting of States Parties, Geneva, 26 November 2008. In May 2009, it reported that it had destroyed 400,940, and had none left to destroy. Presentation by Ukraine, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

In June 2008, Ukraine reported that between 2005 and 2007, an experimental program to partially dismantle and destroy 8,000 POM-2 mines was carried out at the Donetsk Chemical Plant, and a further 48 POM-2 mines were destroyed at the Pavlograd Chemical Plant.⁹

In a November 2008 presentation, Ukraine indicated it has also destroyed its entire stock of 238,010 POMZ-2 and POMZ-2M mines, as well as all 8,060 PMD-6 mines.¹⁰ It subsequently informed Landmine Monitor that the destruction took place in 2006.¹¹

In its Article 7 reports submitted in 2007, 2008, and 2009, Ukraine noted that while its MON-type and OZM-type antipersonnel mines can be used in command-detonated mode in compliance with the Mine Ban Treaty, these stockpiled mines are excessive and not suitable for use, and it has plans to destroy them.¹² The Article 7 report covering 2008 continued to list 296,288 OZM mines and 57,935 MON mines as in the stockpile.¹³

Destruction of PFM-type mines

The Ministry of Defense destroyed a total of 101,088 PFM-1 mines between March and April 1999 at the Desna Training Center at a cost of €120,000 (US\$176,712).¹⁴ These mines contain a liquid explosive filling (VS6-D) that makes them dangerous and difficult to destroy.

In 2002, the European Commission (EC) launched a project to prepare the destruction of Ukraine's remaining PFM mines.¹⁵ However, a contract awarded in December 2005 to a consortium led by the Deutsche Gesellschaft für Technische Zusammenarbeit was terminated on 18 April 2007 at the request of the consortium "on the grounds of non-fulfillment by the [government of Ukraine] of their obligations."¹⁶ No mines were destroyed before the end of the contract.

In April 2008, the Mine Ban Treaty's Standing Committee on Stockpile Destruction convened an informal closed consultation on destruction of PFM-type mines—including Ukraine, interested donors, and experts on stockpile destruction—which concluded that Ukraine should pursue more diversified sources of funding to pay for its stockpile destruction programs.¹⁷

Ukraine confirmed its determination to comply with its stockpile destruction obligation in a presentation to the Standing Committee on Stockpile Destruction in June 2008. Ukraine said it had decided to make a national contribution toward the destruction of a portion (about 1.6

⁹ Presentation by Ukraine, Standing Committee on Stockpile Destruction, Geneva, 2 June 2008. Notes by Landmine Monitor. Ukraine also cited the figure of 8,048 POM-2 mines destroyed in its presentations to the Ninth Meeting of States Parties in November 2008 and the Standing Committee on Stockpile Destruction in May 2009.

¹⁰ Presentation by Ukraine, Ninth Meeting of States Parties, Geneva, 26 November 2008. In May 2009, Ukraine instead cited figures of 238,000 POMZ and 8,006 PMD-6 mines. Presentation by Ukraine, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

¹¹ Telephone interview with Oleksandr Schebetuk, Head of Engineering, Munitions Department, MoD, 17 August 2009. Ukraine's initial Article 7 report in 2006 did not list these as stockpiled mines.

¹² Article 7 Reports, Form B, 11 April 2007, 20 April 2008, and 20 April 2009. The report submitted in 2009 stated that these mines "are considered to be used in their controlled model. They do not fall under the provisions of the Ottawa convention. However, we have an excessive amount of them and they are planned to be destroyed." The report submitted in 2008 said the mines "are unsuitable for use" and will be destroyed. The report submitted in 2007 said these mines "are approved for usage in controllable variant, and are not covered by MBT, but they are not usable and planned for destruction." Presumably this means that the mines are in unsafe condition or beyond their shelf-life and will be destroyed.

¹³ Article 7 Report, Form B, 20 April 2009.

¹⁴ After analyzing the consequences of this destruction, Ukraine decided it was necessary to destroy the rest of the PFM mines in a safer and more environmentally-friendly manner. See *Landmine Monitor Report 2005*, p. 654.

¹⁵ In mid-2003, an EC technical study determined that the condition of the PFM stockpiles was good, and the mines were consolidated into two sites, from a previous total of 13 storage locations. See *Landmine Monitor Report 2006*, p. 765.

¹⁶ See *Landmine Monitor Report 2007*, pp. 714–715.

¹⁷ Informal closed consultations on PFM mines, Standing Committee on Stockpile Destruction, Geneva, 11 April 2008.

million mines) of its PFM stockpile. Ukraine assigned existing facilities and a rotary kiln at the Pavlograd Chemical Plant for this purpose.¹⁸

In August 2008, Ukraine's Prime Minister Yulia Tymoshenko requested a renewal of EC assistance, and the EC responded in October by proposing that European Neighbourhood and Partnership Instrument (ENPI) funds be used.¹⁹

In November 2008, Ukraine confirmed that it had provided funds from its state budget to commence the destruction process, and informed States Parties that a 13 November 2008 Presidential Decree set the starting date of 1 December 2008. It said the mines were already being transported to Pavlograd, and it expected to destroy "the first thousands" of PFM mines in February–March 2009.²⁰

However, it stressed that "by its own resources Ukraine is capable to eliminate only the half of its PFM stockpiles in time [by the June 2010 deadline]. Acquisition of additional rotary kiln will make it possible to speed up the destruction process, with the aim of timely fulfilment [sic] of Ukraine's obligations....Ukraine urges the States Parties to contribute to the provision of financial and technical assistance in order to complete the PFM destruction in Ukraine."²¹

Ukraine agreed in January 2009 to an EC assessment mission to visit the existing stockpile destruction facilities, and the expert visit took place in May 2009.²²

In May 2009, Ukraine told States Parties that it is unlikely it will be able to meet its June 2010 deadline. It said that its plans call for the destruction of 1.5 million PFM mines in 2009 and 600,000 more in 2010, but that the plan was being undermined by a lack of financial resources. It appealed to States Parties to find a "joint solution" to the problem and to come up with an option that would "prevent Ukraine from violating the Article 4 deadline."²³

According to Ukraine's Article 7 report for 2008, a total of 144 PFM mines were destroyed in the reporting period, leaving a total of 5,950,540.²⁴ In the May 2009 presentation, Ukraine provided a different number for the stockpiled PFM mines—5,950,372—presumably indicating the destruction of an additional 168 mines.²⁵

Mines retained for training

Ukraine originally indicated it would retain 1,950 mines (950 PMN and 1,000 PMN-2) for training and research purposes.²⁶ In its April 2008 Article 7 report, this number was reduced to 223 mines (103 PMN and 120 PMN-2),²⁷ with 847 PMN and 880 PMN-2 mines destroyed.²⁸ In its Article 7 report submitted in April 2009, Ukraine lists a total of 211 mines retained for training, with 12 PMN mines destroyed.²⁹

¹⁸ Statement of Ukraine, Standing Committee on Stockpile Destruction, Geneva, 2 June 2008. Notes by Landmine Monitor.

¹⁹ Presentation by Ukraine, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

²⁰ Ukrainian Delegation to the Ninth Meeting of States Parties, "Implementation of the Article 4 of the Ottawa Convention in Ukraine," Non-paper, November 2008; and see presentation by Ukraine, Ninth Meeting of States Parties, Geneva, 26 November 2008.

²¹ Ibid.

²² Presentation by Ukraine, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

²³ Ibid.

²⁴ Article 7 Report, Forms A and G, 20 April 2009. The Article 7 report said the mines were destroyed "carrying out experimental works disassembling and reusing the mine cassettes." In March 2009, a government official told Landmine Monitor that the 144 PFM mines were destroyed by burning in the kiln. Interview with Oleksandr Schebetuk, MoD, Kiev, 20 March 2009. In November 2008, Ukraine was still citing the higher figure of 5,950,684 PFM mines. Presentation by Ukraine, Ninth Meeting of States Parties, Geneva, 26 November 2008.

²⁵ Presentation by Ukraine, Standing Committee on Stockpile Destruction, Geneva, 25 May 2009.

²⁶ Article 7 Report, Form D, 11 April 2007. It is unclear what stockpiles these mines came from because Ukraine had reported the destruction of all its PMN-type mines in 2002 and 2003.

²⁷ Article 7 Report, Form D, 20 April 2008.

²⁸ Ibid, Form G. It appears the mines were not consumed during training activities, but simply destroyed as unnecessary for retention.

²⁹ Article 7 Report, Form D, 20 April 2009.

Ukraine has not reported in detail on the intended purposes and actual uses of retained mines, as agreed by States Parties in 2004.

Scope of the Problem

Contamination

Ukraine is affected by landmines and ERW, both UXO and abandoned ordnance, mostly as a result of heavy fighting between German and Soviet forces in World War II, but also from World War I, the 1917–1921 civil war, and the Cold War. Ministry of Defense (MoD) engineering forces completed partial clearance of affected areas in the mid-1970s, but demining operations continue to this day. The precise scope of any residual mine problem is not known, but the ERW contamination is extensive. On 21 May 2009, one person died and another was seriously injured as a result of explosion of an item of UXO in Lozovoy district.³⁰

In its Article 7 reports, Ukraine has declared no known or suspected areas containing antipersonnel mines under its jurisdiction or control.³¹ On 28 April 2009, two teenagers died and one was injured as a result of a mine blast in Topolskoe village, Izjumska district, Kharkov province.³²

The ERW problem includes World War II ammunition storage areas (ASAs), particularly around the towns of Kerch and Sevastopol where munitions were stored in a horizontal passageway driven into a hill or mountainside known as an “adit.” On 27 August 2008, an ASA belonging to the army’s 61st southern operational command in Lozovoy district, Kharkov province exploded, injuring two men.³³

There was also a problem from a former Soviet ASA at Novobohdanovka that exploded in 2004 (now cleared), as well as military training areas used by the Soviet Army, said to affect 1km² of land in Ukraine. Underwater munitions have been found in the Black Sea near Kerch, Odessa, and Sevastopol, including naval mines from World War II.

There are also said to be 34 former Soviet military training areas with residual contamination, which reportedly cover more than 150km² of land.³⁴ In 1991–2007, these areas were handed over to the local population and local municipalities, but reportedly without full survey and clearance. There have since been civilian deaths and injuries due to handling of items of UXO.³⁵

Casualties

In 2008, Landmine Monitor identified at least six mine/ERW casualties (one killed, two injured, and three unknown) in four incidents.³⁶ The civilian status, gender, and age of three casualties remain unknown, but the other three were male Ministry of Emergency Situations (MES) clearance personnel. ERW caused at least three casualties. Activities at the time of the incident include tampering and working on munitions disposal. Casualties were recorded in Novobohdanovka in Zaporizhia province, in Kriviy Rih city in Dnipropetrovsk province, in Kremenchuk City in Poltava province, and in Odessa, Odessa province.

³⁰ “Kharkovshina: injured person died as a result of explosion in Lozovskaya district in the hospital,” *Pro-Test*, www.pro-test.org.ua.

³¹ See Article 7 Reports, Form C, 20 April 2009 and 20 April 2008.

³² “Mine explosion in Kharkov district: two teenagers died,” 28 April 2009, *UA-Reporter.com*, www.ua-reporter.com.

³³ “Some injured as a result of elimination of the fire in Lozovoy,” 28 August 2008, *Life News*, www.life.ru.

³⁴ Cabinet of Ministers, Decree No. 131, “State Target Social Program for Anti-mine Activity in 2009–2014”; and see “Cabinet of Ministers, Decree No. 131, 18 February 2009, Kiev,” *Zakonodatelstvo Ukraini*, www.zakon1.rada.gov.ua.

³⁵ CCW Protocol V Article 10 Report, Form B, 1 April 2009.

³⁶ Landmine Monitor media monitoring from 1 January 2008 to 31 December 2008; and Landmine Monitor analysis of MES, “Daily Reports,” from 1 January 2008 to 31 December 2008, old.mns.gov.ua.

The 2008 casualty rate is a decrease compared to 2007 (14 ERW casualties; five killed and nine injured),³⁷ and 2006 (10 casualties; seven killed and three injured),³⁸ but with incomplete data collection, casualties may have been unreported.

Casualties continued to be reported in 2009, with at least two casualties (one injured and one killed) as of 31 May 2009.³⁹ On 21 May 2009, one person was killed and one injured while tampering with an unknown device in the village of Katerynivka in Kharkov province.⁴⁰

The total number of mine/ERW survivors in Ukraine is unknown. The MES reported that between 1996 and 2008 there were 229 ERW casualties (100 killed and 129 injured), including 59 children, due to “handling of devices.” No further information was available.⁴¹ Between 2000 and 2008, Landmine Monitor identified at least 115 casualties (55 killed, 57 injured, and three unknown). There was no reliable data for 1999. While it is difficult to obtain detailed information on incidents in Ukraine, it appears that the majority of civilian casualties are due to ERW, and activities at the time of the incident include collecting scrap metal and tampering. According to UN data, between 1945 and 1995, more than 1,500 civilians were killed by mines in Ukraine, and 130 deminers have been killed during clearance operations. During the Soviet occupation of Afghanistan (1979–1989), 3,360 Ukrainians were killed and reportedly every sixth death was the result of a mine explosion.

The total number of Ukrainian mine/ERW casualties that have occurred abroad remains unknown. In 2005, eight Ukrainian military personnel were killed in a command-detonated mine blast in Iraq and seven other Ukrainians were injured. In July 2006, two Ukrainian peacekeepers were injured by a mine or similar device in Iraq. In October 2006, one Ukrainian citizen was killed and one injured in Iraq. In 2006, in Senegal, one Ukrainian taking part in a humanitarian mission was injured by an antivehicle mine. In March 2007, two Ukrainian employees working for a gas company in Algeria were injured when the company bus hit a mine.

The government of Ukraine estimates there are 2.4 to 2.7 million persons with disabilities in Ukraine.⁴²

Risk profile

People are at risk from abandoned unexploded ordnance. Children, particularly teenagers, regularly find and tamper with UXO in Artemovsk, Kerch, Kharkov, Kiev, Novobohdanovka, Sevastopol, and Vinnytsya.⁴³

Program Management and Coordination

An interministerial working group was set up by the Cabinet of Ministers in February 2006. There is no specific victim assistance (VA) strategy, and mine/ERW survivors receive the same services as other persons with disabilities in Ukraine. The State Department for Veterans Affairs coordinates policy on war veterans and victims. The Ministry of Labor and Social Policy, the Ministry of Family, Youth, and Sports, the Ministry of Health, and the Ministry of Science and Education are responsible for disability issues.⁴⁴

⁴³ See *Landmine Monitor Report 2006*, p. 768.

⁴⁴ US Department of State, “2008 Country Reports on Human Rights Practices: Ukraine,” Washington, DC, 25 February 2009.

Data collection and management

In 2001, the armed forces set up a demining center at the Military Engineering Institute of Podolsk Agrar Technical University. Since 2007, the center has been collecting and analyzing data on explosive hazards and demining.⁴⁵

There is no comprehensive casualty data collection in Ukraine. The main source of information remains media reports and MES daily reports, which report information on a variety of emergency situations, including mine/ERW incidents.⁴⁶ From 2004 to July 2007, the NGO Ukrainian Mine Action Coordination Center collected casualty data from media reports, but it is unknown if data is still collected.

Plans

Strategic mine action plans

On 31 January 2007, the Cabinet of Ministers issued Decree No. 75, “Program for the period of 2007–2010 for destruction of explosive devices on the territory of Kerch and Sevastopol since World War II.”⁴⁷ On 18 February 2009, the Cabinet of Ministers issued Decree 131, “State Target Social Program for Anti-mine Activity in 2009–2014,” which seeks to address the problems of affected territories.⁴⁸ The decree sets out requirements and allocates responsibilities for survey and clearance of affected areas. It calls for the civilian population to be given training on how to respond to explosive devices they may encounter.⁴⁹ It also provides the basis for reconstruction of affected regions.⁵⁰

National mine action legislation

A series of decrees and orders have been adopted to regulate mine action in Ukraine. In accordance with a December 1997 Decree from the Cabinet of Ministers and a Joint Order of the ministries of defense, emergency situations, and transport and communications, and the Border Guard Service of 27 May 2008, mine action responsibilities have been allocated among the various state structures concerned (see Demining and battle area clearance section below).

National mine action standards/Standing operating procedures

The state company Ukroboronservice has its own standing operating procedures, which it claims meet the requirements of the International Mine Action Standards. They were first concluded in 2003, updated in 2005, and again in 2008, when new chapters on battle area clearance and mine/ERW risk education were added.⁵¹

Demining and Battle Area Clearance

In accordance with Cabinet of Ministers Decree No. 2294 of 11 December 1999 and a Joint Order of 27 May 2008,⁵² the MES is generally responsible for clearance of affected territories, with the exception of those allocated to the other ministries and bodies. The MoD is responsible for all areas where military units, educational institutions, companies, or organizations belonging to the armed forces are permanently located. Ukroboronservice acts as a subcontractor for the MoD and MES in survey and disposal of ERW in Ukraine. The company also conducts survey and clearance of construction sites.⁵³

⁴⁵ CCW Amended Protocol II Article 13 Report (for the period 15 May 2008 to 15 May 2009), Form B.

⁴⁶ See MES, “Daily Reports,” July 2009, old.mns.gov.ua.

⁴⁷ CCW Amended Protocol II Article 13 Report (for the period 15 May 2008 to 15 May 2009), Form B.

⁴⁸ Ibid; and see also “Cabinet of Ministers, Decree No. 131, 18 February 2009, Kiev,” *Zakonodatelstvo Ukraini*, www.zakon1.rada.gov.ua.

⁴⁹ CCW Amended Protocol II Article 13 Report (for the period 15 May 2008 to 15 May 2009), Form B.

⁵⁰ Interview with Iurii Kolisnyk, Chief, Humanitarian Demining Center, Ukroboronservice, in Šibenik, Croatia, 28 April 2009.

⁵¹ Telephone interview with Iurii Kolisnyk, Ukroboronservice, 9 July 2009.

⁵² Joint Order No. 405/223/625/455 of 27 May 2008, issued by the MES, MoD, the Ministry of Transport and Communications (MTC) and the National Border Guard Service.

⁵³ Telephone interview with Iurii Kolisnyk, Ukroboronservice, 1 April 2009.

The Ministry of Transport and Communications (MTC) is responsible for the transport system, with the help of the MoD and MES. The national Border Guard Service conducts demining (disclosure, destruction, and disposal) in areas under its control on land and in the sea.⁵⁴

In 2007, the MES created a demining center within its Central Rescue Unit, which trains deminers in Explosive Ordnance Disposal Levels 1 and 2. A similar center was created in 2001 by the MoD in Kamenez-Podolskiy in the west of the country, which includes training in the use of mine detection dogs.⁵⁵

Demining and battle area clearance results for 2008 are set out in the table below.

Demining and battle area clearance results for 2008⁵⁶

Operator	Area cleared (km ²)	Mines destroyed	ERW destroyed
MES	2.55	408	116,127
MoD	4.74	0	491
Ukroboronservice	0.30	12	274*

* Transferred to MES for destruction.

Following the 27 August 2008 explosion at the ASA close to the town of Lozovaya in Lozovoy district, almost 14,000 people were evacuated.⁵⁷ On 29 August, clearance teams from the MoD began clearing in a 5km zone around the ASA. Twelve demining teams were said to be engaged in clearance.⁵⁸ Clearance was completed on 28 November 2008, with a total area clearance of 6.65km² and the destruction of 45,573 items of UXO.⁵⁹

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Ukraine is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 June 2016. In Form I of its annual Article 7 reports, Ukraine stated that “There are no antipersonnel landmines (not even potentially) in the regions under the jurisdiction or the control of Ukraine.”⁶⁰

Risk Education

In 2008, risk education (RE) continued to be provided on an *ad hoc* basis. The MES provided limited awareness messages for emergency personnel and civilians in ERW-affected areas as a part of its role in “[sic] preventive measures, minimization of other emergency consequences, [sic] and cleaning areas from the old munitions.”⁶¹ The number of people reached is unknown.

From 1999 to 2008 there was no systematic RE, but limited awareness messages were provided by deminers from the MoD and the MES, and by the Ukrainian Mine Action Information Center. In 2007, it was reported that the Ukrainian Red Cross Society trained some instructors.

⁶¹ Landmine Monitor analysis of MES, “Daily Reports,” July 2009, old.mns.gov.ua; and see also *Landmine Monitor Report 2008*, p. 731.

Victim Assistance

The total number of survivors is unknown, but there are at least 130.⁶² Ukraine provides war veterans with financial support for medical, rehabilitation, and social services. However, veterans reported that pensions are meager and medical care poor.⁶³ Rehabilitation centers provide prosthetics, orthotics, and other assistive devices to war veterans and other persons with disabilities. The main institutions for assistance of mine/ERW survivors are the Social Rehabilitation Center in Kiev and the “Ukrprotez” State Corporation.⁶⁴ The Ukrainian Rehabilitation Center of Afghanistan Veterans, a private center in Kiev, also serves war veterans and other persons with disabilities.⁶⁵

As the majority of public buildings remain inaccessible, access to healthcare, transportation, education, and employment remains difficult.⁶⁶ In 2008, a government audit reported that “the Ministry of Labour and Social Policy failed to implement the State policy as regards development of new types of orthopaedic products for the disabled, and their timely manufacture.”⁶⁷ In 2009, the Rehabilitation Center of Afghanistan Veterans denounced the lack of rehabilitation and psychological care centers in Ukraine.⁶⁸ Since December 2008, persons with disabilities have been entitled to free travel on the underground railway in Kiev.⁶⁹ Special education is limited and a large number of children with disabilities do not go to school.⁷⁰

From January to October 2008, 7,571 persons with disabilities found jobs through government employment placement services, and in the academic year 2007–2008, 12,262 students with disabilities were enrolled in vocational and academic institutions of higher learning.⁷¹

In September 2008, the Public Employment Service of the Ministry of Labor and Social Policy, with assistance from UNDP and the International Labor Organization, launched a program on “Social Inclusion of Persons with Disabilities through Access to Employment.” The program, which will run until September 2009, aims to “facilitate a proactive inclusion of people with disabilities in the open labour market...”⁷²

The ICRC did not report progress in the establishment of a rapid response trauma unit in 2007, as recommended by the evaluation it conducted together with the Ukrainian Red Cross Society in 2006. The unit was to address the psychological needs of children affected by explosions at ASAs in southern Ukraine.⁷³

Ukraine has not reported on victim assistance in any of its Article 7 reports.

Ukraine has legislation prohibiting discrimination against persons with disabilities in employment, education, access to healthcare, and other state services, but enforcement of provisions was hampered by lack of resources.⁷⁴ On 24 September 2008, Ukraine signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol; neither had been ratified as of 1 July 2009.

Support for Mine Action

Landmine Monitor is not aware of comprehensive long-term cost estimates for meeting mine action needs (including RE and VA) in Ukraine. In 2005, the EC awarded a contract valued at €5,910,000 (\$8.7 million) to cover costs for destruction of all PFM-type and non-PFM-type stockpiled mines.⁷⁵ The contract was cancelled prior to completion in 2007. As no cost estimate has since been reported, the original contract value remains the closest known estimate for stockpile destruction in Ukraine.

National support for mine action

No specific national funding for mine action was reported by Ukraine in 2008, nor was national funding reported in 2007. In April 2008, Ukraine stated its commitment to cover a portion of the costs associated with destruction of half its PFM-type mines, but did not commit a specific amount or report timelines for its allocation of funds.⁷⁶ In November 2008, Ukraine reported that it had provided funds from the state budget for the start of destruction of its stock of PFM mines but did not specify when or what amount of funds were allocated.⁷⁷

International cooperation and assistance

No international funding was reported for mine action in Ukraine in 2008 or 2007.

In April 2008, the EC stated its willingness to continue supporting Ukraine's stockpile destruction efforts, but with an emphasis on capacity-building.⁷⁸ Between August 2008 and May 2009, Ukraine and the EC continued to assess the possibility of EC assistance for Ukraine's stockpile destruction program.

UNITED KINGDOM

2008 Key Data

State Party since	1 March 1999
Contamination	Antipersonnel and antivehicle mines, submunitions, booby-traps, other UXO
Estimated area of contamination	13km ² of mined and battle areas
Article 5 (clearance of mined areas)	Deadline: 1 March 2019 Original deadline: 1 March 2009
Demining in 2008	Clearance of one antipersonnel mine

Ten-Year Summary

The United Kingdom of Great Britain and Northern Ireland (UK) became a State Party to the Mine Ban Treaty on 1 March 1999, and national legislation implementing the treaty entered into force the same day. The UK completed destruction of its stockpile of more than two million antipersonnel mines on 19 October 1999. Initially, the UK retained close to 5,000 mines for training purposes, but decided the number was excessive in 2003 and reduced it to less than 2,000. At the end of 2008, it retained 903 mines, an increase from the previous year: after entry into force of the Mine Ban Treaty, there were allegations of attempted transfers of antipersonnel mines in the UK by Pakistani, Romanian, and UK companies. The UK served as co-chair of the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies from 1999–2000, and as coordinator of the Sponsorship Programme for many years.

The UK has not initiated clearance operations despite being a State Party since 1 March 1999. In November 2008 at the Ninth Meeting of States Parties, the UK requested, and was granted, a 10-year extension to its Article 5 deadline to clear mined areas from the Falkland Islands/Malvinas, and pledged to begin clearance of three mined areas close to urban areas. As of May 2009, the UK had begun soliciting tenders from companies to conduct the demining and to run a mine action center on the islands.

The conflicts in Afghanistan and Iraq have led to an increase of British casualties since 2001 due to mines, explosive remnants of war, and victim-activated improvised explosive devices.

Scope of the Problem

Contamination

The United Kingdom is affected by mines and UXO, including cluster munition remnants, by virtue of its control and assertion of full sovereignty over the Falkland Islands/Malvinas, which were contaminated during the armed conflict between the UK and Argentina in 1982. In addition, UK troops continue to be confronted with the threat of mines and explosive remnants of war (ERW) in military operations in Afghanistan and Iraq.

The 1982 armed conflict between Argentina and the UK resulted in many thousands of antipersonnel and antivehicle mines being laid on the Falkland Islands/Malvinas, most by Argentina. The UK has reported that 117 mined areas remain, covering a total area of some 13km² and containing “just over” 20,000 mines.¹ Of these areas, 113 are minefields totaling 7.35km² and the other four (5.78km²) are only suspected of containing mines.²

¹ UK Article 5 deadline Extension Request, 30 May 2008, p. 2. The estimate of the number of mines remaining to be cleared was higher than the 16,000 reported by Argentina in 2006. See Argentina Article 7 Report, Form C, 4 May 2006.

² UK Article 5 deadline Extension Request, 30 May 2008, Tables B.3 and B.4.

There is also UXO, including an unknown number of areas believed to contain cluster munition remnants as a result of use of BL755 cluster bombs by the UK against Argentine positions. The size of the affected areas is not known.

In February 2009, in a letter to Landmine Action, the Ministry of Defence stated the following: “According to historical records either 106 or 107 Cluster Bomb Units (CBU) were dropped by British Harriers and Sea Harriers during the conflict. Each CBU contains 147 BL755 sub-munitions and using the higher CBU figure (107), a total of 15,729 sub-munitions were dropped. Using a 6.4% failure rate assessed during in-service surveillance over 15 years, we would estimate that 1,006 would not explode. Given that 1,378 BL 755s were cleared in the first year after the conflict and that a further 120 have been found and disposed of since (totalling 1,498), clearly there was a slightly higher failure rate. Even if the rate had been closer to 10% and 1,573 had failed, we can only estimate that some 70 remain but that due to the very soft nature of the peat found on the islands, many of these will have been buried well below the surface. We believe that the majority of those remaining are now contained within existing minefields and these will be cleared in due course.”³

The precise extent of other ERW contamination on the Falkland Islands/Malvinas is not known. The UK has also noted the presence of booby-traps on the islands.⁴

Casualties

No human casualties from mines or UXO have been reported in the Falkland Islands/Malvinas since 1984. The UK has reported that six military personnel were injured in 1982 and a further two injured in 1983. Most military accidents took place while clearing/lifting the minefields in the immediate aftermath of the 1982 conflict or in the process of trying to establish the extent of the minefield perimeters, particularly where no detailed records existed.⁵

No civilian mine casualties have ever occurred on the islands.⁶ Over the years, however, there have been numerous instances where civilians have deliberately or inadvertently entered a minefield. The Ministry of Defence has reported “infringement” of minefields by a total of six locals and 15 foreign fishermen or tourists between March 2000 and December 2008.⁷

In the latest incident, three crew members of a Belgian yacht inadvertently entered a minefield at Kidney Cove on East Falklands on 6 December 2008 but left without incident.⁸ In October 2002, a Falkland Islander was fined £1,000 (then US\$1,503) for entering a minefield on Goose Green. It is a criminal offense on the Falkland Islands/Malvinas to enter a minefield.⁹

This record of infringements indicates that people are occasionally entering the minefields either deliberately or unwittingly and livestock deaths (see Socio-economic impact section below), indicate that mines in these minefields are still functioning. Such evidence should warn against complacency in efforts to tackle this contamination as soon as possible.

In 2008, Landmine Monitor identified 30 new British military casualties in Afghanistan (15 killed and 15 injured) from mines, ERW, or improvised explosive devices (IEDs). At least 11 casualties (one woman and 10 men) were reported to be due to antipersonnel mines.¹⁰ These figures are incomplete, as, for example, another 24 casualties in Afghanistan could not be confirmed and no new casualties were identified in Iraq.

³ Letter from Lt.-Col. Scott Malina-Derben, Ministry of Defence, 6 February 2009.

⁸ Lisa Johnson, “Lucky minefield incident for landing crew in Falklands,” *MercoPress*, 9 December 2008, www.mercopress.com.

⁹ *Ibid.*

¹⁰ Landmine Monitor media monitoring from 1 January 2008–30 April 2009.

British mine and UXO casualties abroad between 1999 and 2008 were mostly military and occurred mostly in Iraq and Afghanistan,¹¹ but there were also several humanitarian demining casualties. For example, in 2001, a British deminer was injured when a grenade detonated during demining training in the Democratic Republic of the Congo.¹² In 2002, a British deminer was injured in a demining accident in southern Lebanon.¹³ In 2007, another British deminer was killed in Lebanon.¹⁴ However, total figures are incomplete and Landmine Monitor does not have a total number of casualties from 1999 to 2008. Non-governmental sources tracking casualties in Afghanistan and Iraq have criticized the Ministry of Defence for the lack of transparency and accuracy in reporting British casualties.¹⁵

Socio-economic impact

The impact of contamination in the Falkland Islands/Malvinas is said to be minimal. All 117 areas are reported to have been “perimeter-marked and are regularly monitored and protected by quality stock proof fencing, to ensure the effective exclusion of civilians.”¹⁶ According to the UK, the 13km² of suspected hazardous area represent “only 0.1% of land used for farming. The mined areas cover a wide range of terrain including sandy beaches and dunes, mountains, rock screes, dry peat, wet swampy peat, and pasture land.”¹⁷ A number of instances of cattle, sheep, or horses entering the minefields have been recorded since 2000, some of which resulted in the animal’s deaths.¹⁸

In a statement on 9 May 2008, the Falkland Islands government stated that the mined areas “present no long term social or economic difficulties for the Falklands.” Indeed, Falkland Islanders are reported to have expressed concern about the negative socio-economic impact that a demining operation would have—with disruption and strain on the infrastructure of their small community caused by an influx of a large number of deminers and heavy machinery for an extended period of time, and interference to their growing tourism industry (one of three major industries on the islands).¹⁹

Program Management and Coordination

Mine action

In November 2008, the UK pledged to begin work on establishing a “mine action coordinating committee.”²⁰ Subsequently, a National Mine Action Authority (NMAA) composed of both the UK and the Falkland Islands governments was established to oversee clearance of mined areas on the Falkland Islands/Malvinas. As of May 2009, the NMAA was reviewing national mine action standards for the clearance operations.²¹

In May 2009, the UK issued a request to tender for the Falkland Islands Demining Programme Office (DPO). The role of the DPO will be to execute the policies of the NMAA and to coordinate mine action activities on the Falkland Islands/Malvinas.²² The Ninth Meeting of States Parties

noted the UK's undertaking to provide regular reports on the establishment of a NMAA "and other implementation bodies."²³

Data collection and management

The UK's Explosive Ordnance Disposal Detachment for the Islands and other staff completed training in the Information Management System for Mine Action in April 2008. Subsequently, personnel were engaged in digitizing all information about the mines and their location.²⁴

Plans

On 26 November 2008, the UK announced to the Ninth Meeting of States Parties its intention to begin demining of three mined areas: Fox Bay 8 (West), Goose Green 11, and Stanley Area 3 (M25). Fox Bay 8 is estimated to measure 24,500m²; Goose Green 11, 20,600m²; and Stanley Area 3 (M25), 5,400m². A BL755 cluster munition strike reported to the south of the minefield in Stanley was slated for clearance.²⁵ Thus, the total area of this intended clearance is less than 0.5% of the total mined area on the islands. The UK stated that the areas had been chosen because of their proximity to urban areas and because the variety of terrain would serve as a test of the environmental and ecological impact of demining.²⁶ A Statement of Requirement was being drafted and it was planned to put the work out to tender "in the next few months."²⁷ As of May 2009, the UK planned to issue invitations to tender to up to six companies with the aim that work would start before the end of 2009.²⁸

In a May 2008 statement, the Falkland Island government made clear that it would "have to pay close attention to the environmental implications of complete clearance."²⁹ The UK has stated that the clearance of all mined areas will be subject to an environmental impact assessment in the planning process under forthcoming Falkland Islands domestic law.³⁰

Demining and Battle Area Clearance

No clearance operations had been initiated as of 1 March 2009, the expiry of the UK's Mine Ban Treaty Article 5 deadline for clearance. In 2008, one antipersonnel mine was destroyed when it came to the surface in a known minefield.³¹ In May 2009, the UK announced its intention to invite around four to six companies to tender for demining three mined areas on the Falkland Islands/Malvinas.³²

According to information provided by the Ministry of Defence in 2009, no unexploded submunitions were cleared in 2008, but a BL755 submunition was destroyed in November 2007.³³

³³ Letter from Lt.-Col. Scott Malina-Derben, Ministry of Defence, 6 February 2009.

Progress since becoming a State Party

Under Article 5 of the treaty, the UK is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. On 31 May 2008, the UK submitted to the President of the Eighth Meeting of States Parties a request for an extension of its deadline of 10 years (until 1 March 2019). The UK's extension request stated that the following circumstances had impeded the fulfillment of its Article 5 deadline:

- mined areas have a variety of terrain types and thus a single clearance method cannot be used;
- distance from the UK makes strategic logistics very challenging;
- almost 40% of mined areas are in very isolated locations that can be accessed only with specialized vehicles;
- a wide range of environmental issues affect the flora and fauna, requiring an environmental impact assessment prior to clearance;
- there are a number of environmental remediation protocols associated with every different terrain; and
- climatic conditions restrict work to 10 months of each year and make the use of dogs unlikely.³⁴

The Analysing Group of States Parties, chaired by the President of the Eighth Meeting of States Parties, noted that the UK had made no clear commitment through its extension request to start mine clearance operations and ultimately comply with its obligations. The group noted that the Mine Ban Treaty as a whole would benefit if the UK provided an unequivocal commitment to implement Article 5 as soon as possible. It further noted that "it is unfortunate that after almost ten years since entry into force a State Party is unable to specify how remaining work will be carried out and that a two year trial is still required to obtain all necessary information and to confirm the timescale of the overall project."³⁵

Following opposition from a number of States Parties,³⁶ as well as the ICBL and ICRC, to the UK's blanket 10-year extension request at its initial presentation, the UK revised its request to make it explicit that Scenario 5 of the Field Survey (part of the Feasibility Study conducted by Cranfield University) was its clearance plan for fulfillment of its Article 5 obligations.³⁷ Scenario 5 proposed clearance of all mined areas on the Falkland Islands/Malvinas within a 10-year period, beginning with the establishment of a project office on the Falkland Islands/Malvinas; the development of mine action standards, procedures for environmental impact assessments and remediation, and for external quality assurance and quality control; a trial of the effectiveness of clearance methods; and ending with the handover of all cleared land to a fully fledged mine action center.³⁸ The UK decided to disregard the Field Survey's recommendation for trials of clearance methods and to proceed directly to full clearance.³⁹

While "a number of substantive concerns were raised," the Ninth Meeting of States Parties decided to grant the request for an extension until 1 March 2019, taking into account a number of considerations.⁴⁰ These included taking note of the UK's confirmation that Scenario 5 of the Field Survey served as the UK government's "indicative Clearance Plan, containing clear priorities, timeframes for action and projected milestones for clearance over the period of the

⁴⁰ Decision on the UK Article 5 deadline Extension Request, Ninth Meeting of States Parties, Geneva, 28 November 2008.

extension and as such formed a basis for future work.” The meeting also took note of the UK’s agreement to provide as soon as possible, but not later than 30 June 2010, a detailed explanation of how demining is proceeding and the implications for future demining in order to meet the UK’s obligations under Article 5.⁴¹

The meeting also took note that the UK will keep under annual review the possibility of reducing the time necessary to fulfill its obligations. A number of States Parties expressed the wish that the UK proceed with the implementation of Article 5 much faster than suggested by the amount of time requested.⁴²

Victim Assistance

The total number of survivors since 1999 is unknown. The Ministry of Defence provides compensation to soldiers injured overseas or to the families of deceased soldiers, including mine/ERW casualties, through the Armed Forces Compensation Scheme (AFCS). On 15 December 2008, the ministry announced the doubling of the maximum payment available through the AFCS to £570,000 (\$1,057,065). This would apply retroactively to soldiers who had received compensation since the creation of the scheme in 2005. The ministry stated that more than £10 million (\$18.5 million) in additional compensation would be paid to approximately 2,700 injured service personnel.⁴³ While many veterans welcomed the change, some continued to call for broader reforms so that the AFCS would “take into account the cumulative impact of a soldier’s injuries, their care needs and loss of earnings.”⁴⁴

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates for completion of mine clearance in the Falkland Islands/Malvinas. The UK has not reported on cost estimates associated with the joint UK/Argentina “Field Survey to Examine the Feasibility of Clearing Landmines in the Falkland Islands (Islas Malvinas),” or with its calls for tenders issued in 2009 for the DPO and for clearance operations. In March 2009, the UK Foreign and Commonwealth Office (FCO) reported that funding for demining in the Falkland Islands/Malvinas would come from the FCO.⁴⁵

International support to mine action

The UK reported providing mine action funding totaling £13,451,597 (\$24,945,987/€16,940,097) in 2008–2009, an increase of approximately 7% compared to 2007–2008.⁴⁶ This represents the highest level of funding by the UK since 2000–2001.

At the Ninth Meeting of States Parties, the UK stated that it had decided to maintain “current levels of funding” for mine, cluster munitions and ERW clearance until 2013.⁴⁷

Article 5 (clearance of mined areas)	Deadline: 1 October 2014 Original deadline: 1 October 2009
Demining in 2008	None

Ten-Year Summary

The Bolivarian Republic of Venezuela became a State Party to the Mine Ban Treaty on 1 October 1999. It submitted its initial Article 7 report in September 2002, two and a half years late. Venezuela reported that it completed destruction of its stockpile of 47,189 antipersonnel mines on 24 September 2003, just ahead of its treaty-mandated deadline of 1 October 2003. Venezuela has retained 4,960 antipersonnel mines for training and development purposes, but has not consumed any mines for training. In 2007, Venezuela made statements indicating that it was still making active use of its emplaced antipersonnel mines, which the ICBL decried as inconsistent with the Article 1 ban on use.

Venezuela disclosed that it laid antipersonnel mines around six naval bases in 1995–1997. Despite becoming party to the Mine Ban Treaty in October 1999, Venezuela had not started clearance of any of these bases by June 2009. In November 2008, Venezuela was granted a five-year extension to its Article 5 deadline for clearance of all mined areas.

Landmine Monitor has identified eight mine and explosive remnants of war casualties in Venezuela (four killed and four injured) between 1999 and 2008.

Mine Ban Policy

Venezuela signed the Mine Ban Treaty on 3 December 1997 and ratified on 14 April 1999, becoming a State Party on 1 October 1999. Venezuela has not adopted national implementation legislation stipulating penal sanctions for treaty violations, maintaining that domestic legislation to implement the Mine Ban Treaty is not necessary because international treaties ratified by the government automatically become national law.¹ Venezuela restated this view forcefully during the intersessional Standing Committee meetings in June 2008, in response to an ICRC presentation on Article 9 (national implementation measures).²

On 6 July 2009, Venezuela submitted its annual updated Article 7 transparency report for the period from April 2008 to April 2009. Venezuela has provided six previous reports, most recently in April 2008.³

¹ Telephone interview with Victor Manzanares, First Secretary, Security and Disarmament, Ministry of Foreign Affairs, 4 February 2000. Venezuela's penal code was reformed on 16 March 2005, without any reference to antipersonnel mines. "Partial Reform to the Penal Code," *Official Gazette*, Number 38.148, 16 March 2005.

² Oral Remarks by Venezuela, Standing Committee on the General Status and Operation of the Convention, Geneva, 6 June 2008. Notes by Landmine Monitor. Venezuela said that all ratified international treaties are of the highest domestic legal standing—that of the constitution. The ICRC replied that a specific law was still desirable for various Mine Ban Treaty provisions, such as the Article 3 exception for retained mines and Article 8 provisions on fact-finding missions.

³ Venezuela submitted previous reports in April 2007, on 26 April 2006, 4 July 2005, 1 May 2003, and 10 September 2002. It also submitted a one-page letter to the UN on 25 November 2003, confirming completion of stockpile destruction. Venezuela did not provide an update in 2004. The initial report, due 1 March 2000, was two and a half years late.

Venezuela participated in the Ninth Meeting of States Parties in Geneva in November 2008, and the May 2009 intersessional Standing Committee meetings, speaking on both occasions about mine clearance and its Article 5 deadline extension request.

Venezuela has not engaged in the discussions that States Parties have had on matters of interpretation and implementation related to Articles 1, 2, and 3 (joint military operations with states not party to the treaty, foreign stockpiling and transit of antipersonnel mines, antivehicle mines with sensitive fuzes or antihandling devices, and mines retained for training).

Venezuela is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Venezuela has never submitted an annual report as required by the protocol's Article 13. Venezuela is not party to CCW Protocol V on Explosive Remnants of War. Venezuela has not signed the Convention on Cluster Munitions.

Use

Venezuela has reported that it laid 1,074 antipersonnel mines around six naval bases between April 1995 and March 1997, one of which was subsequently accidentally detonated.⁴ In 2007, Venezuela made statements indicating that it was still making active use of these emplaced antipersonnel mines, which is inconsistent with the Article 1 ban on use.⁵ During 2007 and 2008, the ICBL repeatedly stated its concern that Venezuela was purposefully keeping its antipersonnel mines in place in order to derive military benefit from them, and was not, as required by the treaty, clearing them as soon as possible.⁶

In 2008 and 2009, Venezuela stressed other factors—such as dense vegetation, rough weather, and safety concerns—to explain why it has not yet cleared its antipersonnel mines (see program coordination and management section below).⁷ In June 2008, Venezuela stated that it was not using mines for defensive purposes, even though there are still “anti-state actors” across its border with Colombia.⁸

Production, transfer, stockpiling, and destruction

Venezuela has stated that it has not produced antipersonnel mines.⁹ It is not known to have exported antipersonnel mines. Venezuela previously obtained antipersonnel landmines manufactured by Belgium, Italy, Spain, the United States, and the former Yugoslavia.¹⁰

⁴ Article 7 Report, Form I, April 2008; and email from Yaneth Arocha, First Secretary, Ministry of Foreign Affairs, 28 June 2005. The 1,073 number (1,074 minus the accidental detonation) is the number used in the Article 7 reports submitted in 2008, 2007, 2006, and 2005, which was a revised total from the figure of 1,036 used in the 2003 report. Venezuela has reported different dates of emplacement in Article 7 reports. Most notably, Venezuela reported mines were last laid in March 1997 in its Article 7 report submitted on 26 April 2006 while the Article 7 report submitted on 1 May 2003 reports that mines were last laid in May 1998, the latter date being five months after Venezuela signed the Mine Ban Treaty.

⁵ For more details, see *Landmine Monitor Report 2008*, pp. 740–741.

⁶ ICBL Intervention on Compliance with the Mine Ban Treaty, delivered by Stephen Goose, Human Rights Watch, Head of the ICBL delegation, Standing Committee on the General Status and Operation of the Convention, Geneva, 27 April 2007. The ICBL repeated these concerns in a letter to the Minister of Foreign Affairs, dated 18 July 2007, in statements at the Eighth Meeting of States Parties on 18 and 22 November 2007, and in several meetings with Venezuelan officials during 2007.

⁷ See Article 5 deadline Extension Request, 28 March 2008; Article 7 Report, Form I, April 2008; statement of Venezuela, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 4 June 2008; and statement of Venezuela, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009.

⁸ Statement of Venezuela, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 4 June 2008.

⁹ Article 7 Report, Form H, April 2008; and previous Article 7 reports.

¹⁰ Article 7 Report, Form B, 1 May 2003.

Venezuela completed destruction of its stockpile of 47,189 antipersonnel mines on 24 September 2003.¹¹ It has never specified the types of antipersonnel mines that were destroyed.¹²

In its most recent Article 7 report, submitted in July 2009, Venezuela stated that it is retaining 4,960 PMA-3 antipersonnel mines for training and development purposes, held by the Ministry of Defense.¹³ The number is unchanged from the previous four reports.¹⁴ At the June 2008 intersessional Standing Committee meetings, Venezuela emphasized that States Parties retaining mines under Article 3 have no obligation to use these immediately, and noted that not all states can or need to use them with the same frequency.¹⁵

Venezuela has not used the expanded Form D for reporting on retained mines adopted by States Parties in 2005. Venezuela has not yet reported in any detail on the intended purposes and actual uses of its retained mines—a step agreed by States Parties at the First Review Conference in 2004.

Scope of the Problem

Contamination

Venezuela's mine contamination is the result of mine emplacement by its armed forces at six naval bases near Río Arauca in the Amazon region along its border with Colombia in 1995–1997. After a 25 February 1995 attack on the naval post in Cararabo, Apure state, by suspected non-state armed groups operating across the border with Colombia, Venezuela laid 1,074 mines in 13 minefields around six naval posts in Cararabo, Guafitas, Isla Vapor, Puerto Páez, Río Arauca, and San Fernando de Atabapo.¹⁶ The total mined area is reported to be 180,000m². The maps and photographs in Venezuela's Article 5 deadline extension request clearly show the locations and terrain of the mined areas.¹⁷ The minefields are located on a flood plain in dense vegetation and in an isolated part of Venezuela.¹⁸ The minefields are said to be marked and periodically controlled by technical teams.¹⁹

Casualties

Landmine Monitor identified no mine or explosive remnants of war (ERW) incidents in Venezuela in 2008 or 2009, as of 30 May.

¹¹ Letter from the Permanent Mission of Venezuela to the UN in Geneva, to the UN Disarmament Conference Secretariat, 25 November 2003. The 47,189 mines were more than previously reported as held in stock. In September 2002, Venezuela reported a stockpile of 22,136 antipersonnel mines, but in May 2003 reported a revised total of 46,136 antipersonnel mines. See Article 7 Reports, Form B, 1 May 2003; and Form B, 10 September 2002.

¹² Venezuela's 1 May 2003 Article 7 report, Form B, listed the types and quantities for 46,136 mines still held in stock.

¹³ Article 7 Report, Form D, July 2009. In 2005, Venezuela indicated that 4,950 of the mines were held by the National Armed Forces Armament Directorate, and another 10 were located at the Attorney's Office in Puerto Cabello, Carabobo state. Article 7 Report, 4 July 2005.

¹⁴ In its September 2002 Article 7 report, Venezuela indicated it would retain 2,214 mines; in its May 2003 report it listed 4,614 mines; and in its November 2003 letter it indicated 5,000 mines.

¹⁵ Statement of Venezuela, Standing Committee on the General Status and Operation of the Convention, Geneva, 6 June 2008.

¹⁶ According to earlier Article 7 reports, three minefields were laid at Guafitas in May 1998, which is five months after Venezuela signed the Mine Ban Treaty on 3 December 1997. The May 2003 Article 7 report indicates Venezuela laid 20 SB-33 antipersonnel mines in Guafitas in May 1998. The September 2002 Article 7 report indicates the number was 58 SB-33 antipersonnel mines. See Article 7 Reports, Form C, 1 May 2003; and Form C, 10 September 2002. See also *Landmine Monitor Report 2004*, p. 861.

¹⁷ See Article 5 deadline Extension Request, 28 March 2008, Annexes 5 and 6.

¹⁸ *Ibid.*, p. 27; and statement of Venezuela, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 4 June 2008.

¹⁹ Article 5 deadline Extension Request, 28 March 2008, p. 14.

In November 2007, Venezuela reported that no fatal mine incidents had ever occurred in Venezuela.²⁰ Landmine Monitor identified eight mine/ERW casualties in Venezuela (four killed and four injured) between 1999 and 2008, as well as one military casualty in 1996. The last casualties identified by Landmine Monitor occurred in 2004.²¹ The Venezuelan government has only acknowledged the existence of the two military mine casualties, both injured, in 2004 and in 1996.²²

Program Management and Coordination

Plans

Strategic mine action plans

Venezuela's demining plan is described in its Article 5 deadline extension request. The first year of the operational plan would be devoted to training deminers and purchasing equipment. In February 2009, at the Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas, Venezuela reported that, in accordance with its plan, the procurement of demining equipment had begun and that training of deminers would begin in October 2009.²³ In April 2009, Venezuela attended a technology conference in Šibenik, Croatia, to assess the latest demining equipment, as planned in its extension request, and to make contacts with manufacturers, particularly of advanced demining detectors.²⁴

The four-year clearance operations at the six naval bases are planned to begin in October 2010 and be completed by October 2014 (see table below).²⁵ With only a five-month clearance period each year because of the wet climate, clearance is planned to take 20 months over the four years.

National ownership

Commitment to mine action and victim assistance

Venezuela has not made concerted efforts to meet its Mine Ban Treaty obligations to clear all emplaced antipersonnel mines from mined areas under its jurisdiction or control as soon as possible or by its deadline. As of June 2009 it had not cleared a single mined area since 1999 although the four-year plan for 2010–2014 indicates its improved intention to implement the treaty. It will finance all clearance operations from the national budget.²⁶

National management

The mine action program is under the control of the Ministry of Defense with no civilian input or guidance from the legislature.²⁷ Rear Admiral Alcibiades Jesús Paz, from the Department of Defense, is responsible for coordination, a post to which he was first appointed in 2004.²⁸ There are no external technical advisors.

According to its Article 5 deadline extension request, Venezuela has not yet adopted national standards or confirmed standing operating procedures, although the process was reported to be underway.²⁹

Demining

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Venezuela is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 October 2009. In November 2008, States Parties granted Venezuela a five-year extension of its deadline to 1 October 2014. In granting the extension, States Parties noted that “with speedy establishment of a demining program and acquisition of mechanical demining assets, Venezuela may find itself in a situation wherein it could complete implementation before October 2014 and that this could benefit the Convention.”³¹

At the Standing Committee meetings in June 2008, Venezuela stated that, although it was not using mines for defense purposes, “We still have anti-state actors across the river.”³² As of June 2009, it had still to initiate clearance operations, despite becoming a State Party to the Mine Ban Treaty in 1999. In March 2008, Venezuela said difficult geographical, environmental, climatic, and technical factors had prevented mine clearance and noted that clearance personnel were at risk from attack by Colombian non-state armed groups. It further stated that “the transportation of personnel and equipment must take place under maximum safety in order to prevent placing the deminers in a vulnerable and insecure position. The mined areas are difficult to access and are in areas where civilians are not allowed.”³³

³⁰ Analysis of Venezuela’s Article 5 deadline Extension Request, 31 October 2008, p. 3.

³¹ Decision on Venezuela’s Article 5 deadline Extension Request, Ninth Meeting of States Parties, Geneva, 28 November 2008.

³² Statement of Venezuela, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 4 June 2008.

³³ Article 5 deadline Extension Request, 28 March 2008, p. 5.

Venezuela has cited wet weather as the main reason for not being able to conduct mine clearance. The annual rains in Apure state are estimated to be 100 days and 1,500mm per year, although the number of rainy days is quite low for seven months of the year.³⁴ As the mined areas are located on a flood plain, Venezuela has claimed that the rains would quickly end any ongoing clearance activities.³⁵ In February 2009, at the Managua Workshop on Progress and Challenges in Achieving a Mine-Free Americas, Rear Admiral Alcibiades Jesús Paz said Venezuela was using all means to comply with its treaty obligations and it would not violate the treaty for 1,073 mines. He noted, however, that the weather was unpredictable and as a result it was “not possible” to say when all the mines will be cleared.³⁶

In May 2009, at the Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, the ICBL stated again its view that the failure to initiate clearance does not serve the interests of the Mine Ban Treaty as a whole, and that whatever the merits of granting Venezuela a five-year extension, Venezuela should begin clearance as soon as possible.³⁷ Venezuela said it wishes to comply with all of the details in the extension request and is on schedule to do so.³⁸

Victim Assistance

There are an estimated four mine/ERW survivors in Venezuela. The situation in Venezuela does not warrant specific victim assistance policies. Specialized services, including rehabilitation services, are centralized in urban areas.³⁹

The Venezuelan government asserted that it has provided medical, psychological, and economic assistance to the military survivor injured in 2004.⁴⁰ However, the survivor was reportedly dissatisfied with the level of assistance he received.⁴¹

The Venezuelan constitution prohibits discrimination against persons with disabilities.⁴² Yet implementation remains problematic; the US Department of State reported that the “government did not make a significant effort to implement the law, inform the public of it, or combat societal prejudice against persons with disabilities.”⁴³ As of 1 July 2009, Venezuela had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

Support for Mine Action

Venezuela’s Article 5 deadline extension request includes a budget of VEF30 million (US\$14,019,000) for completion of demining activities during the five years of the extension. Venezuela stated in the request that it will assume the full costs of mine clearance, and funds will be allocated in Venezuela’s annual budget. Venezuela did not report on actual costs or government allocations during 2008 or 2009.

YEMEN

2008 Key Data

State Party since	1 March 1999
Contamination	Antipersonnel and antivehicle mines, UXO
Estimated area of contamination	Remaining suspect hazardous areas total more than 520km ² as of the end of 2008. However it is thought that only some 12km ² would require full clearance; the rest would be cancelled or reduced by technical survey.
Casualties in 2008	20 (2007: 26)
Estimated mine/ERW survivors	At least 5,000
Article 5 (clearance of mined areas)	Deadline: 1 March 2015 Original deadline: 1 April 2009
Demining in 2008	Mine clearance: 5.23km ²
Risk education recipients in 2008	210,559
Progress towards victim assistance aims	Slow
Support for mine action in 2008	International: \$1 million (2007: \$1.1 million) National: \$3.6 million (2007: \$3.5 million)

Ten-Year Summary

The Republic of Yemen became a State Party to the Mine Ban Treaty on 1 March 1999. It enacted national implementation legislation in 2005. Yemen destroyed the last of its known stockpile of 74,000 to 78,000 antipersonnel mines in April 2002. An additional 30,000 mines were found in November 2006 and destroyed in December 2007. Yemen initially retained 4,000 mines for training purposes, of which it has 3,760 left. In recent years, the government and rebel forces have occasionally traded accusations of new use of antipersonnel mines, but Landmine Monitor has not been able to confirm such use.

Yemen is contaminated with mines and explosive remnants of war (ERW), primarily as a result of armed conflicts since 1962. Limited funding and the presence of mines in shifting sands as well as their depth (some may lie up to six meters below the surface of sand dunes) led Yemen to request a six-year extension to its Article 5 deadline for clearance of mined areas from April 2009 to March 2015.

There were some 5,000 mine/ERW casualties in Yemen, including at least 138 recorded by the Yemen Executive Mine Action Center (YEMAC) from 1999 to 2008. Mine/ERW risk education (RE) has been conducted since 1999 by YEMAC and the NGO Yemen Mine Awareness Association, working together to conduct community liaison, deliver community-based RE, train community leaders and teachers, and give direct presentations.

Assistance to mine/ERW survivors was limited to the YEMAC program which was predominantly medically oriented and limited in scope. From 2008–2009, the program's functioning was hampered by a lack of funding and a lack of partnerships. As one of the 26 States Parties with a responsibility for significant numbers of survivors, Yemen set objectives for victim assistance from 2005–2009 but did not reach its target of assisting 2,000 survivors. Services for persons with disabilities in general were limited and highly centralized.

Mine Ban Policy

Yemen signed the Mine Ban Treaty on 4 December 1997, ratified it on 1 September 1998, and it entered into force on 1 March 1999. National implementation legislation was enacted on 20 April 2005.¹ Yemen submitted its 11th Article 7 transparency report on 31 March 2009, covering the period 31 March 2008 to 31 March 2009.²

Yemen participated in the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings in Geneva in May 2009. It made statements on mine clearance and victim assistance (VA) at both meetings.

Yemen elaborated its views on key matters of interpretation and implementation related to Articles 1 and 2 of the Mine Ban Treaty in a letter to Landmine Monitor in April 2006, and again during the intersessional meetings in May 2006. It articulated strong positions mirroring those of the ICBL and many other States Parties.³

Yemen is not party to the Convention on Conventional Weapons and has not signed the Convention on Cluster Munitions.⁴

Production, transfer, stockpiling, and retention

Yemen has stated that it has never produced or exported antipersonnel mines. In October 2005, the UN Monitoring Group on Somalia reported that the government of Yemen had transferred landmines to Somalia's Transitional Federal Government in July 2005; the report did not specify if the mines were antipersonnel or antivehicle.⁵ In a July 2006 letter to Landmine Monitor, Yemen strongly denied transferring mines.⁶

Landmine Monitor has reported that Yemen completed destruction of about 74,000 stockpiled antipersonnel mines on 27 April 2002.⁷ In 2008, however, Yemen indicated that the number destroyed was actually 78,000.⁸ Further clarification is needed. On 16 December 2007, Yemen destroyed an additional 30,000 POMZ-2 antipersonnel mines that were found in November 2006 in an old military warehouse undergoing transformation into a tourist site.⁹

¹ Article 7 Report, Form A, 30 March 2007. On 16 December 2004, the Yemeni Parliament endorsed national implementation legislation and on 20 April 2005, Presidential Law No. 25 was issued to bring the legislation into force.

² Previous reports were submitted on 31 March 2008, 30 March 2007, 3 May 2006, 7 April 2005, 30 March 2004, 10 April 2003, 27 April 2002, 8 September 2001, 14 November 2000, and 30 November 1999.

³ For details, see *Landmine Monitor Report 2006*, p. 782. Yemen supported the view that any mine (even if it is called an antivehicle mine) equipped with a sensitive fuze or sensitive antihandling device that causes the mine to explode from an unintentional act of a person is considered to be an antipersonnel mine and therefore prohibited. It supported the view that the Mine Ban Treaty prohibits the transit and foreign stockpiling of antipersonnel mines. Regarding the issue of joint military operations with states not party to the treaty, Yemen stated the view that it is prohibited to participate in any activity related to the use of antipersonnel mines.

⁴ For details on cluster munition policy and practice, see Human Rights Watch (HRW) and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 262.

⁵ For more details, see *Landmine Monitor Report 2006*, p. 783. In addition, a May 2006 report by the UN Monitoring Group said that in August 2005, traders at the Bakaraaha arms market in Somalia reportedly purchased mines and other arms from a Yemen arms trading network, and a 2003 report said that mines had been shipped from Yemen to Somalia.

⁶ Letter from Amb. Abdulla Nasher, Embassy of the Republic of Yemen to Canada, on behalf of the Minister of Foreign Affairs, to Stephen Goose, HRW, Landmine Monitor Ban Policy Coordinator, 24 July 2006.

⁷ See *Landmine Monitor Report 2002*, p. 522, and subsequent editions. In its 2001 and 2002 Article 7 reports, Yemen reported a stockpile of 78,000 mines, including 4,000 to be retained for training. Its reporting on the destruction of the mines has contained discrepancies, but appeared to total about 74,000. Yet its Article 7 reports have usually cited the figure of 78,000 destroyed.

⁸ Email from Mansour al-Azi, Director, YEMAC, 31 August 2008; Article 7 Report, Form G, 31 March 2008, which reports total destruction of 108,000 mines, including the 30,000 mines destroyed in December 2007. The Article 7 report submitted in 2009 also contains this information.

⁹ Article 7 Report, Form G, 31 March 2008; Article 7 Report, Form B, 30 March 2007. Yemen also informed States Parties during the meeting of the Standing Committee on Stockpile Destruction on 23 April 2007 about the discovery of the 30,000 mines, and indicated they had been handed over for destruction by the end of 2007. Notes by Landmine Monitor/HRW.

In May 2007, it was reported that antipersonnel and antivehicle mines were among weapons purchased from the public in various parts of the country as part of a government arms reduction and arms collection program. The different types of weapons were in the hands of “regular civilians, tribal sheikhs and clans from around the country.”¹⁰

Mines retained for research and training

Yemen reported that, as of March 2009, it retained 3,760 antipersonnel mines for training and research purposes.¹¹ This is the same number of retained mines reported the year before. As it has in the past, Yemen reported using 240 mines to train mine detection dogs, but did not subtract this number from the total retained.¹² YEMAC told Landmine Monitor that the mines were not consumed (exploded) during the training.¹³

Yemen has not reported in any detail on the intended purposes and actual uses of its retained mines as agreed by States Parties in 2004. It has not used the expanded Article 7 report Form D for reporting on retained mines agreed by States Parties in 2005.

Use

Since an insurgency started in June 2004, there have been a small number of reports and allegations of the use of antipersonnel landmines during conflict between government troops and rebel forces led by Abdul-Malik Al-Houthi in the northern mountainous Sa’daa governorate.¹⁴ In this reporting period, the government and the rebels have accused each other of using antipersonnel mines.¹⁵

Landmine Monitor has not been in a position to assess the veracity of the claims of antipersonnel mine use by either side. Since early 2007, the government has imposed a ban on media travel in the north of the country and has severely limited access by humanitarian agencies. It has not published information regarding war casualties.¹⁶

Since 2004, the government has stated that Al-Houthi rebels possess large stockpiles of antipersonnel mines and have used them on occasion.¹⁷ In November 2008, the official state news agency quoted police in Sa’daa saying that there are frequent civilian casualties caused by landmines laid by the rebels.¹⁸ In September 2008, the army published a letter from rebel leader Abdul-Malik Al-Houthi to Yemeni President Ali Abdullah Saleh stating his agreement to the conditions of a peace agreement, one of which was the removal of landmines.¹⁹

¹⁰ Saddam al-Ashmouri, “Weapon buy-backs showcased in Sana’a,” *Yemen Times*, 29 May 2007, www.yementimes.com.

¹¹ Article 7 Report, Form D, 31 March 2009. The retained mines consist of 940 PPMISR-2, 940 PMD-6, 940 POMZ-2, and 940 PMN.

¹² Article 7 Report, Form D, 31 March 2009. Yemen reported the use of 240 mines for training every year from 2003 to 2007, without changing the total number retained. Only in its March 2008 Article 7 report did Yemen subtract the mines used for training, indicating they were consumed, and lowering the number from 4,000 to 3,760 mines.

¹³ Email from Mansour al-Azi, YEMAC, 31 August 2008. He stated that the 240 mines used for MDD training annually will only be subtracted when they are destroyed.

¹⁴ The government accused rebels of using antipersonnel mines in June 2004. There were two unconfirmed reports of the use of antipersonnel mines, allegedly by army forces, in April 2007. The rebels have accused the army of laying mines since late 2007, and the government has alleged rebel use on a few occasions. See *Landmine Monitor Report 2008*, p. 747; *Landmine Monitor Report 2007*, p. 729; and *Landmine Monitor Report 2004*, p. 865.

¹⁵ In 2008 and 2009, armed clashes intensified despite a peace deal brokered by Qatar in February 2008. An agreement was reached in Doha on 1 February 2008 aimed at implementing an earlier cease-fire agreement, also mediated by Qatar, signed by the two sides in June 2007.

¹⁷ See *Landmine Monitor Report 2008*, p. 747; and *Landmine Monitor Report 2004*, p. 865.

¹⁸ “Landmine takes off leg of 17-year-old girl in Saada,” *Yemen News Agency* (Sa’dah), 5 November 2008, www.sabanews.net.

¹⁹ “Al-Houthi confirms commitment to peace conditions,” *Mareb Press*, 7 August 2008.

In August 2008, Al-Houthi representative Sheikh Saleh Habra claimed in an interview, “We often suffer from anti-personnel mines planted in our areas by the Yemeni army, but military officials have made no effort to remove these mines. We defused more than 400 mines, but thousands more still are planted in the ground.” He also stated that landmines have killed 100 women and injured more than 100 more as they grazed their sheep and goats near villages and refugee camps.²⁰

It was reported in September 2008 that a member of the “Mine Clearing Committee” was injured by a mine in Haidan district in Sa’daa while removing antipersonnel mines allegedly placed by the army during conflict with the Al-Houthis.²¹ In April 2009, the website of the Al-Houthi rebels claimed that the 105th Division of the Yemen Army laid antipersonnel mines between Maran and Malahit districts.²²

Scope of the Problem

Contamination

Yemen is contaminated with mines and ERW, as a result of armed conflicts since 1962 (from 1962–1969, 1970–1983, and in 1994). Most of the mines were laid prior to unification in border areas between northern and southern Yemen. A Landmine Impact Survey (LIS) completed in July 2000 identified 592 mine-affected villages across 18 of Yemen’s 21 governorates. Of those, 14 communities were deemed high-impact.²³ As of the end of 2008, 10 of these communities had been cleared of contamination; in three clearance tasks had been suspended and the contaminated areas “permanently marked”; and the suspected hazardous area (SHA) affecting the final community had been cancelled.²⁴ The LIS estimated that SHAs covered 922km², and subsequent demining identified a further 10 mined areas estimated to cover a total of some 600,000m².

As of April 2009, Aden and Al Hodaida governorates had been cleared and handed over, with operations completed in Dhamar, Hajjah, Raymah, and Sana’a governorates,²⁵ but land was still to be handed over.²⁶ In Abyan, Hadramout, and Lahij governorates there are only four mined areas, but these include mines buried up to six meters deep in sand dunes over a total estimated area of 41.4 km².²⁷

Yemen reported that its total remaining SHA was more than 520km² as of the end of 2008.²⁸ Based on YEMAC’s reports of land released since 2000 (almost 750km²), a more accurate estimate of remaining SHA comes to less than one-third of that figure (see Progress since becoming a State Party section below). Moreover, much of the remaining SHA is expected to be released without the need for clearance: Yemen’s Article 5 deadline extension request foresaw that, as of the end of 2008, only some 12km² would require full clearance; the rest would be cancelled or reduced by technical survey.²⁹

Casualties³⁰

In 2008, Landmine Monitor identified at least 20 new mine/ERW casualties in Yemen, including seven people killed and 13 injured. Of these, YEMAC recorded nine new casualties (one killed and eight injured), but did not have access to the restive Sa’daa governorate and could not record

²⁹ Article 5 deadline Extension Request, 31 March 2008, p. 12.

³⁰ Unless noted otherwise, casualty data (1999–15 July 2009) provided by email from Ahmed Alawi, YEMAC, 15 July 2009.

casualties there.³¹ Landmine Monitor identified the remaining 11 casualties, nine in Sa'daa and two in Al-Dhale. In 2007, 26 casualties were reported, including one antivehicle mine incident that caused 10 casualties.

Fifteen of the casualties in 2008 were civilians, one was a deminer, and the status of the remaining four was unknown. At least 13 of the casualties were children (10 boys and three girls), and nine of these occurred while tending animals. Two casualties were women. Seven casualties were caused by ERW, five by antipersonnel mines, two by antivehicle mines, and six by unspecified mines.

The United States Department of State reported that, "At least 60 people, including military personnel, were reportedly admitted to hospital with injuries resulting from mine explosions in Saada [Sa'daa]." It added that at least four people were killed in mine/improvised explosive device (IED) incidents in the Sa'daa region in 2008.³² YEMAC said, however, that while landmines were used in the governorate, most of the military casualties were caused by remote-detonated IEDs and antivehicle mines.³³ Landmine Monitor media analysis confirmed that a significant number of casualties in Sa'daa and neighboring Amran governorate were caused by remote-detonated IEDs or deliberate ambushes of security forces. Landmine Monitor identified at least 11 military casualties due to remote-detonated devices in 2008.³⁴ None of these casualties were included in the totals above.

Médecins sans Frontières reported that it had not treated landmine injuries in Al-Talh and Razah hospitals in Sa'daa.³⁵ The ICRC reported treating one mine/ERW injured person in Sa'daa in 2008.³⁶

Casualties continued to occur in 2009 with at least one person killed and eight injured to mid-July. YEMAC reported seven of these casualties (all injured) including five demining casualties. In one incident in May 2009, the ambulance accompanying demining teams in Hadramout governorate hit an antivehicle mine on the edge of a road used by the teams every day. The area had not been surveyed and was unmarked. The driver lost a foot and two of the other six passengers were slightly injured.³⁷ The other two casualties were a civilian man and woman. Landmine Monitor identified two boys injured while fishing.³⁸

The Yemen Mine Awareness Association (YMAA) noted that one casualty in 2009 occurred when a shepherd walked into an uncleared area marked with white stones, which he thought meant the area was safe.³⁹

Ten-year summary

The total number of mine/ERW casualties in Yemen is unknown. According to the LIS, by 2000 there were 4,904 mine/ERW casualties (2,560 people killed and 2,344 injured). In May 2006, YEMAC estimated there were approximately 2,900 mine/ERW survivors.⁴⁰ Between 1999 and the end of 2008, YEMAC recorded 138 mine/ERW casualties, including 49 people killed and 89 injured. It is unknown if LIS casualties occurring in 2000 are included in these totals. Almost all casualties recorded by YEMAC from 1999–2008 were civilians (127) and 11 were deminers.

³⁹ YMAA, "Report of 1st of March Actions in Yemen," Aden, 1 March 2009.

⁴⁰ Presentation by Mansour al-Azi, YEMAC, Standing Committee on Victim Assistance and Socio-Economic Reintegration, Geneva, 8 May 2006.

At least 58 civilian casualties were children (35 boys, 22 girls, and one of unknown gender). Another 49 were civilian adults (38 men and 11 women), and for 20 people age information was unknown. Antipersonnel mines caused 50 casualties, antivehicle mines 29, ERW 56, and unknown devices caused three casualties.

In the past, YEMAC reported varying casualty figures. In March 2006, YEMAC reported 264 mine/ERW casualties between 2000 and 2005. Data provided by YEMAC to Landmine Monitor between 1999 and 2008 totals 159 casualties (63 killed and 96 injured).⁴¹ In July 2009, YEMAC stated that the casualty database had been verified and erroneous recording removed.⁴²

Landmine Monitor identified at least 26 additional casualties (nine killed and 17 injured) that occurred from 1999–2008, but were not included in the Information Management System for Mine Action (IMSMA) database held by YEMAC. Some were foreign nationals, such as three United Kingdom citizens in incidents in 2005. In recent years casualties were recorded in Sa'daa where YEMAC does not have access.⁴³

Risk profile

Most casualties are farmers and herders and incidents are mainly caused by mines. In all years except 2005, children made up a significant percentage of the casualties, and women were a significant proportion. Many contaminated areas are not marked, as marking is only conducted along with clearance.⁴⁴ The rainy season is the most dangerous because flooding can shift mines. Economic reasons are the primary cause of ERW incidents such as scrap metal trade and entering contaminated areas to tend animals.⁴⁵

Program Management and Coordination

Mine action

The National Mine Action Committee (NMAC) was established in June 1998 by Prime Ministerial decree to formulate policy, allocate resources, and develop a national mine action strategy.⁴⁶ NMAC, chaired by the Minister of State (a member of the cabinet), brings together representatives of seven concerned ministries.

YEMAC was established in Sana'a in January 1999 as NMAC's implementing body. YEMAC is responsible for coordination of all mine action activities in the country.⁴⁷ A Regional Executive Mine Action Branch (REMAB) and a National Training Center in Aden were also set up. Another REMAB was added in March 2004 in al-Mukalla (Hadramout governorate). REMABs are responsible for field implementation of the national mine action plan.

In May 1999, UNDP started a program to support YEMAC. In October 2003, the program moved from direct (UN) execution to national execution. Since the beginning of 2007, UNDP has provided support for resource mobilization (including procurements and recruitment services), and project quality assurance (QA). Support from the Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ) enabled the construction of a mine detection dog (MDD) center in Sana'a and training of MDD handlers.

Risk education

YEMAC's RE department is responsible for planning and implementing RE, monitoring against national standards, and integrating RE into mine action. It has an office in Sana'a and a regional office in Aden. Its RE activities are recorded in IMSMA.⁴⁸ RE was discussed at NMAC meetings, and YMAA representatives attended three of these.⁴⁹ According to YMAA, however, the lack of coordination continued to result in poor RE progress in 2008.⁵⁰

Victim assistance

YEMAC coordinates and implements VA activities under NMAC's supervision. YEMAC has a Victim Assistance Advisory Committee comprised of various ministries to assist with planning, but the committee had no decision-making capacity and met infrequently.⁵¹ Coordination between YEMAC and relevant government organizations or civil society is limited to referral of people to services and some limited information exchange with ministries.⁵² YEMAC does not involve disability NGOs or disabled people's organizations in its policy-making process.⁵³

In 2008, YEMAC reported that it aimed to close its VA program by 2014, but it is unclear if any transition mechanisms are in place.⁵⁴ In its Article 7 report submitted in 2009, Yemen noted that "The National Mine Action Program has a plan to continue to do so [provide services] with all victims in Yemen." YEMAC services were only available to mine survivors and not for other persons with disabilities.⁵⁵

The Ministry of Public Health and Population and the Ministry of Labor and Social Affairs are in charge of disability issues. Both ministries are responsible for the physical rehabilitation sector, but did not coordinate adequately, hampering functioning of service-providing centers, which

are dependent on ministry funding.⁵⁶ The Social Fund for Development and the Rehabilitation Fund and Care of Handicapped Persons (Disability Fund) finance projects and direct support to persons with disabilities.⁵⁷ The Social Fund for Development, an independent body under the Prime Minister, has a national disability program and is the only public institution working on disability policy reform and service delivery.⁵⁸ YEMAC does not envision cooperation with the Social Fund for Development or the Disability Fund “in the near future.”⁵⁹

Data collection and management

The latest version of IMSMA was installed in YEMAC in August 2008.⁶⁰ However, problems accessing data have led to an older version being used for operationally.⁶¹

YEMAC maintains casualty data received through its field teams, hospitals, police, security departments, and other government bodies in IMSMA. Data from the LIS is also incorporated into the database. YEMAC is not able to collect casualty data in Sa’daa, but initiated casualty data collection in the neighboring governorate of Amran in 2009.⁶² In 2008, it was said that there were one to three casualties per month (12 to 36 annually).⁶³

Plans

Strategic mine action plans

The National Mine Action Strategic Plan was based on the LIS results and covered the period 2001–2005. The plan was revised in June 2004 for 2005–2009. The plan’s vision is to “put an end to the suffering of the people and the casualties caused by antipersonnel mines in mine-affected areas by the end of March 2009.” In March 2008, YEMAC updated its strategic mine action plan to cover April 2009 to September 2014, the extension period it sought in its Article 5 deadline extension request (see Progress since becoming a State Party section below).⁶⁴

RE is part of the National Mine Action Strategic Plan 2005–2009, and in 2006 a new RE strategy was developed in response to the Geneva International Centre for Humanitarian Demining (GICHD) livelihoods recommendations and in accordance with national RE standards. YEMAC has consulted stakeholders on the effectiveness of the plan, and concluded that it is appropriate and does not need revision.⁶⁵

VA is included in the 2005–2009 plan and its main strategic objective is: “All landmine/ERW survivors should receive medical care, and the centre should provide them with corrective surgery, physical therapy, prosthetic devices, wheelchairs, eyeglasses and hearing aids, as needed... This objective will be met when all known survivors are registered and provided with assistance as per the centre’s medical and rehabilitation programme.”⁶⁶

YEMAC operates a four-step program for VA: identification of survivors, medical examination, medical and rehabilitation treatment, and socio-economic reintegration. Socio-economic reintegration was added in 2004, but the remainder of the program is unchanged since it started in 2001.

⁶³ Article 5 deadline Extension Request, 31 March 2008, p. 10.

⁶⁴ *Ibid*, p. 13.

⁶⁵ Interview with Mansour al-Azi, YEMAC, in Geneva, 29 May 2009.

⁶⁶ UN, “2008 Portfolio of Mine Action Projects,” New York, November 2007, p. 460.

In May 2009, YEMAC noted that there was no need to change the program, as it provided “tangible support” to survivors.⁶⁷ Nevertheless, psychological support and social reintegration are not included in the program because there was no funding for these components.⁶⁸ Additionally, YEMAC did not find psychosocial support a priority issue, as it thought this was provided by the family network,⁶⁹ even though an evaluation in 2006 showed that mental health care was needed.⁷⁰

National ownership

Commitment to mine action and victim assistance

Yemen provides over 50% of program funds through in-kind contribution of staff, facilities, and social benefits for the national staff, said to be equivalent to US\$3.5 million (€2.4 million) annually.⁷¹ This support covers salaries for the deminers, insurance, social security, compensation, and field allowances, and office and training premises for the program.⁷²

In a statement to the intersessional Standing Committee meetings in May 2009, YEMAC’s director noted that “there were no funds to carry out VA activities as planned,” and that he “could hardly manage to keep the YEMAC VA department open.”⁷³ YEMAC’s VA program operates entirely under national management and, since 2007, increasingly supported by national funding.

Although the YEMAC program was evaluated in 2005 as “...probably one of the best and most advanced in the world... due to strong support by the YEMAC Programme Manager,”⁷⁴ a further evaluation showed that the program’s “coverage to date is limited...” Most survivors had not heard of the YEMAC program and lived without appropriate medical and socio-economic support.⁷⁵

YEMAC delegated the socio-economic reintegration part of its VA program to the NGO Yemen Association for Landmine and UXO Survivors (YALS) which has experienced financial difficulties. In its latest Article 7 report, Yemen noted that YALS was in great need of funds and had been struggling since 2006.⁷⁶ Even though several organizations exist to provide small loans and credits to vulnerable groups, including persons with disabilities, the YEMAC VA program did not attempt to link with them.⁷⁷

National management

Yemen’s mine action program is fully nationally managed. UNDP continues to support the program, but there has been no international technical advisor since 2005.⁷⁸

⁷⁸ Telephone interview with Mansour al-Azi, YEMAC, 12 August 2009.

National budget

In 2008, the national budget allocation to YEMAC was cut due to the economic crisis, directly affecting RE and VA activities, as the government reportedly noted that funding provided was prioritized for clearance. The last international funding for VA was received in 2007.⁷⁹ International donors had been approached, but to no effect. YEMAC also noted that relevant ministries had generated some international funding for assistance to persons with disabilities and other vulnerable groups but that this had not benefited mine/ERW survivors.⁸⁰

The Social Fund for Development funded some 63 projects providing assistance to persons with disabilities (for an amount of \$2.77 million).⁸¹

National mine action legislation and standards/Standing operating procedures

NMAC was established by decree in June 1998 and YEMAC was established in October 1998 as its implementing body. In 2006, the Yemen national mine action standards and YEMAC's standing operating procedures were approved by NMAC.

Program evaluations

An evaluation of UNDP support to the Yemeni mine action program in 2005 recommended that Yemen should conduct a socio-economic assessment of the use of released land. This was carried out in 2006. Based on the results of the assessment, YEMAC planned to establish a department to promote socio-economic development of cleared areas. This had not occurred as of August 2009.⁸²

Demining and Battle Area Clearance

Mine clearance in Yemen is undertaken solely by the Engineering Forces of the Ministry of Defense who are seconded to YEMAC. YEMAC uses a variety of demining tools: manual deminers, MDDs, and, since early 2007, demining machines. A backhoe demining machine, delivered to YEMAC by the US Department of Defense for testing, has been used since January 2007. The machine is intended to clear antipersonnel mines deeper than 1.5 meters in desert areas but, as most minefields consist of both antipersonnel and antivehicle mines, it has not proved particularly efficient.

The major obstacles to demining in 2008 and 2009 were said to be shortfalls in funding and security concerns in some affected areas.⁸³ On 11 February 2009, the directors of YEMAC and the Croatian Mine Action Center signed a cooperation agreement in Cairo. Under the agreement, Croatia will offer modern clearance equipment to Yemen.⁸⁴

Identifying hazardous areas

Land release on SHAs is conducted by YEMAC through technical survey. YEMAC never releases any land without technical survey and QA. QA teams must visit every suspected mined area to cross-check the information.⁸⁵

Demining and battle area clearance in 2008

YEMAC has reported mine clearance of 5.23km² in 2008 and no battle area clearance, despite destroying a significant quantity of UXO.

Demining in 2008⁸⁶

Demining operators	Mine clearance (km ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	UXO destroyed	Area released by survey (km ²)
Demining Units	2.48	—	—	—	—
Survey Teams	1.85	—	—	—	34.80
MDD teams	0.90	—	—	—	—
Total	5.23	70	18	26,322	34.80

Break-down of items destroyed, by operator, was not available at time of publication.

Quality assurance/Quality control

There is no independent quality management system of demining operations. YEMAC has a QA section to verify the quality of its clearance.⁸⁷

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Yemen was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. Despite concerns about the reliability of its data,⁸⁸ Yemen has made significant progress in mine clearance since becoming a State Party to the treaty. On 31 March 2008, however, Yemen submitted a request for a six-year extension to 1 March 2015. On 6 November 2008, it submitted a revised request but did not change the extension period sought.

Yemen cited a series of factors for its failure to meet its 1 March 2009 deadline, including shortfalls in funding (especially in 2003, 2005, and 2006) and the presence of mines in shifting sands as well as their depth (some up to six meters below the surface), as well as its mountainous areas and problems using mine detectors in the ferrous soil.⁸⁹

In granting Yemen's extension request, the Ninth Meeting of States Parties noted that while the extension "seemed workable," success in implementation would be "very much tied to securing donor support." The meeting also noted the "value of further clarity regarding the extent of Yemen's remaining challenge and on steps taken by Yemen to overcome the technical challenges that have posed as impeding circumstances in the past."⁹⁰

Thus, Yemen still needs to provide accurate data on the remaining area to be cleared and to confirm that no mined areas will be excluded from the demining program during the extension period. Previously, Yemen had claimed that certain mined areas would be "permanently marked" due to the "impossibility" of clearance.

⁸⁶ Email from Ahmed Alawi, YEMAC, 21 July 2009.

⁸⁷ Article 5 deadline Extension Request, 31 March 2008, pp. 9–10.

⁸⁸ For example, on several occasions Yemen has reported to Landmine Monitor different figures for clearance and land released by survey for the same years.

⁸⁹ Article 5 deadline Extension Request, 31 March 2008, pp. 3–4.

⁹⁰ Decisions on the request submitted by Yemen for an extension of the deadline for completing the destruction of anti-personnel mines in accordance with Article 5 of the Convention, Ninth Meeting of States Parties, Geneva, 28 November 2008.

Demining from 1999–2008⁹¹

Year	Mine clearance (km ²)	Area released through survey (km ²)
2008	5.23	34.80
2007	2.64	218.08
2006	2.01	179.93
2005	1.74	41.85
2004	2.73	140.07
2003	2.94	38.03
2002	1.87	40.12
2001	1.28	47.78
2000	0.58	6.16
1999	0.10	0
Total	21.12	746.82

Risk Education

The only organization which had an RE program in 2008 was YEMAC, which consists entirely of military staff, and is funded by the government.⁹² YMAA did not have a program due to lack of funding, but YMAA members delivered emergency RE in response to incidents.⁹³

The total number of RE recipients for 2008 of 210,559 is a very significant increase on previous years; 80,931 people were reached in 2007 and 45,524 people in 2006.

In accordance with the National Mine Action Strategic Plan, most affected areas were reached. RE was conducted year-round for 12 days each month.⁹⁴ Priority-setting was based on the LIS but, since 2008, recent casualties and emergency situations have been given higher importance in determining RE priorities.

YEMAC delivered RE using child-to-child and woman-to-woman methods in homes, through direct presentations to men at social gatherings, and through plays, films, and posters. Survivors also participated in delivering RE messages.⁹⁵ YEMAC conducted RE in 132 villages in the following governorates: Abyan, Al-Bayda, Al-Mahra, Hadramout, Ibb, Lahij, and Ta'izz. The total population reached in communities and schools was 109,558 males and 101,001 females. YEMAC also trained teachers in workshops at the district level,⁹⁶ although there is no formal RE program with the Ministry of Education.⁹⁷

YEMAC has eight male and two female RE facilitators.⁹⁸ Most female beneficiaries were girls at school, but few women received RE.⁹⁹

⁹¹ Email from Ahmed Alawi, YEMAC, 21 July 2009. This data does not match with information previously provided to Landmine Monitor and it has not been possible to reconcile this data with earlier reports.

⁹⁹ Email from Aisha Saeed, YMAA, 30 April 2009.

Community liaison is conducted before, during and after demining. A handover ceremony is conducted, and YEMAC demonstrates that clearance has been conducted by walking or driving over the land. This builds community confidence, which had been reported by GICHD in 2006 to be lacking.¹⁰⁰

Most materials used by YEMAC in 2008 were produced by YMAA about four years earlier, and included posters, booklets, stickers, and games, and they were shared with other implementing organizations.¹⁰¹ YEMAC uses models for explanations and gives out material during presentations. YEMAC distributed 57,200 posters during presentations in 132 villages.

Challenges included reaching remote desert areas with a scattered Bedouin population, a lack of funding, and addressing high-risk behaviors resulting from poverty.¹⁰² UNDP visits the field every three months to monitor RE.¹⁰³

RE has been conducted since 1999 by YEMAC and YMAA working together. It was coordinated by YEMAC, through the Mine Awareness Advisory Committee until 2007, when YMAA stopped its program due to lack of funding. By March 2009, a total of 1,094,879 beneficiaries were reported to have received RE.¹⁰⁴ YEMAC conducted RE and community liaison. YMAA trained community leaders to pass RE on to their communities and to report contamination to the demining unit, and produced RE materials. YMAA also conducted child-to-child training.

Victim Assistance

The total number of mine/ERW survivors in Yemen is unknown, but is at least 2,458. From 2008–2009, VA was severely hampered by financial difficulties, as noted above.¹⁰⁵ The survivor organization YALS also noted that the activities implemented ignored many needs of survivors. Survivors were not included in planning or implementation of VA activities.¹⁰⁶ It was also remarked that the assistance provided by YEMAC took time and that “survivors had to wait for their turn, even if they need urgent support.”¹⁰⁷

YEMAC noted that the Social Fund for Development and the Disability Fund only assist those persons with disabilities registered at either fund, but that many survivors are not registered because they live in remote areas.¹⁰⁸

Service provision for persons with disabilities in Yemen is weak, primarily urban-based, and largely inaccessible to those who need it. Cross-sector initiatives such as community-based rehabilitation (CBR) are virtually non-existent.¹⁰⁹ The ICRC noted that, “Many people remain without services, especially in rural areas where there is a near total absence of disability support services, including health education and rehabilitation.”¹¹⁰ For women access is even more limited.¹¹¹

Health and rehabilitation services are highly centralized and mainly located in the major cities (Aden, Sana’a, and Ta’izz) and many persons with disabilities needed to travel long distances for assistance. The centralization of services was a major obstacle to receiving care. Transport and accommodation costs were unaffordable for many, and even more challenging for women

¹¹¹ US Department of State, “2008 Country Reports on Human Rights Practices: Yemen,” Washington, DC, 25 February 2009.

who often needed a male caretaker to accompany them. Medical assistance was of variable quality.¹¹²

Patients had difficulties maintaining their orthopedic appliances, given the distances to physical rehabilitation centers.¹¹³ Only one physical rehabilitation center operates in the remote Hadramout governorate.¹¹⁴ The Ta'izz rehabilitation center, which did not receive assistance, was not functioning at capacity in 2009,¹¹⁵ and it has not functioned well since Handicap International (HI) handed the center over in January 2005.

Psychosocial support activities for mine/ERW survivors were very limited and their importance not recognized. Some limited services were only available in the main cities.¹¹⁶ Existing economic reintegration programs for survivors and other persons with disabilities were weak and few persons with disabilities had access to educational and economic opportunities.¹¹⁷ According to NMAC, a newly-opened bank provides credit to vulnerable groups and poor people, but no agreement has been reached for the bank to include mine/ERW survivors in its mandate.¹¹⁸ Employment quotas stipulate that 5% of government jobs should go to persons with disabilities and by law disabled students are exempt from paying tuition fees. It is unknown to what extent these laws are implemented and schools are often not accessible.¹¹⁹ Mine/ERW survivors and other persons with disabilities receive a pension, but this was insufficient to maintain a reasonable standard of living.¹²⁰

Yemen has legislation to protect the rights of persons with disabilities, but it is unknown whether it is enforced and discrimination remained.¹²¹ On 26 March 2009, Yemen ratified the UN Convention on the Rights of Persons with Disabilities (CRPD) and its Optional Protocol.

Progress in meeting VA26 victim assistance objectives

Yemen is one of the VA26 group, composed of 26 States Parties with significant numbers of mine survivors and “the greatest responsibility to act, but also the greatest needs and expectations for assistance” in providing adequate services for the care, rehabilitation, and reintegration of survivors. Yemen prepared its 2005–2009 VA objectives for November 2005 and in April 2007 it presented its four-phase program as the plan to achieve its objectives.¹²² The plans or objectives have not been revised since, and do not cover all components of VA, as the program is very medically oriented, and the economic reintegration component largely defunct.¹²³

Yemen reported on VA in Form I of its Article 7 reports submitted from 2005–2009; it also reported on VA during meetings of States Parties from 2005–2009 and at the intersessional Standing Committee meetings from 2005–2007 and in 2009.¹²⁴ These statements were limited

to statistical updates on the number of people assisted in the first three phases of the YEMAC program.

In 2008, as in previous years, Yemen did not reach its target of assisting 500 persons per year with medical care, and of reaching 2,000 people with physical rehabilitation between 2005 and 2009. In its Article 7 report submitted in 2009, Yemen stated that some 2,033 survivors had been interviewed since 2001, 1,530 had received medical examinations, and 1,638 provided with medical/rehabilitation services (compared to 1,447 people interviewed, 1,165 medical examinations, and 1,313 services provided to the end of 2007).¹²⁵ The target to assist 500 people with economic reintegration from 2005–2009 was not reached due to financial and capacity issues at YALS; some 202 people received vocational training from 2005–March 2009.¹²⁶

Progress on needs assessments and infrastructure improvements by the Ministry of Public Health and Population, which had a deadline of 2006, the establishment of six vocational training centers, or disability awareness-raising was not reported or identified.¹²⁷

A VA expert was present at the intersessional Standing Committee meetings in 2007 and at meetings of States Parties in 2007 and 2008.

Victim assistance activities

In 2008, YEMAC assisted 230 survivors with medical and rehabilitation services, and some 288 medical procedures were carried out. An additional 12 survivors obtained physical rehabilitation assistance at the Aden Rehabilitation Center without YEMAC support. Since 2001, some 1,339 mobility devices have been provided.¹²⁸ Yemen also reported that community-based rehabilitation projects were training more field staff to expand coverage to all priority areas.¹²⁹

In 2008, the ICRC continued to provide raw materials and components, as well as training to three physical rehabilitation centers (Sana'a, Aden, and Hadramout). It provided financial support to set up a mobile clinic in Sa'daa. Through ICRC-supported centers, 7,652 people were assisted in 2008; 1,216 prostheses were produced (400 for mine/ERW survivors), and 3,967 orthoses (76 for mine/ERW survivors). Seven prosthetic-orthotic technicians were sponsored for training in India.¹³⁰ The ICRC also provided war-surgery training in Sa'daa, but movement restrictions in the governorate hampered medical service provision. Two ICRC-supported hospitals assisted 74 weapon-injured in 2008, including one mine/ERW casualty.¹³¹

In 2008, the Aden Rehabilitation Center received patients from Abyan, Aden, and Lahij and conducted outreach services in these governorates. The center treated 2,326 people in 2008, produced 104 prostheses (44 for mine/ERW survivors), and distributed 2,255 assistive devices in 2008. It also carried an average of 680 physiotherapy sessions per month.¹³²

The Aden Association of People with Special Needs continued to provide vocational and marketing training and income-generating opportunities, with financial support by the Disability Fund and the Social Fund for Development. In 2008, 45 persons with disabilities received

¹²⁵ Article 7 Report, Form I, 31 March 2009; and information provided by Dr. Fouad al-Shamiri, YEMAC, Sana'a, 23 March 2008.

¹³⁰ ICRC, "Physical Rehabilitation Programme: Annual Report 2008," Geneva, 7 May 2009, p. 64; and ICRC, "Annual Report 2008," Geneva, 27 May 2009, p. 367 (contains the exact number of survivors assisted).

¹³¹ ICRC, "Annual Report 2008," Geneva, 27 May 2009, p. 367.

¹³² Interview with Abdullah al-Duhaimi, Director, Aden Rehabilitation Center, Aden, 28 February 2009. The statistics for mobility devices and persons assisted are included in those reported by the ICRC.

training and employment, and the association assisted four persons with disabilities in obtaining government jobs.¹³³

From 2008–2009, YALS received some limited support from the Social Fund for Development, but YEMAC was not able to provide assistance.¹³⁴ In 2008, 48 survivors received vocational training from YALS, eight were assisted in setting up small businesses, and 12 received assistance to access education. YALS also conducted awareness-raising, follow-up of its graduates, and recreational trips for its members. Aside from financial difficulties, YALS noted that reaching survivors in remote areas (where most live) and lack of services in these areas were challenging. Additional obstacles were high illiteracy rates, particularly among women, and cultural constraints preventing women from receiving training.¹³⁵

The Aden Association for the Physically Disabled received funding from Save the Children to carry out inclusive education and advocacy on the CRPD in 2008.¹³⁶

Save the Children continued to support three disability associations in Sana'a and the community-based rehabilitation network in Abyan, Aden, and Ibb, as well as in the Kharaz camp for Somali refugees, where it assisted 80 children with disabilities. Save the Children also organized a regional consultation on the CRPD in cooperation with the Arab Human Rights Foundation (AHRF) and published a CRPD implementation guide in December 2008.¹³⁷

In 2008, the AHRF initiated a psychosocial unit in Sana'a, which was accessed by a few survivors.¹³⁸

Support for Mine Action

Yemen has reported a total cost estimate of \$31,216,667 (€21,198,334) for completing mine clearance during 2009–2014.¹³⁹ This does not take into account costs required to fulfill RE and VA obligations. Yemen's contribution to mine clearance during the extension period is projected to approximate \$18.8 million, while international assistance is expected to be an estimated \$10.5 million and funds from other sources to total roughly \$1.9 million.¹⁴⁰ NMAC is responsible for the allocation and management of national funds for mine action.¹⁴¹

National support for mine action

As of November 2008, Yemen reported national funding to mine action in 2008 to be \$3.6 million.¹⁴² Yemen reported providing \$3.5 million (€2.4 million) to mine action in 2007. From 1999 to 2008, Yemen reported a total of \$50,277,298 (€34,141,856) in funding from all sources, of which \$35,700,220 (€24,242,985) or 71% came from Yemen's national budgets.¹⁴³ In its strategic plan for completing mine clearance, Yemen projected reduced government funding in 2009 (\$2.8 million) followed by a return to current levels. It noted that the government had assumed a 10% annual inflation rate in setting its annual funding levels. Government funds were projected to account for some 60% of total required funds. In addition to the 34% required from international sources, Yemen must identify "resources available from other sources" for the remaining 6% of required funds, or almost \$1.9 million.¹⁴⁴

International cooperation and assistance

In 2008, three countries—Germany, Italy, and the US—reported providing \$1,005,172 (€682,583) to mine action in Yemen. Reported mine action funding in 2008 was approximately 9% less than reported in 2007. Funding at current levels is insufficient to meet the annual amount projected by Yemen as required to carry out its mine clearance strategy during the extension period—ranging from \$1.25 million in 2009 to \$1.9 million from 2010 to 2013—which does not directly address RE or VA needs.¹⁴⁵ In its revised Article 5 extension request, Yemen reported that shortages in funding have occasionally caused the delay or suspension of mine action activities, including the replacement of equipment, deployment of explosive ordnance disposal units and QA and monitoring teams, and restructuring of clearance units.¹⁴⁶ YMAA reportedly suspended all activities during 2008 due to a lack of funding.¹⁴⁷

Yemen reported receiving \$1,331,000 in funding in 2008, including \$1,031,000 from the European Commission (EC) and \$300,000 from UNDP.¹⁴⁸

2008 International Mine Action Funding to Yemen: Monetary¹⁴⁹

Donor	Implementing Agencies/ Organizations	Project Details	Amount
US	From the Department of State	Equipment replenishment	\$500,000
Germany	UNDP	Support of MDD center	\$357,912 (€243,048)
Italy	UNDP	Capacity building	\$147,260 (€100,000)
Total			\$1,005,172 (€682,584)

In February 2009, Croatia signed a cooperative agreement with Yemen, under which Croatia will provide equipment to support clearance operations in Yemen, and the two countries will exchange technical expertise in areas related to treaty implementation. The types of equipment and value of in-kind support were not reported.¹⁵⁰

ZAMBIA

2008 Key Data

State Party since	1 August 2001
Contamination	ERW
Estimated area of contamination	Unquantified
Casualties in 2008	11 (2007: 19)
Estimated mine/ERW survivors	At least 152
Article 5 (clearance of mined areas)	Deadline: 1 August 2011
Demining in 2008	4.78km ² (14 SHAs) and 11 roads were released in 2008–2009
Risk education recipients in 2008	13,000
Support for mine action in 2008	International: Not reported (2007: \$6,850) National: Not reported (2007: \$980,000)

Ten-Year Summary

The Republic of Zambia became a State Party to the Mine Ban Treaty on 1 August 2001. It enacted domestic implementation legislation in December 2003. Zambia completed destruction of 3,345 stockpiled antipersonnel mines in October 2004. It retained 3,346 mines for training, of which 1,226 were consumed during training in 2007. Zambia became co-chair of the Standing Committee on Stockpile Destruction in November 2008. Representatives of the Angolan government and Angolan non-state armed groups both told Landmine Monitor that they had used antipersonnel mines inside Zambia in 1999 and 2000.

Zambia was contaminated with landmines and explosive remnants of war (ERW) as a result of non-state armed groups from neighboring countries having used Zambia as a haven in the 1970s and 1980s. The Zambia Anti-Personnel Mine Action Centre (ZMAC), created in 2001, is responsible for mine action. Until Norwegian People's Aid began a nationwide survey in 2008 the problem was ill-defined. In June 2009, preliminary survey results showed that Zambia's problem is principally from ERW and no residual antipersonnel mine contamination had been confirmed.

ZMAC recorded at least 152 mine and ERW survivors in Zambia until 2007. Until 2003, there were no organized or sustained risk education programs, and it has remained limited. ZMAC has been the main implementing organization, though some risk education activities have also been conducted by NGOs. The main target group has been refugees. ZMAC's capacity to carry out victim assistance has remained limited and access to healthcare and disability services was poor.

Mine Ban Policy

Zambia signed the Mine Ban Treaty on 12 December 1997 and ratified it on 23 February 2001, becoming a State Party on 1 August 2001. Zambia enacted comprehensive domestic implementation legislation on 12 December 2003, which includes penal sanctions.¹

¹ Act No. 16 of 2003, short-title: "Prohibition of Anti-Personnel Mines Act, 2003," date of assent 11 December 2003, enacted by the Parliament of Zambia on 12 December 2003. The act "became effective" in August 2004. Article 7 Report, Form A, 30 March 2005.

Zambia submitted its seventh Article 7 report on 3 April 2009, which covers calendar year 2008.²

At the Ninth Meeting of States Parties in Geneva in November 2008, Zambia was named co-chair of the Standing Committee on Stockpile Destruction, having served as co-rapporteur the previous year. Zambia made a statement during the general exchange of views calling for universalization of the treaty and for greater international assistance with clearance globally. It also made a statement on mine clearance and provided comments on Zimbabwe's Article 5 clearance deadline extension request.

Zambia attended the intersessional Standing Committee meetings in May 2009, where it made a statement on mines retained for training purposes. Zambia also provided an update on mine clearance.

Zambia has intervened on matters of interpretation and implementation related to Articles 1 and 2. At the intersessional Standing Committee meetings in June 2008, Zambia reported that its national implementation legislation directly covers many of these issues.³ It stated that it joins others in calling for a common understanding that any mine that can be set off unintentionally by a person, thereby functioning as an antipersonnel mine, is banned, including antivehicle mines with sensitive fuzes or sensitive anti-handling devices. It also stated its understanding that transit of antipersonnel mines is prohibited, and that participation in joint military operations must be in adherence with the convention.⁴

Zambia is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions in December 2008 and ratified on 24 August 2009.⁵

Production, transfer, stockpile destruction, and retention

Zambia has not produced or exported antipersonnel mines. Zambia completed the destruction of a stockpile of 3,345 antipersonnel mines in October 2004.

There were discrepancies in the number and types of mines retained and consumed for training purposes reported in Zambia's Article 7 reports covering 2007 and 2008.⁶ In its Article 7 report for 2008, Zambia stated that its previous report included "arithmetic and typographical errors." Zambia cited 3,346 as the original number of mines retained for training purposes, with 1,226 of those mines used during training in 2007, leaving 2,120 mines retained.⁷ Although field training was planned for 2008, none took place, and 2,120 mines were still retained at the end of 2008 as follows: 100 ALPHER-120 (China); 100 AUPS-24 (Italy); 100 POMZ-2 (Russia); 100 T. VARS-40 (Italy); 200 MAUS (Russia); 205 T. VARS-50 (Italy); 230 T69 (China); 383 T59 (Russia); and 702 T58 (China).⁸

² Previous Article 7 reports were submitted on 17 April 2008, 10 April 2007, 11 May 2006, 30 March 2005, 9 February 2004, and 31 August 2001.

³ The legislation is explicit about a prohibition on antivehicle mines with sensitive fuzes or antihandling devices which function as antipersonnel mines. It states that "transfer" includes "the transit of anti-personnel mines into, out of, or through Zambia by any means," and says that members of the armed forces can participate in operations or other military activities with the armed forces of a state not party to the Convention, "Provided that the operation, exercise or military activity is not in contravention of the Convention and that such participation does not amount to active assistance in any activity prohibited by the Convention and this Act."

⁴ Statement of Zambia, Standing Committee on the General Status and Operation of the Convention, Geneva, 6 June 2008. Notes by Landmine Monitor.

⁵ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 181.

⁶ See *Landmine Monitor Report 2008*, pp. 764–765. In its report for 2008, Zambia stated it was retaining 3,346 mines for training purposes. Article 7 Report, Forms D and F, 10 April 2007. The retained mines included: 110 POMZ-2 (Russia); 113 T. VARS 40 (Italy); 267 ALPHER 120 (China); 286 AUPS 24 (Italy); 287 T. VARS 50 (Italy); 338 MAUS (Russia); 430 T69 (China); 613 T59 (Russia/Iraq); and 902 T58 (China). In its 2008 report, Zambia reported variously 1,020 and 1,226 mines used in training during 2007, with 2,232 mines retained as of the end of the year. Article 7 Report, Form D, 17 April 2008.

⁷ Article 7 Report, Forms B and D, 3 April 2009.

⁸ *Ibid.*, Form B.

At the May 2009 intersessional Standing Committee meetings, Zambia stated that 2008 field training exercises were cancelled as a result of budgetary constraints. It said that field training exercises were planned for 2009, which would further reduce Zambia's reserve of mines.⁹

Scope of the Problem

Contamination

Zambia was contaminated with landmines and ERW as a result of non-state armed groups from neighboring countries having used Zambia as a haven in the 1970s and 1980s.¹⁰ However, the preliminary results of a nationwide survey found Zambia is primarily contaminated with ERW, including cluster munition remnants, and only one antivehicle mine and one fuze had been found as of July 2009.¹¹

Several surveys since 2003 have provided a partial picture of the problem. One in 2003–2004 by ZMAC identified 41 areas affected by mines and/or ERW, but the survey teams did not access all areas and the results were therefore not exhaustive.¹² Norwegian People's Aid (NPA) determined from an initial assessment in 2007 that tourism, farming, and hydroelectric power—all key pillars for economic growth and development—are affected by the threat of landmines.¹³ ZMAC, however, has reported only that contamination has hindered the exploration of uranium deposits and the development of infrastructure in national game parks.¹⁴

In 2008, the government of Zambia asked NPA to survey seven of its nine provinces—Eastern, Southern, Lusaka, Western, North-Western, Central, and Luapula—primarily in the border areas with Angola, the Democratic Republic of the Congo, Namibia, Mozambique, and Zimbabwe. The survey, which began on 1 September 2008,¹⁵ was expected “to provide standardized and technical data on the location, nature and impact of landmines and explosive remnants of war on communities in the country.”¹⁶ NPA based its survey on the 41 locations identified by the 2003–2004 ZMAC survey.¹⁷

By late July 2009, NPA had visited 570 locations in 46 districts and identified 14 suspected hazardous areas (SHAs) and three confirmed hazardous areas, two of which contained cluster munition remnants and the third ERW. The areas were spread across nine districts: Chiengwe, Chongwe, Kalabo, Kaoma, Luangwa, Sesheke, Shangombo, Siavonga, and Solwezi. None of the SHAs were suspected to contain mines.¹⁸

During the resurvey, a police explosive ordnance disposal (EOD) officer was paid by NPA to destroy the items left by its survey team, including two unexploded submunitions located in Zhaba in Shangombo district in Western province. Items destroyed were one antivehicle mine, one antivehicle mine fuze, and 22 ERW, composed mainly of hand grenades and mortar bombs,

as well as two unexploded submunitions. Preliminary results as of late July 2009 indicated no antipersonnel mines had been found during the survey.¹⁹

In March 2009, ZMAC and UNDP began recruiting an evaluator to assess the survey to ensure it meets both national and international standards.²⁰

Casualties

In 2008, Landmine Monitor identified 11 new ERW casualties, including six people killed and five injured in Zambia. On 5 September 2008, an ERW incident in Zimba, Southern province, resulted in two casualties (one killed and one injured).²¹ On 24 September 2008, one man was killed and three injured while tampering with ERW in Katete, Eastern province.²² On 23 December 2008, another incident resulted in four people killed and one injured.²³

Casualties continued in 2009 with one adult male reportedly injured by ERW in February.²⁴

In 2007, ZMAC identified at least 152 mine survivors across 122 communities in six mine/ERW-contaminated provinces.²⁵ Landmine Monitor identified 62 mine/ERW casualties in Zambia between 1999 and 2008 (10 killed, 28 injured, and 24 unknown).

Program Management and Coordination

Mine action

In accordance with legislation adopted in 2003, the National Committee on Anti-Personnel Landmines (NCAL) serves as the national mine action authority. Coordination of mine action is the responsibility of ZMAC, set up in 2001 by governmental decree and formalized by the 2003 legislation.²⁶

Risk education

In 2008, ZMAC was the main coordinating body for mine/ERW risk education (RE) and worked with the Commissioner for Refugees in the Ministry of Home Affairs. RE is based on the International Mine Action Standards and national standards which were developed in 2003.²⁷ RE is discussed at the quarterly NCAL meetings which are held to review progress, and the Zambian Campaign to Ban Landmines (ZCBL) attends on invitation.²⁸

Victim assistance

As coordinator of the national mine action strategy, which includes victim assistance, ZMAC is primarily responsible for victim assistance, but activities remained limited and mine/ERW survivors benefit from general disability programs under the Ministry of Community Development and Social Services.²⁹

Data collection and management

ZMAC is officially mandated to collect mine/ERW casualty data in Zambia. NCAL contracted NPA to conduct survivor registration as part of its national survey.³⁰ It is expected that ZMAC will enter all the data from the survey into the Information Management System for Mine Action database, which it houses.

Plans

Strategic mine action plans

In 2005, Zambia drafted a three-year Humanitarian Demining Program (2005–2007), which included the objective of clearing hazardous areas by the end of 2007.³¹ The document was updated to cover 2005–2009, adjusting the vision “to be mine-free by the end of 2008.”³² As in previous years, this target objective was largely dependent on national will, mobilization of Zambian resources, and international donor assistance.³³ It also depended on the results of a nationwide survey, which did not begin until September 2008.³⁴ The NPA survey and the follow-up to clear the SHAs identified in the survey will form the basis of future Zambian mine action planning.³⁵

National ownership

Commitment to mine action and victim assistance

Zambia has demonstrated a continuing commitment to mine action,³⁶ but until 2008 progress in meeting its Article 5 obligations had been slow, primarily due to limited resources.

National management

Mine action in Zambia is nationally managed, with ZMAC playing an important role in coordination.³⁷ As noted above, the nationwide survey was conducted by NPA, but destruction of items found was carried out by the Zambian police EOD personnel.

National budget

In June 2008, the Zambian Parliamentary Committee on National Security and Foreign Affairs expressed concern over the lack of progress in addressing the mine problem. The committee recommended increasing funding to ZMAC significantly. Parliament, however, allocated ZMK550 million (about US\$90,000) but by the end of the year had disbursed only half of the amount.³⁸

National mine action legislation and standards/Standing operating procedures

National mine action legislation was adopted in 2003 and entered into force the following year. Standing operating procedures for demining were developed by ZMAC in 2001–2002.³⁹

Demining and Battle Area Clearance

Mine and battle area clearance is conducted by army deminers working for ZMAC and spot clearance is also carried out by police EOD personnel.

In 2008, ZMAC conducted a landmine verification and clearance project in the Lower Zambezi National Park on behalf of the Zambia Wildlife Authority. The project was unable to meet all its goals because it was based on an outdated budget. ZMAC submitted a new budget

with the agreement of the director of the Zambia Wildlife Authority, but as of the end of 2008 new funds had not yet been approved.⁴⁰ While clearing 1,071m² of SHAs, 182 items of UXO were found and destroyed.⁴¹

ZMAC was contracted in 2008 by OmegaCorp Limited, a subsidiary of Denison Mines Corp and a mineral exploration company, to conduct demining in Siavonga district. It was also asked by ZESCO Limited, the state power utility, to demine before work began on a construction project, also in Siavonga district. ZESCO personnel had previously found hand grenades at the Kariba North Bank Power Extension Project site where the Sinohydro Corporation of China had been contracted to build an extension of the electrical plant. As the table below indicates, one antivehicle mine and nine items of UXO were found and destroyed after surveying and clearing 4.78km². After clearance, ZMAC handed over the land to OmegaCorp for mining exploration, and in March 2009, construction of the electrical plant began.⁴²

Land release in 2008⁴³

Demining operators	Province/district	Land release (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	UXO destroyed during mine clearance
Zambian army deminers/ZMAC	Siavonga district, Southern province	4,326,950	0	1	9
Zambian army deminers/ZMAC	Kariba North Bank, Siavonga district	452,530	0	0	0
Zambian army deminers/ZMAC	Lower Zambezi National Park, Luangwa and Chiawa districts	1,071	0	0	182
Total		4,780,551	0	1	191

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Zambia is required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 August 2011. In May 2009, at the Standing Committee meetings, Zambia stated that it was likely all remaining mined areas would be cleared by the Second Review Conference in December 2009 and that Zambia would be able to declare itself mine-free.⁴⁴ In July 2009, the NPA national survey was close to completion, with no antipersonnel mine contamination having been found.⁴⁵

⁴⁵ Emails from Mário Penedo Tomé Nunes, NPA, 22 and 27 July 2009.

Risk Education

RE in 2008 was aimed at refugees and their host communities. The focus was on training trainers of key communicators who would work in their own communities. School-based RE was also being developed and was expected to be completed by the end of 2009.⁴⁶ Approximately 13,000 people received RE in four refugee camps: Meheba (Solwezi), Kala (Kawambwa), Mwange (Mporokoso), and Mayukwayukwa (Kaoma), out of a total population of 55,490 in the camps.⁴⁷ NPA also conducted some RE where necessary alongside its nationwide survey, although this did not form part of their contractual obligations.⁴⁸

Once the survey is completed, it will provide a better understanding of the needs for RE, and this will be used to develop a national mine action strategy that includes RE. During field work, NPA found that communities were generally aware of the issue.⁴⁹ At the Standing Committee meetings in June 2008, Zambia stated that “Mine risk education continues to play a significant role in the prevention of mine related accidents.”⁵⁰

The number of ZMAC RE staff was reduced in 2008.⁵¹ ZMAC had two permanent staff and four co-opted staff from other ministries who assist when required for field work.⁵² Training of 51 key communicators (20 female and 31 male) was conducted in September 2008 in accordance with agreements between Zambia, the Office of the UN High Commissioner for Refugees (UNHCR), the Democratic Republic of the Congo, and Angola, which require Zambia “to sensitize all repatriating refugees on mine awareness.”⁵³ The key communicators then conducted RE in their own communities, in schools, and at the departure centers.⁵⁴ They also conducted RE for Zambian nationals, particularly schoolchildren living in areas awaiting clearance.⁵⁵ RE campaign materials were distributed in refugee camps in collaboration with the Commissioner of Refugees of the Ministry of Home Affairs.⁵⁶ Repatriation of refugees took place from May 2008, and ZMAC provided RE materials for distribution at the departure centers.⁵⁷

To monitor activities, ZMAC periodically visited camps and communities. In 2009, ZMAC conducted a monitoring and evaluation exercise with UNICEF assistance to assess the effectiveness of the training that took place in 2008. It found that key communicators were working effectively, and that 80% of people were “mine aware.”⁵⁸

Progress was made in the inclusion of RE in the school curriculum in areas suspected to be affected.⁵⁹ ZMAC, in conjunction with the Ministry of Education’s Curriculum Development Centre, conducted a workshop in Choma in November 2007 to finalize a teachers’ handbook for RE. A student handbook was also designed.⁶⁰ As of May 2009, 100 schools had been identified for a pilot test in seven of Zambia’s nine provinces.⁶¹

⁶⁰ ZMAC, “ZMAC Director’s Report on Operations, 1 July–31 December 2008,” provided by email from Sheila Mweemba, ZMAC, 28 May 2009; and email from Reuben McCarthy, UNDP, 5 August 2009.

⁶¹ Article 7 Report, Form J, 3 April 2009.

Most RE activities are funded by UNICEF, while UNHCR supports RE activities related to repatriation. The government contributed \$9,340 for RE in 2008, in addition to salaries and other related costs incurred.⁶² Inadequate budgetary funding is reported to be a major hindrance to activity implementation and prevents RE from being provided to all target beneficiaries.⁶³

Until 2003, there were no organized or sustained RE programs, and it has remained limited. ZMAC began conducting RE in 2003, and in 2003 RE was also carried out by the Association for Aid and Relief Japan, and in 2006 by the Lutheran World Federation and Christian Outreach and Development. The main beneficiaries have been refugees so that they are aware of the risks in their own countries when they are repatriated. Limited emergency RE was also conducted in response to incidents.⁶⁴

Victim Assistance

The total number of survivors is unknown but is estimated to be at least 152. In 2008, as in previous years, ZMAC's capacity to carry out victim assistance (VA) remained limited due to inadequate financial resources.⁶⁵ Only \$2,639 was approved by the Ministry of Finance for ZMAC's VA activities in 2008.⁶⁶ No further details were made available. On 6 March 2009, ZMAC held a workshop to identify and help fill gaps that exist in the structures, services, and policies assisting survivors.⁶⁷

Access to quality healthcare remained poor, with people walking long distances to reach facilities, especially in rural areas.⁶⁸

In 2008, the ICRC Special Fund for the Disabled (SFD) continued to support the University Teaching Hospital; it also provided training opportunities. However, production of devices at the center decreased by 47% in 2008 compared to the previous year, mainly due to lack of qualified staff.⁶⁹ In 2008, 170 prosthetic and orthotic fittings were made; the number of fittings for mine/ERW survivors was not specified.⁷⁰

Zambia has disability legislation, but it has not been adequately enforced.⁷¹ On 9 May 2008, Zambia signed the UN Convention on the Rights of Persons with Disabilities, and on 29 September 2008 signed its Optional Protocol; it had not ratified the convention as of 1 July 2009.

Support for Mine Action

Zambia's Mine Action Completion Plan, released in May 2006, includes among its five objectives the creation of a "residual capacity that is sustainable by national resources after the end of international assistance."⁷² The plan does not include a cost estimate for completion or a resource mobilization strategy. In May 2007, UNDP reported that fulfillment of Article 5 obligations in Zambia would cost \$1.4 million (€1,021,078), based on cost estimates related to the UNDP Completion Initiative for the country.⁷³ As of June 2009, Zambia's mine action

budget needs remained to be determined based on the results of the national survey being conducted by NPA.

National support for mine action

According to figures reported by the Zambian Parliamentary Committee on National Security and Foreign Affairs, as of September 2008 the Zambian government had allocated ZMK550,993,582 (\$110,199) for ZMAC annual operations in 2008, a substantial decline from national funding reported by ZMAC in 2007, and only 22% of the ZMK2.5 billion budget requested. The lesser amount was allocated because of reported “ministerial budgetary ceilings.” The committee stated that “by far, the major constraint faced by the Centre in meeting its annual work plans was insufficient funding.”⁷⁴ As a result of national funding shortfalls, most mine action activities were funded from external sources, through UNDP, UNICEF, and private partnerships.⁷⁵

In its annual report for 2008, ZMAC reported that ZMK18.6 million (approximately \$5,580 at 2008 exchange rates) owed to Zambian army deminers from clearance carried out in 2004 was paid by the Zambian government in 2008.⁷⁶ ZMAC did not report whether these payments were made from the overall government allocation and did not report any additional funding.

ZMAC reported a total of ZMK3,263,741,000 (\$979,122) in overall national funding in 2007.⁷⁷

International cooperation and assistance

No international funding was reported for Zambia for 2008. In 2007, France reported providing a \$6,850 (€4,996) in-kind contribution in the form of training. In its 2008 annual report, ZMAC reported that an overall shortfall in funding “continues to be the major hindrance to the implementation of ZMAC activities.” ZMAC reported “a slight increase” in international funding for 2009 compared to 2008, but stated that funds still fall short of program requirements.⁷⁸ ZMAC verification and clearance activities in Lower Zambezi National Park were curtailed because original budgets for the project, established in 2006, were no longer valid in 2008. ZMAC reported that a new budget and workplan for the remaining tasks had been established and submitted for approval and financing.⁷⁹

Zambia reported allocations of \$550,000 from UNDP to NPA for survey activities in 2008.⁸⁰ According to UNDP, this was not new money, but referred to funds provided through UNDP for the impact survey which, due to delays, only started in 2008.⁸¹ UNDP itself reported \$257,000 in expenditures on the survey in 2008, via funds from Canada (\$149,000) and Sweden (\$108,000).⁸² Neither Canada nor Sweden reported funds to Zambia in 2008; Canada reported funding to UNDP in 2006 of C\$350,000 (\$308,641 at 2006 rates) for mapping in support of mine action program.⁸³ ZMAC also reported funding by UNICEF to support ZMAC RE activities in 2008.⁸⁴

ZIMBABWE

2008 Key Data

State Party since	1 March 1999
Contamination	Antipersonnel and antivehicle mines, UXO
Estimated area of contamination	810km ² of mined areas as of end 2008, but to be reduced significantly by technical survey
Casualties in 2008	Two (2007: seven)
Estimated mine/ERW survivors	Unknown but could be 1,300
Article 5 (clearance of mined areas)	Deadline: 1 January 2011 Original deadline: 1 March 2009
Demining in 2008	Mined areas: 3.9km ²

Ten-Year Summary

The Republic of Zimbabwe became a State Party to the Mine Ban Treaty on 1 March 1999. It enacted domestic implementation legislation in January 2001. Zimbabwe destroyed its stockpile of 4,092 antipersonnel mines in November 2000. Zimbabwe served as co-rapporteur, then co-chair, of the Standing Committee on the General Status and Operation of the Convention from 1999–2001. There were repeated allegations of the use of antipersonnel mines by Zimbabwean forces in the Democratic Republic of the Congo at least until 1999; Zimbabwe strongly denied all allegations.

Landmines in Zimbabwe were laid in the 1970s during its war for independence. Assistance from the United States and the European Union ended in 2000, leaving Zimbabwe largely alone to support mine action from national funding. As a result, Zimbabwe has since made little progress in meeting its Article 5 mine clearance obligations. In November 2008, States Parties granted Zimbabwe a 22-month extension of its Article 5 deadline to resurvey the mined areas to identify more accurately the remaining problem.

In its Article 5 deadline extension request, Zimbabwe reported that some 1,550 mine/explosive remnants of war (ERW) casualties had occurred between 1980 and 2008. Between 1999 and 2008, Landmine Monitor identified 104 mine/ERW casualties in Zimbabwe (25 killed, 75 injured, and four unknown). Mine/ERW risk education activities were included in Zimbabwe's five-year mine action plan for 2005–2009, but by 2008, the target to reach more than 2.6 million people in five provinces had not been achieved. There were no specific victim assistance activities in Zimbabwe, and few survivors have adequate access to healthcare and services.

Mine Ban Policy

Zimbabwe signed the Mine Ban Treaty on 3 December 1997 and ratified on 18 June 1998, becoming a State Party on 1 March 1999. In January 2001, Zimbabwe enacted the Anti-Personnel Mines (Prohibition) Act, 2000, which incorporates the treaty into Zimbabwe's domestic law.¹

Zimbabwe submitted its ninth annual Article 7 report, dated December 2008, covering calendar year 2008.²

¹ Article 7 Report, Form A, 1 December 2003. The ICBL expressed concern about a provision in the act relating to joint military operations with a country not party to the Mine Ban Treaty. See *Landmine Monitor Report 2001*, p. 176.

² Zimbabwe previously submitted Article 7 reports in December 2007, December 2006, on 5 December 2005, 8 July 2005, 1 December 2003, 13 February 2003, 4 April 2001, and 11 January 2000.

Zimbabwe attended the Ninth Meeting of States Parties in Geneva in November 2008, where it made a presentation on its Article 5 clearance deadline extension request, and the intersessional Standing Committee meetings in May 2009, where it made a statement on mine clearance.

Zimbabwe has provided its views on matters of interpretation and implementation related to Articles 1, 2, and 3. In May 2006, it stated that in joint military operations Zimbabwean forces will not assist or participate in planning and implementation of activities related to the use of antipersonnel mines. It said that the Mine Ban Treaty “clearly bans” foreign stockpiling and transit of antipersonnel mines, and also prohibits antivehicle mines with sensitive antihandling devices or sensitive fuzes that can function as antipersonnel mines. Finally, it said that the number of mines States Parties chose to retain should only be in the hundreds or thousands and not tens of thousands.³

Zimbabwe is not party to the Convention on Conventional Weapons. As of 1 July 2009 Zimbabwe had not signed the Convention on Cluster Munitions.⁴

Production, transfer, stockpile destruction, and retention

The government maintains that there has been no mine production since independence.⁵ Government and other sources indicate that Zimbabwe was before then a producer and exporter of antipersonnel mines, but not on a significant scale.⁶ On 15 November 2000, Zimbabwe destroyed its stockpile of 4,092 antipersonnel mines,⁷ retaining 700 mines for training and development purposes (500 PMD-6 and 200 R2M2).⁸

In its Article 7 report for 2008, Zimbabwe reported 550 mines retained for training purposes (400 PMD-6 and 150 R2M2). During 2008, 50 R2M2 mines were consumed during training exercises.⁹ Zimbabwe has acknowledged that it also stockpiles Claymore-type devices, but without tripwire fuzes because Zimbabwe considers these illegal under the Mine Ban Treaty.¹⁰

Scope of the Problem

Contamination

Zimbabwe is contaminated with landmines, mostly antipersonnel, and ERW. As of December 2008, the mine threat was across 10 minefields laid in the 1970s. Combat with liberation movements operating out of Mozambique and Zambia also resulted in significant quantities of UXO.¹¹

As of end 2008, Zimbabwe had an estimated 810km² of mined areas, with a number of small suspected hazardous areas (SHA) still to be surveyed (see table below) from an initial contaminated area of 1,119.9km², having released some 310km² since 1980.¹² The estimate of the remaining contaminated area is highly improbable when compared to the known mine problems in other

³ “Response to LM Draft Report for Zimbabwe,” from Col. J. Munongwa, former Director, ZIMAC, 30 May 2006; and see *Landmine Monitor Report 2006*, pp. 810–811, for more details.

⁴ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 262.

⁵ Article 7 Report, Form E, December 2006.

⁶ Earlier statements by Zimbabwe government sources and others indicated that production of two types of Claymore mines, the Z1 and ZAPS, ended when Zimbabwe gained independence in 1980, while production of PloughShare mines was stopped between 1990 and 1993. For more information on past production and export, see *Landmine Monitor Report 1999*, pp. 97–99.

⁷ Zimbabwe destroyed 3,846 PMD-6 mines and 246 R2M2 mines. Article 7 Report, Form G, 8 July 2005.

⁸ Article 7 Report, Form B, 4 April 2001.

⁹ *Ibid.*, December 2008.

¹⁰ Interview with Col. J. Munongwa, ZIMAC, in Geneva, 4 February 2003.

¹¹ See *Landmine Monitor Report 2006*, p. 812; Article 5 deadline Extension Request (Second Revision), 3 November 2008, p. 4; and statement of Zimbabwe, Standing Committee on the General Status and Operation of the Convention, Geneva, 6 June 2008. Data in the Article 7 report submitted in December 2008 is not entirely consistent with other reports.

¹² Article 5 deadline Extension Request (Second Revision), 3 November 2008, p. 2.

affected countries such as Afghanistan, Angola, and Cambodia.¹³ It is likely to be significantly reduced following technical surveys. Zimbabwe's demining records do not indicate how much of the cleared area was released by survey as opposed to full clearance.

Estimated area of contamination in Zimbabwe as of end 2008¹⁴

SHA	Size of SHA (km ²)
Musengezi to Rwenya	436.00
Sango Border Post to Crooks Corner	178.10
Rusitu to Muzite Mission	97.00
Sheba Forest to Beacon Hill	65.00
Rushinga	29.40
Burma Valley	3.90
Kariba Power line	1.50
Mukumbura	Not surveyed yet
Lusulu	Not surveyed yet
Additional mined area at Sango Border Post to Crooks Corner	Not surveyed yet
Total	810.90

Zimbabwe's minefields are known to have one of the highest densities of mines in the world. For example, the border minefields, known as the "Cordon Sanitaire," consisted of a 25m-wide strip of three rows of antipersonnel mines at a density of approximately 5,500 mines per km.¹⁵ Zimbabwe has also reported, surprisingly, that 920,413 mines had been destroyed either by animals or the climate, including more than 788,000 mines in the Victoria Falls to Mlibizi minefield, which was declared cleared by June 2005.¹⁶

The Zimbabwe Mine Action Centre (ZIMAC) reported in 2008 that landmines have adversely affected commercial crop farming and forestry and, in turn, Zimbabwe's exports and hard currency earnings. Much of the timber in mine-affected areas is well past its maturity and has already lost its commercial value.¹⁷ It is estimated that landmines have blocked access to 300km² of communal land, 107km² of commercial farm land, and 50km² of game parks, plus an unknown quantity of tea and timber plantations, and border posts. Zimbabwe has estimated that all but 5% of the total SHA could be used for economic development.¹⁸

The Sango Border Post to Crooks Corner minefield lies largely within the Gonarezhou National Park, which has now been merged into the Great Limpopo Transfrontier Park that Zimbabwe shares with South Africa and Mozambique. Many animals are said to have been killed or maimed by mines in this area. Zimbabwe fears a further delay in clearing the park of mines will result in a major loss of tourist dollars in 2010 when South Africa hosts the Football

¹³ The data describing the landmine problem is the result of four major surveys or assessments since 1980, as well as from records from the former Rhodesian army.

¹⁴ Statement of Zimbabwe, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009; and interview with Col. Jardinous Garira, Director, ZIMAC, in Geneva, 27 May 2009.

¹⁷ *Ibid.*, p. 7.

¹⁸ *Ibid.*, p. 6.

World Cup.¹⁹ Zimbabwe reported 3.9km² of land was cleared in this area in 2008.²⁰ The US\$5 billion Short Term Emergency Recovery Programme of March 2009, however, does not cite landmines as a factor impacting tourism or hindering tourists from visiting the Great Limpopo Transfrontier Park.²¹ In June 2009, a Harare-based commercial company, Might-Hope Demining Services International, reported to Landmine Monitor their belief that due to its distance and isolation, the severity of the problem in the park was underestimated by some local officials.²²

During a Geneva International Centre for Humanitarian Demining visit to the border with Mozambique and South Africa, landmine survivors reported that mines did affect their communities and sometimes killed wildlife.²³

Casualties

In 2008, ZIMAC reported that two boys were killed when picking up a rifle grenade. No further details were available.²⁴ However ZIMAC added that, “several cases are not reported because of [the] remoteness of the areas where accidents occur.”²⁵ It also stated that, some incidents occur as people knowingly engage in “criminal activities” using mines.²⁶

Casualties continued to occur in 2009. An internet news report in January 2009 stated that a man in Rushinga district in northeastern Zimbabwe was killed when landmines exploded in his arms as he prepared to bury them in an effort to keep elephants off his land. The same report also mentioned that two people had been injured by landmines earlier in January.²⁷ In February, two girls from Rushinga (one and five years old) were injured after a landmine they were playing with exploded: the older later died in hospital.²⁸ As of June 2009, ZIMAC was unable to confirm these incidents.²⁹

Between 1980 and November 2008, the government reported more than 1,550 casualties due to mines. Some 120,000 livestock had also reportedly been killed.³⁰ The number of survivors was estimated at 1,300.³¹ Between 1999 and 2008, Landmine Monitor has identified at least 104 mine/ERW casualties (25 killed, 75 injured, and four unknown) in Zimbabwe.³²

Program Management and Coordination

Mine action and risk education

The interministerial National Mine Action Authority of Zimbabwe (NAMAZ) was established in 2000 and is chaired by the Deputy Secretary of the Ministry of Defence. ZIMAC was also established in 2000 and is headed by a Zimbabwean army colonel.³³ ZIMAC is responsible for

³³ Article 7 Report, Form A, December 2008.

coordinating and implementing mine/ERW risk education (RE) according to the five-year mine action plan for 2005–2009.³⁴

Victim assistance

NAMAZ is responsible for formulating national victim assistance policy and ZIMAC is responsible for coordinating activities.³⁵ In 2008, however, no specific victim assistance strategic framework or activities existed. The dedicated ZIMAC departments were inactive.³⁶ The Social Dimension Fund of the Ministry of Public Service, Labour and Social Welfare is responsible for persons with disabilities.³⁷

Data collection

Landmine casualty data is collected and reported to ZIMAC by risk educators³⁸ and police officers, who work with health centers and local authorities.³⁹ ZIMAC reported that information about known casualties had been gathered through interviews in mine-affected areas but these interviews only reached a small sampling of the total population.⁴⁰ A Southern African Development Community report from 2007, previously unavailable to Landmine Monitor, recommended that Zimbabwe conduct a survey of mine casualties to determine the full extent of the problem.⁴¹

Plans

Strategic mine action plan

In August 2004, in preparation for the First Review Conference of the Mine Ban Treaty, Zimbabwe drafted a five-year mine action plan for 2005–2009.⁴² ZIMAC said that the plan was under revision as of June 2007.⁴³ No new plan had been developed as of June 2009, but it was expected that the technical survey of remaining contamination, planned to be completed during Zimbabwe's first extension period to its Article 5 deadline, will lead to the development of a new strategic mine action plan.⁴⁴

Integration of mine action with reconstruction and development

Despite claims that landmines impact economic development, two key planning documents for Zimbabwe do not list addressing the mine problem as a priority for 2009. The \$5 billion Short Term Emergency Recovery Programme of March 2009, which outlines the priorities for governance, social protection, and economic stabilization, does not include mine action as a component that would assist recovery. Similarly, the \$718 million humanitarian consolidated appeal by the UN Office for the Coordination of Humanitarian Affairs (OCHA) in May 2009 makes no reference to mines.⁴⁵

⁴⁵ Government of Zimbabwe, "Short Term Emergency Recovery Programme (STERP): Getting Zimbabwe Moving Again," Harare, March 2009, www.savezimbabwe.com; and OCHA, "Consolidated Appeal for Zimbabwe 2009: Revision," 29 May 2009, ochaonline.un.org. OCHA believed mine action was excluded from the appeal because UNDP was already providing funding and no mine action NGOs were operating in Zimbabwe. Email from Giovanni Bosco, Senior Humanitarian Affairs Officer, OCHA, 5 June 2009.

National ownership

Commitment to mine action and victim assistance

Zimbabwe has made little progress in demining since international sanctions began in 2002. According to ZIMAC's director, mine clearance has not been a government priority during the national economic crisis.⁴⁶ Nonetheless, ZIMAC has continued to operate, albeit with limited results.

National management

Zimbabwe's mine action program is nationally managed. Zimbabwe has not received any international support since 2000.⁴⁷

National budget

In March 2008, when it submitted its initial request to extend its Article 5 deadline, Zimbabwe noted that, "Since 1980, the government has been consistently allocating an annual budget to demining operations, though inadequate to totally clear all the mines. The allocations fall far too short of the total requirements especially in the area of contracting commercial demining companies to complement the military's efforts to carry out humanitarian demining."⁴⁸ Zimbabwe has reported that ZIMAC has had a \$10,000 annual budget since 2002.⁴⁹ It is difficult to assess what could be achieved with such a small annual contribution.

National mine action legislation and standards/Standing operating procedures

No national mine action legislation has been adopted. Zimbabwe uses standing operating procedures developed by RONCO in 1998–2000, which was then providing assistance to Zimbabwe.

Demining and Battle Area Clearance

Zimbabwe National Army engineers, under the command of the National Mine Clearance Squadron, provide the country's manual demining capacity.⁵⁰ Although the lack of accurate data, old and insufficient equipment, difficult terrain, and fierce weather provide for a challenging environment, the primary reason for extremely slow progress in clearing mined areas since 2002 is the impact of international sanctions and the political instability in the country.⁵¹

Although 35 deminers were trained in 2008, raising the total number of deminers to 167, only limited demining occurred in 2008 due to lack of funds.⁵² Zimbabwe has reported that only 3.9km² of SHAs were released from the Sango Border Post to Crooks Corner minefield.⁵³ Quality control/quality assurance is conducted by army engineer deminers on an irregular basis and without independent quality management of clearance tasks.⁵⁴

In May 2009, at the Standing Committee meeting on mine clearance, Zimbabwe stated that it planned to sign a 12-month renewable contract with the Might-Hope Demining Services International (MHDSI) company, to clear 20km² of mined areas near the border with South Africa.⁵⁵ The company's website announced that on 30 May 2009 they would launch "the Gona

⁵⁵ Statement of Zimbabwe, Standing Committee on Mine Clearance, Mine Risk Education and Mine Action Technologies, Geneva, 27 May 2009; and interview with Col. Jardinous Garira, ZIMAC, in Geneva, 27 May 2009.

Re Zhou Transfrontier Park landmine clearance project in preparation for and post the World Cup 2010.⁵⁶ In June 2009, MHDSI confirmed they had signed a contract with the government to clear the Sango Border Post to Crooks Corner minefield “on a voluntary basis,” and that, despite not having received any funding, they were sending a manual demining team to the area to initiate mine clearance operations.⁵⁷

Progress since becoming a State Party

Under Article 5 of the Mine Ban Treaty, Zimbabwe was required to destroy all antipersonnel mines in mined areas under its jurisdiction or control as soon as possible, but not later than 1 March 2009. Despite considerable demining in the first six years after it became a State Party, and subsequent statements that it was doing everything possible within its capacity to comply with its obligations, Zimbabwe submitted a request to extend its Article 5 deadline in March 2008.⁵⁸

Demining in 1999–2008⁵⁹

Year	Demining (km ²)
2008	3.90
2007	7.80
2006	1.02
2003–2005	220.00
1999–2002	N/A
Total	232.72

N/A = not available

Zimbabwe initially requested a seven-year extension based on additional funding from the international community.⁶⁰ However, the estimate of more than 800km² of residual mined areas does not seem credible. The ICBL recommended the contaminated area be resurveyed before an operational plan is finalized. New equipment, the latest survey techniques, and applying land release principles, where necessary, should reduce the size of the mined areas (though probably not the number of mined areas), and enable Zimbabwe to re-submit an extension request with more accurate data. In May and November 2008, Zimbabwe submitted revised extension requests and in November 2008, States Parties to the Mine Ban Treaty granted it a 22-month extension.⁶¹

The 22-month extension period is intended to enable resurvey of the mined areas and the development of a plan based on more realistic data and information. As of late May 2009, ZIMAC was waiting for \$150,000 worth of demining and survey equipment from UNDP. The delay in receiving the equipment had caused ZIMAC to postpone its training course for survey

teams. ZIMAC reported that if the equipment was received by September 2009 they could complete the surveys by March 2011 as set out in the plan in its revised extension request.⁶²

Risk Education

According to the UN, there is an ongoing need for repeated risk education (RE) messaging in mine-affected areas.⁶³ RE was conducted by ZIMAC and army RE teams in 2008. ZIMAC reported that 23,480 individuals were reached in 2008 in four provinces: Matabeleland North, Manicaland, Masvingo, and Mashonal and Central.⁶⁴ This was a decrease from 2007 when 40,000 people received RE.⁶⁵

In 2008, the number of ZIMAC RE staff was reduced to 10. In 2007, ZIMAC also trained 21 army engineers to form four RE teams, and these became operational in 2008. All RE personnel are male.⁶⁶ ZIMAC reported that as a result of shortfalls in funding in 2008, only four of the 18 RE sessions planned for the year were conducted.⁶⁷

The majority of people who received RE were reached during the Zimbabwe International Trade Fair and at provincial agricultural shows, where people visited the ZIMAC stall.⁶⁸ ZIMAC also organized RE sessions in communities with key individuals such as school officials, community leaders, and police officers.⁶⁹ The majority of recipients of RE were women and youth.⁷⁰

Limited RE campaigns began in 1998, with teams trained by US Army personnel and civilians. In 2001, RE intensified due to the number of people resettling in affected areas. However, RE was continuously hampered by a lack of funding, and in 2004 ZIMAC reported that it was only being conducted in regional centers, thus people in remote border areas did not benefit from these campaigns. In 2007, ZIMAC expanded coverage to all four mine-affected provinces, with children a specific target group. Some emergency RE was also conducted in 2007 in Rushinga because clearance had not been conducted to international standards. There is no mention of national RE standards, although in 2005 RE was said to follow the International Mine Action Standards.⁷¹

Victim Assistance

The estimated number of survivors is unknown, but could be as many as 1,300.⁷² In 2008, as in 2007, Zimbabwe stated that, “Completely nothing has taken off in this country in terms of victim assistance.”⁷³ It blamed lack of funding as the main factor impeding compliance with its victim assistance commitments.⁷⁴

In its latest Article 7 report, Zimbabwe said that survivors can receive rehabilitation services at National Rehabilitation Centres. However, Zimbabwe said that “Very few” survivors are able to access such services, as they live in “far remote rural areas.”⁷⁵ In 2009, ZIMAC said the

⁷⁵ *Ibid.*

government could only provide dedicated assistance to military deminers injured on duty. These survivors are being referred to neighboring South Africa, where medical facilities are better.⁷⁶

Government under-funding has compelled medical facilities to charge for their services, making them inaccessible for the majority of the population.⁷⁷ Strikes in the health sector, and a lack of supplies and medication further exacerbated the situation in 2008.⁷⁸ ZIMAC reported that problems in the health sector have seriously affected mine survivors.⁷⁹

In its latest Article 7 report, Zimbabwe stated that most survivors live in rural areas, with poor access to rehabilitation services, which are largely located in urban centers.⁸⁰ On 5 June 2008, the government banned all NGOs from field operations, which is likely to further affect service provision.⁸¹

The ICRC Special Fund for the Disabled continued to provide material, technical support, and management training to three rehabilitation centers. Although statistics for 2008 were not available, it was assumed that overall production dropped by 10% in 2008 due to staffing challenges and declined outreach activities.⁸² Continued support in 2009 is dependent on the level of services provided at the center.⁸³

Zimbabwe has legislation to protect the rights of persons with disabilities, but implementation was hampered by the lack of resources and discrimination persisted. In September 2008, the government announced that it was reviewing the 1992 Disabled Persons Act to make it consistent with the UN Convention on the Rights of Persons with Disabilities, which it had not signed as of 30 May 2009.⁸⁴

Support for Mine Action

No comprehensive long-term cost estimates are known to have been reported by Zimbabwe for fulfilling all of its mine action obligations, including RE and victim assistance. Zimbabwe's revised Article 5 deadline extension request submitted in May 2008 reported cost estimates in excess of \$40 million for the period 2009–2016.⁸⁵ Zimbabwe's second revised extension request for 2009–2011, submitted in November 2008, includes cost estimates totaling \$6,856,000 for resurvey of previously known mined areas, survey of newly identified mined areas, and clearance of the area from Sango Border Post to Crooks Corner. Cost estimates were reported as \$2,028,000 for resurvey, \$1,528,000 for survey, and \$3,300,000 for clearance.⁸⁶ In June 2009, however, ZIMAC reported a projected budget for 2009 alone totaling \$8,080,130 for survey, resurvey, and clearance.⁸⁷

⁸⁶ Article 5 deadline Extension Request (Second Revision), 3 November 2008, pp. 21–22.

⁸⁷ Response to Landmine Monitor questionnaire by Col. Jardinous Garira, ZIMAC, 10 June 2009.

On completion of its survey initiatives in 2011, Zimbabwe intends to submit a second extension request based on survey findings, with a time schedule and revised budget, including projections of international funds required.⁸⁸

The responsibilities of NAMAZ include mobilization of funds and coordinating external assistance from the UN and other organizations or States Parties.⁸⁹ ZIMAC reported that as of June 2009 there was no formal resource mobilization strategy for mine action; instead, funds were directed from the national budget by the Ministry of Defence via the Disaster Management Plan Budget.⁹⁰

National support for mine action

In its second revised Article 5 deadline extension request, Zimbabwe reported a national commitment of \$10,000 to support mine clearance in 2008.⁹¹ The same annual amount was reported from 2002 to 2007.⁹² In May 2009, Zimbabwe entered a renewable 12-month contract with MHDSI for mine clearance, explosive ordnance disposal, and RE tasks, beginning in June 2009.

In the absence of international funding, national funds will presumably apply to costs associated with the MHDSI contract.⁹³ In June 2009 the project-coordinator of MHDSI reported that demining 70km within the Gonarezhou National Park will cost approximately \$720,000; as of June 2009, MHDSI had received only \$2,000 for operations—reportedly from the Zimbabwe National Social Security Authority—and explosives donated by a Zimbabwean arms manufacturer for clearance purposes.⁹⁴ ZIMAC has reported that current government allocations “fall far too short” of covering costs for contracting commercial demining companies.⁹⁵

International cooperation and assistance

No international funding was reported by donors for mine action in Zimbabwe in 2008. ZIMAC reported receiving \$150,000 from UNDP in 2008.⁹⁶ No international funds were reported for 2007.

As of November 2008, Zimbabwe reported economic sanctions, a shortage of demining equipment, a lack of national funding and an absence of international support as the main factors impeding compliance with its mine clearance obligations.⁹⁷

ZIMAC reported that as a result of shortfalls in funding in 2008, the planned mine victim survey could not be conducted; of the 18 RE sessions planned for the year, available funds allowed only four to be undertaken; and of the targeted 13km² to be cleared in the Sango Border Post to Crooks Corner minefield, only 3.9km² were cleared. As a result of continuing shortfalls in 2009, further demining operations in the Sango Border Post to Crooks Corner minefield and elsewhere had not started; training of minefield surveyors had been deferred; the planned victim survey has still not been undertaken; and RE was not taking place.⁹⁸

NON-AFFECTED STATES PARTIES

From 1999–2004 Landmine Monitor reported on every country in the world. Starting in 2005, Landmine Monitor observed developments in but did not prepare country reports for States Parties that had met their core treaty obligations. This is a summary of developments in these 94 countries covering 1999–2008.

Andorra

The Principality of Andorra signed the Mine Ban Treaty on 3 December 1997 and ratified it on 29 June 1998, becoming a State Party on 1 March 1999. Andorra has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Andorra believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. In 2009, Andorra submitted its fifth Article 7 transparency report.

Andorra is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

From 1999–2008, Andorra contributed US\$33,250 to mine action.

Antigua and Barbuda

Antigua and Barbuda signed the Mine Ban Treaty on 3 December 1997 and ratified it on 3 May 1999, becoming a State Party on 1 November 1999. Antigua and Barbuda has never used, produced, imported, exported, or stockpiled antipersonnel landmines, including for training purposes. Antigua and Barbuda has stated that existing legislation makes any treaty it joins part of domestic law, and as such has no plans to enact separate legislation imposing penal sanctions as required by the treaty. Antigua and Barbuda submitted its initial Article 7 transparency report on 29 March 2000, but has not submitted subsequent annual reports.

Antigua and Barbuda is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Australia

The Commonwealth of Australia signed the Mine Ban Treaty on 3 December 1997 and ratified it on 14 January 1999, becoming a State Party on 1 July 1999. Australia formally halted operational use of antipersonnel mines on 15 April 1996. Australia was a minor producer of antipersonnel mines and imported mines from the United States, but was not an exporter. On 10 December 1998, Australia enacted legislation to implement the Mine Ban Treaty domestically. On 30 April 2009, Australia submitted its 11th Article 7 transparency report.

Australia destroyed its stockpile of 128,161 antipersonnel mines in 1999, well before its treaty-mandated destruction deadline of 1 July 2003, and in 2000 it destroyed an additional 6,460 mines. Australia initially retained a total of 10,000 antipersonnel mines for training purposes, but this was reduced to 6,785 by the end of 2008.¹

Australia served as co-rapporteur and then co-chair of the Standing Committees on stockpile destruction (2000–2002), victim assistance (2002–2004), and mine clearance (2007–2009), and was president of the Seventh Meeting of States Parties in 2006.

Australia is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Australia signed the Convention on Cluster Munitions on 3 December 2008, but had not ratified it as of 1 July 2009.²

From 1999–2008, Australia contributed \$93.2 million to mine action.

¹ Australia Article 7 Report, Form D, 30 April 2009.

² For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 30–35.

Austria

The Republic of Austria signed the Mine Ban Treaty on 3 December 1997 and ratified it on 29 June 1998, becoming a State Party on 1 March 1999. Production, export, and use of antipersonnel mines were formally renounced in September 1995. In 1996, Austria enacted legislation to implement the Mine Ban Treaty domestically. In 2009, Austria submitted its 10th Article 7 transparency report. Austria destroyed its stockpile of antipersonnel mines, including 116,000 US M-14 mines and small quantities of prototypes in 1996. Austria did not retain any antipersonnel mines for training.

Austria served as co-rapporteur and then co-chair of the Standing Committees on general status and operation of the convention (2001–2003) and victim assistance (2005–2007), and was the president of the First Review Conference in 2004.

Austria is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Austria signed the Convention on Cluster Munitions on 3 December 2008 and ratified it on 2 April 2009.³

From 1999–2008, Austria contributed \$18.1 million to mine action.

Bahamas

The Commonwealth of the Bahamas signed the Mine Ban Treaty on 3 December 1997 and ratified it on 31 July 1998, becoming a State Party on 1 March 1999. The Bahamas has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. The Bahamas has not enacted new legislation specifically to implement the Mine Ban Treaty. In 2009, the Bahamas submitted its third Article 7 transparency report.

The Bahamas is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Barbados

Barbados signed the Mine Ban Treaty on 3 December 1997 and ratified it on 26 January 1999, becoming a State Party on 1 July 1999. Barbados has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Barbados has not enacted new legislation specifically to implement the Mine Ban Treaty. Barbados submitted its initial Article 7 transparency report on 12 May 2003, but has not submitted subsequent annual reports.

Barbados is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Belgium

The Kingdom of Belgium signed the Mine Ban Treaty on 3 December 1997 and ratified it on 4 September 1998, becoming a State Party on 1 March 1999. Production of antipersonnel mines ceased in 1990 and was banned in 1995. Transfer was banned in 1993. In 1995, Belgium became the first country in the world to pass domestic legislation comprehensively banning antipersonnel mines, and subsequently amended this legislation to ensure full compliance with the Mine Ban Treaty. In 2009, Belgium submitted its 11th Article 7 transparency report.

Belgium destroyed its stockpile of approximately 433,441 antipersonnel mines in September 1997. It initially retained 5,980 antipersonnel mines for training, but this was reduced to 3,245 by the end of 2008.⁴

Belgium served as co-rapporteur and then co-chair of the Standing Committees on general status and operation of the convention (1999–2001 and 2004–2006), mine clearance (2001–2003), and victim assistance (2007–2009), and was president of the Fourth Meeting of States Parties in 2002. Belgium initiated and has coordinated the Article 7 Contact Group.

³ Ibid, pp. 35–38.

⁴ Belgium Article 7 Report, Form D, 30 April 2009.

Belgium is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines, but not Protocol V on Explosive Remnants of War. Belgium signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁵

Belgium has no known mined areas, though mines and UXO from World War I and World War II are still found occasionally.

As of 1 July 2009, no mine/ERW casualties had been reported in Belgium since 2001, when one person was killed and another injured by UXO. Four Belgian deminers were injured in Lebanon in 2007.⁶

From 1999–2008, Belgium contributed \$57.3 million to mine action.

Belize

Belize signed the Mine Ban Treaty on 27 February 1998 and ratified it on 23 April 1998, becoming a State Party on 1 March 1999. Belize has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was enacted on 10 January 2004. Belize submitted its third Article 7 transparency report on 24 March 2006 but has not submitted subsequent annual reports.

Belize is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Benin

The Republic of Benin signed the Mine Ban Treaty on 3 December 1997 and ratified it on 25 September 1998, becoming a State Party on 1 March 1999. Benin has never used, produced, imported, or stockpiled antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically has not yet been enacted. Benin submitted its seventh Article 7 transparency report on 24 June 2008.

Benin is party to the Convention on Conventional Weapons but not its Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. Benin signed the Convention on Cluster Munitions in December 2008, but had not ratified it as of 1 July 2009.⁷

In 2002, Benin opened a regional demining training center for Economic Community of Western African States members.

Bolivia

The Republic of Bolivia signed the Mine Ban Treaty on 3 December 1997 and ratified it on 9 June 1998, becoming a State Party on 1 March 1999. Bolivia has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically has not yet been enacted. Bolivia submitted its third Article 7 transparency report on 9 May 2006 but has not reported on activities for May 2006–2008.

Bolivia is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. Bolivia signed the Convention on Cluster Munitions on 3 December 2008, but had not ratified it as of 1 July 2009.⁸

In November 2007, Chile reported there have been 16 Bolivian mine/ERW casualties on Chilean territory. Mines are emplaced on the Chilean side of the border with Bolivia.

⁷ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 42–43.

⁸ *Ibid.*, p. 43.

Botswana

The Republic of Botswana signed the Mine Ban Treaty on 3 December 1997 and ratified it on 1 March 2000, becoming a State Party on 1 September 2000. Botswana has never used, produced, imported, exported, or stockpiled antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically has not yet been enacted. Botswana submitted its initial Article 7 transparency report on 28 September 2001, but has not submitted subsequent annual reports. In 2001, Botswana reported retaining seven inert antipersonnel mines and three antivehicle mines for training purposes, but has not subsequently reported on the status of these mines.

Botswana is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008, but had not ratified it as of 1 July 2009.⁹

Brazil

The Federative Republic of Brazil signed the Mine Ban Treaty on 3 December 1997 and ratified it on 30 April 1999, becoming a State Party on 1 October 1999. Brazil is a former antipersonnel mine producer, importer, and exporter. Brazil ceased production and export of antipersonnel mines in 1989. Brazil has never used antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically was enacted in 2001. In 2009 Brazil submitted its 10th Article 7 transparency report.

Brazil completed destruction of its stockpile of approximately 27,852 antipersonnel mines in March 2003, ahead of its 1 October 2003 treaty-mandated destruction deadline. Brazil initially retained 17,000 mines for training purposes, but this was reduced to 10,986 by the end of 2008.¹⁰ Of all States Parties, Brazil maintains the third highest number of mines retained for training. In its Article 7 transparency report for 2008 Brazil stated, “The Brazilian Army decided to keep its landmine stockpiles for the training of demining teams up to 2019, taking into consideration the extension of the deadline to the destruction of landmines, in accordance with Article 5, para. 3. Brazil will keep its mines for training purposes whenever there are minefields spread round the world.”¹¹

Brazil is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. As of 1 July 2009, Brazil had not signed the Convention on Cluster Munitions.¹²

Members of Brazil’s military engaged in overseas demining operations have been involved in landmine accidents; one soldier was injured in 1999.

Brunei

Brunei Darussalam signed the Mine Ban Treaty on 4 December 1997 and ratified it on 24 April 2006, becoming a State Party on 1 October 2006. Brunei has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically has been drafted but not yet enacted.¹³ Brunei submitted its initial Article 7 transparency report covering activities up to April 2007 but has not submitted subsequent reports.

Brunei is not party to the Convention on Conventional Weapons and as of 1 July 2009 had not signed the Convention on Cluster Munitions.

⁹ Ibid, pp. 45–46.

¹⁰ Brazil Article 7 Report (for calendar year 2008), Form D.

¹³ Brunei Article 7 Report (for unspecified period ending April 2007), Form A.

Bulgaria

The Republic of Bulgaria signed the Mine Ban Treaty on 3 December 1997 and ratified it on 4 September 1998, becoming a State Party on 1 March 1999. Bulgaria ceased antipersonnel export in 1996 and production in 1998. It reported 72 minefields on its territory, which had been laid during the Cold War. Bulgaria believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. In 2009, Bulgaria submitted its 11th Article 7 transparency report.

Bulgaria finished destruction of its stockpile of 885,872 antipersonnel mines in December 2000, well ahead of its treaty-mandated destruction deadline of 1 March 2003. Bulgaria initially retained 10,446 mines for training purposes, but this was reduced to 3,682 by 31 March 2009. Bulgaria also reported possessing 171,050 antipersonnel mines transferred to Bulgaria by Greece for the purpose of destruction.¹⁴

Bulgaria served as co-rapporteur of the Standing Committee on Stockpile Destruction in 2008–2009.

Bulgaria is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Bulgaria signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.¹⁵

Clearance of all antipersonnel mines in mined areas was completed by 31 October 1999, well in advance of its 1 March 2009 mine clearance deadline.

From 1999–2008, Landmine Monitor identified two soldiers killed and one injured in 2001 when a mine exploded during a training exercise. A child was killed by a mine in Bulgaria in 1997.¹⁶

Burkina Faso

Burkina Faso signed the Mine Ban Treaty on 3 December 1997 and ratified it on 16 September 1998, becoming a State Party on 1 March 1999. Burkina Faso has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Burkina Faso was the 40th country to ratify the treaty, triggering its entry into force six months later. Legislation to enforce the antipersonnel mine prohibition domestically was enacted in 2001. Burkina Faso submitted its ninth Article 7 transparency report on 31 March 2008.

Burkina Faso is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. Burkina Faso signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.¹⁷

Cameroon

The Republic of Cameroon signed the Mine Ban Treaty on 3 December 1997 and ratified it on 19 September 2002, becoming a State Party on 1 March 2003. Cameroon has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically has not been enacted. Cameroon submitted its initial Article 7 transparency report on 5 December 2005, but has not provided subsequent annual reports.

Cameroon destroyed its stockpile of 9,187 antipersonnel mines in April 2003. Cameroon apparently retains 3,154 “inactive mines” for training purposes. Cameroon has not provided further reporting on the use of retained mines as agreed by States Parties in 2004.

¹⁴ Bulgaria Article 7 Report (for the period 31 March 2008 to 31 March 2009), Form D.

¹⁵ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 46–48.

¹⁷ Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 48–49.

Cameroon is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. As of 1 July 2009, Cameroon had not signed the Convention on Cluster Munitions.

Canada

Canada was the first government to sign and ratify the Mine Ban Treaty on 3 December 1997, becoming a State Party on 1 March 1999. Canada ceased antipersonnel mine export in 1987 and production in 1992. Canada has not imported nor used antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically was enacted in November 1997. In 2009, Canada submitted its 11th Article 7 transparency report.

Canada completed destruction of its stockpile of 90,000 antipersonnel mines in November 1997, before the Mine Ban Treaty was opened for signature. Canada initially retained 2,000 mines for training purposes, but this was reduced to 1,939 by 19 April 2009.¹⁸

Canada served as co-chair of the Standing Committee on the General Status and Operation of the Convention (1999–2000), and as co-rapporteur and then co-chair of the Standing Committees on victim assistance (2000–2002), stockpile destruction (2003–2005), and mine clearance (2006–2008). Canada established and has coordinated the Universalization Contact Group. Canada hosted the treaty signing conference in December 1997 and has been instrumental in promoting the treaty's universalization and full implementation.

Canada is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Canada signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.¹⁹

From 1999–2008, Landmine Monitor identified at least 10 Canadian landmine casualties in Afghanistan, of whom three were killed and seven injured.²⁰

From 1999–2008, Canada contributed \$250.42 million to mine action.

Cape Verde

The Republic of Cape Verde signed the Mine Ban Treaty on 4 December 1997 and ratified it on 14 May 2001, becoming a State Party on 1 November 2001. Cape Verde has never used, produced, or exported antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically has not been enacted. Cape Verde has not submitted its initial Article 7 transparency report, which was due 30 April 2002. As part of a NATO operation, the Latvian military destroyed Cape Verde's stockpile of 1,471 antipersonnel mines in June 2006. Cape Verde's deadline for destruction of stockpiled antipersonnel mines was 1 November 2005. It is not known if Cape Verde retained any mines for training purposes.

Cape Verde is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions in December 2008 but had not ratified it as of 1 July 2009.²¹

¹⁸ Canada Article 7 Report (for the period 18 April 2008 to 19 April 2009), Form D.

Central African Republic

The Central African Republic (CAR) acceded to the Mine Ban Treaty on 8 November 2002, becoming a State Party on 1 May 2003. CAR has reported that it has not produced, exported, or imported antipersonnel mines, including for training purposes, and it is not known to have ever used them. CAR believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. CAR submitted its initial Article 7 transparency report, due by 27 October 2003, in November 2004, but has not submitted subsequent annual reports.

CAR is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.²²

Antivehicle mines were used in October 2002 during a period of internal conflict. CAR has residual contamination from these mines but there are no known mined areas.

Comoros

The Islamic Republic of the Comoros acceded to the Mine Ban Treaty on 19 September 2002, becoming a State Party on 1 March 2003. Comoros has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically has not been enacted. Comoros submitted its initial Article 7 transparency report on 20 April 2003 and a subsequent report on 24 June 2004, but has not since provided annual updates.

Comoros is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.²³

Cook Islands

The Cook Islands signed the Mine Ban Treaty on 3 December 1997 and ratified it on 16 March 2006, becoming a State Party on 1 September 2006. The Cook Islands has never used, produced, exported, or imported antipersonnel mines, including for training purposes. The Cook Islands adopted legislation to implement the treaty domestically in 2007. The Cook Islands submitted its initial Article 7 transparency report on 14 May 2007.

The Cook Islands is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.²⁴

Costa Rica

The Republic of Costa Rica signed the Mine Ban Treaty on 3 December 1997 and ratified it on 17 March 1999, becoming a State Party on 1 September 1999. Costa Rica has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was enacted on 17 April 2002. On 29 April 2005, Costa Rica submitted its third Article 7 transparency report, covering 18 November 2004 to 28 April 2005, but has not submitted subsequent annual reports.

Costa Rica is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Costa Rica signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.²⁵

Costa Rica's northern border with Nicaragua was contaminated by mines laid by parties to the 1980s conflict in Nicaragua. In a ceremony on 10 December 2002, Costa Rica announced the completion of clearance in all known mined areas, well ahead of its 1 September 2009 Article 5 clearance deadline.

From 1999–2008, Landmine Monitor did not identify any mine/UXO casualties in Costa Rica.

²³ Ibid, p. 60.

²⁴ Ibid, p. 62.

²⁵ Ibid, pp. 62–63.

Czech Republic

The Czech Republic signed the Mine Ban Treaty on 3 December 1997 and ratified it on 26 October 1999, becoming a State Party on 1 April 2000. The former Czechoslovakia produced and exported antipersonnel mines. Production ceased in 1989 and a transfer moratorium was enacted in 1994. National implementation legislation entered into force on 3 December 1999 and the criminal code was amended to provide penal sanctions for violations of the treaty. In 2009, the Czech Republic submitted its 11th Article 7 transparency report.

The Czech Republic completed destruction of its stockpile of 324,412 antipersonnel mines on 15 June 2001, far in advance of its 1 April 2004 treaty-mandated destruction deadline. The Czech Republic initially retained 4,849 mines for training and development purposes, which was reduced to 2,543 by the end of 2008.²⁶

The Czech Republic is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. The Czech Republic signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.²⁷

The Czech Republic has no known mined areas, but mines and UXO from World War II are still found. In 2004, the Czech Republic finished clearing two military areas contaminated by World War II UXO.

From 1999–2008, the Czech Republic contributed \$5.46 million to mine action.

Dominica

The Commonwealth of Dominica signed the Mine Ban Treaty on 3 December 1997 and ratified it on 26 March 1999, becoming a State Party on 1 September 1999. Dominica has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Dominica has not enacted new legislation specifically to implement the Mine Ban Treaty. Dominica submitted its fifth Article 7 transparency report in 2008.

Dominica is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Dominican Republic

The Dominican Republic signed the Mine Ban Treaty on 3 December 1997 and ratified it on 30 June 2000, becoming a State Party on 1 December 2000. The Dominican Republic has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. The Dominican Republic has stated that it has not enacted domestic implementing legislation because it is not mine-affected and does not stockpile antipersonnel mines. The Dominican Republic submitted its fourth Article 7 transparency report on 10 March 2009.

The Dominican Republic is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Equatorial Guinea

The Republic of Equatorial Guinea acceded to the Mine Ban Treaty on 16 September 1998, becoming a State Party on 1 March 1999. It never responded to a Landmine Monitor inquiry into an allegation of antipersonnel mine use on the island of Bioko. Equatorial Guinea has never produced antipersonnel mines. It has not formally declared the presence or absence of stockpiled antipersonnel mines, but it is not believed to possess a stockpile. Equatorial Guinea has not enacted new legislation specifically to implement the Mine Ban Treaty. Equatorial Guinea has not submitted its initial Article 7 transparency report, due 28 August 1999.

²⁶ Czech Republic Article 7 Report (for calendar year 2008), Form D.

²⁷ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 66–68.

Equatorial Guinea is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Equatorial Guinea is not believed to be mine-affected.

Estonia

The Republic of Estonia acceded to the Mine Ban Treaty on 12 May 2004, becoming a State Party on 1 November 2004. Estonia has never used, produced, exported, or imported antipersonnel mines, including for training purposes. The Estonian criminal code and specific legislation which entered into force on 5 February 2004 provide for the imposition of penal sanctions as required by the treaty. On 13 January 2009, Estonia submitted its fifth Article 7 transparency report. Estonia has stated at times that it had a small stockpile of antipersonnel mines and other times that it did not maintain a stockpile. Its Article 7 report for calendar year 2008 states that Estonia does not have a stockpile of antipersonnel mines or mines retained for training purposes.²⁸

Estonia served as co-rapporteur and then co-chair of the Standing Committee on Stockpile Destruction from 2005–2007.

Estonia is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Estonia had not signed the Convention on Cluster Munitions as of 1 July 2009.²⁹

There are no known mined areas in Estonia, but it is contaminated by mines and UXO from World War I and World War II.

From 1999–2008, there were at least 77 mine/UXO casualties (12 killed and 65 injured), including 21 UXO casualties in 2003.

From 1999–2008, Estonia contributed \$806,000 to mine action.

Fiji

The Republic of the Fiji Islands signed the Mine Ban Treaty on 3 December 1997 and ratified it on 10 June 1998, becoming a State Party on 1 March 1999. Fiji has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Fiji has not enacted new legislation specifically to implement the Mine Ban Treaty. Fiji submitted its second Article 7 transparency report on 21 August 2002 and has not provided subsequent annual reports.

Fiji is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.³⁰

Three Fijian peacekeepers were injured in a landmine incident in south Lebanon in 1999.

France

The French Republic signed the Mine Ban Treaty on 3 December 1997 and ratified it on 23 July 1998, becoming a State Party on 1 March 1999. National implementing legislation, which includes penal sanctions, was enacted on 8 July 1998. On 30 April 2009, France submitted its 11th Article 7 transparency report. In the past, France produced, exported, and used antipersonnel mines. France completed destruction of its stockpile of 1,397,547 antipersonnel mines on 20 December 1999, well in advance of its 1 March 2003 treaty-mandated deadline. France initially retained 4,539 antipersonnel mines for training and development purposes, but this number was reduced to 4,144 by the end of 2008.³¹

²⁸ Estonia Article 7 Report, Forms B and D, 13 January 2009.

²⁹ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 200–201.

³⁰ *Ibid.*, p. 73.

³¹ Article 7 Report, Form D, 30 April 2009.

France served as co-chair of the Standing Committee on Technologies for Mine Action (1999–2000), and as co-rapporteur and then co-chair of the Standing Committee on victim assistance (2001–2003).

France is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. France signed the Convention on Cluster Munitions in December 2008, but had not ratified it as of 1 July 2009.³²

On 28 May 2008, in advance of its 1 March 2009 mine clearance deadline, France declared it had successfully completed clearance of an area around its ammunition storage area near La Doudah, Djibouti. France has no known mined areas, but mines and UXO from World War I and World War II are occasionally found.

In April 2001, a French soldier serving with the SFOR peacekeeping mission operating in Bosnia and Herzegovina was killed by a mine.³³ In July 2002, two French soldiers with the International Security Assistance Force in Afghanistan were seriously injured while clearing mines near Kabul airport.³⁴ A French national working for the German NGO HELP was killed in Chad in 2003.³⁵ Two soldiers were killed by landmines in Afghanistan, one in 2005 and the other in 2006.³⁶ One French deminer was killed in Tajikistan in 2006.³⁷ One French deminer was killed in Lebanon in 2007.³⁸ One French soldier was killed in Djibouti in 2008 when a grenade exploded.³⁹ One French aid worker was killed in Somalia by a mine in 2008.⁴⁰

From 1999–2008, France contributed \$22.3 million to mine action.

Gabon

The Gabonese Republic signed the Mine Ban Treaty on 3 December 1997 and ratified it on 8 September 2000, becoming a State Party on 1 March 2001. Gabon has never used, produced, or exported antipersonnel mines. It has destroyed its stockpile of 1,082 antipersonnel mines. It is not known if Gabon retained any mines for training purposes. Gabon has not enacted new legislation specifically to implement the Mine Ban Treaty. Gabon submitted its initial Article 7 transparency report on 25 September 2002 and has not submitted subsequent annual reports.

Gabon is party to the Convention on Conventional Weapons but not its Protocol II on Landmines or Protocol V on Explosive Remnants of War. As of 1 July 2009, it had not signed the Convention on Cluster Munitions.

Germany

The Federal Republic of Germany signed the Mine Ban Treaty on 3 December 1997 and ratified it on 23 July 1998, becoming a State Party on 1 March 1999. Germany produced, imported, and exported mines. Production was renounced in April 1996, and a 1994 export moratorium was made permanent in 1996. Legislation to enforce the antipersonnel mine prohibition domestically entered into force on 9 July 1998. On 27 April 2009, Germany submitted its 11th Article 7 transparency report. Germany destroyed its stockpile of 1.7 million antipersonnel mines in December 1997. Germany initially retained 3,000 mines for training and development purposes, and this was reduced to 2,437 mines by the end of 2008.⁴¹

⁴¹ Germany Article 7 Report, Form D, 27 April 2009.

Germany served as co-rapporteur of the Standing Committee on Technologies for Mine Action (1999–2000) and as co-rapporteur and then co-chair of the Standing Committees on mine clearance (2000–2002) and general status and operation of the convention (2006–2008).

Germany is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Germany signed the Convention on Cluster Munitions on 3 December 2008 and ratified it on 8 July 2009.⁴²

Germany has no known mined areas. In December 1995, the government announced that all mine-affected areas on the old East-West divide had been cleared. Mines and UXO dating back to World War II continue to be discovered.

One soldier was killed by a landmine in Afghanistan in 2003.⁴³

From 1999–2008, Germany contributed \$183.2 million to mine action.

Ghana

The Republic of Ghana signed the Mine Ban Treaty on 4 December 1997 and ratified it on 30 June 2000, becoming a State Party on 1 December 2000. Ghana has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Ghana has not enacted new legislation specifically to implement the Mine Ban Treaty. Ghana submitted its initial Article 7 transparency report on 24 July 2002 but has not submitted subsequent annual reports.

Ghana is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions but had not ratified it as of 1 July 2009.⁴⁴

Grenada

Grenada signed the Mine Ban Treaty on 3 December 1997 and ratified it on 19 August 1998, becoming a State Party on 1 March 1999. Grenada has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Grenada has not enacted new legislation specifically to implement the Mine Ban Treaty. Grenada submitted its second Article 7 transparency report on 21 June 2004 but has not submitted subsequent annual reports.

Grenada is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.⁴⁵

Guatemala

The Republic of Guatemala signed the Mine Ban Treaty on 3 December 1997 and ratified it on 26 March 1999, becoming a State Party on 1 September 1999. Guatemala has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was passed in 1997. In 2009, Guatemala submitted its seventh Article 7 transparency report.

Guatemala served as co-rapporteur and then co-chair of the Standing Committees on stockpile destruction (2002–2004) and general status and operation of the convention (2004–2006).

Guatemala is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁴⁶

Guatemala was contaminated by UXO and antipersonnel mines, a result of its 36-year internal conflict. With the completion of its national demining plan in December 2005, Guatemala has no known mined or battle areas. Explosive remnants of war, however, continue to be found.

⁴² For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 78–84.

⁴³ Iraq Coalition Casualty Count, “Coalition Deaths by Nationality,” icasualties.org.

⁴⁴ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 84.

⁴⁵ *Ibid.*, p. 208.

⁴⁶ *Ibid.*, p. 85.

According to the Organization of American States (OAS), mines/UXO killed 23 people and injured 20 others from 1994–2003.⁴⁷ In May 2004, two children were killed by a grenade found in a garbage dump. In June 2005, two young men, aged 17 and 18, were killed and five children under 10 were injured when a grenade found near a military base in Jutiapa department exploded. Also in June 2005, two soldiers were injured in an explosion in a military ammunition storage area.⁴⁸

Guinea

The Republic of Guinea signed the Mine Ban Treaty on 4 December 1997 and ratified it on 8 October 1998, becoming a State Party on 1 April 1999. Guinea has never used, produced, or exported antipersonnel mines. Guinea has not enacted new legislation specifically to implement the Mine Ban Treaty. On 24 June 2004, Guinea submitted its initial Article 7 transparency report, which was due 28 September 1999, but it has not submitted subsequent annual reports. Guinea completed destruction of its stockpile of 3,174 antipersonnel mines in November 2003 and did not retain any mines for research or training purposes.

Guinea is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁴⁹

Guinea is not mine-affected but areas near the border with Sierra Leone are contaminated by UXO.

Guyana

The Republic of Guyana signed the Mine Ban Treaty on 4 December 1997 and ratified it on 5 August 2003, becoming a State Party on 1 February 2004. Guyana has never used or produced antipersonnel mines. Guyana has not enacted new legislation specifically to implement the Mine Ban Treaty. In October 2006, Guyana submitted its initial Article 7 transparency report, due 29 July 2004, and it has not submitted subsequent annual reports.

Although Landmine Monitor received information that Guyana had a stockpile, Guyana reported in 2006 that it did not have a stockpile of antipersonnel mines. It is possible that a stockpile was destroyed in an ammunition storage area explosion in 2000.

Guyana is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Haiti

The Republic of Haiti signed the Mine Ban Treaty on 3 December 1997 and ratified it on 15 February 2006, becoming a State Party on 1 August 2006. Haiti has never used, produced, exported, imported, or stockpiled antipersonnel mines, including for training purposes. Haiti has not enacted new legislation specifically to implement the Mine Ban Treaty. On 17 February 2009, Haiti submitted its initial Article 7 transparency report, due 28 January 2007.

Haiti is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Holy See

The Holy See signed the Mine Ban Treaty on 4 December 1997 and ratified it on 17 February 1998, becoming a State Party on 1 March 1999. The Holy See has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. The Holy See believes that new legislation specifically to implement the Mine Ban Treaty is unnecessary since it does not possess antipersonnel mines. In 2009, the Holy See submitted its ninth Article 7 transparency report.

⁴⁷ See *Landmine Monitor Report 2004*, p. 474.

⁴⁸ See *Landmine Monitor Report 2005*, p. 374.

⁴⁹ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 86.

The Holy See is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. The Holy See signed and ratified the Convention on Cluster Munitions on 3 December 2008.⁵⁰

From 1999–2008, the Holy See contributed \$14,000 to mine action.

Honduras

The Republic of Honduras signed the Mine Ban Treaty on 3 December 1997 and ratified it on 24 September 1998, becoming a State Party on 1 March 1999. Legislation to enforce the antipersonnel mine prohibition domestically was adopted on 29 June 2000. Honduras submitted its sixth Article 7 transparency report on 24 April 2007 but has not provided subsequent annual reports. Honduras is not known to have used, produced, or exported antipersonnel mines. Honduras completed destruction of its stockpile of 7,441 antipersonnel mines on 2 November 2000. Honduras initially retained 826 antipersonnel mines for training purposes; this number was reduced to 815 in 2005. It is not known if any mines have been consumed during training activities in 2005–2008.

Honduras served as co-rapporteur and then co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration in 2000–2002.

Honduras is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not its Protocol V on Explosive Remnants of War. Honduras signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁵¹

Honduras was contaminated by mines and UXO along its borders with El Salvador and Nicaragua, the result of armed conflict in those two countries in the 1980s. Honduras completed its national demining program in 2004; however, one person was killed by a mine in 2005 after clearance was completed. Despite the closure of its demining program, Honduras remains affected by residual contamination from mines and UXO.

As of 5 March 2008, the OAS had identified 58 casualties from 43 incidents, including 10 people killed and 48 injured who had never been officially registered or received assistance. Four casualties were military and 54 civilian.⁵² Previously reported casualty information indicated that there may be as many as 200 landmine survivors in Honduras.⁵³ In 2007, there were eight casualties from three incidents involving grenades; three were killed (all children) and five were injured (three children and two men).⁵⁴

Hungary

The Republic of Hungary signed the Mine Ban Treaty on 3 December 1997 and ratified it on 6 April 1998, becoming a State Party on 1 March 1999. Hungary is a former antipersonnel mine producer and exporter. Legislation to enforce the antipersonnel mine prohibition domestically entered into force on 7 March 1998. In 2009 Hungary submitted its 11th Article 7 transparency report. Hungary destroyed 375,339 stockpiled antipersonnel mines from 1998–1999. Hungary retained 1,500 antipersonnel mines for training purposes, but has not reported on the intended purposes and actual uses of these mines as agreed by States Parties in 2004.

Hungary served as co-chair of the Standing Committee on Stockpile Destruction in 1999–2000.

Hungary is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Hungary signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁵⁵

Hungary has no known mined areas but is contaminated by UXO and mines from World War II.

⁵⁰ Ibid, pp. 87–89.

⁵¹ Ibid, p. 89.

⁵² See *Landmine Monitor Report 2008*, p. 426.

⁵³ See *Landmine Monitor Report 2007*, p. 429.

⁵⁴ See *Landmine Monitor Report 2008*, p. 425.

⁵⁵ Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 90.

One explosive ordnance disposal expert was confirmed killed in the period from 1999–2008. An amateur collector of war relics was killed by an item of UXO in November 2003, though it has been estimated that there have been an average of two to three civilian deaths each year.⁵⁶

From 1999–2008, Hungary contributed \$218,000 to mine action.

Iceland

The Republic of Iceland signed the Mine Ban Treaty on 4 December 1997 and ratified it on 5 May 1999, becoming a State Party on 1 November 1999. Iceland has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was enacted on 7 May 2001. In 2008, Iceland submitted its sixth Article 7 transparency report.

Iceland is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Iceland signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁵⁷

From 1999–2008, Iceland contributed \$2.5 million to mine action.

Ireland

Ireland signed and ratified the Mine Ban Treaty on 3 December 1997, becoming a State Party on 1 March 1999. Ireland has never used, produced, stockpiled, or exported antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically was enacted in 1996, with updated legislation passed in 2008. In 2009, Ireland submitted its 11th Article 7 transparency report. Ireland did not have an operational stockpile of antipersonnel mines, but initially retained 129 antipersonnel mines for training purposes; this number was reduced to 67 by the end of 2008.⁵⁸

Ireland is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Ireland signed and ratified the Convention on Cluster Munitions on 3 December 2008.⁵⁹

From 1999–2008, Ireland contributed \$32.7 million to mine action.

Italy

The Italian Republic signed the Mine Ban Treaty on 3 December 1997 and ratified it on 23 April 1999, becoming a State Party on 1 October 1999. Export of antipersonnel mines ceased in 1993 and a moratorium on production and export was declared in 1994. Legislation to enforce the antipersonnel mine prohibition domestically was enacted on 29 October 1997. With amendments, this was used for implementation of the Mine Ban Treaty when the ratification legislation was approved on 26 March 1999. In 2009, Italy submitted its 10th Article 7 transparency report.

Italy completed destruction of its stockpile of 6,529,811 antipersonnel mines on 20 November 2002, well in advance of its 1 October 2003 treaty-mandated destruction deadline. Italy initially retained 811 mines for training and development purposes; this number was reduced to 689 by the end of 2008.⁶⁰

Italy served as co-rapporteur and then co-chair of the Standing Committees on general status and operation of the convention (2006–2008) and stockpile destruction (2002–2004 and 2007–2009).

⁵⁶ See *Landmine Monitor Report 2004*, p. 498.

⁵⁷ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 91.

⁵⁸ Ireland Article 7 Report (for calendar year 2008), Form D.

⁵⁹ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 92–97.

⁶⁰ Italy Article 7 Report (for calendar year 2008), Form D.

Italy is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. Italy signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁶¹

Italy has no known mined areas, though UXO from World War I and World War II are still found occasionally.

From 1999–2008, Italy contributed \$49.2 million to mine action.

Jamaica

Jamaica signed the Mine Ban Treaty on 3 December 1997 and ratified it on 17 July 1998, becoming a State Party on 1 March 1999. Jamaica has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. It submitted its sixth Article 7 transparency report, an undated report covering January 2005 to December 2006, but has not submitted subsequent annual reports.

Jamaica is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Jamaica signed the Convention on Cluster Munitions on 12 June 2009 but had not ratified it as of 1 July 2009.

Japan

Japan signed the Mine Ban Treaty on 3 December 1997 and ratified it on 30 September 1998, becoming a State Party on 1 March 1999. Japan is a former antipersonnel mine producer and importer. It ceased antipersonnel mine production in 1997 and production facilities were decommissioned by 31 March 1999. Legislation to enforce the antipersonnel mine prohibition domestically entered into force on 1 March 1999. In 2009, Japan submitted its tenth Article 7 transparency report.

Japan completed destruction of its stockpile of 985,089 antipersonnel mines on 8 February 2003. Japan initially retained 15,000 antipersonnel mines for training and development purposes; by the end of 2008 this number had been reduced to 3,320.

Japan served as co-rapporteur and then co-chair of the Standing Committees on victim assistance (1999–2001), mine clearance (2002–2004), stockpile destruction (2004–2006), and general status and operation of the convention (2007–2009).

Japan is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. Japan signed the Convention on Cluster Munitions on 3 December 2008 and ratified it on 14 July 2009.⁶²

In 2009, Landmine Monitor identified five new ERW casualties, one killed and four injured in two incidents in Okinawa. Three of these casualties occurred on 24 March 2009, in the worst incident since 1974. A United States marine was killed and another marine and sailor were injured while disposing of ordnance at a US military facility.⁶³ Okinawa, a site of fierce fighting in World War II, was contaminated by an estimated 2,500 tons (2.5 million kg) of ERW.⁶⁴ While much of this has now been removed, Japanese authorities and the US military clear some 30 tons (30,000kg) of ERW from the island every year. The Japanese government is reportedly setting up a ¥1 billion (\$9.7 million) fund to compensate Okinawan survivors.⁶⁵

⁶¹ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 97–99.

⁶² *Ibid.*, pp. 100–102.

⁶³ Eric Talmadge, “60 years after Second World War, Okinawa still rife with bombs,” *The Canadian Press*, 3 May 2009.

⁶⁴ “Excavation triggers WWII bomb blast,” Japan Update, 23 January 2009, www.japanupdate.com.

⁶⁵ Eric Talmadge, “60 years after Second World War, Okinawa still rife with bombs,” *The Canadian Press*, 3 May 2009.

Landmine Monitor had not previously identified landmine and ERW casualties in Japan. However, Japanese media have reported a total of 59 ERW casualties (eight killed and 51 injured) on Okinawa since 1974. Mainland Japan is also affected by ERW from World War II; in May 2008, around 16,000 people were evacuated from a Tokyo residential area while authorities disposed of a bomb.⁶⁶

From 1999–2008, Japan contributed \$293.4 million to mine action.

Kiribati

The Republic of Kiribati acceded to the Mine Ban Treaty on 7 September 2000, becoming a State Party on 1 March 2001. Kiribati has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Kiribati believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. Kiribati submitted its second Article 7 transparency report on 4 June 2004 but has not submitted subsequent annual reports.

Kiribati is not party to the Convention on Conventional Weapons. It had not signed the Convention on Cluster Munitions as of 1 July 2009.

Kiribati has residual UXO contamination from World War II.

Lesotho

The Kingdom of Lesotho signed the Mine Ban Treaty on 4 December 1997 and ratified it on 2 December 1998, becoming a State Party on 1 June 1999. Lesotho has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Lesotho believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. Lesotho submitted its third Article 7 transparency report on 11 May 2006, covering 30 April 2002 to 20 April 2006, but has not submitted subsequent annual reports.

Lesotho is party to the Convention on Conventional Weapons but not its Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. Lesotho signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁶⁷

Liberia

The Republic of Liberia acceded to the Mine Ban Treaty on 23 December 1999, becoming a State Party on 1 June 2000. Mines were used during the country's first civil war (1989–1997). Liberia has never produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Liberia has not enacted new legislation specifically to implement the Mine Ban Treaty. Liberia submitted its initial Article 7 transparency report nearly four years late, on 20 October 2004, and has not submitted subsequent reports.

Liberia is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Liberia signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁶⁸

Liberia has no known mined areas but is affected by explosive remnants of war, the result of 14 years of internal and regional warfare.

From 1999–2008, Landmine Monitor identified 62 mine/ERW casualties in Liberia: 40 killed and 22 injured.

⁶⁶ David Allen and Chiyomi Sumida, "Suspected WWII bomb explodes, injuring 1," *Stars and Stripes, Pacific Edition*, 16 January 2009, www.stripes.com.

⁶⁷ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 107–108.

⁶⁸ *Ibid.*, p. 108.

Liechtenstein

The Principality of Liechtenstein signed the Mine Ban Treaty on 3 December 1997 and ratified it on 5 October 1999, becoming a State Party on 1 April 2000. Liechtenstein has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was passed on 9 September 1999. In 2009, Liechtenstein submitted its 10th Article 7 transparency report.

Liechtenstein is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Liechtenstein signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁶⁹

Lithuania

The Republic of Lithuania signed the Mine Ban Treaty on 22 February 1999 and ratified it on 12 May 2003, becoming a State Party on 1 November 2003. Production and import/export of antipersonnel mines have not been licensed since 1990, and an export moratorium has been in place since 1998. Lithuania states that its law provides for the imposition of penal sanctions as required by the treaty. Lithuania submitted its seventh Article 7 transparency report on 30 April 2009. Lithuania completed destruction of its stockpile of 4,104 antipersonnel mines on 7 June 2004. Lithuania modified 3,987 mines to only function in command-detonated mode, and did not retain any antipersonnel mines for training.

Lithuania served as co-rapporteur and then co-chair of the Standing Committee on Stockpile Destruction from 2006–2008.

Lithuania is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Lithuania signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁷⁰

Lithuania is contaminated by UXO and mines from World War II but there are no known mined areas.

Luxembourg

The Grand Duchy of Luxembourg signed the Mine Ban Treaty on 4 December 1997 and ratified it on 14 June 1999, becoming a State Party on 1 December 1999. Luxembourg has not produced or exported antipersonnel mines, but previously imported mines. Export of antipersonnel mines was banned in April 1997. Legislation to enforce the antipersonnel mine prohibition domestically entered into force in December 1999. Luxembourg submitted its ninth Article 7 transparency report on 30 April 2008. Luxembourg finished destruction of its stockpile of 9,600 antipersonnel mines in August 1997. It initially retained 988 mines for training purposes, and this number was reduced to 855 by the end of 2007.

Luxembourg is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Luxembourg signed the Convention on Cluster Munitions on 3 December 2008 and ratified it on 10 July 2009.⁷¹

From 1999–2008, Luxembourg contributed \$6.78 million to mine action.

Madagascar

The Republic of Madagascar signed the Mine Ban Treaty on 4 December 1997 and ratified it on 16 September 1999, becoming a State Party on 1 March 2000. Madagascar has never used, produced, or exported antipersonnel mines, and it does not have a stockpile, including for training purposes. Madagascar may have had a stockpile of mines prior to becoming a State Party to the treaty. Madagascar has not enacted new legislation specifically to implement the Mine Ban Treaty. Madagascar submitted its fourth Article 7 transparency report on 30 April 2008.

⁶⁹ Ibid, p. 109.

⁷⁰ Ibid, pp. 109–111.

⁷¹ Ibid, pp. 111–113.

Madagascar is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁷²

Malawi

The Republic of Malawi signed the Mine Ban Treaty on 4 December 1997 and ratified it on 13 August 1998, becoming a State Party on 1 March 1999. Malawi has never used, produced, imported, exported, or stockpiled antipersonnel mines. Malawi has not enacted new legislation specifically to implement the Mine Ban Treaty. Malawi submitted its third Article 7 transparency report on 16 May 2005, covering April 2004 to April 2005, but has not submitted subsequent annual reports. Malawi does possess 21 dummy mines used for training purposes.

Malawi is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁷³

There may be some residual mine and UXO contamination near the border with Mozambique.

Between 1999 and 2008, Landmine Monitor identified 10 mine/ERW casualties in Malawi: three killed and seven injured.

Malaysia

Malaysia signed the Mine Ban Treaty on 3 December 1997 and ratified it on 22 April 1999, becoming a State Party on 1 October 2009. Malaysia has never used, produced, or exported antipersonnel mines. It previously imported and stockpiled antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically took effect on 25 June 2000. Malaysia submitted its sixth Article 7 transparency report on 3 May 2006, covering calendar year 2005, but has not submitted subsequent annual reports. Malaysia completed destruction of its stockpile of 94,721 mines on 23 January 2001, well in advance of its October 2003 treaty-mandated deadline. Malaysia chose not to retain any mines for training or development purposes.

Malaysia served as co-rapporteur and then co-chair of the Standing Committee on Stockpile Destruction from 1999–2001.

Malaysia is not party to the Convention on Conventional Weapons, and as of 1 July 2009 had not signed the Convention on Cluster Munitions.

In 2008, two people were killed by a World War II-era bomb.⁷⁴

Maldives

The Republic of Maldives signed the Mine Ban Treaty on 1 October 1998 and ratified it on 7 September 2000, becoming a State Party on 1 March 2001. Maldives has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Maldives has not enacted new legislation specifically to implement the Mine Ban Treaty. Maldives submitted its second Article 7 transparency report on 6 April 2006 but has not submitted subsequent reports.

Maldives is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. As of 1 July 2009, Maldives had not signed the Convention on Cluster Munitions.

Malta

The Republic of Malta signed the Mine Ban Treaty on 4 December 1997 and ratified it on 7 May 2001, becoming a State Party on 1 November 2001. Malta has never used, produced, imported, exported, or stockpiled antipersonnel mines, including for training purposes. Legislation to

⁷³ Ibid, p. 115.

⁷⁴ “World War II bomb explodes, killing 2 in Malaysia,” *The Standard*, 20 August 2008, www.thestandard.com.hk.

enforce the antipersonnel mine prohibition domestically was adopted on 27 April 2001. Malta submitted its sixth Article 7 transparency report in 2008.

Malta is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Malta signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁷⁵

Mauritius

The Republic of Mauritius signed and ratified the Mine Ban Treaty on 3 December 1997, becoming a State Party on 1 March 1999. Mauritius has never used or produced antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically was adopted in April 2001. Mauritius submitted its seventh Article 7 transparency report on 4 April 2008. It destroyed its stockpile of 93 antipersonnel mines in November 2003 and did not retain any mines for training purposes.

Mauritius is party to the Convention on Conventional Weapons but not its Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. As of 1 July 2009, Mauritius had not signed the Convention on Cluster Munitions.

Mexico

The United Mexican States signed the Mine Ban Treaty on 3 December 1997 and ratified it on 9 June 1998, becoming a State Party on 1 March 1999. Mexico has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Mexico believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. In 2009, Mexico submitted its 11th Article 7 transparency report.

Mexico served as co-chair of the Standing Committee on Victim Assistance and Socio-Economic Reintegration from 1999–2000 and as the co-rapporteur and then co-chair of the Standing Committee on the General Status and Operation of the Convention from 2002–2004.

Mexico is party to the Convention on Conventional Weapons but not its Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. Mexico signed the Convention on Cluster Munitions on 3 December 2008 and ratified it on 6 May 2009.⁷⁶

Monaco

The Principality of Monaco signed the Mine Ban Treaty on 4 December 1997 and ratified it on 17 November 1998, becoming a State Party on 1 May 1999. Monaco has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was adopted on 30 August 1999. On 16 March 2009, Monaco submitted its eighth Article 7 transparency report.

Monaco is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. Monaco signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁷⁷

Nauru

The Republic of Nauru acceded to the Mine Ban Treaty on 7 August 2000, becoming a State Party on 1 February 2001. Nauru has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. Nauru's initial Article 7 transparency report, due 31 July 2001, was submitted on 28 July 2004; no subsequent reports have been submitted.

⁷⁵ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 116–117.

⁷⁶ *Ibid.*, pp. 118–119.

⁷⁷ *Ibid.*, p. 121.

Nauru is party to the Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. Nauru signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁷⁸

Netherlands

The Kingdom of the Netherlands signed the Mine Ban Treaty on 3 December 1997 and ratified it on 12 April 1999, becoming a State Party on 1 October 1999. The Netherlands is a former antipersonnel mine producer and importer. The government announced a unilateral ban on use in March 1996. The Netherlands believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. It submitted its ninth Article 7 transparency report on 9 May 2008.

Between 1996 and 2002 the Netherlands destroyed its stockpile of 254,798 antipersonnel mines. The Netherlands initially retained 4,076 mines for training and development purposes but this number was reduced to 2,516 by the end of 2007.⁷⁹

The Netherlands served as co-rapporteur and then co-chair of the Standing Committees on mine clearance (1999–2001) and general status and operation of the convention (2002–2004).

The Netherlands is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. The Netherlands signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁸⁰

One Dutch soldier was killed by a landmine in Afghanistan in 2007.⁸¹ A Dutch tourist was injured in Croatia in 2005.

From 1999–2008, the Netherlands contributed \$182.2 million to mine action.

New Zealand

New Zealand signed the Mine Ban Treaty on 3 December 1997 and ratified it on 27 January 1999, becoming a State Party on 1 July 1999. New Zealand has never produced or exported antipersonnel mines and used them in limited quantities during World War II and the Korean War, but prohibited operational use in 1996. New Zealand destroyed its small stockpile of surplus training/practice mines in 1997. Legislation to enforce the antipersonnel mine prohibition domestically was enacted on 9 December 1998. On 30 April 2009, New Zealand submitted its 10th Article 7 transparency report.

New Zealand served as the co-rapporteur and then co-chair of the Standing Committees on general status and operation of the convention (2003–2005) and victim assistance (2006–2008).

New Zealand is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁸²

From 1999–2008, New Zealand contributed \$13.4 million to mine action.

Niue

Niue signed the Mine Ban Treaty on 3 December 1997 and ratified it on 15 April 1998, becoming a State Party on 1 March 1999. Niue has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. Niue submitted its fourth Article 7 transparency report on 27 April 2006 but has not submitted subsequent reports.

Niue is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

⁸² For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 129–132.

Norway

The Kingdom of Norway hosted the negotiations for the Mine Ban Treaty in September 1997. It signed the Mine Ban Treaty on 3 December 1997 and ratified it on 9 July 1998, becoming a State Party on 1 March 1999. Norway has played a crucial role in developing Mine Ban Treaty structures and processes.

Legislation to enforce the antipersonnel mine prohibition domestically was passed on 16 June 1998. In 2009, Norway submitted its 11th Article 7 transparency report.

No significant production of antipersonnel mines is known to have taken place in Norway; some mine components were manufactured in the early 1990s. Mines were previously imported. Production and transfer of antipersonnel mines were first legally prohibited in 1998. Norway completed destroyed of its stockpile of 160,000 antipersonnel mines in October 1996; no mines were retained for training and development purposes.

Norway served as co-rapporteur and later co-chair of the Standing Committees on general status and operation of the convention (2000–2002), victim assistance (2003–2005), and mine clearance (2005–2007). Norway was President of the Second Meeting of States Parties in 2000.

Norway established and coordinated the Contact Group on Resource Mobilization.

Norway is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Norway signed and ratified the Convention on Cluster Munitions on 3 December 2008 and led the Oslo Process, a diplomatic initiative to create a legally-binding instrument outlawing cluster munitions and establishing a framework for clearing contaminated areas and meeting the needs of cluster munition victims.⁸³

From 1999–2008, Norway contributed \$307.6 million to mine action.

Panama

The Republic of Panama signed the Mine Ban Treaty on 4 December 1997 and ratified it on 7 October 1998, becoming a State Party on 1 April 1999. Panama has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Panama believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. Panama submitted its second Article 7 transparency report on 7 May 2003 but has not submitted subsequent annual reports.

Panama is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. Panama signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁸⁴

Panama has a problem with explosive remnants of war, primarily UXO, as a result of US military exercises and weapons testing on military ranges in the Canal Zone during the three decades prior to 1999.

Papua New Guinea

Papua New Guinea acceded to the Mine Ban Treaty on 28 June 2004, becoming a State Party on 1 December 2004. Papua New Guinea has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Papua New Guinea believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. Papua New Guinea submitted its initial Article 7 transparency report on 29 November 2004 but has not submitted subsequent reports.

Papua New Guinea is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.⁸⁵

It is not believed to be mine-affected but parts of the country are contaminated by UXO from World War II.

⁸³ Ibid, pp. 134–140.

⁸⁴ Ibid, p. 141.

⁸⁵ Ibid, pp. 123–124.

Paraguay

The Republic of Paraguay signed the Mine Ban Treaty on 3 December 1997 and ratified it on 13 November 1998, becoming a State Party on 1 May 1999. Paraguay has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was adopted on 1 May 2002. Paraguay submitted its fourth Article 7 transparency report on 8 October 2007.

Paraguay is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Paraguay signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁸⁶

Portugal

The Portuguese Republic signed the Mine Ban Treaty on 3 December 1997 and ratified it on 19 February 1999, becoming a State Party on 1 August 1999. Portugal is a former antipersonnel mine producer, importer, and exporter. In May 1996 Portugal announced an indefinite moratorium on the production, export and use (except for training purposes) of antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically was enacted on 22 July 2004. In 2009, Portugal submitted its ninth Article 7 transparency report.

Portugal completed destruction of its stockpile of 271,967 antipersonnel mines in March 2003, in advance of its 1 August 2003 treaty-mandated destruction deadline. Portugal initially retained 1,115 antipersonnel mines for training and development purposes, but this was reduced to 760 mines by the end of 2008.⁸⁷

Portugal is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁸⁸

From 1999–2008, Portugal contributed \$147,500 to mine action.

Qatar

The State of Qatar signed the Mine Ban Treaty on 4 December 1997 and ratified it on 13 October 1998, becoming a State Party on 1 April 1999. Qatar has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. Qatar submitted its fifth Article 7 transparency report on 25 March 2009.

Qatar is not party to the Convention on Conventional Weapons and as of 1 July 2009 had not signed the Convention on Cluster Munitions.⁸⁹

From 1999–2008, Qatar contributed \$200,000 to mine action.

Romania

Romania signed the Mine Ban Treaty on 3 December and ratified it on 30 November 2000, becoming a State Party on 1 May 2001. Romania produced and exported antipersonnel mines. Production ceased in 1990 and an export moratorium entered into effect in 1995. Romania believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. In 2009 Romania submitted its fifth Article 7 transparency report.

⁸⁶ Ibid, p. 142.

⁸⁷ Portugal Article 7 Report (for calendar year 2008), Form D.

⁸⁸ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 146–147.

⁸⁹ Ibid, pp. 228–229.

Romania completed the destruction of its stockpile of 1,075,074 antipersonnel mines in March 2004. Romania initially retained 4,000 antipersonnel mines for training purposes but revised this number to 2,500 in 2004. Romania has not reported on the use of these retained mines, a step agreed to by States Parties in 2004.

Romania served as co-rapporteur and later co-chair of the Standing Committee on Stockpile Destruction from 2001–2003.

Romania is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. As of 1 July 2009, Romania had not signed the Convention on Cluster Munitions.⁹⁰

From 1999–2008, a total of eight Romanian soldiers were killed while on duty in Afghanistan (three killed and five injured).

Saint Kitts and Nevis

Saint Kitts and Nevis signed the Mine Ban Treaty on 3 December 1997 and ratified it on 2 December 1998, becoming a State Party on 1 June 1999. Saint Kitts and Nevis has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. Saint Kitts and Nevis submitted its initial Article 7 transparency report on 27 November 1999, which covered 1 March to 27 November 1999, but has not submitted subsequent annual reports.

Saint Kitts and Nevis is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Saint Lucia

Saint Lucia signed the Mine Ban Treaty on 3 December 1997 and ratified it on 13 April 1999, becoming a State Party on 1 October 1999. It has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. As of 1 July 2009, Saint Lucia had not submitted its initial Article 7 transparency report, due 29 March 2000.

Saint Lucia is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Saint Vincent and the Grenadines

Saint Vincent and the Grenadines signed the Mine Ban Treaty on 3 December 1997 and ratified it on 1 August 2001, becoming a State Party on 1 February 2002. Saint Vincent and the Grenadines has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was enacted on 24 December 2002. As of 1 July 2009, Saint Vincent and the Grenadines had not submitted its initial Article 7 transparency report, due 29 March 2000.

Saint Vincent and the Grenadines is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Samoa

The Independent State of Samoa signed the Mine Ban Treaty on 3 December 1997 and ratified it on 23 July 1998, becoming a State Party on 1 March 1999. Samoa has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Samoa believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. Samoa submitted its fourth Article 7 transparency report on 30 April 2008.

Samoa is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁹¹

⁹⁰ Ibid, pp. 229–230.

⁹¹ Ibid, p. 148.

San Marino

The Republic of San Marino signed the Mine Ban Treaty on 3 December 1997 and ratified it on 18 March 1998, becoming a State Party on 1 March 1999. San Marino has never used, produced, exported, or imported antipersonnel mines, including for training purposes. San Marino believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. In 2009, San Marino submitted its seventh Article 7 transparency report.

San Marino is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 and ratified it on 10 July 2009.⁹²

São Tomé e Príncipe

The Democratic Republic of São Tomé e Príncipe signed the Mine Ban Treaty on 30 April 1998 and ratified it on 31 March 2003, becoming a State Party on 1 September 2003. São Tomé e Príncipe has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. On 13 December 2007, São Tomé e Príncipe submitted its initial Article 7 transparency report, due 24 February 2004.

São Tomé e Príncipe is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.⁹³

Seychelles

The Republic of Seychelles signed the Mine Ban Treaty on 4 December 1999 and ratified it on 2 June 2000, becoming a State Party on 1 December 2000. Seychelles has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically was adopted on 8 April 2004. Seychelles submitted its second Article 7 transparency report on 8 July 2005, covering January 2000 to December 2004, but has not submitted subsequent reports.

Seychelles is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. As of 1 July 2009, it had not signed the Convention on Cluster Munitions.

Sierra Leone

The Republic of Sierra Leone signed the Mine Ban Treaty on 29 July 1998 and ratified it on 25 April 2001, becoming a State Party on 1 October 2001. Sierra Leone has not produced or exported antipersonnel mines. Limited quantities of mines were used in various civil conflicts. Sierra Leone has not enacted new legislation specifically to implement the Mine Ban Treaty. On 9 February 2004, Sierra Leone submitted its initial Article 7 transparency report, due 20 March 2002, but has not submitted subsequent reports.

Sierra Leone destroyed its stockpile of between 956 and 959 antipersonnel mines (the exact number was not confirmed) on 11 February 2003.

Sierra Leone is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. It signed and ratified the Convention on Cluster Munitions on 3 December 2008.⁹⁴

There are no known mined areas but Sierra Leone has residual UXO contamination.

From 1999–2008, there were a total of two mine/ERW casualties (both injured). In 2006, Landmine Monitor noted that it had not recorded any new mine/ERW incidents in Sierra Leone since the end of the civil war in 2002.⁹⁵

⁹² Ibid, p. 148.

⁹³ Ibid, p. 149.

⁹⁴ Ibid, p. 151.

⁹⁵ See *Landmine Monitor Report 2006*, p. 650.

Slovakia

The Slovak Republic signed the Mine Ban Treaty on 3 December 1997 and ratified it on 25 February 1999, becoming a State Party on 1 August 1999. The former Czechoslovakia produced and exported antipersonnel mines. Slovakia introduced a moratorium on antipersonnel mine transfers in 1994. Slovakia believes that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. In 2009, Slovakia submitted its 11th Article 7 transparency report.

Slovakia finished destruction of its stockpile of 187,060 antipersonnel mines on 31 August 2000. It initially announced it would retain 7,000 antipersonnel mines for training and development purposes but reduced this to 1,500 by July 2001; as of the end of 2008, 1,422 mines were retained.

Slovakia served as co-rapporteur and then co-chair of the Standing Committee on Stockpile Destruction from 1999–2001.

Slovakia is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. As of 1 July 2009, it had not signed the Convention on Cluster Munitions.⁹⁶

There are no known mined areas in Slovakia, but UXO from World War II is found occasionally.

From 1999–2008, Slovakia contributed \$34.5 million to mine action.

Slovenia

The Republic of Slovenia signed the Mine Ban Treaty on 3 December 1997 and ratified it on 27 October 1998, becoming a State Party on 1 April 1999. Slovenia never produced, imported, or exported antipersonnel mines. It inherited its stockpile of antipersonnel mines from the former Yugoslavia. Legislation to enforce the antipersonnel mine prohibition domestically was passed in December 1998 and April 1999. On 30 April 2009, Slovenia submitted its 11th Article 7 transparency report.

Slovenia completed the destruction of its stockpile of 168,898 antipersonnel mines on 25 March 2003, just ahead of its 1 April 2003 treaty-mandated destruction deadline. Slovenia initially announced it would retain 7,000 antipersonnel mines for training and development purposes, but later reduced the quantity to 3,000; as of the end of 2008, Slovenia had reduced the number of mines retained to 1,991.⁹⁷

Slovenia served as co-rapporteur and then co-chair of the Standing Committee on mine clearance from 2004–2006 and as co-rapporteur of the Standing Committee on the General Status and Operation of the Convention from 2008–2009.

Slovenia is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions on 3 December 2008, and ratified it on 20 August 2009.⁹⁸

Mine clearance in Slovenia was completed in the early 1990s; there are no known mined areas in Slovenia. Slovenia is contaminated by UXO from World War I, World War II, and the independence war of 1991.

From 1999–2008, Slovenia contributed \$4.1 million to mine action.

Solomon Islands

The Solomon Islands signed the Mine Ban Treaty on 4 December 1997 and ratified it on 26 January 1999, becoming a State Party on 1 July 1999. The Solomon Islands has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It believes

⁹⁶ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 239–242.

⁹⁷ Slovenia Article 7 Report, Form D, 30 April 2009.

⁹⁸ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 152–153.

that existing legislation is sufficient to enforce the antipersonnel mine prohibition domestically. The Solomon Islands submitted its initial Article 7 transparency report on 11 February 2004, covering 1 July 1999 to 31 December 2004, but has not submitted subsequent annual reports.

The Solomon Islands is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

The Solomon Islands is contaminated by UXO from World War II.

South Africa

The Republic of South Africa signed the Mine Ban Treaty on 3 December 1997 and ratified it on 26 June 1998, becoming a State Party on 1 March 1999. South Africa is a past producer and exporter of antipersonnel mines. It stopped production in 1995 and prohibited export in 1996. In May 1996, it suspended the use of antipersonnel mines. Legislation to enforce the antipersonnel mine prohibition domestically was promulgated on 5 December 2003. South Africa submitted its 10th Article 7 transparency report on 24 November 2008.

South Africa completed destruction of its stockpile of antipersonnel mines in October 1998. It initially retained 5,000 antipersonnel mines; this number was reduced to 4,380 by the end of 2007.⁹⁹

South Africa served as co-rapporteur and later co-chair of the Standing Committee on the General Status and Operation of the Convention from 1999–2000 and 2003–2005.

South Africa is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not Protocol V on Explosive Remnants of War. South Africa signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.¹⁰⁰

From 1999–2008, one South African was killed and one injured by mines, both while working overseas.

From 1999–2008, South Africa contributed \$178,224 to mine action.

Spain

The Kingdom of Spain signed the Mine Ban Treaty on 3 December 1997 and ratified it on 19 January 1999, becoming a State Party on 1 July 1999. Spain is a former mine producer, importer, and exporter. Production officially ceased in May 1996 and a 1994 export moratorium was made indefinite in 1996. Spain last used antipersonnel mines in 1975 on the Moroccan border of its then-colony of Western Sahara. Legislation to enforce the antipersonnel mine prohibition domestically was passed in October 1998. Spain submitted its tenth Article 7 transparency report in April 2009.

Spain completed destruction of its stockpile of 496,415 antipersonnel mines on 3 October 2000, well in advance of its 1 July 2003 treaty-mandated destruction deadline. Spain initially announced it would retain 10,000 antipersonnel mines for training and development purposes but reduced this number to 4,000 in 2000, and by the end of 2008 Spain had further reduced this to 1,797 mines.¹⁰¹

Spain is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Spain signed the Convention on Cluster Munitions on 3 December 2008 and ratified it on 17 June 2009.¹⁰²

One Spanish soldier was killed by a landmine in Afghanistan in 2007.¹⁰³ Five Spanish peacekeepers were killed and two injured by an antivehicle mine in Lebanon in 2007.¹⁰⁴

From 1999–2008, Spain contributed \$47.5 million to mine action.

⁹⁹ South Africa Article 7 Report, Form D, 24 November 2008.

Suriname

The Republic of Suriname signed the Mine Ban Treaty on 4 December 1997 and ratified it on 23 May 2002, becoming a State Party on 1 November 2002. Suriname imported but never produced or exported antipersonnel mines. An estimated 1,000 mines were planted during a 1986–1992 internal conflict. It has not enacted new legislation specifically to implement the Mine Ban Treaty. Suriname submitted its sixth Article 7 transparency report on 30 April 2008.

Suriname destroyed its stockpile of 146 antipersonnel mines on 25 February 2004, and retained 150 antipersonnel mines for training purposes. Suriname noted in its Article 7 report for 2007 that it did not have any antipersonnel mines retained.

Suriname is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Mine clearance was completed on 4 April 2005, well in advance of Suriname's 1 November 2012 mine clearance deadline. Suriname is affected by explosive remnants of war, primarily abandoned explosive ordnance.

Swaziland

The Kingdom of Swaziland signed the Mine Ban Treaty on 4 December 1997 and ratified it on 22 December 1998, becoming a State Party on 1 June 1999. It has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. Swaziland submitted its second Article 7 transparency report on 11 May 2006, covering 31 January 2000 to 31 March 2005, but has not submitted subsequent annual reports.

Swaziland had a suspected hazardous area, the result of conflict spilling over from neighboring Mozambique, but technical survey did not find any antipersonnel mines. In November 2007, Swaziland announced it had fulfilled compliance with Article 5 almost two years before its 1 June 2009 treaty-mandated deadline.

Swaziland is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Sweden

The Kingdom of Sweden signed the Mine Ban Treaty on 3 December 1997 and ratified it on 25 November 1998, becoming a State Party on 1 May 1999. Sweden is a former antipersonnel mine producer and exporter, and Swedish forces used antipersonnel mines. National implementation of the Mine Ban Treaty was achieved primarily by additions to existing legislation, including penal sanctions for violations of the treaty's prohibitions, which also entered into force on 1 May 1999. In 2009, Sweden submitted its 11th Article 7 transparency report.

Sweden destroyed 3,365,000 stockpiled antipersonnel mines between 1996 and December 2001, including 2,348,149 after the treaty entered into force on 1 May 1999. Sweden initially announced it would retain 13,948 antipersonnel mines for training and development purposes, but revised this total upwards to 16,015 in 2003. As of the end of 2008, Sweden still retained 7,364 antipersonnel mines.¹⁰⁵

Sweden served as co-rapporteur and then co-chair of the Standing Committee on mine clearance from 2003–2005.

Sweden is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. Sweden signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.¹⁰⁶

¹⁰⁵ Sweden Article 7 Report (for calendar year 2008), Form D.

¹⁰⁶ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 161–165.

One Swedish deminer working for Mines Advisory Group was injured in Lebanon in 2007.¹⁰⁷ From 1999–2008, Sweden contributed \$125.8 million to mine action.

Switzerland

The Swiss Confederation signed the Mine Ban Treaty on 3 December 1997 and ratified it on 24 March 1998, becoming a State Party on 1 March 1999. Switzerland is a former antipersonnel mine producer and importer but did not export mines. Production ceased in 1969 and export of antipersonnel mines was banned in December 1996. Legislation to enforce the antipersonnel mine prohibition domestically was adopted on 13 December 1996 and subsequently amended to conform with the Mine Ban Treaty. Switzerland submitted its 11th Article 7 transparency report on 15 April 2009.

Switzerland destroyed its stockpile of 3.85 million antipersonnel mines by 15 March 1999. Switzerland did not retain any antipersonnel mines for training or development purposes.

Switzerland served as co-rapporteur and then co-chair of the Standing Committees on stockpile destruction (2001–2003) and victim assistance (1999–2000 and 2004–2006). Switzerland also served as President of the Ninth Meeting of States Parties in 2008.

Switzerland is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.¹⁰⁸

From 1999–2008, Switzerland contributed \$104.2 million to mine action.

Tanzania

The United Republic of Tanzania signed the Mine Ban Treaty on 3 December 1997 and ratified it on 13 November 2000, becoming a State Party on 1 May 2001. It has never produced or exported antipersonnel mines. Tanzania used mines in Uganda in 1979 and in Mozambique in 1986–1988. It enacted new legislation specifically to implement the Mine Ban Treaty.¹⁰⁹ Tanzania submitted its seventh Article 7 transparency report on 30 April 2009.

Tanzania completed destruction of its stockpile of 22,841 antipersonnel mines in July 2004, well ahead of its 1 May 2005 treaty-mandated deadline. It initially reported 1,146 antipersonnel mines retained for training and development purposes but reported an apparent total of 1,780 by the end of May 2009.

Tanzania served as the co-rapporteur and later co-chair of the Standing Committee on Stockpile Destruction from 2004–2006.

Tanzania is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.¹¹⁰

Timor-Leste

The Democratic Republic of Timor-Leste acceded to the Mine Ban Treaty on 7 May 2003 and became a State Party on 1 November 2003. It has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. On 22 June 2004, Timor-Leste submitted its initial Article 7 transparency report, due 28 April 2004, but has not submitted subsequent annual reports.

Timor-Leste is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Timor-Leste has residual UXO contamination.

¹⁰⁷ See *Landmine Monitor Report 2008*, p. 911.

¹⁰⁸ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 165–169.

¹⁰⁹ Tanzania Article 7 Report, Form A, 15 December 2006.

¹¹⁰ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 170.

Togo

The Togolese Republic signed the Mine Ban Treaty on 4 December 1997 and ratified it on 9 March 2000, becoming a State Party on 1 September 2000. It has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically took effect in 2009. Togo submitted its second Article 7 transparency report on 1 March 2004 but has not submitted subsequent annual reports.

Togo is party to the Convention on Conventional Weapons but not its Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions on 3 December 2008 but as of 1 July 2009 had not ratified it.¹¹¹

Trinidad and Tobago

The Republic of Trinidad and Tobago signed the Mine Ban Treaty on 4 December 1997 and ratified it on 27 April 1998, becoming a State Party on 1 March 1999. Trinidad and Tobago has never used, produced, exported, or imported antipersonnel mines, including for training purposes. Legislation to enforce the antipersonnel mine prohibition domestically took effect on 1 June 2000. In 2009, Trinidad and Tobago submitted its third Article 7 transparency report.

Trinidad and Tobago is not party to the Convention on Conventional Weapons and as of 1 July 2009, it had not signed the Convention on Cluster Munitions.

Turkmenistan

Turkmenistan signed the Mine Ban Treaty on 3 December 1997 and ratified it on 19 January 1998, becoming a State Party on 1 March 1999. It has never used, produced, exported, or imported antipersonnel mines. Turkmenistan inherited a stockpile of antipersonnel mines from the former Soviet Union. It has not enacted new legislation specifically to implement the Mine Ban Treaty. Turkmenistan submitted its fourth Article 7 transparency report on 6 April 2006 but has not submitted subsequent annual reports.

Turkmenistan reported completing destruction of its stockpile of 6,631,771 antipersonnel mines in April 2005. Most were destroyed prior to its March 2003 deadline. It later destroyed 69,200 “cassette” mines (572,200 individual antipersonnel mines) that it had initially planned to retain for training and development purposes.

Turkmenistan is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines but not its Protocol V on Explosive Remnants of War. As of 1 July 2009, Turkmenistan had not signed the Convention on Cluster Munitions.¹¹²

Uruguay

The Eastern Republic of Uruguay signed the Mine Ban Treaty on 3 December 1997 and ratified it on 7 June 2001, becoming a State Party on 1 December 2001. It has never used, produced, or exported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. Uruguay submitted its fourth Article 7 transparency report December 2007.

On 15 September 2004, Uruguay completed destruction of its stockpile of antipersonnel mines, more than a year ahead of its 1 December 2005 treaty-mandated deadline. The number of mines reported as destroyed has varied. Uruguay’s Article 7 report for 2007 reported that 2,013 antipersonnel mines had been destroyed.¹¹³ Uruguay initially retained 500 antipersonnel

¹¹¹ Ibid, pp. 170–171.

¹¹² Ibid, p. 249.

¹¹³ Uruguay Article 7 Report, Form G, December 2007.

mines for training and development purposes; as of the end of 2007 Uruguay had reduced this number to 260.¹¹⁴

Uruguay is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines and Protocol V on Explosive Remnants of War. It signed the Convention on Cluster Munitions on 3 December 2008 but had not ratified it as of 1 July 2009.¹¹⁵

Vanuatu

The Republic of Vanuatu signed the Mine Ban Treaty on 4 December 1997 and ratified it on 16 September 2005, becoming a State Party on 1 March 2006. It has never used, produced, exported, or imported antipersonnel mines, including for training purposes. It has not enacted new legislation specifically to implement the Mine Ban Treaty. Vanuatu submitted its second Article 7 transparency report on 30 April 2008.

Vanuatu is not party to the Convention on Conventional Weapons and as of 1 July 2009 it had not signed the Convention on Cluster Munitions.

Vanuatu does not appear to have mined areas, but is affected by UXO from World War II.

¹¹⁴ Ibid, Form D.

¹¹⁵ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 180.

SIGNATORIES

MARSHALL ISLANDS

Ten-Year Summary

The Republic of the Marshall Islands signed the Mine Ban Treaty on 4 December 1997, but has not yet ratified it. In 2008, the Marshall Islands re-engaged in the Mine Ban Treaty process, but has not committed to ratify within a specific period. Since 2005, the Marshall Islands has voted in support of the annual pro-ban UN General Assembly resolution.

Mine Ban Policy

The Marshall Islands signed the Mine Ban Treaty on 4 December 1997, but has yet to ratify it. In November 2008, a representative of the Marshall Islands said that the government strongly supported the goals and objectives of the Mine Ban Treaty, but cited its relationship with the United States and the burden of treaty participation on small states as principal reasons for not ratifying.¹

In June 2008, the Marshall Islands elaborated on the challenges to ratification posed by its Compact of Free Association with the US. It said that it could not provide “a timeline or detailed approach” for ratification due to “limited technical capacity” and pressing demands including climate change.²

The Marshall Islands attended the Ninth Meeting of States Parties in Geneva in November 2008, the regional workshop on the Mine Ban Treaty convened by Palau in August 2008, and the intersessional Standing Committee meetings in Geneva in June 2008. These meetings marked the country’s re-engagement on landmines: it last attended a Mine Ban Treaty meeting in 1997 and last issued a policy statement in 2003.³

On 2 December 2008, for the fourth consecutive year, the Marshall Islands voted in favor of the annual UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty.⁴

The Marshall Islands confirmed in June 2008 that it has not produced landmines and has no known stockpiles.⁵

The Marshall Islands is not party to the Convention on Conventional Weapons and has not yet signed the Convention on Cluster Munitions.

Scope of the Problem

In June 2008, the Marshall Islands said that while a “largely successful” large-scale clearance effort was undertaken in 1950, some areas of atolls affected by UXO from World War II “were potentially overlooked due to difficult weather conditions or heavy vegetation.” It said the

¹ Statement by Rina Tareo, Chargé d’Affaires, Permanent Mission of the Republic of the Marshall Islands to the UN, Ninth Meeting of States Parties, Geneva, 26 November 2008.

² Statement by Rina Tareo, Permanent Mission of the Republic of the Marshall Islands to the UN, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008. See also, *Landmine Monitor Report 2008*, p. 787.

³ In June 2003, the Marshall Islands said it was reassessing its position on the Mine Ban Treaty. Letter to Landmine Monitor from Raynard Gideon, Acting Secretary, Ministry of Foreign Affairs and Trade, Marshall Islands, 9 June 2003. Also in June 2003, Minister of Foreign Affairs Gerald Zackios told New Zealand’s Minister for Disarmament Marian Hobbs that while the Marshall Islands did not suffer from the effects of landmines, it was nonetheless important to join the international efforts against them.

⁴ The Marshall Islands voted in support of the annual pro-ban UN General Assembly resolution from 2005–2007, but either abstained or was absent from the votes from 1998–2004.

⁵ Statement by Rina Tareo, Permanent Mission of the Republic of the Marshall Islands to the UN, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008.

government “lacks the necessary budget support and technical capacity for UXO surveys, removal, and destruction” and will require outside assistance.⁶ The last recorded landmine casualty in the Marshall Islands was more than 50 years ago.

⁶ Ibid.

POLAND

Ten-Year Summary

The Republic of Poland signed the Mine Ban Treaty on 4 December 1997, but has yet to ratify it. From 1997 through 2003, Poland repeatedly cited several pre-conditions to its ratification. In 2004, it decided ratification could go forward, but in January 2007 named 2015 as the target year. In 2009, the date was advanced from 2015 to 2012. Poland has voted in favor of each of the annual pro-ban UN General Assembly resolutions. Poland has submitted an annual voluntary Article 7 report each year since 2003. It first disclosed a stockpile of 1,055,971 mines at the end of 2002, which had been reduced to 333,573 mines by the end of 2008, including the destruction of 651,117 mines in 2008.

Poland remains contaminated by large quantities of explosive remnants of war (ERW) and, to a much lesser extent, mines from World War II. Between 1999 and 2008, Landmine Monitor identified at least 204 mine/ERW casualties (38 killed and 166 injured). Risk education activities have been conducted since 2002 for local communities, including schoolchildren, by demining patrols of the engineering forces. Persons with disabilities, including mine/ERW survivors, receive adequate assistance although employment opportunities remain limited.

Mine Ban Policy

Poland signed the Mine Ban Treaty on 4 December 1997, but has yet to ratify it. A policy change in 2004 set the goal of ratification as early as 2006, but Poland began to back away from this commitment in early 2006, and reversed course in early 2007.¹ The Ministry of Foreign Affairs wrote to the ICBL in January 2007 stating, “Ministry of National Defense specialists have recently determined that Poland should not become bound by the Convention before 2015. It is projected that by that time the Polish Armed Forces will obtain alternatives to antipersonnel mines.”²

However, in February 2009, Poland decided that it would join the Mine Ban Treaty in 2012. In a letter to the ICBL, a Ministry of Foreign Affairs official wrote, “I am pleased to inform you that Poland has taken all necessary steps in order to accede to the treaty at the earliest possible date.” On 6 February 2009, the government of Poland adopted a policy “Information on the state of readiness of the Council of Ministers to bind the Republic of Poland by the Convention,” where it assured its commitment to ratify the treaty in 2012. In addition, the government obliged the Ministry of National Defense to perform all actions—necessary from the national defense perspective—that need to be completed before the introduction of the convention into Polish law.³

It continued, “The adoption of the *Information* by the Government is the first step in the ratification process that will be initiated formally in due course. We hope that we will be able to announce the beginning of the preliminary preparations to the process during the treaty’s Second Review Conference that will take place in Colombia in December 2009.”⁴

¹ For details on the evolution of Polish policy since 1997, and especially from 2004 to 2007, see *Landmine Monitor Report 2007*, pp. 765–767.

² Letter from Janusz Stanczyk, Under-secretary of State, Ministry of Foreign Affairs, to Jody Williams, ICBL Ambassador, 26 January 2007. The Ministry of National Defense made an assessment that replacing antipersonnel mines with effective alternatives would require between eight and 13 years and cost more than PLN1 billion (more than US\$421 million).

³ Letter from Marek Szczygiel, Deputy Director, Security Policy Department, Ministry of Foreign Affairs, to Simona Beltrami, Advocacy Director, ICBL, 18 March 2009.

⁴ Letter from Marek Szczygiel, Ministry of Foreign Affairs, to Simona Beltrami, Advocacy Director, ICBL, 18 March 2009.

The Council of Ministers formally accepted the *Information* on 17 February 2009.⁵ It states, “The ratification process of the Ottawa Convention is multi-level and complex. It should take into account the need to balance between the state’s defense needs and financial, political and legal consequences in the sphere of internal and international relations. Taking this into account, the Council of Ministers assumes the position that binding the Republic of Poland by the Convention should take place in 2012.”⁶

It also states, “Draft bills, necessary to implement the norms of the Ottawa Convention into the Polish legal system, will be placed on the legislative agenda of the Council of Ministers, within a period enabling the binding of the Republic of Poland by the Ottawa Convention in 2012.”⁷

Poland had on several occasions throughout 2008 indicated that this policy change was coming. In a letter to the Polish Red Cross in February 2008, the Ministry of Foreign Affairs assured that “to the best of our abilities, we will aim at shortening the date of ratification, as much as it will be possible without detriment to our defense capabilities.”⁸ In March 2008, the chairpersons of the Polish Parliament’s committees on national defense and foreign affairs told the ICBL that there are no obstacles to ratification of the treaty in Parliament, but that the ratification process has to be initiated by the government.⁹ The President of the Eighth Meeting of States Parties, Prince Mired Raad Zeid Al-Hussein of Jordan, visited Poland in August 2008 and met with several Polish officials in the Ministry of Foreign Affairs and Ministry of National Defense. Although no formal commitment was given, officials indicated during the visit that Poland would move forward the ratification date from 2015 to 2012.¹⁰

Poland attended as an observer the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings in May 2009, but made no statements.

Poland submitted its seventh voluntary Article 7 report in 2009, which was undated but covered calendar year 2008.¹¹ The report contained information on Poland’s stockpiled antipersonnel mines and their destruction, its plans to reduce further the stockpile, and its international clearance activities.¹²

On 2 December 2008, Poland voted in favor of UN General Assembly Resolution 63/42, which called for the universalization and full implementation of the Mine Ban Treaty. Poland has voted in favor of each of the annual pro-ban treaty General Assembly resolutions since 1997.

⁵ The decision stated, “The Council of Ministers, upon a motion by the Minister of Foreign Affairs, has accepted the *Information on the state of readiness of the Council of Ministers to bind the Republic of Poland by the Convention* and has obliged the Minister of National Defense to undertake adequate compliance actions, subsequent to the state’s defense needs, which should be completed before introducing the Convention into the Polish legal system.” Council of Ministers, Protocol of Decisions, No. 7/2009, Section 8, subsection 16, 17 February 2009.

⁶ *Information*, February 2009, provided by email from Maria Wejs-Domzalska, Third Secretary, Security Policy Department, Ministry of Foreign Affairs, 26 March 2009.

⁷ *Ibid.*

⁸ Letter from Witold Waszczykowski, Under-secretary of State, Ministry of Foreign Affairs, to Andrzej Trybusz, President, Polish Red Cross, 19 February 2008. In April 2007 Poland stated, “We are fully committed to the Mine Ban Treaty and are taking every possible effort to ratify it at the soonest possible moment... We believe the decade-long success of the Mine Ban Treaty lies primarily in its role as a general framework for actions undertaken with a purpose to diminish and ultimately prohibit the use of APMs... The role of the Treaty reaches far beyond mere addressing the problem of the use of APMS. It has opened a new chapter in dealing with the question of arms control and disarmament.” Statement of Poland, Standing Committee on the General Status and Operation of the Convention, Geneva, 23 April 2007.

⁹ ICBL meeting with Janusz Zemke, Chairperson, National Defense Parliamentary Committee and Krzysztof Lisek, Chairperson, Foreign Affairs Committee, Warsaw, 13 March 2008.

¹⁰ “Poland to ratify treaty banning landmines by 2012,” *Polska Agencja Prasowa (PAP)*, Warsaw, 27 August 2008. Translation by BBC Monitoring Europe.

¹¹ Poland submitted previous voluntary Article 7 reports on 14 April 2008, 6 April 2007, 3 May 2006, 11 May 2005, 12 May 2004, and 5 March 2003.

¹² Article 7 Report (for calendar year 2008), Forms B, F, and J. All other forms were marked unchanged or not applicable.

Poland is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Poland submitted an annual report in accordance with the protocol's Article 13 on 15 September 2008. Poland is not party to Protocol V on Explosive Remnants of War, but told Landmine Monitor in April 2009 that it planned to complete the ratification process in 2009.¹³

Poland has not signed the Convention on Cluster Munitions.¹⁴

Production, transfer, use, stockpiling, and destruction

Since signing the Mine Ban Treaty in 1997, Poland has regularly stated that it does not produce, export, or use antipersonnel mines. In March 2006, Poland told Landmine Monitor that current military doctrine does not foresee the use of antipersonnel mines, including in joint military operations or exercises with other states.¹⁵ However, in January 2007, Poland said that it planned to install self-destruct or self-neutralization mechanisms on some antipersonnel mines.¹⁶ In March 2008, officials stated that Poland does not rely on antipersonnel mines for the defense of its national territory or its bases abroad.¹⁷

In the past, Poland produced three types of antipersonnel mines and imported a fourth type. Poland exported antipersonnel mines until 1993. An export moratorium in 1995 was made permanent by cabinet decree on 7 April 1998, which was then superseded by a law adopted in September 2002.¹⁸

Poland undertook a significant destruction of two-thirds of its stockpile of antipersonnel mines in 2008. In its Article 7 report submitted in 2009, Poland stated that at the end of 2008 it stockpiled 333,573 mines.¹⁹ This is a reduction of 651,117 mines from the 984,690 mines Poland had reported holding at the end of 2005.²⁰ It destroyed a total of 467,718 PMD-6 mines and 183,399 POMZ-2(2M) mines. It planned to destroy a total of about 139,000 of the same two kinds of mines in 2009.²¹ This is a much more rapid destruction of stockpiles than previously planned.²²

In 2007, Poland stated that it planned, while destroying most of its stockpile, to carry out the “[g]radual installation in the remaining anti-personnel mines of modern time fuses with self-destruction or self-neutralization mechanisms. As a result, the mines, if used, would pose no threat to civilians after the conflict ends.”²³ However, antipersonnel mines with such mechanisms are clearly prohibited by the Mine Ban Treaty.

¹³ Response to Landmine Monitor questionnaire by Adam Kobieracki, Director, Security Policy Department, Ministry of Foreign Affairs, 23 April 2009.

¹⁴ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 226–228.

¹⁵ Letter from Tadeusz Chomiczki, Ministry of Foreign Affairs, 22 March 2006.

¹⁶ Letter from Janusz Stanczyk, Ministry of Foreign Affairs, to Jody Williams, ICBL, 26 January 2007. Poland has not provided an update on these plans.

¹⁷ Interview with Gen. Romuald Ratajczak and Maj. Zbigniew Ciolek, Ministry of National Defense, Warsaw, 12 March 2008.

¹⁸ See *Landmine Monitor Report 2006*, p. 826.

¹⁹ Article 7 Report (for calendar year 2008), Form B. The stock consists of 212,500 PMD-6, 87,566 POMZ-2(2M), 13,585 PSM-1, and 19,922 MON-100 mines.

²⁰ See Poland's Article 7 reports. Poland initially reported 1,055,971 stockpiled antipersonnel mines at the end of 2002. During 2003, it destroyed 58,291 POMZ-2(2M) mines due to expiry of shelf life. It destroyed another 12,990 stockpiled mines in 2005, again because their life cycle had expired.

²¹ Article 7 Report (for calendar year 2008), Form F.

²² In January and April 2007, Poland stated that it will gradually over the next nine to ten years dismantle its stockpile of antipersonnel mines, destroying about 100,000 mines each year. According to a schedule made by the General Staff in 2007, Poland would disassemble about 125,000 mines each year from 2008 to 2010, and about 115,000 mines each year from 2011 to 2015. The Article 7 report submitted in 2008 stated that beginning in 2008, a total of 750,000 PMD-6 and POMZ-2(2M) mines will “be withdrawn from service and destroyed within 3–4 years.” Article 7 Report, Form F, 14 April 2008. See also, *Landmine Monitor Report 2008*, p. 791.

²³ Letter from Janusz Stanczyk, Ministry of Foreign Affairs, to Jody Williams, ICBL, 26 January 2007.

In April 2009, Poland informed Landmine Monitor, “In 2008, a research project, aiming at the development of a modern and comprehensive system of engineering obstacles (barriers), has been started. As part of this system, there is an expected role for explosive devices, controlled by an operator. These might be considered to be an alternative to antipersonnel mines. 450,000 PLN [US\$189,900] have been spent on this in 2008.”²⁴

In June 2008, a Polish diplomat confirmed that Poland intends to retain about 5,000 antipersonnel mines for training purposes. He emphasized that Poland will not commit to a specific number until after ratification and after the stockpile has decreased significantly.²⁵ In its Article 7 reports, Poland has not reported that it will retain mines for training or development purposes, but rather has stated “not applicable” in Form D concerning retained mines.²⁶ In 2008, Poland used 295 empty antipersonnel mine casings to train demining squads for missions abroad,²⁷ up from the 144 casings it used in 2007.²⁸

Poland has acknowledged that it possesses Claymore-type directional fragmentation mines, and said that these are “meant exclusively for mine-controlled detonation...[which] excludes the possibility of accidental detonation.” The MON-100 is described in Poland’s first Article 7 report as a “[d]irectional fragmentation mine, if equipped with a MUW fuse attached to a tripwire.”²⁹

Scope of the Problem

Contamination

Poland remains contaminated by large quantities of ERW and, to a much lesser extent, mines from World War II. Poland has consistently stated there are no known or suspected mined areas in Poland. The Ministry of National Defense reported that scattered “single” mines, mostly antivehicle, are found emplaced but most mines destroyed are remnants of World War II stockpiles.³⁰

Casualties

In 2008, the Polish police identified at least 10 mine/ERW casualties, including one killed and nine injured.³¹ Information on the location of the incident, and the gender, age and civilian status of the casualties was not made available to Landmine Monitor. ERW caused five casualties and an antipersonnel mine one; four casualties were caused by unknown devices. Activities at the time of the incident included attempting to detonate ERW (five) and being a bystander (four). An additional 29 casualties caused by explosive devices were reported by the police, but were not included in the above total, as it was not possible to determine the devices that caused them. The police stated only that these casualties occurred in the course of criminal acts.

The 2008 casualty rate decreased compared to 2007 (42) and 2006 (21).³² Comparisons with previous years are most likely misleading, because since 2005 casualties caused by all types of explosive devices, including those in criminal acts and industrial incidents were included in the police records.³³

²⁴ Response to Landmine Monitor questionnaire by Adam Kobieracki, Ministry of Foreign Affairs, 23 April 2009.

²⁵ Interview with Col. Marek Zadrozny, Counselor, Permanent Mission of Poland to the UN in Geneva, Geneva, 4 June 2008. In May 2005, representatives of the Ministry of National Defense told Landmine Monitor that Poland planned to keep about 5,000 antipersonnel mines for training purposes. Interview with Col. Marek Zadrozny, Maj. Zbigniew Ciolek, Col. Slawomir Berdak, and Lt. Lech Gawrych, Polish Armed Forces/Ministry of National Defense, Warsaw, 31 May 2005.

²⁶ See Article 7 Reports, undated (for calendar year 2008), 14 April 2008, 6 April 2007, and 25 April 2006.

²⁷ Response to Landmine Monitor questionnaire by Adam Kobieracki, Ministry of Foreign Affairs, 23 April 2009.

²⁸ Letter from Grzegorz Poznanski, Deputy Director, Security Policy Department, Ministry of Foreign Affairs, 14 May 2008.

²⁹ Letter from Ministry of Foreign Affairs, 28 February 2001; and Article 7 Report, Form H2, 5 March 2003. The “MUW” is likely the MUV fuze.

³⁰ See *Landmine Monitor Report 2008*, p. 792.

³¹ Landmine Monitor analysis of data provided by email from Adam Kobieracki, Ministry of Foreign Affairs, 23 April 2009.

³² See *Landmine Monitor Report 2008*, p. 792; and *Landmine Monitor Report 2007*, p. 770.

³³ See *Landmine Monitor Report 2008*, p. 792. For the 1999 to 2008 casualty figures included here, Landmine Monitor has subtracted 18 of these casualties in 2005, as they were from a bomb explosion, manufacturing illegal explosives and an accident in an explosives manufacturing plant. These do not conform to the Landmine Monitor definition of mine/ERW/victim-activated IED casualties.

The Ministry of Foreign Affairs reported that there were no casualties among Polish deminers conducting clearance activities abroad in 2008. However, the ministry reported eight casualties (all killed) among Polish soldiers in Afghanistan, including one soldier killed in an antivehicle mine incident, and seven by improvised explosive devices (IEDs) (unknown if victim-activated or command-detonated).³⁴

No new mine/ERW casualties were reported in 2009 through May.³⁵

The total number of mine/ERW casualties in Poland is not known. Landmine Monitor identified at least 185 casualties (38 killed and 147 injured) between 1999 and 2008.³⁶ With incomplete data collection, casualties may have been under-reported. Between 1945 and 1973, 3,833 civilians (including 3,189 children) were killed and 8,221 (including 6,656 children) were injured in mine/ERW incidents.³⁷ Between 1944 and 1994, 658 soldiers were killed and several thousand injured in clearance operations.³⁸

Between 1999 and 2008, the Polish Ministry of Foreign Affairs reported that there were at least 17 Polish landmine casualties (eight killed and nine injured) who were engaging in military, peacekeeping, or mine clearance operations and other activities outside Poland.³⁹ Landmine Monitor also identified three Polish casualties of victim-activated IEDs (two killed and one injured) in Afghanistan in 2008.⁴⁰

According to 2007 government statistics, there are some 3.8 million persons with disabilities registered in Poland.⁴¹ Poland's 2002 census recorded approximately 5.5 million persons with disabilities, more than 10% of the population.⁴²

Program Management and Coordination

Mine action

Poland does not have a formal civilian mine/ERW action program. The army conducts clearance operations of former military facilities and in response to reports from the general public under a 2002 Ministry of National Defense order as well as other guidelines.⁴³ Polish deminers have also engaged in demining abroad as part of UN or multinational operations. In 2008, this covered the UN peacekeeping operation in Syria, the NATO operation in Kosovo (Kosovo Protection Force), the NATO operation in Afghanistan (International Security Assistance Force), and the European Union Force in Chad.⁴⁴

Victim assistance

The government has stated that as Poland is not mine-affected, there is no specific victim assistance (VA) program for mine survivors.⁴⁵ The Government Plenipotentiary for Disabled People, under the Ministry of Labor and Social Policy, is responsible for disability issues.⁴⁶ The

⁴⁶ See *Landmine Monitor Report 2008*, p. 793; Ministry of Labor and Social Policy, "Disabled persons," www.mpips.gov.pl; and US Department of State, "2008 Country Reports on Human Rights Practices: Poland," Washington, DC, 25 February 2009.

National Consultation Council for Disabled Persons is an advisory body to the Government Plenipotentiary for Disabled People.⁴⁷ There is a State Fund for Rehabilitation of Disabled Persons which allocates funds for rehabilitation and socio-economic reintegration of persons with disabilities.⁴⁸

Data collection and management

The police record mine/ERW casualty data in Poland,⁴⁹ but since 2005, have included casualties caused by all types of explosive devices, including those used in criminal acts and industrial accidents.⁵⁰

Risk Education

There is no formal risk education (RE) program in Poland, and Form I of the latest Article 7 report is marked as “non applicable.”⁵¹ Since 2002, however, RE has been conducted by demining patrols of the engineering forces on a regular basis, through community meetings, lectures, school presentations, distribution of posters, and through the media.⁵² Demining patrols delivered RE during children’s activities in rural areas, and also for people vacationing in contaminated areas. In August 2008, representatives of the engineering forces conducted classes on RE for the Polish Red Cross Youth Trainers course.⁵³

Victim Assistance

The total number of mine/ERW survivors is unknown but at least 157.⁵⁴ Polish law does not differentiate between mine/ERW survivors and other persons with disabilities.⁵⁵ Civilian mine/ERW survivors are entitled to the same healthcare benefits as other people with health insurance, for whom all necessary surgical and rehabilitation services, including prostheses and most orthopedic equipment, are provided free of charge.⁵⁶ Military casualties are entitled to free medicine and orthopedic equipment and are eligible for military pensions.⁵⁷

Employment for persons with disabilities remains problematic, but in 2008 the employment rate increased to 24.9% of persons with disabilities (compared to 22.6% in 2007).⁵⁸ In 2009, the Ministry of Labor and Social Policy stated that the social reintegration of persons with disabilities was a high priority.⁵⁹ In 2008, the ministry encouraged the employment of persons with disabilities in the public and private sector through training and awareness-raising.⁶⁰ People permanently unable to work as a result of war-related injuries, including mine/ERW survivors, are entitled to compensation.⁶¹

⁶⁰ US Department of State, “2008 Country Reports on Human Rights Practices: Poland,” Washington, DC, 25 February 2009.

⁶¹ See *Landmine Monitor Report 2006*, p. 831.

Poland has legislation protecting the rights of persons with disabilities in employment, education, healthcare, and in the provision of other state services.⁶² The Charter of Rights for People with Disabilities and its amendments ensure equal status and opportunities for persons with disabilities.⁶³ Some societal discrimination against persons with disabilities continued to be reported.⁶⁴

On 30 March 2007, Poland signed the UN Convention on the Rights of Persons with Disabilities. As of 1 July 2009, Poland had not ratified the convention or signed its Optional Protocol. In 2009, the government reported that it could reconsider signing the protocol after the treaty's entry into force.⁶⁵ It also stated that it would take the time necessary to analyze the legal and financial implications of the convention before ratifying.⁶⁶

Support for Mine Action

Poland has reported providing in-kind contributions to mine action in 2008 in the form of 45 mine clearance personnel from the Polish Armed Forces in support of the UN Disengagement Observer Force in Syria, in KFOR (Kosovo) and ISAF (Afghanistan), and with the European Union Force in Chad. As in previous years, Polish personnel carried out mine clearance, explosive ordnance disposal, and RE tasks.⁶⁷ Poland did not provide a value for these contributions.

STATES NOT PARTY

ARMENIA

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	320km ² of mined and battle areas, though likely to be reduced significantly by technical survey; areas under control of Armenia probably contain cluster munition remnants
Casualties in 2008	0 (2007: one)
Demining in 2008	Not reported
Support for mine action in 2008	International: \$208,099 (2007: \$0)

Ten-Year Summary

The Republic of Armenia has expressed support for the Mine Ban Treaty, but has consistently maintained that it cannot join unless Azerbaijan does so. It has voted in favor of every annual UN General Assembly resolution calling for universalization of the Mine Ban Treaty since 1997.

Armenia has made little progress in clearing mined and battle areas from its war with Azerbaijan which ended in 1994. A landmine impact survey, completed in 2005, is widely believed to have significantly overstated the extent of the problem, which remains to be accurately defined.

From 1999–2008, Landmine Monitor identified at least 91 mine/explosive remnants of war (ERW) casualties in Armenia, although in the absence of effective data collection, casualties may have been under-reported or occasionally double-counted. Mine/ERW risk education has been provided irregularly and activities ended in mid-2007. There are no specific victim assistance policies, structures, or activities in Armenia. Armenia has structures to address the needs of persons with disabilities, including survivors, but access remains problematic and the quality of services is poor. Despite legislation prohibiting discrimination against persons with disabilities, discrimination continued to occur.

Mine Ban Policy

Armenia has not acceded to the Mine Ban Treaty. In a letter to Landmine Monitor in June 2009, Armenia stated that it “values the Mine Ban Treaty as an important step toward the elimination of an entire category of excessively injurious conventional weapons.” It said that while it cannot join “at the moment,” it “considers the possibility of accession.” It also noted that it “supports the Treaty and values the idea of transparency and confidence-building measures.”¹ It insisted, however, “Armenia makes it clear that it cannot sign the Treaty unless Azerbaijan agrees to

¹ Letter from Armen Yedigarian, Head, Department of Arms Control and International Security, Ministry of Foreign Affairs, 9 June 2009. It further stated, “However, Armenia expects that other countries of the region express clear intention to accede to the same idea and share the similar information and express readiness for common transparency.”

do so.... [T]o assume legally binding obligations, Armenia expects that other countries of the region express clear intention to accede to the [Mine Ban Treaty].”² It has made similar statements in the past.³

Officials have often said that Armenia cannot join the treaty given the country’s security issues and the fact that the territorial dispute over Nagorno-Karabakh has not yet been resolved. Armenia still views mines along the border with Azerbaijan as essential to its defense, and officials have stated that they will not be removed until peace is established.⁴

Armenia has voted in favor of each annual UN General Assembly resolution supporting the universalization and full implementation of the Mine Ban Treaty since 1997, including Resolution 63/42 on 2 December 2008.

Armenia attended as an observer the Ninth Meeting of States Parties in Geneva in November 2008, but made no statements. It did not attend the intersessional Standing Committee meetings in May 2009.

Armenia is not party to the Convention on Conventional Weapons.⁵ As of 1 July 2009, it had not signed the Convention on Cluster Munitions.

In June 2009, Armenia repeated past statements that it has never produced or exported antipersonnel mines.⁶ Armenia inherited a stockpile from the Soviet Union, but its size and composition is not known. Armenia has stated that this information is sensitive and that “the issue to provide this kind of data is contingent on a similar level of political commitment by other parties in the region to present the same information.”⁷

Officials have said that Armenia last used antipersonnel mines in April 1994.⁸ In 2007 and 2008, Azerbaijan officials accused Armenian armed forces of continuing to use antipersonnel mines.⁹ However, no evidence has been made publicly available, and Landmine Monitor has not been able to verify these allegations. In December 2008, it was reported in the Azerbaijan press that, following a cross-border exchange of fire, Azerbaijan specialists discovered and neutralized an unknown number of antipersonnel mines which they claimed had been laid by the Armenian side.¹⁰ There was no other evidence provided and no independent confirmation of this claim.

² Letter from Armen Yedigarian, Ministry of Foreign Affairs, 9 June 2009. It is notable that Azerbaijan submitted a voluntary Article 7 transparency report in November 2008.

³ For example, in September 2006, it said “Armenia has on many occasions expressed its willingness to accede to the Convention perceiving it as one of the instruments for elimination of an entire category of excessively injurious conventional weapons. Armenia’s accession to the Convention is contingent upon the readiness of other countries of the region to adhere to the Convention and comply with its regime. In this context we believe that the simultaneous accession of regional countries to the Convention will ensure the effectiveness of the Convention and will reciprocally reduce the security threat perception in the region.” “Position of the Republic of Armenia on Ottawa Convention and the Issue of Anti-Personnel Landmines,” written statement distributed at the Seventh Meeting of States Parties, Geneva, 18–22 September 2006.

⁴ See *Landmine Monitor Report 2004*, p. 919.

⁵ Armenia said in September 2006 that it voluntarily submits annual transparency reports to the UN Secretary-General in keeping with Article 13 of Amended Protocol II, but Landmine Monitor has not been able to obtain copies of these reports. “Position of the Republic of Armenia on Ottawa Convention and the Issue of Anti-Personnel Landmines,” written statement distributed at the Seventh Meeting of States Parties, Geneva, 18–22 September 2006.

⁶ Letter from Armen Yedigarian, Ministry of Foreign Affairs, 9 June 2009.

⁷ *Ibid.*

⁸ *Ibid.*; and see also *Landmine Monitor Report 2006*, pp. 832–833.

⁹ In December 2007, the director general of the Azerbaijan National Agency for Mine Action accused Armenia of recent mine use along the Contact Line. He stated that Armenian armed forces had used antipersonnel and antivehicle mines in military operations “in the past six to seven years” and that mine clearance teams had found mines of Armenian manufacture with a production date of 2003 on them. He said discoveries of Armenian mines on the Contact Line in December 2007 were still being investigated. “Nazim Ismayilov: Sappers found mines ‘made in Armenia’ on the contact line,” *Azeri Press Agency* (Karabakh), 18 December 2007, en.apa.az. Similarly, in March 2008, a Ministry of Foreign Affairs official stated that “Armenian military forces use a wide range of mines in occupied Azerbaijani territories and even now they are involved in this process.” Statement by Hikmet Hajiyev, Second Secretary, Department of Security Affairs, Ministry of Foreign Affairs, Baku Public TV, 3 March 2008.

¹⁰ “Mine found in trench in Terter Region,” *Azeri Press Agency* (Karabakh), 27 December 2008.

Scope of the Problem

Contamination

Armenia is affected by landmines and explosive remnants of war (ERW), primarily as a result of the conflict with Azerbaijan in 1988–1994. In 2005, the Armenia Landmine Impact Survey (LIS) identified 60 communities impacted by a total of 102 suspected hazardous areas. The areas were in five districts bordering Azerbaijan. It was estimated that 321.7km² were contaminated by mines and ERW, but this total is likely to be significantly reduced by subsequent technical survey. According to the United States Department of State, some 40,000 internally displaced persons have still to return, in part due to fear of landmines.¹¹ It is not known whether Armenia's borders with Georgia and Turkey are also contaminated.

In addition to the recorded dangerous areas, there are also believed to be ammunition stockpiles and depots left over from when Armenia was under Soviet control. There is believed to be significant mine and ERW contamination, including cluster munition remnants, on territory that was seized from Azerbaijan during the 1998–1994 conflict and which remains under the control of Armenia.¹²

Casualties

There have been no new reports of mine/ERW casualties in Armenia in 2008 or in 2009, as of May.¹³ However, casualties may be under-reported, as there is no systematic casualty data collection. The last identified casualty occurred in 2007, when one civilian was injured in a mine incident in Ichevan, Tavush province.¹⁴ The US Department of State reported that “two military personnel were killed and 19 military personnel injured by landmine explosions,” but it was unclear whether these were in Armenia, Nagorno-Karabakh, or elsewhere.¹⁵

The total number of mine/ERW casualties remains unknown. From 1999 to 2008, Landmine Monitor identified at least 91 mine/ERW casualties (six killed, 34 injured, and 51 unknown), although in the absence of effective data collection, casualties may have been under-reported or occasionally double-counted. Between 1990 and April 2007, the Armenian National Committee of the ICBL (ANC-ICBL) database contained information on at least 548 survivors (including at least 10 children and 11 women). The LIS identified 394 casualties (110 people killed and 284 injured) in 39 communities of 11 districts.

There are some 158,700 persons with disabilities registered in Armenia.¹⁶

Program Management and Coordination

Mine action

An Interagency Governmental Commission on Mine Action was set up in October 2005, but it is not known whether it is still active.¹⁷

¹¹ US Department of State “2008 Country Reports on Human Rights: Armenia,” Washington, DC, 25 February 2009.

¹⁷ The commission is ‘responsible for developing the national mine action strategy, demining contaminated areas in support of economic development, and mobilizing the necessary resources.’ See *Landmine Monitor Report 2008*, p. 797.

Victim assistance

There is no specific government agency responsible for victim assistance (VA) in Armenia. The Department of Disabled and Elderly People within the Ministry of Labor and Social Affairs is responsible for disability issues, although it was reportedly not particularly effective.¹⁸ An Armenian official reported that a National Commission on Persons with Disabilities was established in February 2009, but no further information was available.¹⁹

The 2005 LIS reported that VA needed expansion and capacity-building. However, a 2006 ICRC assessment concluded that the needs of mine survivors were adequately met (and ICRC assistance was not needed). Based on recommendations made in the LIS, the UNDP mine action project for 2006 had a VA component; activities included a full survey of mine casualties, the development of a VA strategy, draft legislation for survivors, medical and physical rehabilitation projects, and training of medical personnel in affected regions. However, UNDP has not been involved in VA activities since the project ended in December 2006.²⁰

There is no mention of VA in Armenia's Second Poverty Reduction Strategy Paper, although the strategy aims at improving social assistance programs for persons with disabilities.²¹

Data collection and management

There is no comprehensive casualty data collection mechanism in Armenia. There were two primary sources of casualty data: the 2005 LIS and the ANC-ICBL. The ANC-ICBL did not provide updated casualty information from April 2007 to May 2009, and it is unknown if the database is still operating.²² The Ministry of Defense does not provide information on military mine casualties.

Plans

Strategic Mine Action Plan

With UNDP support, Armenia produced a national mine action strategy for 2007–2010, though UNDP ended its humanitarian demining project in Armenia in December 2006. Little or no progress has been reported in the implementation of this strategic plan.

National ownership

There is scant evidence of any commitment to mine action by the government of Armenia. Following the end of the UNDP humanitarian demining project, major mine clearance operations appear to have ended. Draft national mine action legislation was prepared in 2005 but is not thought to have been adopted. National mine action standards are not believed to have been drafted. The program is nationally managed without external technical advisors.

The 2007–2010 strategy foresees an annual increase in demining capacity of 37%, but this has not happened. The strategy also mentions that the economic situation and the level of potential economic development are such that the support of the international community and specific donors will be necessary, but there is no evidence of any active effort to search for international funds.²³

Program evaluations

Funding for the UNDP program came from the European Commission (EC). Its support was evaluated by the Geneva International Centre for Humanitarian Demining in 2008, but the results of the evaluation were not publicly available as of 1 July 2009.²⁴

¹⁸ US Department of State, "2008 Country Reports on Human Rights Practices: Armenia," Washington, DC, 25 February 2009; and see also *Landmine Monitor Report 2008*, p. 800.

²² The ANC-ICBL declined to provide data in 2009. Emails from Jemma Hasratyan, Coordinator, ANC-ICBL, 13 and 14 May 2009.

²³ For example, there have been no appeals in UN mine action portfolios since 2006.

²⁴ Email from Vera Bohle, Senior Expert on Evaluation and International Humanitarian Law, GICHD, 2 June 2009.

Demining and Battle Area Clearance

The Ministry of Defense has provided the only demining capacity in Armenia; manual and mechanical methods and mine detection dogs have been used in the past. There has been no independent quality assurance system in place for clearance operations. It is not known whether demining is still being actively conducted. Overall, demining in Armenia has been slow and productivity rates low, with the Ministry of Defense reporting some 1.8km² of land cleared from 2002 to the end of 2008.²⁵ Reasons previously cited for the lack of progress have included weather conditions that restrict clearance from May to October and difficult terrain that sometimes allows only the use of manual assets.

The end of EC and UNDP support appears to have further slowed demining progress, although the United States provided mine detection and disposal equipment to Armenia in early 2008 and claimed that the delivery marked the beginning of a larger program of US support for demining in Armenia in 2008. Subsequently, the US reported that it had provided two weeks training in demining in early April 2008 for Armenian deminers using trainers from the Kansas National Guard. The training was funded through the US European Command's Humanitarian Mine Action office.²⁶ No further progress has been reported.

Progress since 1999

Reporting by Armenia on its mine clearance operations has been extremely poor. In August 2009, Armenia reported clearance figures for 2002 to 2009, which are set out in the table below. It has not been possible for Landmine Monitor to verify the figures provided, and it is not known whether the clearance figures include battle area clearance as well as mine clearance, although 10,000 items of ERW were reportedly destroyed in 2006.²⁷

Demining from 1999–end 2008²⁸

Year(s)	Area cleared (m2)
2008	0.28
2007	0.10
2006	0.52
2005	0.22
2004	0.54
2003	0.15
2002	0
1999–2001	N/R

N/R = not reported

In 2009 through August, a further 17,500m² were reported to have been cleared, with mine clearance operations said to be underway in Nerqin Hand village in Syunik province.²⁹

²⁵ Email from Maj. Armen Zakaryan, Ministry of Defense, 10 August 2009.

²⁶ "US Government Assistance to Armenia," Winter–Spring 2008, Vol. 1, Issue 3, p. 2, www.usa.am.

²⁷ See *Landmine Monitor Report 2007*, p. 776.

²⁸ Email from Maj. Armen Zakaryan, Ministry of Defense, 10 August 2009. The figures reported in August 2009 for clearance in 2005 and 2006 were significantly higher than those provided previously to Landmine Monitor (0.09km² and 0.22km², respectively).

²⁹ Email from Maj. Armen Zakaryan, Ministry of Defense, 10 August 2009.

Risk Education

No formal mine/ERW risk education (RE) activities have been conducted in Armenia since mid-2007.³⁰ In 2008, mine risk topics continued to be included in the Primary Military Preparedness course taught by secondary school teachers. UNICEF expressed concerns about the appropriateness of the course, but authorities asserted that, with Armenia being in a “no war no peace situation,” preparedness classes were of crucial importance, particularly for boys, who undertake two years of compulsory military service starting at age 18.³¹ Although UNICEF completed its activities in 2007, it had trained 50 educational staff and school administrators with a view to making RE self-sustaining.

RE started some 10 years after the conflict with Nagorno-Karabakh was over, and activities were conducted irregularly. RE was provided to an unknown number of beneficiaries, but mainly men and children, in 2003, 2005, 2006, and 2007 through school and community-based activities. Operators included the Armenian Center of International Association of Puppeteers, supported by the ICRC, AHDC, Armenian Red Cross Society (ARC), and UNICEF supported by UNDP; RE was also provided through public dissemination in local media in 2005–2006.

No evaluation has been conducted, but in 2005 the ANC-ICBL conducted a survey of 250 people in three mine-affected border villages in Tavush, Syunik, and Gegharkunik provinces. The survey revealed that only 17% of those interviewed considered they received sufficient mine/ERW awareness.³²

Victim Assistance

The total number of mine/ERW survivors is unknown, but is at least 548.³³ There is no specific VA strategy, and mine/ERW survivors receive the same services as other persons with disabilities in Armenia.³⁴ Services for persons with disabilities, including mine/ERW survivors, remain insufficient,³⁵ although some new programs were introduced in 2008.³⁶ The US Department of State reported that “hospitals, residential care, and other facilities for persons with serious disabilities are substandard.”³⁷

Armenia has a wide network of healthcare facilities, and emergency care is provided at district hospitals or first-aid posts. Although some progress has been registered in the healthcare sector, particularly in primary healthcare, access in rural areas remains difficult.³⁸ For instance, in Syunik, one of the contaminated provinces on the border with Azerbaijan, there is a serious lack of health personnel (there are no surgeons and no anesthesiologists in the region) and ambulances. Residents in need of medical care need often to travel long distances on mountainous roads.³⁹ In 2009, the government announced an increase in healthcare expenditure.⁴⁰

³⁰ Email from Edmon Azaryan, ARC, 6 May 2009; and email from Alvard Poghosyan, UNICEF, 4 May 2009.

³¹ Email from Alvard Poghosyan, UNICEF, 4 May 2009.

³² See *Landmine Monitor Report 2005*, p. 661.

³³ Based on ANC-ICBL data collected between 1990 and April 2007. See *Landmine Monitor Report 2007*, p. 777.

³⁸ Republic of Armenia, “Sustainable Development Program,” Yerevan, October 2008, p.239; EC, “Progress Report Armenia,” Commission Staff Working Document, SEC (2009) 511/2, 23 April 2009, p. 17; and International Development Association and International Monetary Fund, “Republic of Armenia. Poverty Reduction Strategy Paper—Second Progress Report Joint Staff Advisory Note,” 3 August 2006, p. 6.

³⁹ Sara Khojyan, “Conditions in the South: Syunik region suffers lack of medical personnel,” *ArmeniaNow* (Yerevan), 27 March 2009.

⁴⁰ “Armenian government to increase support for healthcare system,” *ARKA News Agency* (Yerevan), 16 July 2008.

Medical care is provided free of charge for persons with disabilities, and the government provides free wheelchairs and prosthetics, but, access remains problematic.⁴¹ In 2008, the Ministry of Labor and Social Affairs approved a specific social protection program for persons with disabilities, which included 70 provisions on legislative reforms, medical and social guarantees, training, and employment.⁴²

In Yerevan, there are rehabilitation structures to address survivors' needs.⁴³ The International Post-Trauma Rehabilitation Center for patients with spinal cord injuries and the Pediatric Trauma, Orthopedics and Rehabilitation Center in Yerevan reportedly provide modern rehabilitation services with well-trained physiotherapists. However, the Center for Prosthetics and Orthotics (Interorto), formerly the Yerevan Prosthetic-Orthopedic Enterprise, is reportedly the only rehabilitation service provider to receive state funding to provide free prostheses for persons with disabilities in Armenia. In mine-affected districts, rehabilitation services remain less comprehensive.⁴⁴

In 2008, the ICRC supported the training of one military and one civilian surgeon at a war-surgery seminar in Nalchik, Russia.⁴⁵ In 2008, the Marshall Legacy Institute funded the training of one rehabilitation team from the Pediatric Trauma, Orthopedics and Rehabilitation Center at the Institute for Rehabilitation in Slovenia.⁴⁶

It is unknown if psychosocial support services are available for civilian survivors. Lack of employment opportunities for persons with disabilities is an issue of concern, with some 90% of persons with disabilities unemployed.⁴⁷ In November 2008, the country's first job fair for persons with physical disabilities was organized in Yerevan.⁴⁸ Access to inclusive education for children with disabilities continued to be limited.⁴⁹

Military mine survivors have greater access to higher quality services than civilians. Military and civilian survivors with a disability receive pensions based on the degree of disability, although the pensions were inadequate to provide a minimum standard of living.⁵⁰

In 2009, a staff member from the Ministry of Labor and Social Affairs participated in a regional workshop to promote service provision for mine survivors in Tbilisi, Georgia. The workshop was organized by the ICRC and the International Trust Fund for Demining and Mine Victims Assistance (ITF).⁵¹

Armenia has legislation prohibiting discrimination against persons with disabilities and mandating accessible government buildings, yet discrimination continues to be a problem.⁵² On 30 March 2007, Armenia signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol; neither had been ratified as of 1 July 2009.

Support for Mine Action

In 2008, two countries reported providing \$208,099 (€141,314) in funding to mine action in Armenia. No international funding was reported for 2007.

The International Trust Fund for Demining and Mine Victims Assistance (ITF) reported supporting rehabilitation training for two specialists from Armenia in 2008, with the Marshall Legacy Institute and Slovenia as donors.⁵³

2008 International Mine Action Funding to Armenia: Monetary⁵⁴

Donor	Implementing Agencies/ Organizations	Project Details	Amount
US	US European Command	Mine action	\$200,000
Slovenia	ITF	VA	\$8,099 (€5,500)
Total			\$208,099 (€141,314)

In August 2009, Armenia reported that “all financial resources for the maintenance of the Armenian Humanitarian De-Mining Center have been provided by Armenian government since 2008. Also, the financing of all mine clearance annual program actions has been committed from the national budget since 2008.”⁵⁵ No details have, however, been provided to Landmine Monitor.

⁵³ ITF, “Annual Report 2008,” p. 60.

⁵⁴ USG historical chart containing data for FY 2008, from “To Walk the Earth in Safety 2008,” provided by email from Timothy Groen, Office of Weapons Removal and Abatement, US Department of State, 18 June 2009; and email from Gregor Kaplan, Security Policy Division, Ministry of Foreign Affairs of Slovenia, 19 June 2009.

⁵⁵ Email from Maj. Armen Zakaryan, Ministry of Defense, 10 August 2009. The figures reported in August 2009 for clearance in 2005 and 2006 were significantly higher than those provided previously to Landmine Monitor (0.09km² and 0.22km², respectively).

AZERBAIJAN

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	268km ² (not including land occupied by Armenia)
Casualties in 2008	23 (2007: 32)
Estimated mine/ERW survivors	Unknown, estimated to be at least 1,986
Demining in 2008	3.1km ² of battle areas 1.46km ² of mined areas
Risk education recipients in 2008	104,416
Support for mine action in 2008	International: \$1.7 million (2007: \$3.7 million) National: \$6.3 million (2007: \$2.2 million)

Ten-Year Summary

The Republic of Azerbaijan has stated that it will not join the Mine Ban Treaty until its conflict with Armenia has been settled. Azerbaijan has shown greater support for the treaty in recent years, notably by submitting voluntary Article 7 reports in 2008 and 2009, and voting for the pro-ban UN General Assembly resolution every year since 2005.

Azerbaijan's mine and explosive remnants of war (ERW) problem is primarily a result of conflict with Armenia from 1988–1994 and abandoned ammunition from the Soviet era. It has made significant progress in all forms of land release in recent years, under the auspices of the Azerbaijan National Agency for Mine Action (ANAMA).

There are no conclusive mine/ERW casualty figures for Azerbaijan. ANAMA was unable to provide adequate data on casualties from 1999 to 2008. For the same period, the Azerbaijan Campaign to Ban Landmines reported 360 mine/ERW casualties (82 killed and 278 injured). RE has been conducted in Azerbaijan since 2001, primarily by ANAMA with UNICEF support.

The provision of victim assistance in Azerbaijan has advanced over the past decade. The growing national economy has seen a substantial increase in government investment in social services, including healthcare provision across the country. Yet victim assistance services still suffered from a lack of funding.

Mine Ban Policy

Azerbaijan has not acceded to the Mine Ban Treaty. In recent years, Azerbaijan has shown greater signs of support for the mine ban, although it has also continued to state that it cannot accede to the treaty until the conflict with Armenia has ended.¹

On 2 December 2008, Azerbaijan voted in favor of UN General Assembly Resolution 63/42, the fourth successive year it has supported the annual resolution calling for universalization and full implementation of the Mine Ban Treaty.

¹ Officials have made positive statements regarding the treaty since 2005. See *Landmine Monitor Report 2006*, pp. 842–843.

In November 2008, Azerbaijan submitted its first voluntary Article 7 transparency report, covering the period from June 2000 to November 2008.² While the report has details about mine clearance, victim assistance, and risk education activities, it does not include any information on Azerbaijan's stockpiled antipersonnel mines. It submitted a second report on 17 July 2009, covering the period from November 2008 to April 2009.

In the report submitted in 2008, Azerbaijan said that it "can not accede to the Ottawa Convention without settlement of the armed conflict, restoration of territorial integrity of the Republic of Azerbaijan, and having a threat of hostility resumption, even though Azerbaijan stopped planting of additional mines. Therefore adherence to the Ottawa Convention will be possible only after the final settlement of the conflict between Azerbaijan and Armenia."³

This report also asserted that Azerbaijan fully supports the goals, purposes and principles of the Mine Ban Treaty including the comprehensive ban on use, stockpiling and transfer of antipersonnel landmines. Azerbaijan considers this "an important humanitarian objective of the world community in the XXI century.... Despite the difficulties, Azerbaijan follows most of the provisions of the Convention by not producing or transferring antipersonnel mines.... As the sign of our real dedication and support to the Ottawa Process, Azerbaijan is taking a free will initiative in submitting the Report pursuant to the Article 7 of the Convention."⁴

In March 2008, a Ministry of Foreign Affairs official stated, "Azerbaijan supports the solution of humanitarian mine problems on a global level. Azerbaijan fully supports the principles and philosophy of the Ottawa Convention. Azerbaijan is ready to meet obligations in a national level and to provide its contribution."⁵

Azerbaijan attended as an observer the Ninth Meeting of States Parties in November 2008, and made a statement about its mine action program, its support of the Mine Ban Treaty, its voluntary Article 7 report, and its reasons for not joining the treaty. It also attended the intersessional Standing Committee meetings in May 2009, but made no statements.

Azerbaijan is not party to the Convention on Conventional Weapons. It has not signed the Convention on Cluster Munitions.⁶

Production, transfer, stockpiling, and use

Azerbaijan has stated on several occasions, including in its voluntary Article 7 report submitted in 2008, that it does not produce or export antipersonnel mines,⁷ In June 2005, Azerbaijan said that it is "unilaterally committed to non producing and non accumulating" antipersonnel mines.⁸ Azerbaijan's landmine stockpile is a legacy of the Soviet era, but the number and types of landmines held are not known. The voluntary Article 7 report did not include information on Azerbaijan's stockpile.

² Voluntary Article 7 Report (for the period June 2000 to November 2008). Azerbaijan utilizes the standard reporting format, with Forms A–J. The cover page has the proviso that it does not "provide information concerning anti-personnel mines in the occupied territories of the Republic of Azerbaijan including Nagorno-Karabakh and seven adjacent regions, currently controlled by Armenian armed forces." See also ANAMA, "Azerbaijan Provides Report Under Article 7 of the Ottawa Convention," 18 November 2008, www.anama.baku.az; Rashad Suleymanov, "Azerbaijan Submits First Anti-Personnel Mine Report to the UN," *Azeri Press Agency*, 21 November 2008, az.apa.az. Azerbaijan first stated in 2005 that it was considering submitting a report. Statement of Azerbaijan, Standing Committee on the General Status and Operation of the Convention, Geneva, 13 June 2005.

³ Voluntary Article 7 Report (for the period June 2000 to November 2008), Form A.

⁵ Statement by Hikmet Hajiyev, Second Secretary, Department of Security Affairs, Ministry of Foreign Affairs, Azerbaijani Public TV, Baku, 3 March 2008.

⁶ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 188.

⁷ Voluntary Article 7 Report (for the period June 2000 to November 2008), Form A.

⁸ Statement of Azerbaijan, Standing Committee on the General Status and Operation of the Convention, Geneva, 13 June 2005.

Officials have stated that Azerbaijan has not used antipersonnel mines since the end of its conflict with Armenia in 1994 and does not intend to use them in the future, but would not rule out the possibility.⁹ Landmine Monitor is not aware of any specific legal measures Azerbaijan has taken to prohibit production, trade, or use of antipersonnel mines.

Azerbaijan officials have alleged that Armenian forces have used antipersonnel mines in recent years, yet no evidence has been made publicly available and Landmine Monitor has been unable to verify the allegations.¹⁰ In December 2008, local media reported that, following a cross-border exchange of fire, Azerbaijan specialists discovered and neutralized an unknown number of antipersonnel mines, which they claimed had been laid by the Armenian side.¹¹ There was no evidence provided and no independent confirmation of this claim.

Scope of the Problem

Contamination

Azerbaijan is contaminated by mines and ERW, primarily as a result of the armed conflict with Armenia in 1988–1994. A general survey of contamination was undertaken in 2001, followed by a Landmine Impact Survey (LIS) in 18 districts carried out from September 2002 to June 2003. The LIS identified 480 mine-impacted communities and 163 ERW-impacted communities in 18 districts. In total, 970 suspected hazardous areas (SHAs) covering 736km² of land were found to be affecting 514,000 people.¹²

In late 2006, ANAMA significantly reduced the overall estimate of contamination to 306km², based on a survey conducted with the support of local authorities of the 11 mine/ERW-affected districts. This revised figure included areas not identified by the LIS. The estimate was further reduced to 268km² by the end of 2008 as a result of land release efforts. ANAMA continues to revise the estimate of contamination using its Resurvey Team from its Training, Survey and Quality Assurance Division (TSQAD), (see Demining and battle area clearance section below).

There are also significant amounts of abandoned explosive ordnance, including cluster munition remnants, especially in and around warehouses at a former Soviet ammunition storage area (ASA) at Saloglu in Agstafa district. In 1991, when Azerbaijan gained independence, the departing Soviet army blew up the facility, scattering tens of thousands of munitions over an area of 44km². As of July 2009, about 1.35km² of sub-surface contamination remained to be cleared.¹³

The precise extent of the mine/ERW problem in areas of Azerbaijan occupied by Armenia is unknown.¹⁴ In addition to Nagorno-Karabakh, the districts of Gubadly, Jabrayil, Kelbajar, Lachin, and Zangilan, as well as parts of Aghdam, Fizuli, and Terter are under the control of Armenian forces. These areas are expected to have extensive mine/ERW contamination with estimates of the total size of affected areas varying from 350 to 830km².¹⁵

⁹ See *Landmine Monitor Report 2006*, p. 844. See also, Voluntary Article 7 Report (for the period June 2000 to November 2008), Form A.

¹⁰ In December 2007, ANAMA's director general accused Armenia of recent mine use along the LoC. He stated that Armenian armed forces had used antipersonnel and antitank mines in military operations "in the past 6–7 years," and that mine clearance teams had found mines of Armenian manufacture with a production date of 2003 on them. He said discoveries of Armenian mines on the LoC in December 2007 were still being investigated. "Nazim Ismayilov: Sappers found mines 'made in Armenia' on the contact line," *Azeri Press Agency*, 18 December 2007, en.apa.az. Similarly, in March 2008, a Ministry of Foreign Affairs official stated that, "Armenian military forces use a wide range of mines in occupied Azerbaijani territories and even now they are involved in this process." Statement by Hikmet Hajiyevev, Ministry of Foreign Affairs, Public TV, 3 March 2008.

Casualties

ANAMA reported three new mine/ERW casualties (all injured) in Azerbaijan in three antivehicle mine incidents in 2008. Two incidents occurred during agricultural activities: the activity at the time of the third is unknown. Two of the casualties were civilians and the occupation of the third was not reported.¹⁶

ANAMA reported to Landmine Monitor in July 2009 that there were three mine/ERW casualties in 2007, not the previously reported 20 casualties (four killed and 16 injured).¹⁷ The reported reason for the discrepancy was duplications of mine/ERW casualties entered into the Information Management System for Mine Action (IMSMA) database. In 2009, ANAMA staff worked to remove all duplicated casualty results from IMSMA for the data from 1999 onwards.¹⁸

The Azerbaijan Campaign to Ban Landmines (AzCBL) reported 23 new mine/ERW casualties (one killed and 22 injured) from 19 incidents in 2008. The majority of casualties were men (21); there was one woman, and the other casualty was a child of unknown gender. More civilians (14) reportedly became casualties than military (nine) in 2008. The only person AzCBL reported killed in 2008 by a mine/ERW was a civilian. Antipersonnel mines caused the highest number of incidents (eight), while six were caused by antivehicle mines, and five by other ERW. The AzCBL data represents a decrease from its numbers reported in 2007 (33 casualties including 10 killed and 23 injured) and in 2006 (35 casualties with four killed and 31 injured).¹⁹

Discrepancies between the data collected by ANAMA and AzCBL continued in 2008. This was reportedly the result of different data collection processes and scope, including differing ranges of coverage, sources of information, verification processes, and the definition of casualties. However it was reported to Landmine Monitor that ANAMA and AzCBL began crosschecking casualty data in 2008.²⁰

Casualties continued to occur in 2009, with ANAMA recording eight mine/ERW casualties (all injured), as of 10 June. All casualties were male with the exception of one military personnel.²¹ AzCBL reported 11 new mine/ERW casualties (two military personnel killed and nine civilians injured), as of June 2009.²²

The total number of casualties from mines/ERW in Azerbaijan is unknown. As of May 2009, ANAMA reported a total of 2,347 casualties (361 people killed and 1,986 injured). The start date for this data is unclear.²³ ANAMA was unable to provide adequate data on casualties from 1999 to 2008.²⁴ There are also mine survivors in Azerbaijan from the war between the former Soviet Union and Afghanistan, although the total number is not known. From 1999 to 2008, AzCBL has identified 360 casualties (82 killed and 278 injured). Of these, 191 were civilians and 169 were military personnel. Men were the majority of casualties (313), women five, and 42 were children of unknown gender. From 2005 to 2008, antipersonnel mines caused the greatest number of incidents (35), antivehicle mines caused 19, and other ERW 18. Since 2005, the reported number of casualties annually has been decreasing.²⁵ The decrease in casualties has been attributed to the increase in risk education in affected areas.²⁶ There are reportedly some 275,000 persons with physical disabilities in Azerbaijan.

¹⁶ Data from ANAMA provided by emails from Murad Rahimov, Information Manager, ANAMA, 3 July 2009, 9 July 2009, 13 July 2009, and 14 July 2009.

²⁴ ANAMA provided some data, but it was lacking in casualties provided in previous years and was unable to provide explanation for the discrepancies.

²⁵ Email from Hafiz Safikhonov, AzCBL, 23 June 2009.

²⁶ Email from Murad Rahimov, ANAMA, 14 July 2009.

Risk profile

The majority of casualties are men on active military duty. Civilian casualties mainly occur during livelihood activities such as cattle grazing, collecting firewood, cultivating/plowing, and burning vegetation.

Program Management and Coordination

Mine action

ANAMA was established as a civilian organization in 1998 by Presidential Decree and serves as the national mine action center.²⁷ A Joint Working Group, consisting of representatives from various ministries, was created in 1999 to provide regular guidance to ANAMA. The Joint Working Group has not met since 2005 “due to lack of need.” ANAMA has been dealing with concerned ministries and state bodies on a bilateral basis.

ANAMA undertakes its mine action management role from its headquarters in Baku, regional office in Fizuli, regional training center in Khanlar, and three operational centers in Agstafa, Agjabedi, and Terter. As of the end of 2008, ANAMA had a total of 383 employees: 253 operational staff and 130 administrative support staff.²⁸ Since 1999, UNDP has provided support to ANAMA. UNDP manages a trust fund for mine action in Azerbaijan, but has not provided a technical advisor since 2005.²⁹

Risk education

ANAMA also coordinates mine and ERW risk education (RE) activities. The ANAMA Mine Risk Education Working Group includes representatives from relevant ministries and NGOs and meets when necessary.³⁰

Victim assistance

ANAMA managed the Azerbaijan Mine Victim Association (AMVA), fundraised for victim assistance (VA) services, and implemented a number of programs for mine/ERW survivors in 2008. ANAMA coordinated VA in 2008 through the Mine Victim Assistance Working Group. Both the Ministry of Health and the Ministry of Labor and Social Welfare are responsible for protecting the rights of persons with disabilities.³¹

Data collection and management

The IMSMA database was installed at ANAMA in September 1999; it continues to use an older version of the system, due to concerns about the loss of data during migration to a more recent version.³² Reports of RE activities conducted by community volunteers are provided to ANAMA, but not entered in IMSMA as the older version does not accept RE data.³³

ANAMA coordinates government collection of mine action and mine/ERW casualty data in Azerbaijan and has used IMSMA since 2001 to store the information.³⁴ ANAMA collected casualty data in 2008 from its network of district offices, media reports, national NGOs, and in coordination with the Azerbaijan Red Crescent Society (AzRCS). ANAMA and AzRCS signed a partnership agreement in December 2007 that facilitates a broader coverage of mine/ERW casualty data collection across the country. In 2008, the partnership trained and used AzRCS

regional branch staff to begin collecting casualty data and information on mine/ERW survivor needs.³⁵ Only incidents that have been verified by ANAMA are recorded in IMSMA.³⁶

AzCBL continued to utilize a network of regional coordinators to collect casualty data from civil and military hospitals, rehabilitation centers, and media reports. AzCBL collected data in all mine/ERW-affected areas of the country except the Nakhchivan Autonomous Republic.³⁷

Plans

Strategic mine action plans

ANAMA's mine action strategy for 2009–2013 seeks to: reduce and clear accessible suspected hazardous areas (about 170km²); develop and expand operational capacity; and support intensified and extended RE and VA programs. In the longer term, ANAMA plans to further increase and reinforce its operational and management capacity to enable it to address the mine and ERW threat from the occupied areas once they are returned to Azerbaijan. ANAMA foresees the need for up to seven regional offices, 700 operational staff, 120 mine detection dogs, and 18 demining machines.³⁸

RE activities outlined in the Azerbaijan National Strategic Mine Action Plan of 2003 included: integration of RE into the school curriculum; conducting sustainable community-based RE activities; training field operation teams in RE; developing and disseminating RE materials; coordinating the working group; ensuring the involvement of organizations operating in affected areas; and conducting RE for military "operating in the newly liberated areas."³⁹

The main directive for the Mine VA Working Group is the strategic plan developed from the Country Mine Victim Needs Assessment Survey in 2004.⁴⁰ In 2008, a revision of the MVA Strategy was finalized, with key objectives reviewed and a stronger coordination role given to the working group.⁴¹

Integration of mine action with reconstruction and development

In 2008, ANAMA completed its support for the State Plan for Socio-Economic Development of the Regions 2004–2008. A total of 30km² of land was released for use, including clearance of 183 houses, one school, and one hospital. The Ministry of Economic Development has elaborated a Socio-Economic Development Plan of Regions of Azerbaijan for 2009–2013, which includes a provision for mine action.⁴²

⁴² Interview with Nazim Ismaylov, ANAMA, Baku, 4 June 2009.

National ownership

Commitment to mine action and victim assistance

The government of Azerbaijan has provided significant financial support to the mine action program. In 2008 Azerbaijan provided more than 80% of the mine action program budget, one of the largest national contributions on a percentage basis in the world.⁴³ The provision of VA in Azerbaijan has also advanced over the past decade.

National management

Azerbaijan's mine action program is under full national management.

National mine action legislation and standards/Standing operating procedures

There is no national mine action legislation in force, although a draft law has existed since 2002. National mine action standards were initially developed in 2000 and then revised in 2006 to meet the International Mine Action Standards. A review of all national mine action standards was planned to start in June 2009.⁴⁴ In 2007, a new area reduction standing operating procedure (SOP) was developed and adopted. A new resurvey SOP was drafted and approved by ANAMA in 2008.⁴⁵

Program evaluations

In 2008, two independent international evaluations were conducted of the mine action program in Azerbaijan. The first was an evaluation of UNDP's support to mine action in Azerbaijan since 1999, with the remit also to assess the relevance of ANAMA's proposal to support mine action abroad, including through the creation of an international mine action training and resource centre in Azerbaijan⁴⁶ (*see Support for mine action, below*). The evaluation concluded that: "The mine action programme is highly integrated with all aspects being co-ordinated by ANAMA. The 'hard issues' of mine clearance and unexploded ordnance disposal (EOD) are well managed and targeted. The 'soft issues' of mine risk education (MRE) and victim assistance are also well managed."⁴⁷ It praised a major clearance project at Zobjuq (to facilitate construction of new houses to resettle 2,104 internally displaced families) for its use of innovative procedures: "Some of these new procedures were developed by ANAMA alone and are well ahead of those in many other countries."⁴⁸

The evaluation also concluded that: "ANAMA wishes to expand its reach beyond Azerbaijan, initially – possibly – to Afghanistan, Georgia and Tajikistan. With the possible exception of Afghanistan, this appears entirely possible... Its wish to create a centre of excellence has already been achieved but its apparent wish to become a regional centre needs further thought. The concept has merit but the form it would take and the geographical spread are unclear."⁴⁹

In May 2008, the Geneva International Centre for Humanitarian Demining (GICHD) conducted a mission in Azerbaijan as part of a broader evaluation of European Commission support to mine action programs in South Caucasus and Central Asia. The results of the evaluation were not publicly available as of July 2009.⁵⁰

In June 2009, UNDP conducted a mission to carry out a feasibility study on the establishment of an International Mine Action Center in Azerbaijan. The main purpose was to evaluate current ANAMA capacities in terms of provision of international training and assess the opportunities for it to become an internationally recognized service provider.⁵¹ The results of the evaluation were not publicly available as of July 2009.

Demining and Battle Area Clearance

Demining is primarily carried out by two national NGOs, which together employ 158 staff, and ANAMA, while battle area clearance (BAC) is largely the responsibility of ANAMA alone. In 2008, ANAMA operated with three manual clearance teams while the two national NGOs—Dayag (“Relief Azerbaijan”) and the International Eurasia Press Fund (IEPF)—each operated with 38 deminers performing manual clearance operations in five mine-affected regions: Aghdam, Fizuli, Gorandoy, Khojavend, and Terter.⁵²

ANAMA has an 18-person Emergency Response Team, a 52-person manual demining team and a 60-person UXO clearance team that operated on the Saloglu project.⁵³ The total number of people involved in mine action in Azerbaijan is 541 (including support staff); there are 27 mine detection dogs and seven demining machines.⁵⁴

Identifying hazardous areas

In 2008, ANAMA established a new Resurvey Team. The main function of the team is to update data collected during the LIS and revise it together with the local authorities. During 2008, the team resurveyed 282 communities in 13 districts and released 11.6km² of SHAs as not being contaminated.⁵⁵ From January–May 2009, ANAMA released a further 5.95km².⁵⁶

Demining and battle area clearance in 2008

In 2008, ANAMA cleared 3.1km² of battle areas (2.68km² of battle areas in Fizuli and 0.43km² of explosive ordnance disposal in the Saloglu project), destroying in the process 12,971 items of UXO. Total mined area cleared decreased in 2008 (1.46km², see table below) compared to 2007 (2.12km²), while release of land by technical survey increased (14.1km²) compared to 2007 (12.22km²).⁵⁷

Demining in 2008⁵⁸

⁵⁷ Email from Nigar Vagabova, ANAMA, 27 July 2009.

⁵⁸ Data provided in response to Landmine Monitor questionnaire by Tural Mammadov, ANAMA, 19 June 2009, and by email, 7 July 2009; and email from Nigar Vagabova, ANAMA, 27 July 2009. Somewhat surprisingly, no antipersonnel mines were reported destroyed in 2008, although for the period November 2008 through April 2009, Azerbaijan reported 11 antipersonnel mines destroyed during clearance operations in Fizuli district. See Voluntary Article 7 Report (for the period November 2008 to April 2009), Form G.

In 2009, ANAMA was expecting to reduce and clear a total of 12km² of contaminated land and release a further 17.5km² through resurvey.⁵⁹ On 10 June 2009, the government tasked ANAMA to clear 400,000m² in Guzdek, close to Baku. The 12-month clearance is of a former ASA.⁶⁰

Internal quality assurance (QA) is carried out by the clearance team engaged in clearance while external QA is now the sole responsibility of ANAMA's TSQAD, which in early 2008 was moved from the Operations Department and put under the director of ANAMA to give it more independence. Quality control (QC) is conducted immediately after clearance is completed, through a process of sampling on up to 50% of the cleared land. Most quality control checks in 2008 were implemented by the Sampling/QA/QC Team, which consists of eight deminers and two MDD sets. Given this capacity, ANAMA has now stopped using the "exchange method" in which one demining team was used to conduct external QA/QC of an area cleared by another team.⁶¹

Land is handed over to the end users through the provision of a clearance certificate, with a sketch map of the cleared area attached. These documents are given either to the landowner or to the local municipality.

Release of Mined and Battle Areas from 1999–2008⁶²

Year	Mine clearance (km ²)	BAC (km ²)	SHAs released by survey (km ²)
2008	1.46	3.11	25.70
2007	2.12	4.11	12.22
2006	2.07	5.47	12.53
2005	1.85	3.00	2.36
2004	1.69	4.50	0.39
2003	1.37	3.40	0.17
2002	0.63	0.37	0.09
2001	0.47	0.23	0.09
2000	0.08	0.03	0
1999	0	0	0
Total	11.74	24.22	53.55

Risk Education

In 2008, 104,416 people received RE, a similar number to 2007.⁶³ RE was conducted by the education sector, local committees, the AzRCS, and two national demining NGOs, Dayag and IEPP.⁶⁴ It was delivered at schools, through a network of community volunteers managed by

⁵⁹ Email from Nigar Vagabova, ANAMA, 27 July 2009.

⁶⁰ "ANAMA conduct clearance operations in Guzdek settlement," 25 June 2009, www.anama.baku.az.

⁶¹ Response to Landmine Monitor questionnaire by Elnur Gasimov, Team Leader, TSQAD, 19 June 2009.

⁶² These figures are based on Landmine Monitor research. Azerbaijan has reported that from June 2000 through April 2009, it has "cleared" 100km², with the destruction of 153 antipersonnel mines, 193 antivehicle mines, and 425,578 ERW. See Voluntary Article 7 Report (for the period November 2008 to April 2009), Form A.

⁶³ Email from Musa Jalalov, ANAMA, 9 July 2009; and see *Landmine Monitor 2008*, p. 808.

⁶⁴ Statement by Musa Jalalov, ANAMA, Baku, 27 February 2009.

the District Executive Authorities, and by demining teams alongside clearance operations. In 2008, no military personnel received RE, but some units in contaminated districts were provided with RE materials.⁶⁵ RE activities mainly target 13 districts along the border with Armenia, and include camps for internally displaced persons (IDPs) and refugee settlements.⁶⁶

In January 2008, the UN Department of Public Information-Azerbaijan, ICRC, AzRCS, relevant ministries, and NGOs attended a seminar in Baku on UNICEF experiences in financial handover of RE programs to state budgets. In 2008, all school-based and community-based RE activities were funded by the state.⁶⁷

The Ministry of Education is responsible for the RE school program, including monitoring and integration of RE into school curricula.⁶⁸ Refresher training was given to 16 master trainers. By the end of 2008, a total of 2,335 teachers from 1,185 schools in 24 districts had been trained to deliver RE in Azerbaijan.⁶⁹

ANAMA reported that, as a result of community-based RE, the population has developed increased awareness in recent years. People report suspected contamination to the local authorities, ANAMA offices, and police.⁷⁰ Dangerous areas are marked during survey and clearance, and the methods are publicized through RE activities.⁷¹

In 2008, the ICRC and AzRCS built new safe-play areas in seven villages along the Line of Contact (LoC)⁷²; in total, 42 safe-play areas have been built with Norwegian Red Cross funding.⁷³

Activities in 2008⁷⁴

Organization	Type of activity	No. of beneficiaries
AzRCS	Safe-play areas (seven new areas in 2008)	5,000 children accessed safe-play areas (not included in beneficiary total)
District Executive Authorities	Community-based RE through 116 volunteer committees—awareness-raising sessions and distribution of materials	51,104
IEPF and Dayag	RE alongside demining operations	1,312
Ministry of Education	School-based RE	52,000 students

Monitoring and evaluation is conducted by the ANAMA RE department with the involvement of donors and partner organizations.⁷⁵

⁷⁵ Voluntary Article 7 Report (for the period November 2008 to April 2009), Form I.

In 2001, ANAMA and UNICEF implemented a joint RE project in 20 districts, including eight districts with a high concentration of IDP settlements, including training community members, teachers and health workers, as well as theater and distribution of materials. In September 2002, an external evaluation commended UNICEF for building national capacity, with an indicator of success being that children were reporting suspicious objects. The report's recommendations were later implemented, including building strong relations with partners, integration of RE into the school curriculum, and encouraging volunteers to form mine committees.

In 2003, the demining NGO IEPF started to conduct RE. In 2004, the AzRCS with ICRC started to conduct RE, train volunteers, and build safe-play areas for children. In 2004, the NGO Relief Azerbaijan started RE with prioritization based on LIS data and ongoing casualty information. In 2005, regular coordination meetings started and national standards were developed. In 2006, RE was delivered through radio and television for the first time. In 2007, the transition of RE to government bodies began as the Ministry of Education assumed responsibility for the implementation and monitoring of RE in schools, and district authorities managing the volunteer community-based RE activities. In 2007, emergency RE sessions were held and warning billboards set up in hazardous areas in response to mine/ERW incidents.

Victim Assistance

The total number of survivors is unknown, but is estimated to be at least 1,986.⁷⁶ Government departments, and local and international NGOs and organizations ran a variety of services for mine/ERW survivors in Azerbaijan in 2008. The situation for mine/ERW survivors is reported to have improved through government and NGO efforts.⁷⁷ As the national economy continued to prosper, in 2008, the government increased budgetary allocations to the health sector considerably.⁷⁸ Yet, despite the increases, it was reported that there were "still inadequate budgetary allocations to the social sectors."⁷⁹ According to ANAMA, a primary challenge in 2008 for the government VA services was inadequate funding.⁸⁰

In 2008, the Ministry of Health approved the National Concept Paper on Health Reform. The paper addressed the improvement of the primary healthcare services throughout the country, and the establishment of a healthcare financing system.⁸¹ In 2008, the Ministry of Labor and Social Welfare initiated a needs assessment survey of persons with disabilities and started to offer professional skills development services to persons with disabilities.⁸²

A government-facilitated program funded by the State Oil Company of Azerbaijan Republic resulted in the construction of three medical centers in regional areas. A fourth that was due to be built in Fizuli in 2008 was delayed and is planned for construction in 2009.⁸³

The State Social Protection Fund carried out pension reforms in collaboration with UNDP and the World Bank in 2008.⁸⁴ In September 2008, a Presidential Decree ordered a monthly pension for permanently disabled war veterans. The pension will be aggregated depending on the severity of the disability and administered through the Ministry of Labor and Social Welfare.⁸⁵

⁸⁵ "Azerbaijan's head of state decrees on instituting President's grant for war invalids," 9 September 2008, www.president.az.

The government's AMVA program in 2008 provided a range of services to mine/ERW survivors. This included the provision of prosthetic and mobility devices to 211 mine/ERW survivors, physical rehabilitation to one survivor, loans through a micro-credit scheme to 52 survivors, and vocational training to 29 survivors. The two new branches of AMVA set up in 2007 in Fizuli and Agstafa districts became better established in 2008.⁸⁶ A primary challenge to ANAMA's VA work for 2008, and continuing into 2009, was raising the funds to ensure continuation of the programs.⁸⁷

The Ministry of Labor and Social Welfare is responsible for providing rehabilitation services. In 2008, it operated four rehabilitation centers. The Ahmedly Prosthetic Orthopedic Rehabilitation Center in Baku provided 95 prostheses and 12 orthoses to mine/ERW survivors in 2008, nine of whom attended the clinic for the first time.⁸⁸ The Nakhchivan center delivered 16 prostheses and three orthoses to mine/ERW survivors in 2008.⁸⁹ The center in Ganja provided 30 prostheses and eight orthoses to mine/ERW survivors in 2008.⁹⁰

The fourth center, the Rehabilitation Center of Invalids of the Republic in Baku, provided rehabilitation, diagnostic, and psychosocial support to 252 mine survivors in 2008, 14 of whom attended the center for the first time. This center reported that in 2008 there was an outstanding need for training of medical staff, wheelchairs, and functional hospital beds. A new building was due to be constructed in 2009 and planned to house an additional 120–150 beds.⁹¹ The ICRC concluded its support to the three rehabilitation centers (Baku, Ganja, and Nakhchivan) at the end of 2007, but continued close contact with the centers' management throughout 2008.⁹² The ICRC cited indifference to "repeated attempts... to raise concern about weak points in the physical rehabilitation sector" as the reason for terminating direct technical support.⁹³

From May 2008, ANAMA and Chirag Humanitarian Development Public Union distributed wheelchairs provided by the Wheelchair Foundation to mine survivors in five districts.⁹⁴

A number of government departments and NGOs provided business and vocational skills training to mine/ERW survivors and their families in 2008. It was reported, however, that persons with disabilities, including mine/ERW survivors, had limited employment and education opportunities.⁹⁵

In 2008, the International Organization for Migration continued to implement a two-year socio-economic reintegration project that began in late 2007. The project operated in six mine/ERW-affected districts under the supervision of the International Trust Fund for Demining and Mine Victims Assistance (ITF) and ANAMA. Since the project began, it has provided business skills training to 85 mine survivors, 52 of whom also received small business loans. The work has been financially supported by ANAMA, Austria, Slovenia, and South Korea through the ITF.⁹⁶

The Ojag Humanitarian Union implemented a vocational training project financed by the Marshall Legacy Institute from August 2008, through the Ganja City Regional Resource Center. The project trained 12 mine survivors and family members in 2008 in carpet weaving and

tailoring.⁹⁷ Ojag also provided support to develop a marketing strategy and business plan to enable the center to distribute its goods to a wider population.⁹⁸

In November 2008, the NGO Centre of Social and Psychological Rehabilitation for Youth (also called “Dirchelish”) and ANAMA began a five-month project funded by the United States Embassy in Azerbaijan to ensure equal opportunities in employment and education for young mine survivors.

AzCBL ran micro-credit projects in two regions in 2008, funded by the Swiss Foundation for Landmine Victims Aid. Four mine/ERW survivors and 20 family members of survivors participated in the project. All loans were repaid, enabling the project to continue.⁹⁹ AzCBL also received a grant to run a legal awareness campaign targeting persons with disabilities, including mine survivors, funded through the Abilis Foundation.¹⁰⁰

National legislation prohibits discrimination against persons with disabilities in employment, education and access to healthcare, or other state-provided services. Yet discrimination against persons with disabilities was reported in 2008.¹⁰¹ A number of international and local NGOs ran educational campaigns to change social perceptions of children with disabilities and to encourage their social integration. Most public buildings remained inaccessible to persons with disabilities.¹⁰²

On 28 January 2009, Azerbaijan ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol.

Support for Mine Action

No comprehensive long-term cost estimates are known to exist for meeting all mine action needs in Azerbaijan. The current ANAMA workplan includes several strategic funding objectives, including the development of a national private sector partnership, establishing an in-country trust fund for mine action and establishing a charitable fund in support of mine victim activities.¹⁰³ As a result of joint research by the Azerbaijan government and the World Bank into the return of internally displaced persons to Nagorno-Karabakh in the event of a resolution to the conflict with Armenia, the head of ANAMA stated in September 2007 that US\$600 million was required to complete mine and UXO clearance in Nagorno-Karabakh and other occupied areas of Azerbaijan.¹⁰⁴

International support to mine action

In 2007, the UN reported that the government “has expressed an interest in Azerbaijan’s potential transition to a donor country...and pursuing opportunities for regional leadership” including international support of mine action.¹⁰⁵ In June 2009, Azerbaijan began a training program for mine clearance personnel from the Afghan National Mine Action Authority. The government is reportedly funding the program, in which four groups of Afghan personnel will observe and receive training from ANAMA staff in Azerbaijan. Azerbaijan has not reported a

valuation for this in-kind assistance.¹⁰⁶ In July 2009, ANAMA initiated training at its Goygol Regional Training Base¹⁰⁷ for personnel of the Ministry of Defense and Ministry of Internal Affairs of Georgia.¹⁰⁸

National support for mine action

ANAMA reported national funding in 2008 totaling \$6,312,500, an increase from \$2,235,296 provided in 2007. In total, Azerbaijan has reportedly contributed roughly \$12.3 million to the mine action program from 1999 to the end of 2008, to cover the costs of capacity-building, resource mobilization, and overall support to the mine action program.

International cooperation and assistance

In 2008, four countries reported providing \$1,723,262 (€1,170,217) to mine action in Azerbaijan. Reported international mine action funding in 2008 was approximately 54% less than reported in 2007. There are no baseline statistics or cost estimates against which to measure the adequacy of 2008 funding levels.¹⁰⁹

The ITF reported supporting a VA project in Azerbaijan during 2008, with funding for micro-credit and small business training to landmine survivors. Austria, Slovenia and South Korea were reported as donors.¹¹⁰ The ITF reported funding from South Korea of \$70,000 for VA in Azerbaijan in 2008.¹¹¹

BAHRAIN

Ten-Year Summary

The Kingdom of Bahrain has not acceded to the Mine Ban Treaty but has voted in favor of every pro-ban UN General Assembly resolution since 1996. Since 2004, it has shown increasing interest in the Mine Ban Treaty and in 2008 said it was closely studying accession. Ministry of Defense officials have said Bahrain keeps a “limited” stock of antipersonnel mines for training purposes only.

Mine Ban Policy

Bahrain has not acceded to the Mine Ban Treaty. Increased interest in treaty accession seen in 2007 did not appear to have intensified in 2008 or 2009.¹ In a November 2008 letter to the ICBL, the Ministry of Foreign Affairs stated, “Bahrain endorses the treaty’s aims and principles and continues to study closely the possibility of accession. Such accession would involve complex legal, domestic and international issues, and a number of relevant authorities in Bahrain are continuing to carry out close study of such issues.”² Officials have also cited the need to coordinate with other Gulf Cooperation Council member states regarding accession.³

Bahrain was one of the focal countries during the ICBL’s universalization activities at the time of the 10th anniversary of the entry into force of the Mine Ban Treaty on 1 March 2009.⁴

Bahrain did not participate as an observer in the Ninth Meeting of States Parties in Geneva in November 2008 or in the intersessional Standing Committee meetings in May 2009. This was in contrast to its attendance at the Eighth Meeting of States Parties in November 2007 and the June 2008 intersessional meetings.

Bahrain has voted in favor of every pro-ban UN General Assembly resolution since 1996, including Resolution 63/42 promoting universalization and full implementation of the Mine Ban Treaty on 2 December 2008.

Bahraini officials have stated that the country has never produced, exported, or used antipersonnel mines and is not mine-affected.⁵ Ministry of Defense officials have said Bahrain keeps a “limited” stock of antipersonnel mines for training purposes only.⁶

Bahrain is not party to the Convention on Conventional Weapons. As of June 2009, it had not signed the Convention on Cluster Munitions.⁷

¹ See *Landmine Monitor Report 2008*, p. 814. In November 2007, during an ICBL mission, members of the Bahraini House of Representatives, including the Vice-Speaker, expressed support for accession to the treaty, and a Ministry of Foreign Affairs representative spoke of accelerating the accession process. In May 2007, in response to an ICBL letter, Bahrain wrote, “His Highness the Prime Minister and his Government are tackling this issue with sincere concern and full commitment.” During a March 2007 ICBL mission, several Bahraini officials and legislators expressed support for accession to the treaty.

² Letter from Amb. Fouad Darwish, Director of International Organizations, Ministry of Foreign Affairs, 24 November 2008.

³ Various officials expressed this to ICBL delegation members during advocacy visits in 2008 and 2009.

⁴ See “1400 NGOs called on Bahrain to accede to the Mine Ban Treaty,” *Alwasat*, 1 March 2009; and “Bahrain joining the Mine Ban Treaty will enforce its international image,” *Alwatan*, 2 March 2009.

CHINA

Ten-Year Summary

The People's Republic of China has continued to insist on the military necessity of antipersonnel mines, but has endorsed the "ultimate goal of a total ban." Since 2003, China has shown increased interest in the Mine Ban Treaty. After repeatedly abstaining from voting on the annual pro-ban treaty UN General Assembly resolution from 1997 to 2004, it has voted in favor from 2005 to 2008. China has not laid any antipersonnel mines in the past 10 years, its export moratorium has remained in place, and officials told Landmine Monitor in 2008 that production facilities were either idle, shut down, or converted to manufacture other products. While still believed to have the world's largest stockpile of antipersonnel mines, since the late 1990s China has reported the destruction of more than two million stockpiled mines that had either expired or were not compliant with Amended Protocol II of the Convention on Conventional Weapons. It has also modified antipersonnel mines that did not meet the protocol's requirements, most notably for detectability.

China is affected by mines and explosive remnants of war (ERW) along its borders with India, Russia, and Vietnam, although three clearance "campaigns" on the border with Vietnam since 1992 have vastly reduced the extent of the problem and promoted significant cross-border trade.

The exact number of mine and ERW casualties between 1999 and 2009 is unknown but likely higher than reported. There was no systematic mine/ERW risk education (RE) in China, but since 2005, the People's Liberation Army has provided some *ad hoc* RE in Yunnan province. Since 1999, mine/ERW survivors have lacked access to services because of centralization in urban areas and cost. Disability awareness and legislation have improved, especially since 2007, but the impact on the lives of mine/ERW survivors has not yet been observed.

Mine Ban Policy

China has not acceded to the Mine Ban Treaty. China attended as an observer the Ninth Meeting of States Parties in Geneva in November 2008, where it stated that "China endorses the purposes and objectives of the Convention, and appreciates the humanitarian spirit reflected therein."¹

On 2 December 2008, China, for the fourth consecutive year, voted in favor of the annual UN General Assembly resolution (Resolution 63/42) calling for universalization and full implementation of the Mine Ban Treaty. China stated that its vote "reflects the recognition and attention that China gives to the important status and role of the Convention."²

China attended the intersessional Standing Committee meetings in May 2009, but made no statements. In an interview with Landmine Monitor at that time, a Chinese official gave no indication of further movement toward joining the Mine Ban Treaty.³

China is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines, and has made clear its preference for the CCW restrictive approach that still considers use of antipersonnel mines to be legitimate. China attended the Tenth Annual Conference of States Parties to Amended Protocol II in November 2008 and submitted its annual report required by Article 13 in September 2008.

China is not party to CCW Protocol V on Explosive Remnants of War. China has not signed the Convention on Cluster Munitions.⁴

¹ Statement by Amb. Wang Qun, Ninth Meeting of State Parties, Geneva, 24 November 2008.

² Ibid.

³ Interview with Li Yang, Counsellor, Permanent Mission of China to the UN in Geneva, Geneva, 28 May 2009.

⁴ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 195.

Use, production, and transfer

China has been one of the world's largest producers of antipersonnel mines. Two government-owned companies, China North Industries Corporation (NORINCO) and Chinese State Arsenal, produced at least 22 types of antipersonnel mines, including six copies of Soviet designs.⁵ Since 1997, antipersonnel mine production in China has been limited to mines with self-destruct and self-deactivation mechanisms, which are compliant with CCW Amended Protocol II.⁶ Officials told Landmine Monitor in 2008 that production facilities were either idle, shut down, or converted to manufacture other products;⁷ there has been no official confirmation of this information.

In September 2008, China repeated that it was making progress in developing alternative weapons to antipersonnel landmines.⁸

Since 1996, China has had a formal moratorium on the export of any mines that do not comply with Amended Protocol II. In practice, it is not known to have exported any type of antipersonnel mine since that time. China has apparently not laid new minefields in many years, but reserves the right to do so.

Stockpiling and destruction

China is believed to have the largest antipersonnel mine stockpile in the world. Landmine Monitor has estimated the Chinese antipersonnel mine stockpile at 110 million, including perhaps 100 million Type 72 mines.⁹ Chinese officials dispute this figure but have never offered an alternative number of stockpiled antipersonnel mines.¹⁰

In ratifying Amended Protocol II, China exercised the optional nine-year deferral period for compliance with key restrictions. The deadline for China to comply with the protocol's technical specifications on the detectability and reliability of antipersonnel mines was 3 December 2007. In November 2007, the government stated that "China has strictly implemented obligations of the Protocol. China conducted technical modification to or destroyed stockpiled APLs [antipersonnel landmines] which failed to meet the requirements of the Protocol."¹¹

However, China continues to possess stocks of non-compliant antipersonnel mines whose use would be prohibited under Amended Protocol II. The protocol does not prohibit possession, or require destruction, of stockpiles of non-compliant mines, it only prohibits their use. China's September 2008 Article 13 report states, "In 2008, Chinese military continued to destroy a group of out-dated Anti-personnel landmines and other explosives according to the CCW Op Prot II."¹² When asked to clarify this statement, a Chinese official said that these were old mines that were not compliant with Amended Protocol II and had been scheduled for destruction. He said destruction will continue in the coming years.¹³

¹¹ Statement of China, Eighth Meeting of States Parties, Dead Sea, 18 November 2007; see also statement by Amb. Cheng Jingye, Ministry of Foreign Affairs, Ninth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2007.

¹² Article 13 Report, Form C, September 2008.

¹³ Telephone interview with Wang Chang, Second Secretary, Permanent Mission of China to the UN in Geneva, 29 May 2009.

China's most recent Article 13 report notes that new techniques will allow them to accelerate the process of destroying obsolete mines.¹⁴ China has reported destroying quantities of antipersonnel mines for the past several years, but has provided few concrete details.¹⁵

Scope of the Problem

Contamination

China has emplaced antipersonnel mines on its borders with India, the Russian Federation, and Vietnam. The United States estimated in the 1990s that China had planted some 10 million mines along these borders.¹⁶ China's military has estimated that around two million mines of a wide variety of types were emplaced on the Vietnam border alone.¹⁷

Minefields on the Vietnam border have inflicted heavy casualties among local residents and cross-border traders, caused loss of livestock, and held back cultivation of land. At the end of 2008, Chinese media cited local authorities in Yunnan province as reporting that the border prefecture of Wenshan alone had almost 6,000 landmine casualties since 1979. Sharen village in the prefecture's Funing county is said to be known internationally as a landmine-ridden village. Most of the 87 villagers have reportedly lost one or both legs to landmines.¹⁸

China reported in December 1999 that the mine threat on its side of the border with Vietnam, namely in Yunnan province and Guangxi Zhuang Autonomous Region, "has been basically removed" following major clearance operations between 1992 and 1999.¹⁹ At that time, however, the border had not been fully demarcated, and several dozen square kilometers of land where minefields remained were disputed.²⁰ Border demarcation and clearance of these mined areas, which restarted in 2005, were reported to be nearly complete by the end of 2008.²¹

The clearance has paved the way for prosperous border trade. China has been Vietnam's largest trade partner since 2007, with trade hitting US\$16.6 billion in the first 10 months of 2008, according to the Chinese government.²²

Casualties

In 2008, three new antipersonnel mine casualties were reported; two men and one woman were injured in Malipo county along the Sino-Vietnamese border.²³ In 2007, two antipersonnel mine casualties occurred in Yunnan province.²⁴ A Chinese deminer was also injured in Lebanon in March 2008.²⁵ No new mine/ERW casualties were reported for 2009 through 1 April. Due to the lack of public information about mine/ERW casualties, it is certain that some go unreported.²⁶

²⁴ See *Landmine Monitor Report 2008*, p. 819.

²⁵ *Ibid.*

²⁶ *Ibid.*

In June 2008, a Chinese official said that no mine/ERW casualties had occurred in China or among Chinese citizens (including deminers) since 1999,²⁷ but in 2009 a representative of the Chinese military was quoted as saying: “Almost every minesweeping soldier has a scar on their [sic] body.”²⁸

Landmine Monitor has identified 5,707 mine/ERW casualties, mostly in Wenshan prefecture in Yunnan province.²⁹ This figure was confirmed when at the end of 2008 Chinese media cited local authorities in Yunnan province as reporting that the border prefecture of Wenshan alone had had almost 6,000 landmine casualties since 1979.³⁰ In Sharen village in the prefecture’s Funing county, “Most of the 87 villagers have lost one or both of their legs to landmines.”³¹

Since 2000, 16 additional mine casualties (all injured) have been reported, although the actual number is probably significantly higher.³²

Program Management and Coordination

Mine action

There is no formal mine action program in China. Mine clearance is conducted by the People’s Liberation Army (PLA) as a military activity.³³ Demining of the Vietnam border was conducted in three “campaigns” in Yunnan province and Guangxi Zhuang Autonomous Region. The first campaign in 1992–1994 cleared 102.8km² and resulted in another 159.5km² being “closed off.” The second campaign in 1997–1999 reportedly cleared some 500,000 landmines and 180,000 ERW, but no details were provided of the area cleared. Press reports cited claims by the Chinese military that this second clearance operation was the largest in world military history.³⁴

These two campaigns did not, however, deal with minefields located in disputed areas of the border, where 500,000 mines reportedly covered 40km². After technical survey of mined areas in the former disputed area on the Vietnam border, China embarked on the third clearance campaign, in Guangxi Zhuang Autonomous Region and Yunnan province, in 2005 which continued through 2008.³⁵

Victim assistance

Mine/ERW survivors receive the same services as other persons with disabilities under China’s 11th Five-Year Plan (2006–2010).³⁶ The Chinese Disabled People’s Federation (CDPF) coordinates disability issues and serves as the Secretariat for the State Council Working Committee on Disability, a body including representatives of government ministries and agencies.³⁷ In 2008, the Ministry of Health assumed a greater role in coordinating physical rehabilitation services.³⁸

Data collection and management

It is believed that the government collects information on mine/ERW casualties, but this information is not publicly available.³⁹

Risk Education

No systematic risk education (RE) activities were recorded in 2008, but in June 2008 a Chinese official reported that the PLA carried out mine awareness campaigns for civilians living in former disputed areas in Yunnan province.⁴⁰ These activities have been ongoing since 2005, when the PLA began providing RE to civilians as a trial.⁴¹

Between 1999 and 2009, the only reported RE took place in Yunnan province; this included awareness-raising on markings for local residents and RE for children in school and at home in 2003.⁴²

Victim Assistance

The estimated number of survivors is unknown but at least 4,224. In 2008, access to services for persons with disabilities, including mine/ERW survivors, improved in major cities but the majority (75%) who live in rural areas had limited access to services.⁴³ Access to assistance is unequal due to the centralization of services in cities and increasing costs.⁴⁴ While many physical rehabilitation service providers exist in China, the two main providers are the Ministry of Civil Affairs and the CDPF.⁴⁵ However, the hospitals under the Ministry of Health are also playing an increasing role in physical rehabilitation services.⁴⁶

In 2007, new regulations on the employment of persons with disabilities were passed. However, in 2008, fewer than 1% of persons with disabilities were assisted in finding employment, and only 17% received a pension or subsidy.⁴⁷ In July 2008, China revised its Law on the Protection of Persons with Disabilities and included measures to improve social security.⁴⁸ While conditions for persons with disabilities are still far from what the law calls for,⁴⁹ this reform created a “relatively clear general regulatory framework.”⁵⁰ Advances have also been made in raising disability awareness.⁵¹ On 1 August 2008, China ratified the UN Convention on the Rights of Persons with Disabilities, but not its Optional Protocol.

At the end of 2008, the ICRC completed the first five years of its support to the Red Cross Society of China, Yunnan Branch’s (RCSC-Yunnan) rehabilitation activities for poor amputees. It helped establish a center in Kunming and two repair workshops, supported training, and donated materials and equipment. As of 2008, the RCSC-Yunnan managed all physical rehabilitation activities, but the ICRC planned to continue to monitor and provide materials. In 2008, RCSC-Yunnan provided 40 prostheses (a quarter of the total 176 produced) to mine survivors, including to four people who had never previously had access to services.⁵² Between 2004 and 2008, RCSC-Yunnan assisted nearly 300 mine/ERW survivors.⁵³

Support for Mine Action

China provides mine action assistance abroad under a joint program started by the Ministry of Foreign Affairs and the Ministry of Defense in 1998. The annual budget for mine action support is around CNY6 million (approximately \$860,000), including a contribution to the UN Voluntary Trust Fund.⁵⁴ In view of budgetary constraints, countries are said to be selected according to the urgency of their needs.⁵⁵ Since 2007, China has provided financial support for demining in Ecuador, Eritrea, and Peru.⁵⁶ In November 2008, China reported having contributed funds for mine action to Ecuador, Ethiopia, and Peru, but without specifying the dates or value of contributions.⁵⁷

China has stepped up its contribution to international humanitarian demining operations by sending engineers to participate in UN peacekeeping operations in Lebanon. As of April 2008, China had four 15-person teams of combat engineers (each including 10 deminers/explosive ordnance disposal operators) deployed with the UN Interim Force in Lebanon (UNIFIL) as the Chinese Engineer Battalion (CHINBATT), operating in areas south of the Litani river. A 275-person unit of engineers prepared to deploy to Lebanon in February 2009 for the fifth rotation of Chinese troops in UNIFIL.⁵⁸

The first contingent, consisting of three demining teams, arrived in Lebanon in May 2006 and became operational in August 2006 after the UN Mine Action Coordination Centre South Lebanon (MACC-SL) provided assistance in developing CHINBATT's standing operating procedures and training to international standards and Lebanese National Technical Standards and Guidelines. The teams were trained by MACC-SL for battle area clearance (BAC) in order to assist clearance of cluster munition remnants.

The first three teams rotated back to China in February 2007 and were replaced by four teams, also trained and accredited for BAC. They were replaced by another four teams who received accreditation in November 2007, two for BAC and two for explosive ordnance disposal (EOD). A fourth rotation occurred in May 2008, and a fifth team formed in January 2009 prepared to deploy in February.⁵⁹ China reported in January 2009 that its engineers had destroyed more than 600 landmines since September 2007.⁶⁰ Since their first deployment, one Chinese team member was wounded during an EOD operation in November 2007. The casualty had not been certified for EOD by MACC-SL.⁶¹

At the 2007 Beijing Summit of the Forum on China-Africa Cooperation, China pledged “to continue to support and take part in the humanitarian demining operations in Africa” and to “provide financial and material assistance and related training for African countries within its capacity.”⁶² In 2007, China provided training and equipment for 47 deminers from Angola,

Starting in April 2008, China sponsored a six-week mine clearance training course for 20 military officers from northern and southern Sudan at the PLA Engineering Science and Technology University.⁶⁴ In January 2009, China donated 20 sets of mine clearance equipment to the Government of Sudan.⁶⁵ China also sent a four-person team to Egypt to train deminers and in January 2009 provided 70 detectors.⁶⁶

China continued in 2009 to contribute engineers to UN peacekeeping operations in Lebanon. As of April 2009, it had four 15-person teams of combat engineers deployed with UNIFIL. In March 2009, the contingent received certification from the UN Mission in Sudan for mine and battle area clearance.⁶⁷ China did not report the value of in-kind contributions to Lebanon in 2008.

CUBA

Ten-Year Summary

The Republic of Cuba has not conducted any mine clearance in its minefields around the United States naval base at Guantánamo over the last 10 years.

Mine Ban Policy

Cuba has not acceded to the Mine Ban Treaty. In a February 2009 meeting with an ICBL delegation, Cuba's Ambassador to Nicaragua reaffirmed Cuba's support for the humanitarian aspects of the Mine Ban Treaty but also emphasized that Cuban policy on antipersonnel mines is governed by its view of the military utility of the weapon. He expressed Cuba's interest in attending the Mine Ban Treaty's Second Review Conference in Colombia in November 2009.¹

On 2 December 2008, Cuba abstained from voting on UN General Assembly Resolution 63/42 calling for universalization of the Mine Ban Treaty, as it had with previous annual General Assembly resolutions in support of the antipersonnel mine ban. Earlier, it explained its opposition, saying that due to continued "hostility and aggression" against it, Cuba was unable to renounce the use of mines needed for the preservation of its sovereignty and territorial integrity. It stated that it would continue to support efforts to address the impact of landmines "which maintain the necessary balance between humanitarian concerns and national security."²

Cuba did not attend as an observer the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008 or the intersessional Standing Committee meetings in Geneva in May 2009.³

Cuba's state-owned Union of Military Industries (Unión de las Industrias Militares, UIM) is believed, in the absence of any denial or clarification from the government, to continue to produce antipersonnel mines.⁴ Since 1996, Cuba has stated on several occasions that it does not and has never exported antipersonnel mines.⁵ There is no official information available on the size and composition of Cuba's stockpile of antipersonnel mines.⁶ Cuba declined to respond to a questionnaire submitted by Landmine Monitor.⁷

¹ ICBL meeting with Amb. Luis Hernández Ojeda, Embassy of Cuba, Managua, Nicaragua, 25 February 2009. Notes by the ICBL.

² Statement by Rodolfo Benítez Versón, Counsellor, Chargé d'affaires, Permanent Mission of Cuba to the UN in New York, "Explicación de voto del Representante de Cuba, sobre el proyecto de resolución L.6" ("Explanation of Vote of the Representative of Cuba on draft resolution L.6"), UN General Assembly, First Committee, New York, 29 October 2008, embacuba.cubaminrex.cu.

³ Cuba last attended Mine Ban Treaty meetings in 2006 (Seventh Meeting of States Parties) and 2004 (First Review Conference).

⁴ Jane's Information Group lists Cuba as producing three types of antipersonnel mines (a plastic blast mine and two types of stake-mounted fragmentation mines) as well as an antivehicle mine. *Jane's Mines and Mine Clearance 2008*, (Surrey, UK: Jane's Information Group Limited, 2008), CD-edition. According to the US Department of Defense, Cuba has produced three different types of antipersonnel mines: PMFC-1 and PMFH-1 fragmentation mines and the PMM-1 wooden box mine. US Department of Defense, ORDATA Online, ordatamines.maic.jmu.edu.

⁵ Letter from Juan Antonio Fernández Palacios, Ministry of Foreign Affairs, 13 June 2003. Cuban antipersonnel mines have, however, been cleared by deminers in Angola and Nicaragua.

⁶ One source has reported that Cuba stockpiles the Soviet-manufactured OZM-4, POMZ-2, and POMZ-2M mines, in addition to mines manufactured domestically. Online update, *Jane's Mines and Mine Clearance*, 18 November 1999.

⁷ Email from Rodolfo Benítez Versón, Permanent Mission of Cuba to the UN in New York, 23 February 2009, noted that the questionnaire had been forwarded to Havana. Cuba has declined to provide updated information to Landmine Monitor every year since 2003.

Cuba is party to the Convention on Conventional Weapons (CCW) but has not joined Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. Cuba has not signed the Convention on Cluster Munitions.⁸

Scope of the Problem

Cuba's mine contamination remains unchanged from previous years.⁹ Cuba maintains minefields around the United States naval base at Guantánamo in the southeast of Cuba. In 2007, Cuba said it carries out "a strict policy with regard to guaranteeing a responsible use of antipersonnel mines with an exclusively defensive character and for [Cuba's] national security."¹⁰ According to an earlier statement by the Ministry of Foreign Affairs, existing minefields are duly "marked, fenced and guarded" in accordance with CCW Amended Protocol II.¹¹ According to a book published in 2008, mines laid around the naval base detonate "at least once a month," but it has not been possible to independently confirm this claim.¹²

⁸ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 197.

⁹ See, for example, *Landmine Monitor Report 2007*, pp. 813–814.

¹¹ Statement of the Directorate of Multilateral Affairs, Ministry of Foreign Affairs, 19 June 2000.

¹² "The Cuban mines detonate at least once a month, sometimes starting fires that sweep across the fence line. [Staff Sergeant Kaveh Wooley of the US Marines] ... described a fire that started the previous summer and turned into a giant cook-off, with about 30 mines exploding..." Daniel P. Erikson, *Cuba Wars: Fidel Castro, the United States, and the Next Revolution* (USA, Bloomsbury, October 2008), pp. 196–197.

EGYPT

Ten-Year Summary

The Arab Republic of Egypt has not acceded to the Mine Ban Treaty, insisting that it needs antipersonnel mines for border defense. Egypt has abstained on every annual pro-Mine Ban Treaty UN General Assembly resolution. Egypt has often participated as an observer in Mine Ban Treaty meetings, most recently in November 2008. In 2004, Egypt said that the government had imposed a moratorium on production and export of antipersonnel mines, claiming that it last produced in 1988 and exported in 1984.

Egypt has made slow progress in setting up a civilian mine action program to support the clearance of mines and explosive remnants of war (ERW) on its territory dating back to World War II. Clearance operations, part of the first phase of a joint government-UNDP project related to the North West Coast, began in February 2009.

Landmine Monitor recorded at least 190 mine/ERW casualties (55 killed and 135 injured) in Egypt between 1999 and 2008. There has never been a formal risk education program in Egypt, and only very limited *ad hoc* activities have been reported in the last 10 years, including in 2008. Progress in recent years has been made in providing mine/ERW survivors in Egypt with medical care and economic support. However, there is no national victim assistance strategy in Egypt and the majority of survivors did not receive specialized assistance in 2008. Discrimination against persons with disabilities continued to be reported in 2008.

Mine Ban Policy

Egypt has not acceded to the Mine Ban Treaty. Egypt has often stated its reasons for opposing the treaty, including that antipersonnel mines are seen as a key means for securing Egypt's borders and that responsibility for clearance is not assigned in the treaty to those who laid the mines in the past.

On 2 December 2008, Egypt was one of only 18 countries that abstained from voting on UN General Assembly Resolution 63/42, which promotes the universalization and full implementation of the Mine Ban Treaty. Egypt has abstained on similar resolutions in previous years. In a statement to the UN First Committee, Egypt said it abstained,

“... due to the particular unbalanced nature of this instrument which was developed and concluded outside the United Nations context.... Egypt views this convention as lacking balance between the humanitarian consideration related to APLM [anti-personnel landmine] production and their legitimate military use for border protection. Furthermore, the convention does not acknowledge the legal responsibility of States for demining APLM they themselves have laid, in particular in territories of other States, making it almost impossible for many States to meet alone the Convention's demining requirements....The mentioned weaknesses are only complemented by the weak international cooperation system of the Convention which remains limited in its effect and much dependent on the will of donor States. The weaknesses of Ottawa convention have kept the largest world producers and some of the world's most heavily affected States outside its regime, making the potential for its universality questionable and reminding us all of the value of concluding arms-control and disarmament agreements in the context of United Nations and not outside its framework.”¹

¹ Statement of Egypt, “Explanation of Vote on Resolution on the Ottawa APLM Convention, L.6,” First Committee of the UN General Assembly, New York, 30 October 2008.

Egypt attended as an observer the Ninth Meeting of States Parties in Geneva in November 2008, but it did not make any statements. It did not attend the intersessional Standing Committee meetings in May 2009, although it has often attended these meetings in the past.

In March 2009, an Egyptian parliamentarian stated that the government had failed to adequately address the problem of landmines in Egypt, calling for the dismissal of the Minister of State for International Cooperation. He cited the slow removal of mines as delaying Egypt's accession to the Mine Ban Treaty.²

Egypt signed the Convention on Conventional Weapons in 1981, but has not ratified it. It attended as an observer the Tenth Annual Conference of State Parties to Amended Protocol II in November 2008.

Egypt has not signed the Convention on Cluster Munitions.³

Production, transfer, and stockpiling

Egypt has stated that it stopped production of antipersonnel mines in 1988 and export in 1984.⁴

At the First Review Conference of the Mine Ban Treaty in December 2004, Egypt's Deputy Assistant Foreign Minister stated that "the Egyptian government has imposed a moratorium on all export and production activities related to anti-personnel mines."⁵ This was the first time that Egypt publicly and officially announced a moratorium on production.⁶ This statement, combined with the apparent lack of any production activities for many years, led Landmine Monitor to remove Egypt from its list of antipersonnel mine producers in 2005. However, Landmine Monitor still is not aware of any official decrees or laws by the government to implement permanent prohibitions on production or export of antipersonnel mines.

Egypt is believed to have a large stockpile of antipersonnel mines, but no details are available on the size and composition of the stockpile, as it is considered a national security secret.

In 2008 and 2009, Egyptian authorities continued to find and seize mines and other ordnance in the Sinai Peninsula. In July 2008, authorities discovered a large quantity of munitions, including 20 antivehicle mines, in the town of Al-Sheikh Zoeid, near Egypt's border with Gaza.⁷ In August 2008, police found a cache containing 500kg of explosives taken from mines and other ordnance in the city of Rafah, bordering Gaza.⁸ In May 2009, Egyptian authorities reportedly seized 48 antipersonnel mines, among other weapons, allegedly destined for Palestinian groups in Gaza.⁹

Scope of the Problem

Contamination

Egypt is contaminated with mines and ERW, especially UXO, from World War II. Most of the battles took place in the area between the Quattara depression and Alamein at the Mediterranean coast. Other affected areas lie around the city of Marsa Matrouh and at Sallum near the Libyan

³ For details on Egypt's cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 197–199.

⁴ See, for example, Statement of Egypt, Seventh Meeting of States Parties, Geneva, 22 September 2006.

⁵ Statement of Egypt, First Review Conference, Nairobi, 2 December 2004.

⁶ Egypt told a UN assessment mission in February 2000 that it ceased export of antipersonnel mines in 1984 and ended production in 1988, and several Egyptian officials over the years also told Landmine Monitor informally that production and trade had stopped. However, Egypt had not responded to repeated requests by Landmine Monitor to make that position formal and public in writing. Thus Landmine Monitor kept Egypt on its list of producers. Egypt reportedly produced two types of low metal content blast antipersonnel mines, several variations of bounding fragmentation mines, and a Claymore-type mine. There is no publicly available evidence that Egypt has produced or exported antipersonnel mines in recent years. See *Landmine Monitor Report 2004*, p. 957.

⁷ "Weapons and contraband tunnels found in Egypt's Sinai," *Agence France-Presse*, 18 July 2008.

⁸ "Half ton of explosives seized in border city with Gaza strip," *Almasry Alyoum* (daily newspaper), Cairo, 22 August 2008.

border.¹⁰ In addition, ERW from armed conflicts between Egypt and Israel in 1956, 1967, and 1973 remains to be cleared, especially in eastern areas (the Sinai Peninsula and Red Sea coast).

No reliable figures for the extent of contamination exist. The joint Egypt/UNDP project document of November 2006 referred to 2,680km² of contamination, which is almost four times the estimated contaminated area in Afghanistan.¹¹ Similarly, the number of mines and ERW that remain to be cleared can be little more than speculation. The Egyptian army has estimated that 16.7 million explosive items have still to be found, including both antipersonnel and antivehicle mines and much larger quantities of UXO.¹²

Casualties

In 2008, there were 40 new mine/ERW casualties recorded in Egypt in eight governorates from 11 incidents, which resulted in 14 people killed and 26 injured.¹³ Casualties included 28 men, one woman (injured), 11 boys (seven killed and four injured), and no girls. ERW caused 33 of the casualties, landmines caused six, and an unknown device caused one casualty.¹⁴ Three incidents involving four casualties occurred in Matruh governorate, where the Ministry of International Cooperation (MIC) and UNDP mine action program operates. The other incidents occurred outside the area covered by the mine action project, including two incidents in Ismailia, and one incident in each of Albihira, Al Suez, Alqaliobia, Alexandria, North Sinai, and Alsharqia governorates. Two incidents causing five casualties occurred while people were trying to illegally cross the Egypt-Libya border. The vast majority of casualties occurred during activities relating to the scrap metal trade (29 casualties). Other activities at the time of incident included playing with ERW (three), playing/recreation (three), travel (three), agriculture (one), and fishing/hunting (one). Except for the two incidents that occurred at the Egypt-Libya border, none of the casualties witnessed any danger signs or had received risk education, despite some living in or near to mine/ERW-affected areas.

The 2008 figures represent an increase compared to the 25 mine/ERW casualties (eight killed and 17 injured) recorded in 2007, and is the highest annual number of casualties since 1999. One incident in May 2008 in Alexandria governorate, the explosion of a World War II shell that was being dismantled for scrap metal caused 17 casualties (four killed and 13 injured). People in the street were caught in the blast, as well as those in the workshop.

Casualties continued in 2009, with 22 new mine/ERW casualties recorded (13 people killed and nine injured), as of 30 June 2009. Nine casualties were boys (eight killed and one injured) and the rest were men. Activities at the time of the incidents included agriculture (four), fishing/hunting (four), travel (three), playing with ERW (three), playing/recreation (three), and providing security (one); the activities of four casualties were unknown. In May 2009, a police officer was injured when he handled a landmine while working at the Egypt-Israel border.¹⁵

The MIC, with UNDP and the local NGO Peace Gardens, conducted a mine/ERW survivor survey from January to May 2008, on the North West Coast (primarily in Matruh governorate). The primary objective of the survey was to verify existing information on survivors collected by the Office of the Governor of Matruh and the governorate's Social Solidarity Department. Interviews were also conducted to identify previously unknown survivors in cooperation with local authorities. It is estimated that some 80–90% of mine/ERW-affected communities were covered by the survey.

¹³ Unless stated otherwise, information collected by Protection and Mine Action and Human Rights Foundation for Mine Victims in Egypt, and provided by Ayman Sorour, Director, Protection, Cairo, 24 July 2009.

¹⁴ It was not reported whether the casualties were caused by antipersonnel or antivehicle mines.

¹⁵ Unless stated otherwise, information collected by Protection and Mine Action and Human Rights Foundation for Mine Victims in Egypt, and provided by Ayman Sorour, Director, Protection, Cairo, 24 July 2009.

The survey identified 645 mine survivors living on the North West Coast, 94% of whom were males and three percent children. It should be noted the survey recorded the age of the person at the time of the survey, not when the mine/ERW incident occurred. Among the injured, 48% suffered upper body injuries, 37% lower body injuries, and 15% other injuries. The number of people injured annually from 2002 to 2004 was found to be 18, but by 2007 the number had decreased to three.¹⁶

The number of mine/ERW survivors recorded in the survey was considerably lower than the estimate of 8,000 mine/ERW casualties which, according to UNDP is “understood to relate to casualties in the whole country.”¹⁷ It should be noted that the Peace Gardens survey included only those injured and those who still lived on the North West Coast at time of survey. A number of survivors particularly from Bedouin communities are assumed to have moved from the area since they were injured by mines/ERW. As a result, the survey does not capture all those injured by mines/ERW in the survey area. The survey did not include military casualties from mines/ERW. The Ministry of Defense estimated that about 700 people, soldiers and civilians, have been killed in mine explosions since 1945.¹⁸

Landmine Monitor recorded at least 190 mine/ERW casualties (55 killed and 135 injured) in Egypt between 1999 and 2008.¹⁹

Risk profile

People are at risk from a significant number of mines and UXO, especially near urban settlements and potential development areas (Alamein, Dabaa, Matruh, and Sallum). Casualties are increasingly being caused by scrap metal collection. According to the Ministry of Interior, explosives used in a number of criminal acts over the past few years have been taken from mines and ERW in the Sinai Peninsula. Population growth, new development projects, expansion of urban zones, and increased tourism has resulted in more people being in affected areas, increasing the potential for further casualties.²⁰

Socio-economic impact

The impact of contamination is said to be significant. Irrigation projects, an essential facet of national development projects in desert areas, have experienced delays because of the need to clear mines and UXO.²¹ It has been claimed that mines and UXO in the Western Desert may deny access to an estimated 4.8 billion barrels of oil reserves as well as 13.4 trillion cubic feet (379 billion m³) of natural gas.²² New kinds of tourism, such as safari and eco-tourism, can encroach on affected areas, increasing the risk of incidents. It is necessary to warn people of potential hazards, but there is a fear of discouraging travel to the country.²³

Program Management and Coordination

Mine action

In 2000, the Prime Minister issued a decree establishing a National Committee for Supervising Mine Clearance and the Development of the North West Coast to supervise demining of this area. The National Committee serves as the focal body for the North West Coast Development Plan, approved in October 2005 by the Cabinet of Ministers, as well as for mine action coordination within the Egyptian government. The committee is chaired by the Minister of International

Cooperation who oversees and coordinates mine action activities. The committee consists of 20 ministries, four governorates, and five NGOs. A project agreement was signed between Egypt and UNDP in November 2006 to establish a mine action program to address contamination in the North West Coast.

On 28 October 2007, the MIC issued a decree formally establishing the Executive Secretariat for the Demining and Development of the North West Coast (the “Executive Secretariat”) as a unit in the ministry.²⁴ The Executive Secretariat is the coordination body for all mine action activities within the Egyptian government, with the UN, civil society, and the donor community. In June 2008, the Information Management System for Mine Action (IMSMA) was installed in the secretariat’s Cairo headquarters.

A UNDP Chief Technical Advisor (CTA) was recruited in October 2007 and assigned to the Executive Secretariat. Following his resignation at the end of April 2009, recruitment of a new CTA was ongoing, but had not been completed as of August 2009.²⁵

Victim Assistance

Victim assistance (VA) is one of the Executive Secretariat’s four strategic goals. Part of the long-term development plan of the North West Coast is the development of social services and local community capacities, through which mine/ERW survivors and their families would benefit.²⁶

The first phase of the UNDP and government project “Support to the North West Coast Development Plan and Mine Action Project,” scheduled for February 2007 to July 2008, envisioned implementing a VA needs assessment, developing a VA strategy, and initiating implementation of the strategy. By June 2009, the casualty survey had been completed and subsequently some potential projects had been identified, and one had started implementation.²⁷

In November 2008, the Executive Secretariat contracted a consultant to carry out a study on planned local initiatives by NGOs for mine/ERW survivors and families of casualties in the North West Coast region.²⁸ A field office of the Executive Secretariat was established in Mara Matruh in January 2009, tasked with coordinating VA activities and updating casualty data, among other responsibilities.²⁹ A national VA strategy had yet to be completed, however, and the implementation of the second phase had not begun as of April 2009.³⁰ UNDP noted that this phase was scheduled to start on 31 December 2009.³¹

The Ministry of Education and the Ministry of Social Solidarity share responsibility for protecting the rights of persons with disabilities.

Data collection and management

Two NGOs, Protection Against Armaments and Consequences (Protection) and the Mine Action and Human Rights Foundation for Mine Victims in Egypt jointly collected mine/ERW casualty data in 2008. The two organizations gathered information through interviews with government and NGO staff, from media reports, hospital records, and police reports. The information was compiled and provided to Landmine Monitor by Protection.

In June 2008, IMSMA was installed at the head office of the Executive Secretariat in Cairo to record casualty data. The MIC, with UNDP and Peace Gardens, conducted a mine/ERW survivor survey from January to May 2008, primarily in Matruh governorate. The primary objective of the survey was to verify existing information on survivors collected by the Office of the Governor of Matruh and the governorate’s Social Solidarity Department. Interviews were also conducted to identify previously unknown survivors in cooperation with local authorities. It

is estimated that some 80–90% of mine/ERW-affected communities were covered by the survey. By September 2008, the data collected by the Peace Gardens survey had been integrated into IMSMA.³²

Plans

Strategic mine action plan

The “Support to the North West Coast Development Plan and Mine Action Project” between Egypt and UNDP was signed in November 2006 and, following an extension, was due to run until December 2009. This project constitutes the first phase and was to focus on the following: (i) The establishment of an Executive Secretariat for Mine Clearance and Development of the North West Coast within the MIC to ensure that an effective coordination mechanism for the North West Coast Development Plan is in place and that mine action support is provided to facilitate the implementation of the Plan; (ii) The development of a communications and resource mobilization strategy and coordination with donors, civil society and private sector; (iii) The conduct of pilot demining operations in response to identified humanitarian and developmental needs; (iv) The conduct of risk education/VA; and (v) An outline of the scope of Phase II. Based on the achievements and lessons learned of the first phase, the aim of the second phase will be to expand the mine clearance operations, enlarge the scale and accelerate the implementation of development projects in the area, strengthen the structures and procedures of the Executive Secretariat, mobilize more resources, and expand victim assistance activities.³³

In July 2009, the Executive Secretariat reportedly released a strategy paper for risk education, prepared in collaboration with the GICHD. The Executive Secretariat planned to launch a “structured campaign” later in the year.³⁴

National ownership

Commitment to mine action and victim assistance

Egypt has been slow to set up a functioning civilian mine action program, despite support from UNDP, and there has been little public reporting of progress in demining. It has also suffered from a significant turnover of staff.

Demining and Battle Area Clearance

The Egyptian army is the only authorized demining operator in Egypt and it has carried out demining operations both within and outside the country. It is reported that 300 army personnel have been involved in clearance, which is conducted according to national standing operating procedures.³⁵ Demining operations are usually carried out using manual techniques. The army claims to have adequate experience with technical survey, which will be a key component of the demining operations given that extensive survey and area reduction will be required because of the lack of accurate minefield maps.

From 7 February 2009 until 31 July 2009, demining operations were reported to have cleared 210,214 items of UXO and 13,720 mines from 14,474 acres (approximately 58.6km²).³⁶ It has not been possible to verify these figures, which seem high given the available resources.

Risk Education

There has not yet been a formal risk education (RE) program in Egypt, and only very limited *ad hoc* activities have been reported in the last 10 years, including in 2008.

³² Executive Secretariat, “Mine Clearance Project,” Technical report, Cairo, June 2009, p. 18.

³³ Information from Executive Secretariat, contained in email from Reuben McCarthy, Conflict Prevention and Recovery Specialist, Sub-Regional Office for Eastern and Southern Africa, UNDP, 31 August 2009.

³⁴ Ibid.

³⁵ Ibid.

³⁶ Email from Hala Nour, Executive Secretariat, 8 August 2009; and information provided by Hala Nour, in email forwarded by Amb. Fathy El Shazly, Executive Secretariat, 30 August 2009.

RE was included in the joint UNDP/Egypt project signed in November 2006, yet little has been implemented. In July 2008, the Chair of the State Information Service stated that a three-month RE campaign in Matruh, Alexandria, Suez, Al-Arish, northern and southern Sinai, and Ismailia governorates would take place,³⁷ but no activities had taken place as of July 2009.³⁸

A consultant was hired to draft a strategy and needs assessment in 2008, but after the field work had been conducted, the strategy was not completed.³⁹ In November 2008, UNDP's CTA stated that an RE poster had been designed and that RE sessions were underway.⁴⁰ As of July 2009, the poster had not been distributed. RE sessions, conducted by the RE officer at the Executive Secretariat, consisted of general discussions with people about the dangers of mines and UXO during the collection of casualty data.⁴¹ Emergency RE was also delivered in late 2008 and in 2009 in response to incidents.⁴²

The Executive Secretariat has gathered RE materials from other countries to adapt for use in Egypt; it has also obtained a set of RE resources for children which, once finalized, will be used through the media; and an agreement has been made with Hanz Zeidle Foundation and the Nile Media Centers (belonging to the State Information Service) to conduct RE in Matruh governorate in the school year from September 2009 to July 2010.⁴³

Prior to 2008, some very limited RE was conducted by NGOs, and media coverage of the mine issue generated some awareness of the danger of mines and UXO.

Victim Assistance

The total number of mine/ERW survivors is unknown, but is at least 658.⁴⁴ In 2008, the government began a number of initiatives to assist survivors. Previously, very few services were available to survivors. The Executive Secretariat began facilitating the provision of physical therapy to high-priority survivors, supporting the development of a community-based development association for survivors and families of casualties, and initiating vocational and economic support to survivors.

In July 2008, the Executive Secretariat established emergency evacuation procedures for explosion incidents, including a map of all the medical facilities along the northwest coast.⁴⁵ The government also reported the purchase of 609 new ambulances in fiscal year 2007–2008.⁴⁶

In general, however, government health and employment services available to the majority of survivors and persons with disabilities were of poor quality and unevenly distributed.⁴⁷ Services were centralized in cities; few were available in rural and desert areas, where the majority of mine/ERW incidents occur and survivors live. The cost of transportation into cities for medical treatment is unaffordable for some survivors. In Matruh governorate, the most mine/ERW-affected area of the country, infrastructure is poor, social services inadequate, and education levels low. From Matruh, some casualties have to travel up to 150km to reach a hospital. The army-run Al-Agouza Center for Rehabilitation in Agouza was the only provider of comprehensive rehabilitation services in the country.⁴⁸

⁴⁶ State Information Service, Government of Egypt, "Egypt Yearbook 2008," undated, p. 294, www.sis.gov.eg.

⁴⁷ US Department of State, "2008 Country Reports on Human Rights Practices: Egypt," Washington, DC, 25 February 2009.

⁴⁸ *Ibid.*

From the Peace Gardens survey results, the Executive Secretariat identified 206 survivors in need of artificial limbs. In October and November 2008, 27 survivors were provided with artificial limbs and physical rehabilitation through the Al-Agouza Center for Rehabilitation.⁴⁹ Precedence was given to young survivors with a good occupational prognosis.⁵⁰ The Executive Secretariat covered all costs for the survivors to access and receive the artificial limbs.⁵¹ In June 2009, 61 more survivors received artificial limbs at the center.⁵² The New Zealand government provided funds for this initiative.⁵³

On 13 January 2008, the Minister of International Cooperation, who is also Chair of the National Demining and Development Committee, signed a cooperation agreement with the Secretary General of the Social Development Fund to offer 500 job opportunities to mine survivors and families of casualties.⁵⁴ The Social Development Fund was established to finance small and medium-sized projects for persons with disabilities in Egypt, including providing vocational training and capacity-building.⁵⁵ Throughout the reporting period, 33 individual projects tailored to the economic and social needs of survivors were developed through this agreement.⁵⁶ However, by April 2009, no job had been provided to a survivor.⁵⁷

The Executive Secretariat, in coordination with the Office of the Governor of Matruh and with substantive participation of traditional Bedouin chiefs, created the community development association Productive Society for the Survivors of Mines Accidents (PROSSMA) in 2008. PROSSMA planned to coordinate and financially support small and medium-sized enterprises owned by survivors or their families from 2009 onwards.⁵⁸ The governor's office agreed to provide land and financial and administrative support to PROSSMA.⁵⁹

No laws in Egypt prohibit discrimination against persons with disabilities and widespread discrimination was reported in 2008. Law provides that all businesses must designate 5% of their jobs to persons with disabilities. Statistics regarding the implementation of the employment law were unavailable and it was reported by a government official that most employers do not comply.⁶⁰ Egypt ratified the UN Convention on the Rights of Persons with Disabilities on 14 April 2009, but as of 1 July had not signed the Optional Protocol.

Support for Mine Action

Landmine Monitor is not aware of comprehensive cost estimates for meeting mine action needs (including RE and VA) in Egypt. In January 2008, a news report cited Egyptian officials estimating that a sum of \$250 million (€169.8 million) was required for clearance of all areas in Egypt affected by mines and ERW.⁶¹ No other figure has been reported, and no detailed breakdown or explanation of costs has been provided to support the \$250 million estimate.

The MIC has responsibility for developing a resource mobilization strategy to support the North West Coast Development Plan and Mine Action Project including coordination with donors, civil society and the private sector. UNDP supports the MIC in donor coordination and resource mobilization.⁶²

National support for mine action

In 2006, the government of Egypt pledged to provide \$261,730 to the North West Coast Development Plan and Mine Action project along with in-kind support from the Egyptian army and government ministries.⁶³ During 2008, the Egyptian army agreed to provide 250 mine clearance personnel for the demining of two pilot areas within the North West Coast project.⁶⁴

International cooperation and assistance

In 2008, two countries reported contributing a total of \$918,244 (€623,553) via UNDP to mine action in Egypt. Reported funding in 2008 was 25% more than reported funding in 2007.

As of October 2008, UNDP Egypt reported a \$780,200 shortfall in mine action funding. On 30 June 2009, UNDP and MIC agreed on a budget revision that deducted \$770,000 from the budget originally set for the project (of about \$3,148,000).

2008 International Mine Action Funding to Egypt: Monetary⁶⁵

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Germany	UNDP	Mine clearance	\$775,224 (€526,432)
New Zealand	UNDP	Unspecified mine action	\$143,020 (NZ\$200,000)
Total			\$918,244 (€623,553)

In February 2009, China contributed 70 sets of demining equipment and the services of five demining experts to support mine clearance in Egypt.⁶⁶ China has not yet reported a valuation for this assistance.

⁶² UNDP, "Mine Action on Mine Awareness Day: The Government of Egypt and UNDP sign a project document that promises to eradicate all mines from Egyptian soil," Press release, Cairo, 4 April 2008. FINLAND

Ten-Year Summary

In 1997, the Republic of Finland set the goal of joining the Mine Ban Treaty by 2006, but in 2004 pushed the date for accession back to 2012. Finland has voted in favor of every pro-Mine Ban Treaty UN General Assembly resolution since 1997, and has participated in most Mine Ban Treaty meetings. Finland has not been willing to reveal any details about its stockpile of antipersonnel mines, but claims that all mines are in storage and none are deployed in minefields.

Mine Ban Policy

Finland has not acceded to the Mine Ban Treaty. It is the only European Union (EU) country that has not signed, ratified, or acceded to the Mine Ban Treaty. In September 2004, Finland announced that it would join the Mine Ban Treaty in 2012, six years later than its previously stated goal, and would destroy its mine stockpiles by 2016.¹

Finland attended as an observer the Ninth Meeting of States Parties in Geneva in November 2008, where during the general exchange of views it reiterated its intention to join the treaty in 2012 and destroy all stockpiles by 2016.² In March 2009, a Ministry of Defense official confirmed that this timeline had not changed.³ Finland participated in the intersessional Standing Committee meetings in Geneva in May 2009, but made no statements.

On 2 December 2008, Finland voted in favor of UN General Assembly Resolution 63/42, calling for universalization and full implementation of the Mine Ban Treaty. It has voted in favor of all annual pro-ban General Assembly resolutions since 1997.

Finland told Landmine Monitor in June 2008 that it will not submit a voluntary Article 7 report before acceding to the treaty, although other states not party to the treaty have done so.⁴

Finland has declared that it “does not produce or export anti-personnel landmines and, during peacetime, anti-personnel mines are in stockpiles. There are no minefields in Finland.”⁵ Production of antipersonnel mines in Finland ceased in the early 1970s, and Finland has not acquired any antipersonnel mines since then. An EU Joint Action obliges Finland not to procure more antipersonnel mines.⁶ The Ministry of Defense will not reveal details regarding Finland’s stockpile of antipersonnel mines.⁷

¹ The decision to step back from Finland’s long-stated goal to join the treaty in 2006 was included in the Security and Defense Policy Review 2004, which was approved by parliament on 21 December 2004. The goal of joining the treaty by 2006 was first stated in December 1997, reiterated in December 1999 and December 2000, and confirmed by a government report on foreign and security policy approved by parliament in December 2001.

³ Interview with Pentti Olin, Senior Adviser, Ministry of Defense, Helsinki, 25 March 2009.

⁴ Interview with Amb. Kari Kahiluoto, Permanent Mission of Finland, Geneva, 4 June 2008.

⁵ Statement by Erkki Tuomioja, Minister of Foreign Affairs, Conference on Disarmament, “Final Record of the 979th Plenary Meeting,” Geneva, 15 March 2005, CD/PV.979, p.7.

⁶ Ministry of Defense, “Puolustusministeriön Jalkaväkimiinaselvitystyöryhmän Väliraportti” (“Interim report of Ministry of Defense working group on infantry landmines”), 19 December 2003, published 10 February 2004, www.defmin.fi.

⁷ Following entry into force of CCW Amended Protocol II, Finland destroyed some types of antipersonnel mines (Sakaramiina 57 and 61) and adapted others (SM-65). CCW Amended Protocol II Article 13 Report, Form C, 4 December 2000.

Finland has said that it needs to have alternatives to antipersonnel mines in place before joining the treaty.⁸ The Finnish Defense Force has suggested replacing them in part with cluster munitions. In June 2008, a Finnish diplomat confirmed that the option of replacement with cluster munitions is still being considered.⁹ According to the Prime Minister, it needs them to protect its borders.¹⁰ As of June 2009, Finland had not signed the Convention on Cluster Munitions.¹¹

Finland is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It submitted its annual report, as required by Article 13, on 22 September 2008. Finland is also party to Protocol V on Explosive Remnants of War.

Support for Mine Action

Finland reported contributing €4,982,526 (US\$7,337,268) to mine action in 2008, an increase of approximately 37% compared to 2007 and nearer to average funding levels for 2006 and earlier years.¹²

2007 International Mine Action Funding by Finland: Monetary¹³

Recipient	Implementing Agencies/ Organizations	Project Details	Amount
Afghanistan	UN Mine Action Service (UNMAS), HALO Trust	Landmine and ERW survey, mine clearance	\$3,092,460 (€2,100,000)
Cambodia	Handicap International, HALO, Norwegian People's Aid	Mine/UXO victim information system, mine clearance	\$1,568,319 (€1,065,000)
Angola	HALO, ICRC, FinnChurchAid	Mine clearance, victim assistance	\$1,178,080 (€800,000)
Global or Other	UNMAS, Geneva International Centre for Humanitarian Demining, KEO-70	Core funding, monitoring visits	\$614,849 (€417,526)
Ethiopia	Norwegian People's Aid	Mine detection dog capacity, technical survey	\$294,520 (€200,000)
Iraq	ICRC	Victim assistance	\$294,520 (€200,000)
Somaliland	HALO	Mine clearance	\$294,520 (€200,000)
Total			\$7,337,268 (€4,982,526)

Finland directed funding to Iraq in 2008 but not in 2007. All other states and Somaliland received funds in both 2007 and 2008.

⁸ See *Landmine Monitor Report 2007*, p. 821. The Security and Defense Policy Review 2004 stated that the Finnish Defense Force would be provided with €200 million in extra funding over eight years for replacements for landmines, and the army would have to allocate an additional €100 million. The replacement process is to start in 2009 and continue until 2016. The Review proposed to replace antipersonnel mines with close combat weapons and sensors.

GEORGIA

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Scattered mines and significant UXO contamination following the armed conflict with Russia in August 2008
Estimated area of contamination	Unknown
Casualties in 2008	35 (2007: Unknown)
Estimated mine/ERW survivors	Unknown but at least 591
Demining in 2008	BAC: At least 7.89km ²
Risk education recipients in 2008	44,000
Support for mine action in 2008	\$8,705,885

Ten-Year Summary

Georgia has not acceded to the Mine Ban Treaty, although it has expressed support for it and has voted in favor of every annual UN General Assembly resolution calling for universalization of the treaty. Georgia has had an official moratorium on the use of antipersonnel mines in place since September 1996. However, it appears that Georgian Armed Forces used antipersonnel mines every year from 2001 to 2004, and in 2006 in the upper Kodori Gorge.

Georgia remains contaminated by mines and explosive remnants of war (ERW) including cluster munition remnants. Contamination is primarily a result of conflict over the breakaway areas of Abkhazia and South Ossetia, most recently in August 2008, as well as from minefields around former Soviet military bases handed over to Georgia by Russia. As of 2009, a national mine action program was being established with international support.

The number of mine/ERW casualties decreased from more than 100 in 1999 to 35 in 2008. However, since Georgia has lacked a casualty data collection system, casualties are recorded from media sources, which is probably not reliable. Emergency risk education was conducted after the August 2008 conflict; previous activities were limited. Planned ICRC handover of the main prosthetics provider to local ownership was hampered by insufficient revenue and delayed state funding. There were no significant improvements in emergency medical care, psychological support, social or economic reintegration, or laws. Positive public policy measures were taken, however, to address the rights of persons with disabilities, including mine survivors. Most healthcare and other services to persons with disabilities were provided by the state, but were inadequate. Few victim assistance services were provided by NGOs.

Mine Ban Policy

Georgia has not acceded to the Mine Ban Treaty. Georgia has not made notable public statements regarding its landmine policy since April 2007, although it has continued to participate in Mine Ban Treaty meetings, including the Ninth Meeting of States Parties in Geneva in November 2008 and the intersessional Standing Committee meetings in May 2009.

Over the years, Georgia has frequently stated its general support for a ban on antipersonnel mines. It has voted in favor of the annual UN General Assembly resolution calling for universalization of the Mine Ban Treaty every year since 1997, including Resolution 63/42 on 2 December 2008. In April 2007, Georgia stated “Georgia is well aware that the negative impact of landmines far outweighs their military value, and tries to make its possible contribution in facilitation of the process of elimination and eradication of this threat...Georgia fully shares

the principles and objectives of the Ottawa Convention and the concern of the international community regarding the challenge of anti-personnel landmines.”¹

At the same time, Georgia has consistently said that it has refrained from joining the Mine Ban Treaty due to its inability to fulfill the treaty’s obligations in disputed territories not controlled by the government—Abkhazia and South Ossetia.² In a September 2008 meeting with the ICBL, and in March 2009 communications with Landmine Monitor, Georgian officials reiterated this as a reason for not acceding to the treaty.³

Georgia is party to the Convention on Conventional Weapons, and joined Amended Protocol II on landmines on 8 June 2009 and Protocol V on Explosive Remnants of War on 22 December 2008.⁴ It had previously said it could not adhere to Amended Protocol II for the same reasons as the Mine Ban Treaty.⁵

Georgia has not signed the Convention on Cluster Munitions.⁶

Use

Georgia has had an official moratorium on the use of antipersonnel mines in place since September 1996.⁷ In April 2007, a representative from the Georgian Ministry of Foreign Affairs told States Parties, “Since that time [1996] corresponding official structures of Georgia have been strictly refraining from use of anti-personnel mines. I have the chance to confirm my country’s firm resolution to keep this commitment in the future.”⁸

Despite its denial of past use, it appears that Georgian Armed Forces used antipersonnel mines every year from 2001 to 2004, as well as in 2006 (see below).⁹ Opposition forces and Russian peacekeepers also alleged that Georgian forces laid mines in South Ossetia in 2006 and 2007. Landmine Monitor has not been able to confirm the allegations.¹⁰

¹ Statement by George Dolidze, Deputy Director, Department for Security Policy and Euro-Atlantic Integration, Ministry of Foreign Affairs, Standing Committee on the General Status and Operation of the Convention, Geneva, 23 April 2007.

² For example, in September 2006, Georgia told States Parties, “Over the years, one of the principle reasons for not acceding to the Convention has been the existence of...territories uncontrolled by the central authorities of the state and therefore, incapability to fulfill the obligations put forward in the convention. However... discussions concerning the possibility of reconsideration of the above-stated position have started.” Statement of Georgia, Seventh Meeting of States Parties, Geneva, 21 September 2006.

³ Internal Report on ICBL Meeting with the Permanent Mission of Georgia to the UN in Geneva, 23 September 2008; email from George Dolidze, Ministry of Foreign Affairs, 31 March 2009; and email from Kartlos Koranashvili, Deputy Head of Administration, Department of International Relations and Euro-Atlantic Integration, Ministry of Defense, 23 March 2009.

⁴ Each protocol enters into force for Georgia six months after these dates on which it formally gave its consent to be bound.

⁵ Statement by George Dolidze, Ministry of Foreign Affairs, Standing Committee on the General Status and Operation of the Convention, Geneva, 23 April 2007.

⁶ For details on cluster munitions policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 205–207.

⁷ The moratorium was proclaimed by President Eduard Shevardnadze at the UN in September 1996 and has been repeated by officials many times since. See *Landmine Monitor Report 1999*, p. 792; and Note Verbale to the OSCE, 17 January 2001.

⁸ Statement by George Dolidze, Ministry of Foreign Affairs, Standing Committee on the General Status and Operation of the Convention, Geneva, 23 April 2007. Georgia has made similar statements previously. See Statement of Georgia, Seventh Meeting of States Parties, Geneva, 21 September 2006; and *Landmine Monitor Report 2006*, p. 890. In May 2005, the Ministry of Defense stated that the operational plan of the Georgian Armed Forces does not include mine use. ICBL meeting with David Sikharulidze, Deputy Minister, Ministry of Defense, Tbilisi, 25 May 2005.

⁹ See *Landmine Monitor Report 2005*, pp. 706–707; and *Landmine Monitor Report 2004*, pp. 968–969.

¹⁰ See *Landmine Monitor Report 2007*, pp. 826–827. In June 2008, South Ossetian authorities blamed Georgia for laying a mine which killed a boy outside Tskhinvali. Georgian authorities responded that the Russian mine type in the incident is not one held in their arsenal. “Separatists Accuse Georgia of Placing Mines in Conflict Zone,” *Georgian Mze TV*, 15 June 2008, georgiandaily.com.

There were allegations of use of antipersonnel mines by both Georgia and Russia during the heavy fighting related to South Ossetia in August 2008.¹¹ Each side has denied the allegations.¹² Human Rights Watch conducted extensive on-the-ground research in Georgia during and after the conflict in 2008, but was not able to confirm any use of antipersonnel mines. Both sides did, however, use cluster munitions, causing numerous civilian casualties.¹³

Upper Kodori Gorge

The Kodori Gorge is a narrow river valley in the Zemo-Abkhazia administrative region adjoining the Abkhazia breakaway region of Georgia. Paramilitary organizations allied with Georgia occupied the northern section of the gorge in mid-2006. In mid-July 2006 new conflict erupted after a paramilitary leader refused to disarm and declared autonomy from Georgia. Georgian security forces responded by invading the gorge and seizing control of its northern section. There were reports and allegations of mine use by both Georgian forces and paramilitary units.¹⁴

While not referring specifically to the Kodori Gorge operation, Georgia told Mine Ban Treaty States Parties in statements made in September 2006 and again in April 2007 that it had not used antipersonnel mines since 1996.

During the 2008 conflict, Abkhazian and Russian forces moved into the upper Kodori Gorge and retook it from Georgian forces. The British NGO HALO Trust has confirmed to Landmine Monitor that it encountered minefields suspected to be laid since 2006 containing antipersonnel mines in parts of the upper Kodori Gorge when it gained access to the area after the August 2008 conflict.¹⁵

Production, transfer, and stockpiling

Georgian officials maintain that Georgia has never produced, exported, or imported antipersonnel landmines since independence in 1991.¹⁶ Georgia inherited what is believed to be a small stockpile of antipersonnel mines from the former Soviet Union, but the exact size and composition of that stock remains unknown.¹⁷ Georgian officials have said in the past that the moratorium on use (see above) also covers production and transfer.¹⁸

¹¹ For allegations on both sides, see politicalminefields.wordpress.com. Georgia provided the ICBL and others with a document titled “Bombed and Mined Areas During Russian Occupation (from August 7, 2008),” dated 26 August 2008, that alleges Russian use of antipersonnel mines in at least eight locations from 7 August to 21 August 2008. See also, Georgian Ministry of Foreign Affairs, “RF delays in the withdrawal of its military forces,” 18 August 2008, georgiamfa.blogspot.com; “Russian Troops Remain, But with Lighter Presence,” *Washington Post*, 21 August 2008, www.washingtonpost.com; and HRW interview with Batu Kutelia, First Deputy Minister, Ministry of Defense, Tbilisi, 22 August 2008.

¹² An official from the Georgian Ministry of Defense said that the Georgian Armed Forces did not use mines during the conflict. Email from Kartlos Koranashvili, Ministry of Defense, 23 March 2009. An official from the Russian Ministry of Foreign Affairs wrote, “Despite Georgian aggression in South Ossetia, the Russian Federation did not employ the use of cassette [cluster] bombs or antipersonnel landmines.” Letter from Andrei Kelin, Director, Fourth Department of CIS Countries, Ministry of Foreign Affairs of the Russian Federation, 30 January 2009.

¹³ HRW, “A Dying Practice: Use of Cluster Munitions by Russia and Georgia in August 2008,” April 2009, www.hrw.org.

¹⁴ At the time, Russian peacekeepers alleged that Georgian forces laid new mines near a new Georgian checkpoint, on the northern side of Broken Bridge, the point of separation between Abkhazian and Georgian controlled sections of the gorge. Abkhazian officials accused Georgian troops of mining roads and bridges in the upper part of the gorge.

¹⁵ Emails from HALO, 7 August 2009 and 9 July 2009.

¹⁶ Statement by George Dolidze, Ministry of Foreign Affairs, Standing Committee on the General Status and Operation of the Convention, Geneva, 23 April 2007. Georgia has said this many times in the past.

¹⁷ ICBL meeting with David Sikharulidze, Ministry of Defense, Tbilisi, 25 May 2005. In August 2007, Georgia said that it had recovered an undisclosed number of antipersonnel and antivehicle mines from a former Russian Army base in Akhalkalaki. Pavel Belov, “Russians Leave Cesium and Landmines Behind in Georgia,” *Kommersant*, 17 August 2007, www.kommersant.com.

¹⁸ Statement to the ICBL-Georgia Committee by David Nardaia, Head, Department on International Cooperation, Ministry of Defense, Tbilisi, October 2006. A similar statement was made during the international workshop “Regional Cooperation and Confidence Building through Mine Action,” Tbilisi, 4–6 October 2005.

South Ossetia

South Ossetia is a breakaway region of Georgia that shares a border and has very close ties with Russia.¹⁹ South Ossetian officials have not made any public statements about a mine ban and have not taken any unilateral steps to ban antipersonnel mines. Prior to the 2008 conflict, South Ossetia was judged to have only a minor landmine problem. The armed conflict between Georgia and Russia over South Ossetia lasted one week in August 2008. As noted above, there is no evidence that either side used antipersonnel mines during the conflict. However, both used cluster munitions and a wide variety of other weapons that left behind extensive ERW contamination in South Ossetia and other parts of Georgia.

Georgia and Russia are both party to CCW Protocol V on Explosive Remnants of War.²⁰ Under this instrument, the duties of user states include “provid[ing] where feasible” assistance for ERW clearance. Affected States Parties must also take “all feasible precautions” to protect civilians, including through risk education, and all States Parties “in a position to do so” must provide assistance for clearance and risk education.

Scope of the Problem

Contamination

Georgia is affected by landmines and ERW, although the full extent of the problem was not yet publicly known, pending the completion of a General Mine Action Assessment (see below). Most of the contamination is a legacy of armed conflict over the breakaway areas of Abkhazia and South Ossetia. The conflict in August 2008 added new ERW contamination, including cluster munition remnants.²¹

The bulk of the problem in Georgia comes from mines laid around former Russian military bases. HALO surveyed Georgia, where military restrictions permitted access, in 2004. HALO found an “immediate requirement for clearance” around Sagarejo military base about 45km east of the capital, Tbilisi, due to a remaining PFM-1 and PFM-2 mine threat in the woodlands surrounding the base used by locals.²² As of July 2008, however, funding for the clearance project had not been secured.²³ All former Russian military bases on territory under Georgian control have been closed and transferred to Georgia: the last of these was handed over in November 2007.²⁴ According to the Georgian Ministry of Defense, suspected mined areas are located in Akhalqalaqi, Gonio Range, Kopitnari, Mtskheta, Osiauri, Sagarejo, Telavi, and Vaziani.²⁵ There is also contamination in areas around the “Red Bridge” on the border between Azerbaijan and Georgia.²⁶

¹⁹ During the Soviet era, South Ossetia was an autonomous region of the Georgian SSR. In autumn 1990 it proclaimed full sovereignty within the USSR. Georgia’s government reacted by abolishing the autonomous status of South Ossetia in December 1990, leading to armed conflict in 1991–1992. The conflict culminated with South Ossetia’s *de facto* secession from Georgia in 1992. In June 1992 a cease-fire brokered by Russia created a Joint Control Commission and Joint Peacekeeping Forces, with Georgian, Russian, and Ossetian units. Tensions escalated in 2004 after Georgia decided to prioritize the restoration of its territorial integrity, with increased instability and occasional skirmishes. Relations between Georgia and Russia also became increasingly strained. See HRW, “Up in Flames: Humanitarian Law Violations and Civilian Victims in the Conflict over South Ossetia,” January 2009, pp. 16–20.

²⁰ Russia formally submitted its consent to be bound by the Protocol on 21 July 2008, and the instrument took effect for it on 21 January 2009. Georgia gave its consent to be bound on 22 December 2008, and it entered into force on 21 June 2009. After agreeing to be bound, the countries must not “defeat the object and purpose” of the Protocol, even prior to entry into force.

²¹ See *Landmine Monitor Report 2007*, p. 839; and “UN warns Georgia returnees of uncleared land mines,” *AP* (Geneva), 26 August 2008, www.ihl.com.

²² Email from Matthew Hovell, HALO, 6 September 2009.

²³ See *Landmine Monitor Report 2008*, p. 839; and email from Matthew Hovell, HALO, 2 July 2008.

²⁴ See *Landmine Monitor Report 2008*, p. 840; and telephone interview with Kartlos Koranashvili, Ministry of Defense, 23 June 2008.

²⁵ Email from Irakli Kochashvili, Deputy Head, International Relations and Euro-Atlantic Integration Department, Ministry of Defense, 6 September 2009.

²⁶ Interview with George Dolidze, Ministry of Foreign Affairs, in Geneva, 28 May 2009. HALO’s survey of the area found a barrier minefield approximately 7km long.

Assessments prior to the conflict had concluded that the mine problem in South Ossetia was minor and its impact low. Following the armed conflict in August 2008, there was evidence of a potentially significant problem with UXO in South Ossetia and elsewhere in Georgia, although its full extent was not known. A 20km-wide corridor between Gori and Tskhinvali where the bulk of the conflict took place was particularly affected. According to HALO, this area has been contaminated with cluster munition remnants, S-8 and BM-21 rockets, and abandoned ammunition.²⁷ HALO has found three types of unexploded submunitions: the AO-2.5 RTM, 9N210, and M095.²⁸ As of June 2009, HALO estimated that up to 9km² of primarily agricultural land would require clearance.²⁹ HALO would like to undertake a detailed assessment mission in South Ossetia in 2009.³⁰ As of mid-August, however, it had not been granted access.³¹

In addition to the contamination centered on South Ossetia, other areas were bombed including the upper Kodori Gorge.³² There is also a threat from UXO, including cluster munition remnants, in Poti harbor, which is used by the coast guard, and which was bombed during the conflict.³³

Casualties

In 2008, Landmine Monitor identified new 26 casualties due to mines, submunitions, and other ERW in 13 incidents, including nine people killed and 17 injured. Most casualties were men (17), one was a woman, and the gender of one adult was unknown. The remaining eight were children (six boys, one girl, and one of unknown gender). Eight casualties were police and the other 18 civilian. No demining casualties were reported. Five casualties were caused by antipersonnel mines, two by an antivehicle mine, seven by unspecified mines, seven by submunitions, and five by unknown devices. The most common activities at the time of the incident were: collecting scrap metal (seven) and collecting wood and handling explosive devices (five each). Of the total, eight casualties were recorded in South Ossetia in four incidents. Six were police casualties (including five in one incident) and the other two were children.³⁴

This is an increase compared to 2007 when only three people were injured by mines in South Ossetia. Due to a lack of comprehensive data collection, however, the total number of casualties in 2008 is not known.

In 2008, another 11 civilian casualties were reportedly injured in four mine incidents while crossing the border area of the Gali district of Abkhazia into Georgia. Casualties from at least from three of those incidents received medical care in Georgia.³⁵

In addition, one Georgian soldier was killed by what appears to have been a landmine in Iraq in June 2008; it was not known if the device was command-detonated.³⁶

³¹ Email from Matthew Hovell, HALO, 11 August 2009.

³² HALO, "Caucasus & Balkans, Georgia, The Problem," www.halotrust.org.

³³ "NPA Georgia Operations Overview," Presentation by Jonathon Guthrie, Program Manager, Georgia BAC, NPA, 31 March 2009.

³⁴ Information based on Landmine Monitor media monitoring between 1 January and 31 December 2008.

³⁵ These casualties have been included in the total for Abkhazia for 2008. See report on Abkhazia in this edition of Landmine Monitor.

³⁶ See *Landmine Monitor Report 2008*, p. 841.

According to Human Rights Watch (HRW), at least 16 civilians were killed and 54 injured during cluster munition strikes during the 2008 conflict.³⁷ These casualties of direct cluster munition use are not included in the total mine/ERW casualties for 2008.³⁸

Casualties continued to occur in 2009, with six casualties reported to mid-June (three killed and three injured). Three casualties were men and three were women. Mines caused four casualties and ERW two.³⁹

There is no complete account of casualties for the period since 1999. Between 2001—the start of ICBL Georgian Committee (ICBL-GC) data collection—and the end of 2008, Landmine Monitor identified 387 casualties (104 killed, 267 injured, and 16 unknown). ICBL-GC recorded 383 casualties based primarily on media coverage from 2001 to May 2007, when it ceased reporting. However, the reliability of the information gathered was questioned and no verification of the data was subsequently undertaken. HALO recorded 27 mine casualties in Georgia, excluding Abkhazia, between 2001 and 2005.⁴⁰ Casualties decreased from 111 in 2001 to 16 in 2005. After this period casualties appeared to be on the rise again but adequate reporting was not available.⁴¹

In 2009, the Georgian Foundation for Prosthetic and Orthopedic Rehabilitation (GEFPOR) reported that it had registered at least 591 amputee mine survivors, including survivors from past conflicts since World War II.⁴² In 2007, GEFPOR provided details on 357 amputee mine/ERW survivors injured from past conflicts.

Risk profile

Since August 2008 the risk to people from ERW, particularly unexploded submunitions, has increased significantly. People engaged in “community clearance” are at risk but, according to HRW, “Despite the risk, locals say they are driven to clear by the need to protect their families and work in the field.”⁴³ People also remain at limited risk from mines, particularly near the Inguri river that divides Abkhazia from the rest of the country.⁴⁴

Program Management and Coordination

Mine action

As of mid-2009, a formal mine action program was being established in Georgia, and coordination was somewhat confused, with a variety of national and international actors engaged in two, seemingly parallel initiatives.

On 9 October 2008, a Memorandum of Understanding was signed between the Georgian Ministry of Defense and the United States-based organization, the Information Management & Mine Action Programs (iMMAP).⁴⁵ iMMAP was tasked by the US Department of State to support the Georgian government, in particular by establishing an Explosive Remnants of War Coordination Center (ERWCC).

³⁷ HRW, “A dying practice: use of cluster munitions by Georgia and Russia in August 2008,” New York, April 2009, pp. 1, 40, 54.

³⁸ Landmine Monitor total casualty figures include only individuals killed or injured in incidents involving explosive devices unintentionally detonated by the presence, proximity, or contact of a person. Casualties of other weapons of war and targeted weapons, including cluster munitions during strikes have not been included in totals. The future entry into force of the Convention on Cluster Munitions may result in a reassessment of how cluster submunition casualties are defined.

³⁹ Information based on Landmine Monitor media monitoring between 1 January and 15 June 2009.

⁴² Email from Marika Kalmakhelidze, Public Relations Manager, GEFPOR, 24 April 2009.

⁴³ HRW, “A dying practice: Use of cluster munitions by Russia and Georgia in August 2008,” April 2009, p. 74.

⁴⁴ Information based on Landmine Monitor media monitoring between 1 January and 31 December 2008.

⁴⁵ “Americans will help to demine the territory of Georgia,” *Newsru.com*, 10 October 2008, www.newsru.com.

The official opening of the ERWCC was held on 25 February 2009 in Tbilisi.⁴⁶ According to Giorgi Muchaidze, Georgia's Deputy Minister of Defense, who spoke at the launch, "It is more important to reorganize the above mentioned office as a national mine action centre, which would be [a] step forward for struggling with this problem."⁴⁷ It is envisioned that the ERWCC will ultimately become a nationally owned endeavor, supported by international technical advisors, to address Georgia's ERW problem. The future development of ERWCC will see the addition of a national director and other local managerial staff.⁴⁸ As of mid-2009, ERWCC/iMMAP was hosting weekly operational coordination meetings with mine action actors in Georgia.⁴⁹

A second mine action coordination initiative is located within the Georgian Ministry of Defense, which was working to establish its Georgian Mine Action Center (GMAC) as a national entity.⁵⁰ The Georgian Ministry of Defense initially responded to the need for mine action coordination by setting up a mine action cell within Joint Staff of the Georgian Armed Forces in the J-3 Operations Department in October 2008. The Ministry of Defense planned to expand the national coordination capacity and transform the mine action cell from military to civilian oversight.

On 23 October 2008, a two-year Memorandum of Understanding on "humanitarian mine action assistance" was signed between the Georgian Ministry of Defense and the Slovenia-based International Trust Fund for Demining and Mine Victims Assistance (ITF). The ITF initiated a national capacity-building program in January 2009. The ITF's contributors—the Czech Republic, Hungary, and Slovenia—have supported a program to train staff and set up a national mine action center, in coordination with the Ministry of Defense and ERWCC/iMMAP.

Risk education and victim assistance

There was no coordination body for risk education (RE) or victim assistance (VA) in 2008. The ERWCC has a mandate to coordinate RE.⁵¹ In early 2009, iMMAP made preparatory measures to also take on victim assistance coordination.⁵² The Ministry of Labor, Health and Social Affairs (MoLHSA) of Georgia is responsible for coordination of disability issues.⁵³

Data collection and management

Upon request from the Georgian Ministry of Defense, the Geneva International Centre for Humanitarian Demining (GICHD) provided the ministry with the Information Management System for Mine Action (IMSMA). The installation of the system and adequate training of the national personnel was carried out by iMMAP.⁵⁴ GICHD trained two ERWCC staff in the latest version of the database. These two staff members (one local and one international) have in turn conducted training for Georgian counterparts in Tbilisi including the ministries of defense, internal affairs, and health, as well as a number of international organizations engaged in the mine action program.⁵⁵

There was no mine/ERW data collection system in Georgia in 2008. In early 2009, iMMAP collected information on survivors from GEFPOR and the state prosthetic center, and was planning to standardize data for use in IMSMA.⁵⁶

Plans

Strategic mine action plans

Norwegian People's Aid (NPA) implemented a four-month General Mine Action Assessment, which was due to be completed by end-2009. This information will assist the ERWCC to develop a strategic mine action plan and determine national priorities.⁵⁷ The assessment would be complemented by an underwater survey of Poti harbor.⁵⁸

The short-term priority for the Georgian Ministry of Defense was to clear all areas contaminated during the August 2008 conflict. It then planned to establish a national mine action authority to manage mine action nationwide as well as to carry out quality management of clearance and issue the requisite certificates.⁵⁹

The long-term aim is to develop demining capabilities in accordance with the International Mine Action Standards (IMAS) to clear all of Georgia, and to develop a stronger VA capacity.⁶⁰ In response to a request by Georgia for assistance in dealing with its ERW problem from the August 2008 conflict, as of March 2009, NATO's Maintenance and Supply Agency was seeking to set up a project to be led by Estonia and Lithuania to develop the skills of the Military Engineer Brigade of the Georgian army in humanitarian demining and ERW clearance. The project, which was expected to start before the end of 2009, will involve provision of modern EOD training and equipment.⁶¹

In December 2008, the Georgian parliament reviewed a Concept Paper on the Social Integration of Persons with Disabilities as a first step toward signing the UN Convention on the Rights of Persons with Disabilities and the introduction of a national disability plan for Georgia. The government is required to develop a national disability action plan based on the articles of the paper and submit it to parliament by September 2009. It also needed to revise

relevant legislation and propose actions for implementation of the plan by November 2009.⁶² The concept paper had been developed by the Coalition for Independent Living, a national coalition of disabled persons' organizations, in cooperation with MoLHSA.⁶³

National ownership

Commitment to mine action and victim assistance

Georgia has stated its commitment to eradicating the mine threat in the country and has been cooperating with international organizations to address the threat from ERW.⁶⁴ On 10 October 2008, the Joint Staff of the Georgian Armed Forces (J-3) created a section to deal with the mine problem.⁶⁵ As of mid-2009, however, there was not yet a fully operational mine action program in Georgia, and no national authority responsible for mine action. Previously, the Ministry of Defense had announced plans to elaborate a mine action strategy and establish a mine action center, which would be managed in accordance with "the relevant principles of the Mine Ban Treaty and CCW Amended Protocol II."⁶⁶

National mine action legislation and standards/Standing operating procedures

As of June 2009, there was no national mine action legislation in Georgia.⁶⁷ Soviet standing operating procedures are currently used for demining by Georgian military personnel, which use a range of military breaching techniques, although personnel are said to have been trained to NATO standards as well. According to a Georgian Ministry of Defense official, in the future Georgia would like to adopt demining procedures that meet IMAS requirements.⁶⁸ No national standards had been adopted as of June 2009, although iMMAP had reported taking a lead in their development.⁶⁹

Demining and Battle Area Clearance

Demining and battle area clearance were carried out in 2008 by Georgian military deminers and two international NGOs: HALO and NPA. Clearance of populated areas, roads, and railroads remains the responsibility of the Ministry of Internal Affairs, while the special engineering unit of the Ministry of Defense is responsible for clearing military areas. Both were engaged in clearance operations of cluster munition remnants and other UXO after the August 2008 conflict.⁷⁰ When Russian forces withdrew from Gori and Kareli districts, the Georgian military stepped in with an engineering unit of 80 deminers.⁷¹ Georgian clearance personnel reportedly focused on surface clearance, handing over affected areas to international deminers to do subsurface clearance.⁷²

As of February 2009, however, Georgian military clearance personnel had ceased operations, but NPA was training 26 national deminers to start work in March 2009.⁷³ NPA signed a Memorandum of Understanding (MoU) with the Ministry of Defense in September 2008⁷⁴ and

an implementing agreement was signed between the two parties on 20 February 2009.⁷⁵ To expedite the process, NPA brought in experienced deminers who had worked previously in Bosnia and Herzegovina and Lebanon. The MoU was due to expire in September 2010 and the implementing agreement to conduct battle area clearance will expire on 12 December 2009. NPA is not conducting mine clearance in Georgia, only battle area clearance (BAC).⁷⁶ NPA clears submunitions to a depth of 30cm.⁷⁷ It expected to continue clearance in Georgia until at least September 2009.⁷⁸

HALO started clearance operations immediately after the conflict because it had already established a demining program in Abkhazia.⁷⁹ A new MoU between the Georgian Ministry of Defense and HALO was signed on 5 September 2008.⁸⁰ As of February 2009, HALO had 40 teams of 6 deminers working in Georgia.⁸¹

Battle area clearance in 2008⁸²

Demining operators	BAC (km2)	Unexploded submunitions destroyed	Other UXO destroyed
NPA	1.11	35	2
HALO Trust	6.78	631	94
Ministry of Defense	N/R	687	more than 2,200

N/R = not reported

Other international demining personnel were also involved in BAC following the August 2008 conflict. According to the Georgian Ministry of Defense, before their withdrawal, Russian military forces conducted clearance of mined areas around their checkpoints. Civilians reported clearance by Russian troops in Disti, Kvemo Khviti, Meurneoba, Tirdznisi, Variani, Varianis, and Zemo Khviti.⁸³ They have not reported in detail on their clearance as of 1 July 2009, although statements to the CCW cited clearance by EMERCOM personnel of 3,000 items of ERW from 3 August to 16 September 2008.⁸⁴

⁸¹ HRW, "A Dying Practice, Use of Cluster Munitions by Russia and Georgia in August 2008," April 2009, p. 72; and email from Matthew Hovell, HALO, 6 September 2009.

⁸² "NPA Georgia Operations Overview" Presentation by Jonathon Guthrie, NPA, 31 March 2009 and email from Jonathon Guthrie, 8 September 2009; and email from Andrew Moore, Program Manager, HALO, 14 August 2009. HALO also reported 67,889m² of subsurface BAC as well as the destruction of 694 items of stray ammunition and 300 items of small arms ammunition. The Georgian Ministry of Defense has reported that the Engineering Battalion of the Georgian Armed Forces has disposed 687 unexploded submunitions and more than 2,200 other items of UXO, but did not specify the period during which clearance took place. Email from Irakli Kochashvili, Ministry of Defense, 6 September 2009.

⁸³ HRW, "A Dying Practice, Use of Cluster Munitions by Russia and Georgia in August 2008," April 2009, p. 62.

⁸⁴ Statements of Russian Federation, CCW Group of Governmental Experts on Cluster Munitions, Geneva, 1 September 2008, and CCW Group of Governmental Experts on Protocol V, 23 April 2009 (Notes by Landmine Action); see also Russian Embassy to Cambodia, "An update on the humanitarian relief efforts of the Russian Federation aimed at providing assistance to civilian population of the South Ossetia affected by the conflict in the region," undated, www.embrusscambodia.mid.ru; and UN OCHA, "Situation Report No. 7 on the Situation in Georgia," 25 August 2008, www.reliefweb.int.

On 6 September 2008, five Estonian explosive ordnance disposal specialists were deployed in the east and south of Georgia to help locate and disarm UXO left over from the conflict. The Estonian personnel cleared a number of items of UXO before leaving the same month.⁸⁵ In addition to demining activity the specialists helped Georgia in building the mine clearance system and carried out relevant training sessions.⁸⁶

Local people have also tried to clear items of UXO. Despite the risks, locals say they are driven to clear by the need to protect their families and to work in their fields.⁸⁷

Quality management

One of the biggest initial challenges facing deminers was said to have been a lack of coordination among the demining operators, which used different methods of clearance. As described above, the Georgian military focused on (faster) surface clearance, while the international organizations adopted a slower, more thorough approach, including proper record keeping.⁸⁸

Both HALO and NPA have their own internal quality assurance (QA) and quality control (QC) procedures. NPA has requested the ERWCC to conduct QA/QC prior to handover of land.⁸⁹ As of June 2009, the ERWCC was said to be conducting external QA and QC activities and was in the process of establishing and developing a national quality management capacity.⁹⁰

Risk Education

In response to the August 2008 conflict and the new ERW contamination, two emergency RE programs were launched by the ICRC and HALO, together with UNICEF and the Ministry of Education. Activities included mass media broadcasts; RE presentations in communities, centers for internally displaced persons, and schools; and distribution of materials. Until 10 October 2008, the ICRC was the only organization able to implement RE in the “buffer zone” (the zone between the north of Gori and South Ossetia, controlled by Russia in August until 10 October 2008). Once the buffer zone opened up, HALO also started activities there.⁹¹ More than 44,000 people were reached, including in 180 schools.⁹² HRW noted that, “Witness testimony and the limited number of civilian casualties from duds suggest that these programs may have been successful in at least some cases.”⁹³

A hotline number to report contamination to police was aired on television and printed on flyers.⁹⁴ At the request of several mine clearance organizations, the ICRC supplied signs to mark contaminated areas.⁹⁵

Limited RE was conducted between 1999 and 2006 by the ICBL-GC, Ministry of Education, and HALO, with support from UNICEF and the ICRC. In 1999, the ICBL-GC began a campaign working with the local government in the western Zugdidi region. In 2001, Georgia reported that RE was conducted in schools, but the ICBL-GC found that only very limited RE was conducted, without support. In 2003, HALO started an RE program particularly targeting people illegally crossing the border with Abkhazia, then expanding to focus on areas around former military bases. Information gathered by HALO in 2004 found that many people had not received RE and were unaware, uninformed, and at times reckless. In early 2006, HALO ended its activities due to lack of funding.

Victim Assistance

The total number of mine/ERW survivors is not known but reportedly numbers at least 591.⁹⁶ The medical and rehabilitation sectors in Georgia continued to suffer from lack of funding, poor infrastructure and equipment, inadequate and low-quality services, and additional payments for services. Psychological support and economic reintegration opportunities were lacking. Little progress was made in enforcing legislation or implementing plans to improve the lives of persons with disabilities including mine survivors. However, progress was made in NGO-government coordination and policy making.⁹⁷

Persons with disabilities, including landmine survivors, have little access to adequate quality medical services or community-based alternatives.⁹⁸ Since 2006, health system capacity was being enhanced with World Bank loans, which were extended to the end-2010. However, government privatization of the health sector posed a substantial risk to equal availability of services.⁹⁹ In response to the 2008 conflict, the ICRC supported two hospitals in central and western Georgia assisting weapon-injured patients. The ICRC also provided minor repairs to Tskhinvali hospital, located within the 2008 conflict zone.¹⁰⁰

Access to rehabilitation and prosthetics services and other necessary devices is generally insufficient.¹⁰¹ GEFPOR provides services including prostheses free of charge to landmine survivors. People from isolated areas pay for their transport and there is limited accommodation at the center for them. GEFPOR has the only technicians trained to the International Society for Prosthetics and Orthotics' category II in Georgia; one is a mine survivor. Due to ongoing financial difficulties and delayed government funding, some 130 people were on a waiting list for devices in May 2009. There was no reported increase in beneficiaries requiring prostheses as a result of the recent conflict. In accordance with its sustainability planning, GEFPOR produces devices using ICRC technology. In addition, Otto Bock brand prostheses are sold as part of a cost recovery system. Technicians received training from the ICRC and the Otto Bock company in 2008.¹⁰² The ICRC continued to cover approximately one-third or more of GEFPOR's costs and continued to cover prosthetic treatment costs at the Vladikavkaz Orthopedic Center in Russia. The ICRC also provided training on psychological support to physiotherapists.¹⁰³

There is a recognized shortfall of specialized personnel in the field of psychological support and social reintegration, including social workers, occupational therapists, and psychological assistance workers. There is little access to inclusive education, continuing education, and

⁹⁶ Email from Marika Kalmakhelidze, GEFPOR, 24 April 2009. However, this figure reflects the number of registered mine survivors that are in need of some orthopedic device. Casualties that do not need for example an amputation might never visit the GEFPOR centre and thus would never be registered.

vocational training. Georgia lacks teachers with experience in addressing the needs of persons with disabilities and no special training is available.¹⁰⁴

The Law on the Social Protection of the Disabled was not fully implemented and persons with disabilities faced discrimination in employment, education, and access to services.¹⁰⁵ The mobility and social participation of persons with disabilities was inadequate.¹⁰⁶ Many persons with disabilities, including amputees and mine survivors, rarely leave their homes.¹⁰⁷

In May 2009, the MoLHSA hosted a three-day regional workshop organized by the ICRC and the ITF on comprehensive approaches to rehabilitation and reintegration services for mine victims and other persons with disabilities. Participants attended from Armenia, Azerbaijan, Georgia, and Tajikistan and well as Albania, Bosnia and Herzegovina, and Slovenia. One of the objectives of the workshop was to initiate discussions on developing comprehensive national VA program in Georgia. The ITF planned to initiate a socio-economic reintegration for mine survivors' project in late 2009.¹⁰⁸

Victim assistance activities

The NGO Association of Disabled Women and Mothers of Disabled Children (ADW) continued in 2008 to provide assistance to persons with disabilities and their families, including mine/ERW survivors in the Zugdidi region. In 2008, ADW provided school textbooks for six children, including two survivors and two family members, and provided wheelchairs to two mine survivors and assisted a mine survivor's child with disabilities to access pre-primary school education. In cooperation with the Swiss NGO Geneva Call, ADW undertook a socio-economic needs assessment survey of landmine survivors in the Zudidi and Tskhinvali regions of Georgia in June 2008. In cooperation with the Ministry of Education and Science, ADW supported one mine survivor in continuing college education.¹⁰⁹

GEFPOR reported providing services to 23 amputee mine/ERW survivors in 2008; at least 16 survivors received prostheses.¹¹⁰

In 2008, the ICBL-GC continued its vocational training project providing small business opportunities to some 20 mine/ERW survivors and other persons with disabilities; part of the project funding was carried over to 2009 to provide opportunities for new beneficiaries.¹¹¹

Support for Mine Action

Landmine Monitor is not aware of comprehensive cost estimates for overall clearance, RE, or VA in Georgia. No comprehensive estimates have been reported for mine action in South Ossetia.

As a result of ERW and cluster munition remnants contamination left by the August 2008 conflict, the UN Office for the Coordination of Humanitarian Affairs (OCHA) included a mine action component in its August 2008 flash appeal for humanitarian assistance to Georgia. Funds requested for mine action included US\$125,000 to the UN Mine Action Service for coordination of emergency mine action, and \$350,000 to UNICEF for RE. After a review of the humanitarian situation, OCHA issued a revised appeal in October 2008, in which only the \$350,000 RE appeal remained, which had already been surpassed by contributions and commitments totaling

\$394,926.¹¹² OCHA reported that no additional or separate funding was needed for the mine action sector because HALO operations in Georgia were fully covered during the period covered by the revised appeal.¹¹³

National support for mine action

Georgia did not report contributions to mine action operations in 2008. No national funding was reported in 2007.

International cooperation and assistance

Eight countries and the European Commission (EC) reported contributing \$8,705,885 (€5,911,914) to mine action in Georgia. No international funding was reported in 2007.

2008 International Mine Action Funding to Georgia: Monetary¹¹⁴

Donor	Implementing Agencies/Organizations	Project Details	Amount
US	HALO, government of Georgia	Emergency survey and response, mine action coordination	\$5,200,000
Canada	iMMAP	Capacity-building, cluster munitions/ERW clearance	\$906,842 (C\$966,679)

Republic, Hungary, and Slovenia as contributors to the project. The ITF supported training of Georgian rehabilitation specialists in 2008, with Slovenia reported as the sole donor.¹¹⁵

In addition to its specific monetary contributions in 2008 to national mine action initiatives, the European Commission reported in May 2009 a €39 million (\$57,431,400) general commitment during 2008 to mine action in a number of countries. Georgia was among the states named as recipients within the overall commitment.

¹¹⁵ ITF, “Annual Report 2008,” p. 63.

INDIA

2008 Key Data

Mine Ban Treaty status	Not a State Party
Stockpile	Unknown; estimated 4–5 million
Contamination	Antipersonnel and antivehicle mines, IEDs
Estimated area of contamination	Unknown
Casualties in 2008	33 (2007: 170)
Estimated mine/ERW survivors	Unknown but estimated 1,903
Demining in 2008	Not reported
Risk education recipients in 2008	Unknown

Ten-Year Summary

The Republic of India continues to view antipersonnel mines as legitimate weapons necessary for use on its borders. India has abstained from voting on every pro-ban UN General Assembly resolution since 1997. India planted large numbers of mines along its border with Pakistan between December 2001 and July 2002 during an escalation of tensions. India is one of the world's few remaining mine producers. In 2007, India reported that it had converted a large existing stockpile of M14 antipersonnel mines to make them detectable in accord with Amended Protocol II of the Convention on Conventions Weapons. India has had an export moratorium in place since 1996.

The Indian Army has taken responsibility for demining but has not reported on the extent or results of its operations. Despite official statements that clearance of the heavily mined border with Pakistan has been completed, media reports indicate extensive residual contamination.

Between 1999 and 2008, Landmine Monitor identified 2,931 casualties in India from mines/explosive remnants of war (ERW)/improvised explosive devices (IEDs) (1,028 killed and 1,903 injured). However, India lacks effective or systematic data collection of mine/ERW/IED incidents. There has been some risk education (RE) by the Indian Army, the Indian Red Cross Society, and various civil society actors, but there has never been a systematic RE policy framework or program in India. The Indian government claims survivors are provided with compensation, employment, and assistance, but survivors struggle to access healthcare and rehabilitation services, which are often urban-based and overwhelmed. Compensation is not provided systematically and often not at all. In 2008, the government tried to improve employment opportunities for persons with disabilities, but discrimination continued to be widespread.

Mine Ban Policy

India has not acceded to the Mine Ban Treaty. In October 2008, India again asserted, "Landmines continue to play an important role in the defence of the states that have long land borders with difficult and inhospitable terrains." At the same time, it stated, "India will also continue to pursue the objective of a non-discriminatory, universal and global ban on anti-personnel mines in the manner that addresses the legitimate defence requirements of states."¹

¹ Statement by Arjun Charan Sethi, Member of Parliament, First Committee of the 63rd Session of the UN General Assembly, New York, 21 October 2008.

On 2 December 2008, India abstained from voting on UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty, as it has on similar annual resolutions since 1997. In explaining its vote, India said it “supports the vision of a world free of the threat of anti-personnel mines” and noted that the “availability of militarily effective alternative technologies that can perform, cost-effectively, the legitimate defensive role of anti-personnel landmines will considerably facilitate the goal of the complete elimination of anti-personnel mines.”²

India sent an observer to the Ninth Meeting of States Parties to the Mine Ban Treaty in November 2008 in Geneva.³ It detailed the “measures and steps taken by [India that] underline its commitment to the humanitarian ideals” of the Mine Ban Treaty.⁴ It also attended the May 2009 intersessional Standing Committee meetings, but did not make a statement.

India is party to the Convention on Conventional Weapons (CCW), its Amended Protocol II on landmines, and Protocol V on Explosive Remnants of War. It submitted its annual Article 13 report for Amended Protocol II,⁵ and two Protocol V Article 10 reports.⁶

India has not signed the Convention on Cluster Munitions.⁷

On 18 March 2009, the Control Arms Foundation of India, in collaboration with the Centre for International Politics, Organisation and Disarmament at Jawaharlal Nehru University, organized a “Disarmament as Humanitarian Action: Commemorative Conference on 10 Years of Entry Into Force of the Mine Ban Treaty and Other Disarmament Treaties.” The conference brought together campaigners, scholars, students, researchers, lawyers, diplomats, and other representatives from government to share knowledge, raise issues, and determine ways to persuade the government of India to accede to the Mine Ban Treaty. In a presentation at the event, retired Major-General Nilendra Kumar stated that “a number of senior officers who had been mine victims have risen to the top positions in the Army.... It is a matter of regret that despite this, the military top brass has not really accepted that landmines do not offer any significant military advantage.”⁸

In January 2009, a public demonstration in Srinagar against mine use in Kashmir called on India and Pakistan to join the Mine Ban Treaty.⁹ In February 2009, an International People’s Tribunal on Human Rights and Justice in Kashmir, which held hearings in Indian-administered Kashmir in 2008 and early 2009, issued a memorandum on its findings to Jammu and Kashmir Chief Minister Omar Abdullah. Among the findings was that “the placement of landmines along the border and other sensitive areas in Jammu and Kashmir continues to endanger lives, including those of children. While the Government of India is not a signatory to the [Mine Ban Treaty], and has continued to justify landmine use in Jammu and Kashmir, we ask that the Government of Jammu and Kashmir institute a comprehensive ban on the use of landmines. We ask that an

² India’s Explanation of Vote on A/C.1/63/L.6, 29 October 2008. The explanation came after the vote on the resolution in the First Committee.

³ Since the First Review Conference in 2004, India has sent an observer to every Meeting of States Parties, and every intersessional Standing Committee meeting.

⁴ Statement by Prabhat Kumar, Counselor, Permanent Mission of India to the Conference on Disarmament, Ninth Meeting of States Parties, Geneva, 24 November 2008.

⁵ India submitted a CCW Amended Protocol II Article 13 report summary sheet covering the period September 2007 to September 2008 which is unchanged from the previous year with the exception of some contact information.

⁶ India submitted its initial Protocol V Article 10 report covering the period 1 January 2007 to 31 May 2008, and a second Article 10 report on 6 April 2009 covering the period of 1 June 2008 to 31 March 2009. In both reports, India states that Articles 3, 4, 5, 6, and 7 are not applicable to India because they pertain to future wars and because no contamination from ERW exists in India.

⁷ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 208–210.

⁸ Conference Summary (unpublished), made available to Landmine Monitor by the Control Arms Foundation of India, 24 June 2009. Maj.-Gen. Nilendra Kumar was Judge Advocate General of the Indian Army at the time of his retirement in November 2008.

⁹ Showkat A. Motta, “India-Pakistan urged to sign treaties on landmines,” *Kashmir Watch*, 16 January 2009, www.kashmirwatch.com.

audit be conducted to ascertain the impact of landmines on local communities, to determine the extent of casualties, devastation, and displacement, and undertake rehabilitation of those affected and de-mining.” Upon receipt of the memorandum on 11 February 2009, Chief Minister Omar Abdullah made a public statement saying that he would consider the memorandum at the highest level, and would invite the International People’s Tribunal for further discussions.¹⁰

Production, transfer, and stockpiling

India is one of the few countries still producing antipersonnel mines. India claims that all production is vested with government agencies.¹¹ In response to a Right to Information Act (RTI) request, the Ministry of Defence confirmed that active production of landmines took place between 1 January 2007 and 31 December 2008. Five mine types were produced during that period, including two types of antipersonnel mines (AP NM-14 and AP NM-16) and two types of antivehicle mines (AT ND 1A and AT ND 4D), as well as the APER 1B mine.¹² Landmine Monitor is not familiar with the APER 1B mine, presumably an antipersonnel mine. It does not appear in standard reference works on mine types, and has not, to our knowledge, been referred to publicly by India before. The Ministry of Defence declined to answer an RTI request regarding how many mines were manufactured during this period.¹³

The Ministry of Defence said that no landmines produced by Ordnance Factories were exported during the period.¹⁴ India has had a formal export moratorium of unlimited duration in place since 3 May 1996. It has stated that it favors an outright ban on transfer of antipersonnel mines even to States Parties of CCW Amended Protocol II.¹⁵ However, five Mine Ban Treaty States Parties have reported Indian-made mines in their stockpiles: Bangladesh, Bhutan, Mauritius, Sudan, and Tanzania. India has previously denied that any transfer of landmines to these countries took place.¹⁶

In 1999, Landmine Monitor estimated that India stockpiled between four and five million antipersonnel mines, one of the world’s largest stockpiles.¹⁷ India has neither confirmed nor denied this estimate. In March 2008, Brigadier Vijai Sharma, Deputy Director of the Directorate of Military Operations, stated that India does not possess mines which can detonate due to the presence of mine detectors and does not possess—nor is it designing—any mine with antihandling characteristics.¹⁸

¹⁶ See *Landmine Monitor Report 2005*, p. 715.

¹⁷ See *Landmine Monitor Report 1999*, p. 467. The figure may no longer be accurate following the large number of mines planted along the Pakistani border in 2001 and 2002, or in light of new production of mines.

¹⁸ Control Arms Foundation of India, “Conference on the Indispensability of Anti-Personnel Mines for India’s Defence: Myth or Reality?” Conference report, New Delhi, 26 March 2008, p. 75.

Use

In April 2008, a senior Indian official repeated the assertion that, “There is no minefield or mined area in any part of India’s interiors,” but acknowledged that “minefields are laid, if required, along the border areas as part of military operations.”¹⁹ He said that the infiltration of Kashmiri militants across the Line of Control (LoC) between Pakistani and Indian-administered sections of Kashmir is the main rationale for mines laid along the LoC, as well as the international border.²⁰ Similarly, in October 2007, Ministry of Defence spokesperson Colonel A. K. Mathur in Srinagar, Jammu and Kashmir, reportedly stated that mines are laid there only by the army to halt infiltration of militants, but not by the militants themselves.²¹

Indian government representatives have often stated that India does not use mines for “counter-insurgency or counter terrorist operations or for maintenance of law and order or internal security situations.”²² However, this does not appear to apply to counter-insurgency operations in Kashmir, where mines have been laid in the Kashmir valley.²³ In March 2009, two civilians were reportedly injured by antipersonnel mines near army posts. In one case, the Superintendent of Police in Handwara reportedly said the mine was planted “around OP post of 33 RR Camp in 84–85 forest compartment of Magam,” explaining that the army has laid mines around army posts to prevent militant attacks. An Army 15 Corps spokesperson reportedly said the Handwara incident was being investigated to determine if the army or non-state armed groups (NSAG) had mined the area.²⁴

India’s last major use of antipersonnel mines took place between December 2001 and July 2002, when the Indian Army deployed an estimated two million mines along its 2,880km northern and western border with Pakistan in Operation Parakram.²⁵ This was probably the most extensive use of antipersonnel mines anywhere in the world since the Mine Ban Treaty was negotiated and first signed in 1997.

Non-State Armed Groups

On 4 March 2009, the Zomi Re-unification Organisation (ZRO) renounced mine use by signing Geneva Call’s Deed of Commitment. Geneva Call stated that the ZRO began to destroy its stockpiles and clear the mines that it had laid after commencing dialogue with Geneva Call in 2008, and that the ZRO completed these tasks prior to signing the Deed of Commitment. In its statement to Geneva Call, ZRO President Thanglianpau stated, “I am proud that as an armed revolutionary movement, we have prioritised humanitarian issues, and consider this a major step forward and hope it will serve as an example to others.”²⁶ The ZRO had not previously been identified as a mine user by Landmine Monitor. In October 2007, the United Jihad Council, a coalition of 18 militant organizations in Kashmir, issued a Declaration of a Total Ban on

¹⁹ Statement by Brig. S.M. Mahajan, Director of Military Affairs, Ministry of External Affairs, Fifth National Conference of the Indian Campaign to Ban Landmines (Indian CBL), New Delhi, 23–24 April 2008. ²⁶ Geneva Call, “The Zomi Re-unification Organisation commits to the ban on anti-personnel mines,” Press release, 4 March 2009, www.genevacall.org. The ZRO did not provide information to Geneva Call on the number of mines it cleared. It stated it destroyed 300–320 stockpiled mines, but did not specify their type or method of destruction. Email from Nicolas Florquin, Program Officer, Geneva Call, 22 June 2009.

Antipersonnel Mines in Kashmir.²⁷ In August 2006, the Kuki National Organization in Manipur pledged not to use antipersonnel mines by signing Geneva Call's Deed of Commitment, as did the National Socialist Council of Nagalim-Isak/Muivah (NSCN-IM) in Nagaland in October 2003.²⁸

In March 2009, two women and a teenage girl were injured by what appears to have been a victim-activated IED while they were tilling land near an NSCN-IM military camp at Shikavi village near Dimapur.²⁹ NSCN-IM denied having laid the device and told Geneva Call that it believes "enemies" placed the device in its territory with the intention of discrediting the NSCN-IM.³⁰

The Communist Party of India-Maoist (CPI-M) and its armed wing, the People's Liberation Guerrilla Army, have continued to use command-detonated IEDs.³¹ While these were frequently reported as "landmines" in the media and specialized reports on the conflict, Landmine Monitor could not identify any incidents clearly involving victim-activated mines or explosive devices. CPI-M IEDs have caused civilian casualties.³² In 2008, Human Rights Watch reported that the CPI-M recruits children for manufacture and deployment of landmines and IEDs.³³

Kashmiri insurgents continued to use command-detonated IEDs, with some resulting in civilian casualties.³⁴ Again, these were often reported as "landmines" in the media, but Landmine Monitor could not identify any incidents clearly involving victim-activated mines or explosive devices. A June 2008 Indian government report on IED use by militant organizations states that Maoist and Kashmiri groups both use command-detonated devices.³⁵

In February 2009, security forces reportedly discovered three pressure-activated IEDs in two locations while on patrols in Khangtun and Old Changpol in Samtal, Chandel district, Manipur.³⁶ The area is known to be a United National Liberation Front stronghold.

In December 2008, security forces reportedly recovered 15 antipersonnel mines, among other weapons, from a camp of the Kanglei Yawol Kanna Lup, an armed group operating in Manipur.³⁷ This group was not previously known to possess antipersonnel mines.

In January 2009, security forces reportedly recovered four unidentified mines among other weapons from a camp of the Karbi Longri North Cachar Hills Liberation Front, an armed group operating in Assam.³⁸ In February 2009, security forces reportedly recovered one unidentified mine among other weapons from surrendering militants of the National Liberation Front of Tripura and its associate Borok National Council of Tripura, armed groups operating in Tripura.³⁹ Neither group was previously known to possess mines of any type.

Media continued reporting seizures of mines, mostly unidentified, by authorities in different parts of India, including Jammu and Kashmir⁴⁰ and Andhra Pradesh.⁴¹

Scope of the Problem

Contamination

India is contaminated with mines, mainly as a result of mine-laying by government forces on and near the northwestern border with Pakistan during the 2001–2002 stand-off between the two countries. Antipersonnel and antivehicle mines were laid on cultivated land and pasture, and around infrastructure and a number of villages.⁴² India also contends with increased use of IEDs and mines by non-state armed groups in other parts of the country (see Use section above).⁴³ The extent of India's ERW problem is not known.

In its Amended Protocol II Article 13 report submitted in November 2005, India claimed that it had concluded mine clearance operations along its northern and western borders and all arable land had been cleared and returned to its owners, except land required "for operational purposes."⁴⁴ Defence Minister A. K. Anthony repeated the claim in March 2008.⁴⁵

India's Engineer-in-Chief's Staff Directorate reported in 2009 that "all mines laid during Operation Parakram were recovered/cleared (99.32%) by 2006." It stated that the very few stretches where demining was not possible "due to terrain conditions" were fenced in accordance with UN protocols. The Staff Directorate also indicated some clearance of these mined areas had continued (see Demining and battle area clearance section below).⁴⁶

Unofficial estimates cited in the Indian media, however, put the area still contaminated in 2007 at 160km² of Jammu and 1,730km² of Kashmir.⁴⁷ An army officer interviewed in 2009 said no official assessment has been made of the extent of remaining contamination but that such estimates could still be correct.⁴⁸ Military authorities acknowledge that areas prone to infiltration by militants are still mined but say the areas are clearly marked. However, they also say heavy rainfall, snow, mudslides, and avalanches can cause mines to move.⁴⁹

According to some reports, as much as 280km² was mined along the LoC during Operation Parakram, which directly affected more than 6,000 families across 21 villages.⁵⁰ Although substantial border areas have been returned to civilian owners, other sources say some sections of the LoC in Jammu and Kashmir remain heavily mined.⁵¹ The Uri sector of Baramulla district, for instance, is said to have remained mined and fenced along the LoC since 1990. In the Karna sector of Kupwara district, mines were laid through villages cut in half by the LoC. Kupwara

district was heavily affected by the 8 October 2005 earthquake, and authorities are said to fear that mines planted in the area were displaced as a result.⁵²

An army officer stated in April 2008 that demining was underway, and that most of the areas in Jammu and Kashmir have been demined and handed over to the farmers.⁵³ However, a field visit by Landmine Monitor to Khari village in Poonch district in May 2009 found that mines planted in 1965 had not been removed and were located only 100m from one resident's house.⁵⁴

Minefields also reportedly remain from the 1962 war with China along the Tankso valley to Spangmik road in the vicinity of Pangong Tso Lake in the Himalayas.⁵⁵ Mine contamination in Sikkim, a landlocked Indian state in the Himalayas, was acknowledged in 2008 by a government ministry for the first time. Mines in remote areas were reported to have caused casualties among wildlife, including yak, Tibetan sheep, and Tibetan wolves.⁵⁶ Civil society organizations also report continuing casualties from landmines in Manipur, bordering Myanmar.⁵⁷

An explosion at an Indian Army ammunition storage area in Khundru, south Kashmir, in August 2007 was reported to have killed six people and left 25 people missing.⁵⁸ Media quoted a senior army officer as saying that UXO had affected an area of 225km².⁵⁹ A little over a year later, Indian media cited authorities in South Kashmir as saying the army had reported clearing 60% of rice fields in affected areas but residents were still reluctant to return to their land.⁶⁰

Casualties

Landmine Monitor identified 33 casualties (12 killed and 21 injured) of mines, ERW, and victim-activated IEDs in 2008. Antipersonnel mines caused the most casualties (13), followed by ERW (nine), IEDs (five), and other mines (five). One casualty resulted from an unknown device. The majority of casualties (24) were civilians and nine were security forces. The largest number of casualties were adult men (14), followed by adult women (5), girls (5), and boys (4); the gender of five casualties was unknown. The most common activities at the time of the incident were handling a device (10), security and patrolling (7), gardening (3), and collecting wood and water (3). Most casualties occurred in Jammu and Kashmir (20), followed by Manipur (12).

The 33 casualties in 2008 represent a decrease from the number identified in 2007 (170 casualties: 41 killed and 129 injured) and 2006 (107 casualties: 41 killed and 66 injured). Due to the lack of a systematic data collection system, however, this should not be considered indicative of a trend.⁶¹

The cumulative number of casualties in India is not known. Between 1999 and 2008, Landmine Monitor has identified 2,931 mine/ERW/IED casualties in India (1,028 killed and 1,903 injured). A 2003–2004 survey by the Indian Institute for Peace, Disarmament and Environmental Protection (IIPDEP) identified some 1,295 civilian casualties (325 killed and 970 injured) in Rajasthan, Punjab, and Jammu and Kashmir.⁶² A 2008 study in Poonch district estimated that more than 700 people were disabled by mines in the last 10 years.⁶³

⁶³ "Landmines cause disability to over 700 people in IHK," *Kashmir Media Service* (Srinagar), 15 March 2009, www.kmsnews.org.

The Sinlung Indigenous Peoples Human Rights Organisation reported a total of 47 landmine casualties (22 killed and 25 injured) between 2001 and 2008 in Chandel and Churachandpur districts of Manipur. The casualties included 31 males, 16 females, and three whose gender was unidentified. A casualty list compiled by the Army headquarters in Manipur and obtained by the Indian Institute for Peace, Disarmament and Environmental Protection showed 52 civilian casualties in 2004–2006, including 16 killed.⁶⁴

India's 2001 Census and 2002 National Sample Survey estimated that persons with disabilities made up 2% of the population;⁶⁵ alternative estimates suggest it could be as high as 4% to 8%.⁶⁶

Casualties occurred at a higher rate in 2009, with 45 casualties (15 killed and 30 injured) as of 13 June.

Risk profile

People living in the conflict-affected states of Jammu and Kashmir, Manipur, Punjab, and Rajasthan, are particularly at risk from mines, ERW, and IEDs. Adult men and security forces are most at risk.

Socio-economic impact

In addition to causing casualties, inhabitants state that mines prevent cultivation of large areas of agricultural land and harm livestock. The speaker of Jammu and Kashmir's legislative assembly said in 2007 that more than 6,000 families and some 3,500 acres (14km²) of agricultural land in his constituency alone are mine-affected.⁶⁷ Disruption to livelihoods as a result of the Khundru ammunition storage area explosion prompted south Kashmir authorities to distribute food rations to the population in affected areas.⁶⁸

Program Management and Coordination

Mine action

India has no civilian mine action program and no structured mechanism to address the problems from mines and ERW.⁶⁹ Its international point of contact for clearance activities is the Disarmament and International Security Affairs Division within the Ministry of External Affairs. The Director-General of Military Operations decides on mine clearance after receiving assessment reports from the command headquarters of the respective districts where mine clearance is needed.⁷⁰

Victim assistance

There is no systematic policy framework for the management, implementation, or coordination of RE or victim assistance (VA) in India. The Ministry of Social Justice and Empowerment's Disability Division is responsible for coordinating the education and welfare of persons with disabilities.⁷¹ The ministry's disability Central Coordination Committee (CCC) is a coordination body of NGOs and governmental agencies working on disability issues.⁷² The Rehabilitation Council of India regulates and monitors services for persons with disabilities.⁷³ The Office of

the Chief Commissioner for Persons with Disabilities investigates claims of mistreatment of persons with disabilities.⁷⁴

Data collection and management

India has no mine/ERW/IED casualty data collection system. Landmine Monitor monitors casualties reported in the media, but under-reporting is likely given the remoteness and insecurity of the areas where casualties occur.

India collects information on persons with disabilities through its census and National Sample Surveys.⁷⁵ In 2008, India launched a National Disability Register. Persons with disabilities can register for certification of their disability to become eligible for services. The register will also be used for data collection and as a source of reference. The government's disability web portal has an online form to facilitate registration, but the form does not distinguish between disabilities that occur "by accident" and mine/ERW/IED incidents.⁷⁶

Demining and Battle Area Clearance

The Army Corps of Engineers is responsible for clearing mines as well as IEDs placed by non-state armed groups.⁷⁷ Media reports indicate police also play an active part in clearing mines and IEDs in states dealing with insurgency.⁷⁸

The Engineer-in-Chief's Staff Directorate reported that few LoC minefields had been demined between the start of 2007 and the end of 2008 but the army had recovered and destroyed 927 mines, of which 524 were antivehicle mines and 403 were antipersonnel mines.⁷⁹

In November 2007, the army reportedly deployed three tanks in the Chhamb area of the LoC to act as demining machines, with operations said to be due to last four to five months.⁸⁰ An army source interviewed by Landmine Monitor in May 2009 said that the Chhamb sector had been cleared, primarily because the flat terrain made demining possible. An army official interviewed in Jammu and Kashmir was unaware of plans for any further demining operations in the Kashmir valley, citing the difficulties of demining in the hilly terrain.⁸¹

Indian Army units have sustained heavy casualties in the course of demining operations, notably since the start of mine-laying on the Pakistan border in December 2001. Minister of Defence A. K. Anthony reported in March 2008 that 61 people had been killed and 292 injured in the course of demining operations.⁸²

Risk Education

In 2008, India asserted that, "Information on mines laid along border areas is disseminated among the civilian population of the area and the media" and that minefields were fenced and well marked.⁸³ In March 2008, the Indian Army organized workshops in remote areas of Poonch district for schoolchildren on how to identify explosive devices and take safety measures to save their lives.⁸⁴

⁸⁴ "School children being trained to identify IEDs," *Alternative News Network* (Jammu), 24 March 2008, www.annonline.in.

In March 2009, however, the Coalition of Civil Society claimed marking and fencing of minefields in Kashmir was inadequate.⁸⁵ Landmine Monitor field research in Jammu and Kashmir found that while the army was disseminating some information on mines, ERW, and IEDs, no efforts were made to coordinate activities with the Ministry of Education.⁸⁶

The ICRC and Indian Red Cross Society (IRCS) state that since they were unaware of any landmine casualties in Jammu and Kashmir, they were not undertaking any RE efforts there. They had not included RE in their earlier program activities in Rajasthan and Punjab. The ICRC did not have precise figures of the number of landmine casualties in Jammu and Kashmir, and confirmed that the organization was not permitted to enter the border areas of Jammu and Kashmir where most mine incidents were understood to occur.⁸⁷

Since at least 2000, the police, military, and other security forces have engaged in some information dissemination, particularly in conflict-affected regions such as Jammu and Kashmir. They provided information on the presence of minefields, precautions to be taken when encountering mines/ERW/IEDs, and how to report them to authorities.⁸⁸

The most concerted effort at RE has been led by the IRCS in Rajasthan and Punjab since 2003. With technical support from the ICRC, IRCS volunteers collected information, briefed the media, trained trainers, delivered basic safety messages, and held workshops.⁸⁹ While some efforts were made by the IRCS to provide RE in Jammu, plans to expand the program to Jammu and Kashmir were never realized.⁹⁰ The other main player has been IIPDEP, which has raised awareness since 1999, particularly through workshops from 2003 to 2007.⁹¹

Victim Assistance

The total number of survivors is unknown, but is estimated to be 1,903. At the Ninth Meeting of States Parties in November 2008, India asserted that, “Concerted efforts have been made to rehabilitate casualties...by providing monetary compensation, employment and assistance.”⁹² However, India does not have specific VA policies or activities and survivors generally receive the same care as other persons with physical disabilities.

Emergency and continuing healthcare is provided by the public sector, along with the private and non-profit sectors. State hospitals in urban areas have the capacity to treat mine/ERW/IED survivors, but such services are not available in rural areas, where many incidents occur.⁹³

India’s health system is reportedly “overwhelmed” by high levels of disease, underinvestment, and a large population.⁹⁴ In May 2008, *Time* magazine said that “India’s economic boom has had, so far at least, little impact on health standards.” It quoted Indian Prime Minister Manmohan Singh as admitting that public health spending was “seriously lagging behind other developing countries in Asia.”⁹⁵

⁹⁵ Simon Robinson, “India’s Medical Emergency,” *Time*, 1 May 2008, www.time.com.

The Ministry of Social Justice and Empowerment continued to provide rehabilitation services to rural areas through 16 district centers. The government plans to expand rehabilitation services to 400 districts, but, according to the United States Department of State, “The impact of government programs was limited due to the concentration of funding provided to a few organizations,” generally in urban areas.⁹⁶ This made rehabilitation difficult to access for mine/ERW survivors living in remote areas, particularly in Jammu and Kashmir.⁹⁷

Through its Special Fund for the Disabled (SFD), the ICRC continued to support the prosthetic and orthotic services and training for the Christian Medical College in Vellore, and for Mobility India in Bangalore. Through the two centers, in 2008 the ICRC funded the provision of 559 prostheses and 111 orthoses to 424 persons with disabilities, identified through community-based rehabilitation programs. The ICRC also supported two teachers from each center to attend a seminar on prosthetics and orthotics at the Vietnamese Training Centre for Orthopaedic Technologists (VIETCOT).⁹⁸

Through its Physical Rehabilitation Program and in partnership with the IRCS, the ICRC continued to support two artificial limb centers in Jammu and Srinagar, which produced 76 prostheses (17% of them for mine survivors), 95 orthoses (17% of them for mine survivors), and distributed 20 pairs of crutches and 19 wheelchairs. The ICRC provided mentoring and training and funded two staff from the hospital to study prosthetics and orthotics at the Mobility India center.⁹⁹ The IRCS also ran a rehabilitation center at the Government Medical College in Jammu.¹⁰⁰

The Composite Regional Center in Jammu is located near mine-affected areas and provides free services and prosthetics. In 2007–2008, it distributed 54 prostheses and 235 orthoses and provided rehabilitation services to 1,988 people in “outreach camps” in the community.¹⁰¹

In Srinagar, the Sultan-ul-Arifeen Artificial Limb Centre continued to provide Jaipur limb prostheses. Jaipur limbs are produced by Bhagwan Mahaveer Viklang Sahayata Samiti, which in 2007–2008 produced more than 20,000 artificial limbs.¹⁰² The parastatal ALIMCO (Artificial Limbs Manufacturing Corporation of India), also produced artificial limbs and has established Limb Fitting Centres around the country. It claims to provide limbs and components to a million persons with disabilities in India every year.¹⁰³

Disability and Development Partners (until 2005 the Jaipur Limb Campaign UK) continued to support a variety of disability projects in partnership with Mobility India in Bangalore, including rehabilitation services, an accessible taxi service, educational opportunities, training, and research.¹⁰⁴

In June 2008, the Indian Army’s 5/5 Gorkha Rifles, under the banner of the Army Wives Welfare Association (AWWA), hosted a rehabilitation camp in the Uri sector of the Kashmir valley to help people to help disabled survivors. Some 45 wheelchairs, 53 crutches, 40 hearing aids, and 59 walking sticks were distributed.¹⁰⁵

¹⁰⁵ Bilal Butt, “Indian Army host camp for landmine blasts victims,” 19 June 2008, *Asian News International*, www.thaindian.com.

In March 2009, Indian media reported on the efforts of Jagbir Singh Sudan, a local school principal and philanthropist in Poonch, whose trust has reportedly provided 3,000 mine survivors with artificial limbs. The trust is named after his father, Pritam Singh, who was a World War II amputee.¹⁰⁶

A variety of rehabilitation and vocational services are available to disabled Indian military personnel. The Queen Mary's Technical Institute (QMTI), in Range Hill, Pune, provides vocational training. The Paraplegic Rehabilitation Centres in Kirkee and Mohali provide rehabilitation to disabled military veterans. The Red Cross Home in Bangalore is a home for disabled former soldiers and also provides rehabilitation.¹⁰⁷

The Indian government claims that mine survivors and families of those killed by mines are compensated.¹⁰⁸ A brigadier in the Indian Army posted to Jammu and Kashmir told Landmine Monitor that "India has a system of compensation in place which has matured over a period of time and is quite responsive...All cases of compensation to mine victims are dealt with on priority."¹⁰⁹ In March 2008, India's Ministry of Defence reported that 353 civilian mine casualties had received compensation.¹¹⁰ Implementation of compensation appeared unsystematic, however, with the media reporting some casualties (or their families) receiving compensation between Rs10,000 (US\$230) and 300,000 (\$6,900).¹¹¹ Others reportedly received no compensation at all.¹¹² In meetings with 21 mine survivors in Poonch in 2009, Landmine Monitor found that none of them had been compensated. Indeed, field research revealed that, partly due to the long bureaucratic claims process, no compensation had been given in Poonch for four years.¹¹³ Survivors in Poonch confirmed that they received a pension of Rs300 (\$7) every six months, but said that they are not compensated for the long distances they must travel to claim it.¹¹⁴

Psychosocial support for survivors is lacking, particularly in Kashmir, where the mental health system is reportedly strained by the ongoing conflict.¹¹⁵ On 27 February 2009 in Sri Ganganagar, Rajasthan, 128 mine survivors marched to raise awareness of their difficulties and call on the Indian government to ban landmines. They also presented a petition to local officials asking for physical and economic rehabilitation support.¹¹⁶

In 2008 and early 2009, the Indian government announced a variety of policy initiatives aimed at increasing economic opportunities for persons with disabilities. In July 2008, the government created a program providing incentives to companies employing persons with disabilities.¹¹⁷ In October 2008, the government announced an effort to provide 100,000 persons with disabilities

with jobs.¹¹⁸ In June 2009, Indian railways reported it would hire more than 4,000 persons with disabilities.¹¹⁹ Indian law requires that 3% of all public sector jobs and educational opportunities be reserved for persons with disabilities, but in reality they comprise only 0.44% of public sector employees and 1% of students.¹²⁰ The National Handicapped Finance and Development Corporation offers loans for persons with disabilities.¹²¹

India's Persons with Disabilities Act protects equal rights for persons with disabilities. However, the law's provision making implementation dependent on the government's "economic capacity" reportedly weakened its effect. Discrimination against persons with disabilities was reportedly "widespread."¹²² Buildings and transport are rarely accessible, although in July 2008, the government pledged to make accessibility improvements at India's universities.¹²³ While a variety of NGOs and associations for persons with disabilities lobby for better policies for persons with disabilities, mine/ERW survivors are often not included in such efforts as they live in remote and conflict-affected regions.¹²⁴

The Indian government continued to maintain a detailed National Interactive Web Portal on Disability, with news, services directories, and useful information for persons with disabilities.¹²⁵

India ratified the UN Convention on the Rights of Persons with Disabilities on 1 October 2007; it entered into force in May 2008. As of 1 July 2009, India had not signed its Optional Protocol.

Support for Mine Action

India did not report on national funding for its own mine action programs in 2008 or 2007. India reported providing training to Cambodian army demining personnel in 2008 under an agreement to provide annual training to Cambodia. India also reported providing demining equipment to the Cambodian army in September 2008.¹²⁶

IRAN

Ten-Year Summary

The Islamic Republic of Iran's policy on banning antipersonnel mines has not changed in the past decade. It has cited its perceived need for antipersonnel mines on its borders as the main reason for not joining the Mine Ban Treaty. Iran has abstained from voting on every annual UN General Assembly pro-ban resolution since 1997. There is evidence that Iran has produced and exported antipersonnel mines in the past decade, despite government statements that it stopped both activities.

Iran has one of the world's largest mine and explosive remnants of war (ERW) problems, but the precise extent of contamination is not known. Seemingly huge demining operations have been undertaken in past years under the auspices of the Islamic Republic of Iran Mine Action Center (IRMAC), but reported results are unreliable and demining methods do not appear to meet the International Mine Action Standards.

Between 1999 and 2008, Landmine Monitor identified at least 840 mine/ERW casualties (238 killed, 542 injured, and 60 of unknown status). Under-reporting is significant, however, and there might have been more than 10,000 total casualties. From 2002–2008, risk education was provided by several governmental organizations and NGOs in affected provinces. There is no specific victim assistance framework and little is known about Iran's victim assistance activities. Services are in place for war-injured persons, including mine/ERW survivors, and healthcare has improved over the last decade, but remote areas are not well-served and not all survivors are eligible for state support.

Mine Ban Treaty

Iran has not acceded to the Mine Ban Treaty. Iran has cited its perceived need for antipersonnel mines on its borders as the main reason for not joining the treaty.¹

Iran has abstained from voting on every annual UN General Assembly resolution supporting the Mine Ban Treaty since 1997, including Resolution 63/42 on 2 December 2008. In explaining its vote, Iran stated that it “shares the humanitarian concerns” of States Parties to the Mine Ban Treaty, and welcomes “every effort to stop this trend” of irresponsible mine use. It continued, “The Ottawa Convention, however, focuses mainly on humanitarian concerns while neglecting or not adequately taking into account legitimate military requirements of many countries, particularly those with long land borders, for the use of APLs [antipersonnel landmines] in defending their territories. Due to the difficulties of monitoring sensitive extensive areas by established and permanent guarding posts of effective warning systems, landmines continue to be the effective means, for those countries, to ensure the minimum security requirement of their borders.”²

Iran has never participated as an observer in the annual meetings of States Parties to the Mine Ban Treaty, and, with one exception (May 2001) has not attended meetings of the intersessional Standing Committees in Geneva.

¹ In a February 2006 letter to Landmine Monitor, the Ministry of Foreign Affairs stated, “Due to our expansive borders and problems resulting from narcotics and terrorist trafficking, our defense institutions are considering the use of landmines as a defensive mechanism.” In August 2005, the director of IRMAC stated that Iran is against the use of landmines, but war in and occupation of two countries bordering Iran were not conducive to Iran joining the Mine Ban Treaty. Government representatives told Landmine Monitor in January 2004 and July 2003 that they believe that if mines were removed from the country's borders more Iranian soldiers would be killed while protecting the borders and drug trafficking would increase dramatically. They also stated that the cost of Iran joining the Mine Ban Treaty would be enormous. In July 2003, the government stated, “Landmines continue to be the sole effective means to ensure the minimum security requirement of borders in countries with long land borders.” For detailed sources, see *Landmine Monitor Report 2008*, pp. 857–858.

² Delegation of the Islamic Republic of Iran, Explanation of Vote on the Draft Resolution L.6, UN General Assembly, First Committee, New York, 29 October 2008.

In December 2008, Iranian authorities raided and temporarily closed the NGO Center for Participation in Clearing Mined Areas, also known as the Mine Clearing Collaboration Campaign (MCCC), run by 2003 Nobel Peace Laureate Shirin Ebadi. The ICBL protested the closure.³ Ebadi had launched the NGO, which she created to support mine action in Iran, at the Mine Ban Treaty's First Review Conference in November–December 2004. She has also called on Iran to join the Mine Ban Treaty, and make a greater effort on mine clearance and victim assistance.

Iran is not party to the Convention on Conventional Weapons.⁴ It has not signed the Convention on Cluster Munitions.⁵

Production, transfer, stockpiling, and use

IRMAC's director told Landmine Monitor in August 2005 that Iran neither uses nor produces landmines.⁶ In September 2002, the Ministry of Defense declared, "The Islamic Republic of Iran, since the termination of its war [1988], has not produced anti-personnel mines."⁷ Iran is thought to have a large stockpile of antipersonnel mines, but no official information is available on its size and composition.

Iran exported a significant number of antipersonnel mines in the 1990s and earlier. An export moratorium was instituted in 1997, but it is not known if it is still formally in effect. In February 2006, the Ministry of Foreign Affairs stated, "It has been several years since Iran voluntarily halted export of anti-personnel mines."⁸

Despite these government statements, there is evidence that Iran has both produced and exported antipersonnel mines in the past decade.

In January 2008, media reports claimed that Afghan authorities seized stocks of Iranian-produced antipersonnel mines in Afghanistan's Farah province, as well as in other provinces in prior months.⁹

Tajikistan, a State Party to the Mine Ban Treaty, reported that in 2007 two Iranian YM-1 antipersonnel mines were "transferred from the stockpiles of the force structures of the Republic of Tajikistan to the Tajikistan Mine Action Center for the purposes of destruction. The indicated antipersonnel mines were confiscated or detected by the force structures as a result of counter-terrorism activity."¹⁰

³ ICBL, "Call for the Immediate Reopening of Nobel Peace Laureate Shirin Ebadi's Offices in Tehran," Press release, 22 December 2008, Geneva.

⁴ Iran told Landmine Monitor it has "announced its support for the regulations stipulated in the second protocol of this convention regarding the method of utilizing antipersonnel landmines." Letter to Landmine Monitor (Human Rights Watch), File No: 322-1/153811, from Ali Jazini, Director, Interests Section of the Islamic Republic of Iran, Embassy of Pakistan in Washington, DC, 1 February 2006, transmitting the response of the Iranian Ministry of Foreign Affairs to a letter sent on 7 September 2005.

⁵ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 210.

⁶ Interview with Hossein Vaziri, Director, IRMAC, Tehran, 28 August 2005. He did not state when Iran allegedly stopped using and producing mines, nor if there is a formal policy or law prohibiting use and production. Iran has manufactured several types of antipersonnel mines, including the YM-1, MK4, and a Claymore-type mine. Jondollah activists allege that Iranian forces maintain an "internal border" with mines in order to control insurgency in Baluchi areas of Iran. See *Landmine Monitor Report 2007*, p. 846.

⁷ Letter to Landmine Monitor from the Permanent Mission of the Islamic Republic of Iran to the UN in New York, 6 September 2002.

⁸ Letter to Landmine Monitor (Human Rights Watch), File No: 322-1/153811, from Ali Jazini, Interests Section of the Islamic Republic of Iran, Embassy of Pakistan in Washington, DC, 1 February 2006, transmitting the response of the Iranian Ministry of Foreign Affairs to a letter sent on 7 September 2005.

⁹ One report cites 113 mines recovered, including 50 antipersonnel mines. "Landmine deport smuggled from Iran discovered," *Pajhwok Afghan News*, 25 January 2008; and see "Iranian Land Mines Found in Taliban Commander's House," *Radio Free Europe/Radio Liberty*, 25 January 2008.

¹⁰ Tajikistan Article 7 Report, Form B2, 3 February 2008.

In November 2006, the UN Monitoring Group on Somalia reported shipments of arms including landmines from Iran to combatants in Somalia in violation of the embargo.¹¹ The type of mine, antipersonnel or antivehicle, was not specified. In response, Iran stated that it had not transferred any arms to Somalia.¹²

Landmine Monitor received information in 2002, 2003, and 2004 that demining organizations in Afghanistan were removing and destroying many hundreds of Iranian YM-I and YM-I-B antipersonnel mines, date stamped 1999 and 2000, from abandoned Northern Alliance frontlines.¹³

Non-state armed groups

In April 2009, the Congress of Nationalities for a Federal Iran (CNFI), a grouping of Iranian opposition political parties, called for an antipersonnel landmine ban in Iran, urging Iranian armed groups to sign the Deed of Commitment administered by the Swiss NGO Geneva Call and for the Iranian government to accede to the Mine Ban Treaty.¹⁴

In 2009, three factions of the Komala party signed the Geneva Call Deed of Commitment, pledging no use of antipersonnel mines. On 7 April 2009, the Kurdistan Organization of the Communist Party of Iran (the Komala) and the Komala Party of Kurdistan signed the Deed of Commitment, followed on 16 June 2009 by the Komala Party of Iranian Kurdistan. All three factions acknowledged that they used antipersonnel mines sporadically in the past.¹⁵

The Democratic Party of Iranian Kurdistan (Parti Démocratique du Kurdistan d'Iran, PDKI) signed the Deed of Commitment on 5 December 2007.¹⁶ In August 2008, the PDKI showed Geneva Call a stockpile of more than 400 antipersonnel mines that it said would be destroyed as soon as possible. The PDKI also admitted to previous use of antipersonnel mines prior to halting armed activities.¹⁷ On 1 September 2008, a stockpile of 392 PDKI antipersonnel mines was destroyed in Koya, northern Iraq. Mines destroyed included Chinese and Italian versions, as well as mines of Russian and United States design but of unknown manufacture.¹⁸

Militants in the Baluchi areas of Iran have carried out attacks using explosives, but few if any appear to have been antipersonnel mines or other victim-activated devices.¹⁹

¹¹ The report states that on 25 July 2006 an aircraft carrying arms, including an unknown quantity of mines, from Iran landed at Baldogle airport and was met by senior members of the Courts Union and the Dayniile Islamic Court. "Report of the Monitoring Group on Somalia pursuant to Security Council resolution 1676 (2006)," S/2006/913, 22 November 2006, p. 22.

¹² *Ibid.*, p. 62.

¹³ Information provided to Landmine Monitor and the ICBL by HALO Trust, Danish Demining Group, and other demining groups in Afghanistan. Iranian antipersonnel and antivehicle mines were also part of a shipment seized by Israel in January 2002 off the coast of the Gaza Strip.

¹⁹ In February 2009, Jondullah, a militant group operating in the Baluchi area near the border with Pakistan, claimed responsibility for an improvised explosive device (IED) or antivehicle mine which killed and injured Revolutionary Guard personnel in the Saravan area. D. Khatinoglu, "Blast kills 9 soldiers in Iran: Jondullah," *Trend News*, 14 February 2009, news-en.trend.az. In June 2007, an Iranian soldier reportedly died after stepping on a landmine during counter-insurgency activity against Kurdish militants. STRATFOR, "Situation Report," 13 June 2007, www.stratfor.com. In October 2007, an Iranian soldier reportedly was killed by an unspecified landmine "planted by thugs" in Piranshahr district close to the border with Iraq. "Iran Guards Corps member killed in land mine blast, buried in Orumiye," *BBC Monitoring Caucasus*, 4 October 2007.

Scope of the Problem

Contamination

Mines and ERW, especially UXO, remain in Iran from the 1980–1988 conflict with Iraq, affecting particularly the provinces of Ilam, Kermanshah, Khuzestan, Kurdistan, and West Azerbaijan.²⁰ UXO is said to include cluster munition remnants.²¹ No credible estimates exist for the extent of contamination remaining and the socio-economic impact is poorly understood. In April 2007, Brigadier General Morteza Habibi, who at that time headed IRMAC, claimed that 9,000km² of land remained to be cleared in the five provinces. It was also claimed that 34,000km² had been demined since 1988. Previously, the eastern provinces of Khorasan and Sistan-Baluchestan have also been reported to be affected by mines, especially in border areas with Pakistan and Afghanistan.

Casualties

In 2008, Landmine Monitor identified at least 87 mine/ERW casualties: five killed and 82 injured.²² IRMAC reported 75 of these casualties, and the media 12. The majority of casualties were civilians of unknown gender and age (70); eight were deminers (men, civilian/military status unknown); and four military/police (men). The age, gender, and civil status of five casualties are unknown.

Little information is known about the device type, location, or activity at the time of the incident. At least eight casualties were engaged in clearance operations and one in security activities (the activity of the remaining 78 casualties is unknown). Landmines caused at least 12 casualties; the device type for the remaining 75 casualties is unknown. Casualties were recorded in at least two western provinces, Kermanshah (seven) and Ilam (five), but the location of 75 casualties was unknown. An additional 11 casualties (nine killed and two injured) were identified through media reports but not included in the total as it was not possible to verify if they were already counted in IRMAC's total.

In 2009, the Ministry of Defense reported that casualty rates had decreased,²³ and in 2008 IRMAC was reported saying the casualty rate had fallen to 1.5 casualties per day. However, the MCCC estimates that there are on average 2.2 incidents per day.²⁴ The Iranian Minorities Human Rights Organization (IMHRO) reported that there are approximately 1,000 new, mainly civilian, casualties each year.²⁵ Between September 2008 and April 2009, IMHRO reported 250 casualties (mainly children and women).²⁶

Casualties continued to be identified in 2009, with at least eight mine casualties (two killed, four injured, and two of unknown status), as of 31 May 2009.²⁷ At least six casualties were civilians; the status of two was unknown. Three casualties were males of unknown age; one was a man and one was a female of unknown age; the age and gender of three casualties was unknown. Activities at the time of the incident included traveling (four) and conducting agricultural activities (two); the activity of two casualties was unknown. Antipersonnel mines caused five casualties and unknown mines three. Casualties occurred in West Azerbaijan province (four) and in Kurdistan province (two); the location of the remaining two casualties was unknown.

²⁶ IMHRO, "2009 Mine Monitoring Report: Mine fields increased in Minorities' areas of Iran," 4 June 2009, iranianminorityshumanright.blogspot.com.

²⁷ Landmine Monitor media monitoring from 1 January to 31 May 2009.

The total number of mine/ERW casualties in Iran remains unknown. Between 1999 and 2008, Landmine Monitor identified at least 840 mine/ERW casualties including 238 killed, 542 injured, and 60 of unknown status.²⁸ One local media report estimated that from 1994 to 2008 some 10,000 people were killed in landmine incidents.²⁹ The number of deminer casualties is unknown, but local media reported that between 2000 and 2008, 168 people were killed in clearance operations.³⁰

According to a 2006 study by the Janbazan Medical and Engineering Research Center (JMERC), between 20 August 1988 and 20 March 2003 at least 3,713 persons were injured by landmines and ERW, including 1,499 people who underwent amputations in five western provinces of Iran. Among the amputees, 92% were male and 8% female; the average age at the time of the incident was 13–23 years old. The most common activities at the time of the incident were grazing livestock (29.6%), farming (8.1%), tampering (7.9%), and playing (4.5%). The study found that 33.1% of casualties were registered in Kurdistan, 22.2% in Kermanshah, 19.8% in West Azerbaijan, 15.1% in Ilam, and 9.9% in Khuzestan.³¹

Another study, carried out between 1998 to 2004, collected information on 156 casualties (six killed and 150 injured) who were treated at the Shahid Motahhary Hospital in West Azerbaijan province. It found that 80% of casualties were civilians and 20% military. The majority of casualties were male (95%) and 5% were female; 65% of casualties were between 15 and 35 years old. Activities at the time of the incident included herding, farming, smuggling, and playing; no statistics on activities were provided.³²

In 2006, the UN reported that since the early 1990s, there had been approximately 10,000 casualties in Iran (some 4,000 people killed and 6,000 injured). During the same period more than 850 casualties among military deminers were reported.³³ Ministry of Interior data, used by the Iranian Mine Victim Resource Center (IMC), recorded 6,765 mine casualties in Iran (2,840 people killed and 3,925 injured) from 1988–2002 in five provinces. The Sina Trauma and Surgery Research Center (STSRC) also recorded 990 people killed and 1,270 injured in incidents in Kermanshah province from 1994–2004. According to the STSRC, more than 95% of the mine incidents it recorded resulted in civilian casualties and around 15% involved children.

Risk profile

At-risk groups are men conducting livelihood activities (farmers, nomads, and shepherds), children and women living in western provinces,³⁴ as well as military personnel and deminers (see Casualties section above). Pilgrims traveling to Karbala in Iraq are also said to be at risk.³⁵

²⁸ See previous editions of Landmine Monitor. *Landmine Monitor Report 2007* did not report a total casualty figure for 2006, however, it cited a Ministry of Defense report that nine deminers had been killed and 20 injured in clearance operations and that the IRCs recorded “more than 60 civilian casualties.” Therefore, for this report, Landmine Monitor has counted 89 casualties (nine killed, 20 injured, and 60 unknown) in 2006. *Landmine Monitor Report 2005* reports two sets of figures for 2003, 34 killed and 101 injured recorded by IMC and 45 killed and 21 injured reported in the media. As there is no way to determine whether these figures overlap, for this report, Landmine Monitor has counted 135 casualties (34 killed and 101 injured) for 2003. *Landmine Monitor Report 2004* reported 191 casualties (69 killed and 122 injured) in 2001. However, *Landmine Monitor Report 2003* reported 18 civilians killed, 52 army deminers killed and 122 army deminers injured in 2001. Therefore, for this report, Landmine Monitor has counted 192 casualties (70 killed and 122 injured) in 2001.

Program Management and Coordination

Mine action

The National Mine Action Council (NMAC) was established in 2003 by the government (the legislative basis is not known). It consists of the ministries of interior, foreign affairs, health and medical training, the provincial governors of the five mine-affected border provinces in the west, the joint chief of command for the armed forces, IRMAC, national mine action NGOs, and operational demining units belonging to Iran's armed forces.³⁶ The NMAC is chaired by the Minister of Defense.

In 2003, NMAC established IRMAC, a civilian body, to implement and coordinate mine action activities.³⁷ IRMAC has five regional offices (one in each of the five western contaminated provinces).³⁸

Risk education

IRMAC is responsible for the coordination of risk education (RE) and established an RE committee in December 2005 that includes representatives from the ministries of defense, education, and welfare, the Iranian Red Crescent Society (IRCS), and the ICRC. There has been no coordination meeting since 2007, although IRMAC is kept informed of ongoing RE activities by operators.

Victim assistance

Despite the high number of mine/ERW casualties, there is no specific victim assistance (VA) framework in Iran. IRMAC does not implement³⁹ or coordinate VA activities.⁴⁰ The Foundation of Martyrs and Veterans Affairs is the main organization responsible for war-injured persons, including mine/ERW survivors,⁴¹ although some services are provided by the State Welfare Organization, the Imam Khomeini Relief Foundation,⁴² and the IRCS.⁴³

Policies created by IRMAC under the Ministry of Defense do not include any objectives on VA, but have the general aim of "raising the standards of victim assistance and integrating mine action activities with development projects."⁴⁴

Data collection and management

IRMAC does not have a robust data collection and management system and does not use the Information Management System for Mine Action (IMSMA). There is no comprehensive data collection system in Iran and it is unclear which organization has the final responsibility to collect information on mine/ERW incidents. Casualty data is recorded by hospitals (although there is limited information in existing medical files), police, and provincial authorities.⁴⁵

As in previous years, IRMAC did not respond to Landmine Monitor requests for detailed casualty data. IRMAC stated that it collects casualty data,⁴⁶ but one source reported to Landmine Monitor that IRMAC does not collect/verify casualty data directly and it has no casualty

³⁶ See also IRMAC, "Demining activities," www.irmac.ir.

⁴⁶ Interview with Amir Hossein Saeedi, IRMAC, Tehran, 6 November 2008.

database.⁴⁷ Landmine Monitor was not able to confirm this information. IRMAC reported that the IMSMA “could not be received for political reasons.”⁴⁸

JMERC maintains a mine casualty database with medical and demographic details.⁴⁹ In 2006, JMERC, in collaboration with the ICRC, published the first phase of an epidemiological study of mine/ERW injuries in five western provinces of Iran.⁵⁰ A second phase of the study, which includes casualty data collection, was ongoing as of July 2009; results are expected in 2011.⁵¹ Several research institutes in Iran have conducted historical casualty data collection for research purposes. It is unknown if the IMC collected casualty data from 2008–2009.⁵²

Plans

Strategic mine action plans

In February 2007, the Minister of Defense reportedly declared that a 40-year timetable for mine clearance was being reduced to five years. He further noted that “In view of the president’s special attention to this matter, the ministry has given priority to mine clearance operations.” He claimed that operations would be concluded in West Azerbaijan and Kurdistan provinces by 21 March 2007, and that one year later, the province of Kermanshah would be cleared of mines. Finally, he declared that, “in line with our schedule and taking into account the high level of contamination in Khuzestan and Ilam Provinces, these two provinces will be decontaminated by 1389 [2011].”⁵³

On 5 May 2009, the UNDP Deputy Representative in Iran, Sagen Bayeva, met with NMAC and IRMAC staff and discussed possible Iran-Iraq cooperation in mine action in border areas with the support of UNDP.⁵⁴ The extent of any subsequent progress has not been reported.

It is not known if the 2007 national action plan for RE has been implemented.

National ownership

Commitment to mine action and victim assistance

Despite Iran’s predictions of completing mine clearance within five years, there is little evidence that this will be achieved. Iran’s mine action program is under full national management and all mine action operations are funded from national resources. In 2007, the International Congress on Landmine Induced Injuries was held in Tehran and VA was identified as a priority for mine action in Iran. In 2000, the First International Conference on Landmine Victim Assistance during Peace Period was held in Tehran to discuss VA efforts.

National mine action legislation and standards/Standing operating procedures

On 5 April 2009, the Iranian Parliament adopted legislation to support deminers of private companies.⁵⁵ Under the new legislation, the Foundation of Martyrs and Veterans Affairs, a governmental organization, is responsible for providing medical and socio-economic support to deminers who are injured or killed during their duties, as well as their families.⁵⁶ New national mine action standards and supporting standing operating procedures were said to have been drafted in 2008;⁵⁷ as of July 2009 it was not known if they had been formally approved. In 2005, IRMAC claimed to have developed national mine action standards based on the International Mine Action Standards.⁵⁸

⁴⁷ Landmine Monitor source requesting anonymity.

Demining and Battle Area Clearance

Iran's demining capacity consists primarily of engineer units of the Iranian army and the Revolutionary Guard. Demining projects in support of oil exploration often use the private sector, which typically recruits retired veterans.⁵⁹ One such commercial demining company is ISOP (Immen Sazan Omran Pars), which was established in 2004 in Tehran by war veterans with authorization from the Ministry of Defense.⁶⁰ Deminers use manual methods and machines, but not mine detection dogs. In March 2007, a total of 941 deminers (300 from the army, 200 from the Revolutionary Guard, and 441 from private companies) were reportedly employed in demining operations. In accordance with Iran's five-year demining plan it was planned to deploy a total of 8,000 people for demining,⁶¹ but more recent figures for demining capacity are not available.

Demining and battle area clearance results for 2008⁶²

Province	Area released (km ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	UXO destroyed
Ilam	743	43,560	25,420	75,849
Kermanshah	51	13,676	3,580	42,228
Khuzestan	1,204	38,225	48,896	82,325
Kurdistan	4	10,875	0	0
West Azerbaijan	4	12,253	0	0
Total	2,006	118,589	77,896	200,402

In the past, the casualty rate among deminers was very high. In 2007, IRMAC reported that 168 demining personnel had been killed and a further 697 injured over the course of eight years. This would represent the highest known casualty rate for deminers in the world. In 2008, there were a further 61 reported demining casualties (of whom four were killed and 57 injured). In response to the level of casualties, demining units are now obliged to use personal protective equipment systematically and the use of mechanical demining equipment, such as flails, has been increased.⁶³

Quality management and handover of cleared land

Quality management is performed for IRMAC by Mohandesin Moshaverine Omrane Iran (Omran Iran Consulting Engineers, OICE).⁶⁴ Once quality management is complete, IRMAC issues a handover certificate, which should be signed first by the contractor, then by OICE, thirdly by IRMAC, and lastly by the land owner (beneficiary).⁶⁵ Governors General (the representatives of the government at the provincial level) monitor the post-clearance use of land. They report any incident in previously cleared areas. The contractor is responsible to re-clear lands on which any incident occurs.⁶⁶

Risk Education

In 2008, RE was provided by the State Welfare Organization of the Ministry of Welfare and Social Security (Behzisti), the IRCS, and local NGOs. The ICRC continued to provide technical and financial support.⁶⁷ The number of beneficiaries reached is unknown, but target groups included schoolchildren, teachers, nomads and shepherds living in five affected western provinces (Ilam, Kermanshah, Khuzestan, Kurdistan, and West Azerbaijan), as well as Afghan returnees across the country.⁶⁸

The State Welfare Organization provided school-based RE in cooperation with the Ministry of Education and IRMAC in the five affected western provinces.⁶⁹ Awareness messages were provided in all schools in Ilam and between 60 and 80% of all schools in contaminated areas of the remaining provinces.⁷⁰ In 2008, with ICRC support, it organized a training session for RE trainers in Ilam province.⁷¹ The State Welfare Organization used various RE materials including books, leaflets, and documentaries translated into local languages.⁷² It also implemented a pilot RE project that specifically targeted farmers and nomads in Kermanshah province.⁷³ In 2009, the State Welfare Organization's RE activities were expanded to target some 30,000 people in Ilam province (from some 5,000-6,000 people previously).⁷⁴

The IRCS provided awareness messages for local people in the five affected western provinces and for Afghan returnees.⁷⁵ The IRCS training program for volunteers in affected provinces included an RE component.⁷⁶ The ICRC also supported another local NGO which was working with the army to mark some dangerous areas in Kermanshah province.⁷⁷

The NGO Pishgaman Maaf implemented an RE pilot project in 10 villages in Kurdistan province.⁷⁸ Thirty-one members of Pishgaman Maaf received RE training from the ICRC and the IRCS.⁷⁹ In 2009, coverage has been expanded to 40 villages.⁸⁰

From 2002 to 2008, RE has been provided in affected areas by several governmental and non-governmental organizations including the IRCS, the State Welfare Organization, IRMAC, local NGOs, Zaynab Welfare Agency, ICRC, and UNHCR.

Victim Assistance

The total number of survivors is unknown but estimated to be between 546 and 6,000.⁸¹ Little information is available on governmental and NGO agencies providing assistance to persons with disabilities, including war-injured and mine/ERW survivors. In 2009, during the International Day for Mine Awareness and Assistance in Mine Action, the Ministry of Defense

⁷⁹ ICRC, "Special Report: Mine Action 2008," Geneva, April 2009, p. 20.

⁸⁰ Telephone interview with Nima Dadbin, ICRC, 27 July 2009.

⁸¹ The lower number is based on Landmine Monitor data (1999–2009); the higher one is based on UN statistics from UN, "2006 Portfolio of Mine Action Projects," New York, 2007, p. 199. For more information see the casualty section in this report.

stated its commitment to support mine survivors and their families.⁸² However, in 2008, several persons with war injuries expressed their dissatisfaction with the assistance received, stating that many disabled do not enjoy decent standards of living.⁸³

Services to assist mine/ERW survivors are in place, although quality and accessibility varies between urban centers and remote villages.⁸⁴ Eligibility criteria for mine/ERW survivors who want to receive government services is an issue of concern, as the procedures are time-consuming.⁸⁵ Certain categories of people are excluded from services/benefits (for instance those who intentionally entered a minefield or tampered with a device).

Specialized care is available in large cities (usually provincial capitals). Institutions providing medical and rehabilitation services to mine/ERW survivors included the Mehran Emergency Center, Ilam provincial hospital, Sanandaj Besat Hospital in Kurdistan province, the STSRC in Tehran, and the Kowsar Orthotics and Prosthetics Center.⁸⁶ While there are state funds for vocational training of persons with disabilities, these centers are mainly in urban areas.⁸⁷

Iran has legislation protecting persons with disabilities. Accessibility for persons with disabilities remained an issue of concern.⁸⁸ As of 1 July 2009, Iran had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

Victim assistance activities

The number of mine/ERW survivors assisted in 2008 or in the last 10 years is unknown. The Foundation of Martyrs and Veterans Affairs provides a wide range of services to war-injured persons (including mine/ERW survivors) and their families, including healthcare, education, and financial support.⁸⁹

JMERC does not implement VA activities but conducts research on mine/ERW casualties. As of May 2009, ongoing projects included: a comparative study on post-traumatic stress disorder among mine/ERW and chemical weapons survivors in Kurdistan province; a study to increase the knowledge of mine/ERW survivors using a special educational package; and a collective medical examination camp for 50 young survivors of mine/ERW survivors.⁹⁰

In April 2008, IRMAC initiated a new project to provide support, including social and psychological assistance, for the families of mine casualties, specifically focused on deminers' families. No progress was reported as of July 2009.

Support for Mine Action

Landmine Monitor is not aware of comprehensive cost estimates for meeting mine action needs in Iran. Iran has not reported on the value of national funding to its own mine action program in 2008, as in 2007. As of May 2009 Iran had contributed three battle area clearance teams to support clearance efforts in southern Lebanon.⁹¹ It has not reported on the value of this contribution to date.

ISRAEL

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Antipersonnel and antivehicle mines, UXO, AXO
Estimated area of contamination	Unknown
Casualties in 2008	Two (2007: two)
Estimated mine/ERW survivors	Unknown but at least 13 since 1999

Ten-Year Summary

The State of Israel's policy has not changed over the past decade. It supports the humanitarian goals of the Mine Ban Treaty but views antipersonnel mines as a necessary and legitimate means for security. Israel said it stopped production and importation of antipersonnel mines in the early 1980s; in 2004, Israeli officials disclosed for the first time that production lines had been dismantled. Israel declared a moratorium on the transfer of antipersonnel mines in 1994, which has been extended for three-year periods until July 2011. The last confirmed use of antipersonnel mines by Israel was during its withdrawal from southern Lebanon in 2000. Israel was alleged to have used antipersonnel mines in several specific instances in Gaza and the West Bank (Occupied Territories) in 2000 and 2001, and to have laid antipersonnel mines during the July–August 2006 conflict in Lebanon, but has denied the charges.

Israel is affected by mines and explosive remnants of war (ERW), although the precise extent remains unclear. In 2008, the Israeli Defense Forces reportedly cleared 11,000 mines. Since 1999, at least six mine/ERW casualties have been recorded. No formal mine/ERW risk education (RE) activities exist, but *ad hoc* RE is provided in awareness sessions in schools, as part of army training, and by local authorities. Israeli health and social services are able to respond adequately to mine/ERW survivors' needs.

Mine Ban Policy

Israel has not acceded to the Mine Ban Treaty. In November 2008, an Israeli official reiterated that "Israel is not in a position to join the Mine Ban Treaty. The regional circumstances prevailing in the Middle East prevent Israel from committing to a total ban on anti-personnel mines and unfortunately have not improved since our previous communication."¹ In April 2007, Israel said that "while Israel supports the humanitarian goals of the convention, it is unable to disregard its specific military and security needs, it cannot commit to a total ban on anti-personnel mines as they are a legitimate means for defending its borders against possible incursions such as terrorist attacks and therefore is not in a position to consider membership."²

Since 1997 Israel has abstained each year from voting on annual UN General Assembly resolutions calling for universalization and full implementation of the Mine Ban Treaty, including UNGA Resolution 63/42 on 2 December 2008.

Israel did not participate as an observer in the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008, but attended the intersessional Standing Committee meetings in May 2009. It did not make any statements.

¹ Letter from Rodica Radian-Gordon, Director, Arms Control Department, Ministry of Foreign Affairs, 10 November 2008.

² Email from Joshua Zarka, Counselor for Strategic Affairs, Ministry of Foreign Affairs, 18 April 2007.

Israel is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Israel submitted an annual report in accordance with Article 13 in November 2008. Israel is not party to Protocol V on Explosive Remnants of War. As of 1 July 2009, Israel had not signed the Convention on Cluster Munitions.³

Production, transfer, stockpiling, and use

The size and composition of Israel's stockpile of antipersonnel mines remains unknown, but it includes both hand-emplaced and remotely-delivered mines.⁴ Israel has said it "ceased all production and imports of antipersonnel mines in the early 1980s."⁵ It has dismantled its antipersonnel mine production lines.⁶

Israel declared a moratorium on the transfer of antipersonnel mines in 1994, which was extended for three-year periods in 1996, 1999, 2002, 2005, and 2008. The current moratorium is effective until July 2011.⁷

On 31 December 2007, the Defense Export Control Act entered into force in Israel. The act "criminalizes, inter alia, any violation of the export without an export license or contrary to its provisions. This Act serves as Israel's statutory framework for the implementation of its obligations under the CCW regarding restrictions and prohibitions on transfer and the Moratorium on any sales of [antipersonnel mines]."⁸

Israel's November 2008 CCW Amended Protocol II annual report states, "There were no newly emplaced minefields this year."⁹

In December 2008, Israel launched 22 days of intense military operations in Gaza. According to one news report, the law department of the Israeli Armed Forces sanctioned use of antipersonnel mines during the conflict, but there has been no confirmation of their use.¹⁰ Israel used numerous antivehicle mines for controlled demolition of structures, but a Human Rights Watch field mission found no evidence of use of antipersonnel mines.¹¹ There was also no evidence of use of antipersonnel mines by Palestinian groups, though Israel apparently anticipated it, as demonstrated by Israel's use of numerous "CARPET" minefield-clearing fuel-air-explosive weapons.¹²

Scope of the Problem

Contamination

Israel is affected by landmines and ERW. Mines dating from World War II remain, and Israel has subsequently used mines along its borders, near military camps and training areas, and near civilian infrastructure. The exact extent of overall contamination is not known, but unconfirmed

³ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 212–215.

⁴ Israel reported that in 2005 the IDF destroyed 15,510 outdated mines at an ammunition disposal facility. It has not reported any further destruction of mines since that time. CCW Amended Protocol II Article 13 Report, Form C, 22 November 2005.

⁵ Email from Meir Itzhaki, Regional Security and Arms Control Division, Ministry of Foreign Affairs, 10 February 2003. In the past, Israel produced low metal content blast antipersonnel mines, bounding fragmentation mines, and Claymore-type directional fragmentation munitions, designated M12A1, No. 2, No. 3, No. 4, and No. 6.

¹¹ Internal notes from Human Rights Watch field mission to Gaza, December 2008–January 2009.

¹² Ibid. For information regarding reports of use of antipersonnel and antivehicle IEDs by Hamas militia during the conflict, see report on Palestine (OPT) in this edition of *Landmine Monitor*.

press reports have suggested that some 33km² of land are suspected to be mined in Israel, the West Bank, and the Golan Heights.¹³ A total of 70,000 antivehicle mines and 50,000 antipersonnel mines were reportedly laid by the Israeli Defense Forces (IDF) and the Jordanian Armed Forces in the Jordan Valley in past decades, although exact dates of placement are not available.¹⁴ According to a report published by the Knesset Research Unit in 2002, 350 minefields in Israel and the Occupied Territories were regarded as no longer necessary to Israel's security.¹⁵

As a result of various conflicts, some parts of Israel are also contaminated by ERW—both abandoned explosive ordnance and UXO—remaining in the areas of confrontation and near military training areas. A further hazard has arisen from Palestinian improvised explosive devices (IEDs). In addition, Israeli military training fields are said to be sometimes improperly fenced or not fenced at all, and some UXO go uncollected.¹⁶ According to the commander of the bomb squad of the National Police, all known strike locations of cluster munitions fired into Israel from Lebanon by Hezbollah were cleared of any remnants found at the time. No survey was conducted, nor was there any attempt to identify strikes that may have landed in the desert.¹⁷

In 2006, mined areas in Israel were said to be fenced and marked with warning signs in Hebrew, Arabic, and English, clearly positioned on the perimeter of every minefield.¹⁸ However, it had earlier been reported that some of the areas, especially in the south, were not marked or fenced, and were potential hazards to the civilian population; the IDF policy of marking mined areas and not fencing them was criticized.¹⁹ In recent years, landmines exposed and moved by flooding in the northern Golan Heights have presented a new danger for local civilians.²⁰ On 11 February 2008, the Peace Court of the city of Haifa ordered the State to award NIS62,240 (US\$14,939) in compensation to two brothers in Majdal Shams in the Golan Heights for the damages incurred in 2000, when landmines were swept down the hill from a minefield to their courtyard. The court concluded that the IDF was aware of the dangerous position of the minefield but took no preventive measures.²¹

Israel has declared that information on the location of minefields is provided to the Israeli Mapping Center. Maps are reportedly available to the public and periodically updated. Further information regarding minefield locations is provided by local municipalities in response to land rights and use inquiries.²² Minefields are clearly marked with signs in Hebrew, Arabic, and English.²³

Casualties

In 2008, Landmine Monitor identified two new ERW casualties: an 11-year-old boy was killed and his father injured by an unexploded shell while hiking near Ramat Hovav in Negev. The media reported that they “wandered into an IDF firing range.”²⁴ In its 2008 CCW Article 13 report, Israel also reported two civilian casualties occurring between November 2007 and

November 2008 while they tried to “steal mines from a fully fenced and marked minefield.”²⁵ Further details and the date of the incident were not made available. Therefore, the casualties were not included in the 2008 total. In 2007, two mine/ERW casualties were reported.²⁶

Casualties continued to be reported in the first quarter of 2009. On 1 March, a farmer was injured by a mine while looking for mushrooms.²⁷ On 11 March, a man sustained severe injuries after entering a clearly marked minefield with two friends. He subsequently died while being rescued by helicopter; two other people were unhurt.²⁸

Media reported on Israeli military mine casualties in Gaza during Operation Cast Lead in December 2008–January 2009.²⁹ Landmine Monitor was told by an Israeli official that these casualties were caused by IEDs, not mines. Further detail was not provided.³⁰ Instances of people inadvertently entering minefields in the Golan Heights have been reported but without casualties.³¹

The total number of mine/ERW casualties between 1999 and 2009 is unknown, with Landmine Monitor recording only one incident prior to 2007—a soldier injured in 2000.³² In 2005, it was reported that IEDs caused “many casualties among Israeli civilians,” but it is unclear whether these were victim activated or command detonated devices.³³ Additionally, at least 19 Israeli military mine/ERW casualties occurred outside of Israel: four killed and four injured in Gaza (2003); and six killed and five injured in Lebanon (2006).³⁴

Program Management and Coordination

There is no national agency to manage or coordinate demining efforts. On 17 February 2000, the government decided that mine clearance would be implemented by civilian companies and supervised by a civilian authority, which would initiate clearance requests. However, the IDF decided a year later that it held sole responsibility for mine clearance.³⁵ Mine/ERW survivors are not treated differently from other persons with disabilities. The Ministry of Social Affairs and Social Services is responsible for disability issues.³⁶

Data collection and management

Mine/ERW casualty data is not publicly available although an Israeli official reported that there are several casualty databases in the country, including a database at the Ministry of Defense which, however, does not make a distinction between casualties from mines and those from other explosive devices.³⁷

²⁵ Article 13 Report, Form F, November 2008. It is possible that the casualties in this report are the same as those reported by the media on 23 May 2008.

³⁶ See Ministry of Social Affairs and Social Services, www.molsa.gov.il.

³⁷ Telephone interview with Meir Itzhaki, Permanent Mission of Israel, 2 April 2009.

Demining and Battle Area Clearance

During 2008, 500 inspections of fencing and markings of minefields were conducted by the IDF Engineering Corps, and 11,000 mines were reportedly cleared.³⁸ In addition, in October 2008, the IDF reported that clearance of minefields in the northern Jordan Valley had been conducted as a training exercise.³⁹ As of November 2008, the IDF Engineering Corps was continuing to measure minefields using global positioning systems, as well as what appears to be recording of the “history” of minefields.⁴⁰

In 2008, the IDF Northern Command began to promote usage of private clearance companies, so as to limit the IDF’s legal responsibility in areas it had cleared and then declared safe.⁴¹ An Israeli civil company conducted “two significant mine clearance projects,” one involving UXO clearance in Ramat Hovav and the other involving unspecified clearance in Pardes Hana.⁴² The extent of the areas cleared, and the number of items of ordnance disposed of, were not reported.

Risk Education

In 2008, mine/ERW risk education (RE) continued to be provided on an *ad hoc* basis, as has been the case since 1999. Formal risk education is reportedly not needed as the level of awareness among Israelis is high.⁴³ RE messages were provided to schoolchildren during terrorism awareness sessions, as well as to all Israelis in military service.⁴⁴ Local municipalities continued to provide information on minefield locations to citizens, and field trip organizers needed to coordinate their routes with the IDF which provided “appropriate mine awareness instructions.”⁴⁵ Between 2000 and 2001, Israeli NGOs also provided RE in Angola and Kosovo.⁴⁶

Victim Assistance

The estimated number of survivors is unknown but is at least 13 since 1999. Israel has sufficient capacity to address the needs of persons with disabilities, as well as vast experience in trauma surgery and rehabilitation. Medical, rehabilitation, and socio-economic reintegration costs of insured persons with disabilities, including mine/ERW survivors, are covered by the Israeli National Insurance Institute. Mine/ERW survivors can also be eligible for financial compensation under the Benefits for Victims of Hostilities Law of 1970.⁴⁷ However, in 2009, Israeli veterans reported gradual cuts in government support for welfare, with voluntary organizations having to fill the gaps. They also said that negotiating compensation can be time-consuming.⁴⁸ As of 1 July 2009, Israel had not ratified the UN Convention on the Rights of Persons with Disabilities or signed its Optional Protocol.

In 2003, it was also reported that Israeli rehabilitation specialists were sent out under UN auspices and that rehabilitation exchange agreements were concluded with several countries.⁴⁹

KAZAKHSTAN

Ten-Year Summary

The Republic of Kazakhstan has repeatedly stated that it needs landmines to protect its border. In 2007 and 2008, Kazakhstan voted in favor of the annual pro-ban UN General Assembly resolution, after abstaining in all previous years. The Minister of Defense stated in 2007 that 3,000 expired mines had been destroyed from stockpiles and more would be destroyed in the future. Government officials have at times acknowledged the use of landmines in border areas and at other times denied the existence of minefields in Kazakhstan.

Mine Ban Policy

Kazakhstan has not acceded to the Mine Ban Treaty. It has expressed support for the treaty's humanitarian objectives, but cited the perceived need for antipersonnel mines to protect its border and the perceived need for alternatives to the weapon as the reasons Kazakhstan has not yet joined.¹

On 2 December 2008, Kazakhstan voted in favor of UN General Assembly Resolution 63/42, calling for universalization and full implementation of the Mine Ban Treaty. This was the second year in a row it voted for the annual pro-ban resolution, after abstaining each year since 1997.

Kazakhstan did not attend as an observer the Ninth Meeting of States Parties to the Mine Ban Treaty in November 2008, nor did it attend the intersessional Standing Committee meetings in May 2009.

Kazakhstan has stated that it is not a producer of antipersonnel mines. It has had a moratorium of unlimited duration on export and transit of landmines since 1997.²

The size of Kazakhstan's antipersonnel mine stockpile is not known, but a 1998 media report estimated that the government had between 800,000 and one million antipersonnel mines.³ Officials have said that many of the mines have expired, that some have been destroyed in recent years, and that a plan for further destruction is in place.⁴

A media report on 18 July 2008 stated that police found an ammunition cache containing antivehicle and antipersonnel mines in the Aktobe region.⁵

Government officials have at times acknowledged the use of landmines in border areas and at other times denied the existence of minefields in Kazakhstan.⁶

Kazakhstan is not party to the Convention on Conventional Weapons. As of 1 July 2009, it had not signed the Convention on Cluster Munitions.⁷

¹ For examples, see *Landmine Monitor Report 2008*, p. 870.

DEMOCRATIC PEOPLE'S REPUBLIC OF KOREA

Ten-Year Summary

The Democratic People's Republic of Korea (DPRK)—North Korea—has not engaged at all in efforts to ban antipersonnel mines. It has not responded to annual requests from Landmine Monitor to provide information on its policies and practices. It is considered a producer and stockpiler of antipersonnel mines. The scope of the problem and the extent of any demining in North Korea remain unclear. No information about mine and explosive remnants of war (ERW) casualties is publicly available, and no mine/ERW risk education has been reported. There are no specific services for mine/ERW casualties, and sanctions, floods, and restrictions for international organizations have reduced the country's capacity to address the needs of persons with disabilities.

Mine Ban Policy

North Korea has not acceded to the Mine Ban Treaty. Ministry of Foreign Affairs officials have stated that North Korea supports the aims and objectives of the treaty but is not ready to accede, given its complex security situation.¹

On 2 December 2008, North Korea abstained from voting on UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty. It did not offer any explanation of its vote.² It has never attended an international or regional meeting on the landmine issue. In May 2009, an official told the ICBL that North Korea is “not interested in engaging on that topic.”³

North Korea produced antipersonnel mines in the past, but no information is available on possible current production.⁴ North Korean mines have been found in Angola and Sudan, but there are no reports of recent transfers.⁵ The size of North Korea's stockpile of antipersonnel mines is not known, but it is probably substantial.

North Korea is not party to the Convention on Conventional Weapons. It has not signed the Convention on Cluster Munitions.⁶

¹ Email from Kerry Brinkert, Director, Implementation Support Unit, Geneva International Centre for Humanitarian Demining, 1 February 2006. In 1998, a government representative indicated that it supported the “humanitarian purposes and the nature of” the Mine Ban Treaty, but could not accede to it “for security reasons” given the circumstances on the Korean peninsula. Statement by Counselor Kim Sam Jong, Permanent Mission of the DPRK to the UN in New York, 4 December 1998; and “Official Records of the UN General Assembly, Fifty-third Session, 79th plenary meeting” (New York: UN General Assembly, 4 December 1998), A/53/pv79, pp. 8–9.

² North Korea also abstained from voting on the annual pro-Mine Ban Treaty UNGA resolution in December 2007. It was absent from every previous vote from 1997–2006. It was one of only 10 nations to abstain on the first UNGA landmine resolution in 1996 calling for the negotiation of an international agreement to ban antipersonnel mines.

³ Telephone interview with unidentified official at the Permanent Mission of the DPRK to the UN in Geneva, 27 May 2009.

⁴ North Korea has produced Model 15 fragmentation mines and APP M-57 blast mines. See Eddie Banks, *Brassey's Essential Guide to Anti-Personnel Landmines* (London: Brassey's, 1997), p. 164; and Colin King, ed., *Jane's Mines and Mine Clearance 2004–2005* (Surrey, UK: Jane's Information Group Limited, 2005), p. 211.

⁵ Colin King, ed., *Jane's Mines and Mine Clearance 2004–2005* (Surrey, UK: Jane's Information Group Limited, 2005), p. 211.

⁶ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 216–217.

Scope of the Problem

Contamination

North Korea admitted in 1998 that it had laid landmines in the Demilitarized Zone (DMZ) between the north and south of the peninsula.⁷ The affected areas are reported to be marked and fenced. In early 2006, officials commented to the Mine Ban Treaty Implementation Support Unit that North Korea had not laid mines elsewhere in the country,⁸ despite fears noted in *Landmine Monitor Report 2004* that sections of the east or west coast were also mined.⁹ In December 2006, a North Korean defector claimed that in 1981, when he was stationed in Ryongyon-kun, South Hwanghae province, on the west coast just above the 38th parallel, he had observed mined areas along the shore that were fenced and marked with warning signs.¹⁰

There are also believed to be ERW, particularly UXO, in North Korea left from the conflict on the Korean peninsula in the 1950s.¹¹

Casualties

As in previous years, it is not known if new mine/ERW casualties occurred in North Korea in 2008 or in 2009 through 1 April.¹² The ICRC reported that 0.17% of 1,204 prostheses it provided in 2008 went to mine survivors; it is unknown when they were injured.¹³

Since 1999, Landmine Monitor recorded one mine incident when, in December 2002, a North Korean soldier involved in construction work in the DMZ lost a foot in a landmine explosion.¹⁴ It is likely that other incidents remained unreported.

Program Management and Coordination

The needs of mine/ERW survivors are addressed by existing services with several bodies responsible for service provision, including the Ministry of Public Health, the Ministry of People's Armed Forces, and the Korean Federation for the Protection of Disabled People (KFPD).¹⁵

Victim assistance

While North Korea is still considered "one of the least hospitable societies for people with disabilities," it took steps towards improving the quality of life of persons with disabilities in 2008¹⁶ by re-engaging with some international organizations that were forced to leave in 2005, once again allowing them to assist health facilities and to reform institutions housing persons with disabilities.¹⁷ In 2004, North Korea was believed to have had a comprehensive system for assisting persons with disabilities,¹⁸ but the 2005 expulsion of NGOs, UN sanctions in 2006, and floods in 2006–2007 had reduced the country's capacity to address the needs of persons with disabilities.¹⁹

¹⁸ See *Landmine Monitor Report 2004*, p. 1019.

¹⁹ Telephone interview with NGO representative speaking on condition of anonymity, 30 March 2009.

In 2003, the government adopted the Law of Disability Protection, but implementing legislation had not been passed by 2008.²⁰ As of 1 July 2009, North Korea had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

The ICRC continued to support government physical rehabilitation centers. In November 2008, representatives from these centers, the KFPD, and government bodies expressed their interest in developing a national rehabilitation structure that would standardize regulations and methods.²¹

²¹ ICRC, "Physical Rehabilitation Programme: Annual Report 2008," Geneva, 7 May 2009, p. 39.

REPUBLIC OF KOREA

Ten-Year Summary

The Republic of Korea (ROK)—South Korea—has insisted on the military necessity of antipersonnel mines, while acknowledging the negative humanitarian consequences. South Korea has consistently abstained from voting on the annual UN General Assembly resolution calling for universalization of the Mine Ban Treaty. South Korea began producing remotely-delivered, self-destructing antipersonnel mines in 2006. It has maintained an indefinite moratorium on the export of antipersonnel mines since 1997. In May 2006, South Korea revealed that it had a stockpile of 407,800 antipersonnel mines, but in 2009 said the figure is classified.

Demining has remained exclusively in the hands of the army which committed substantial numbers of personnel but limited funds to mine action and made limited headway clearing the main areas of contamination. Mines are estimated to affect some 32km², especially in the heavily affected Demilitarized Zone (DMZ) and the Civilian Control Zone (CCZ).

Landmine Monitor has identified 63 mine casualties between 1999 and 2008 (six killed and 57 injured). South Korea had very limited risk education activities during this period. There have not been any specific services for mine/ERW survivors during this 10-year period but medical and rehabilitative care is of good quality, and all citizens are covered through the national health insurance system. Government compensation is also available, but only seven claimants have been successful since 2002.

Mine Ban Policy

South Korea has not acceded to the Mine Ban Treaty. It has never sent observers to the annual meetings of States Parties to the Mine Ban Treaty, but has attended intersessional meetings sporadically, as well as some regional landmine meetings. It did not attend the intersessional Standing Committee meetings in May 2009.

On 2 December 2008, South Korea abstained from voting on UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty, as it has in previous years. South Korea accompanied this vote with a statement that “due to the unique security situation on the Korean Peninsula, we are compelled to give priority to our security concerns, and unable to accede to the Convention at this point.”¹

South Korea is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. South Korea submitted its annual report required by Article 13 of Amended Protocol II.² South Korea adhered to Protocol V on Explosive Remnants of War (ERW) on 23 January 2008, becoming a State Party to the protocol on 23 July 2008. South Korea has not signed the Convention on Cluster Munitions.³

¹ Statement by Youn Jong Kwon, First Secretary, Permanent Mission of the ROK to the UN in New York, 63rd UN General Assembly meeting, New York, 29 October 2008.

² CCW Amended Protocol II Article 13 Report, 30 October 2008. The report consists only of a cover sheet with mine clearance information and references to visits by Colombia and Prince Mired Raad Zeid al-Hussein of Jordan.

³ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 217.

Use, production, and transfer

South Korea told Landmine Monitor that it did not engage in any new use of antipersonnel mines during 2008.⁴ It also said that there was no production, export, or importation of antipersonnel mines in 2008.⁵ In 2007, a private company, the Hanwha Corporation, produced about 10,000 self-destructing antipersonnel mines, as well as an unknown number of Claymore directional fragmentation mines.⁶

South Korea has produced two types of Claymore mines, designated KM18A1 and K440. South Korean officials have stated that the country only produces the devices in command-detonated mode, which is lawful under the Mine Ban Treaty, and not with tripwires, which are prohibited.⁷

In 2008, South Korea stated that it has “faithfully enforced an indefinite extension of the moratorium on the export of AP [antipersonnel] mines since 1997, which does not include Claymore-type mines.”⁸

In June 2009, South Korea told Landmine Monitor, “The government-led R&D program on the development of ‘remotely-controlled mine’ which will replace anti-personnel mines is underway. The newly developed mines will meet the requirements set out in the Amended Protocol II to the CCW.”⁹

According to one report, the Korean military is planning to deploy remote-controlled “Spider bombs” along the DMZ by 2013.¹⁰ Bids have been solicited for development of the weapon, apparently a copy of the US XM-7 Spider Networked Munitions System.¹¹ As developed by the United States, the Spider system initially had a “battlefield override switch” that, in addition to remote detonation, would allow the device to function in a victim-activated mode, making it incompatible with the Mine Ban Treaty. After criticism from the US Congress, this feature was dropped. It is not known whether South Korea’s version will have such a feature.

Stockpiling

In 2009, South Korea told Landmine Monitor that the size of its stockpile is classified.¹² However, in response to annual questionnaires from Landmine Monitor from 2006 to 2008, South Korea said its stockpile consisted of 407,800 antipersonnel mines.¹³ Previously, the government stated that it held a stockpile of about two million antipersonnel mines.¹⁴

⁷ Interview with Younghyo Park, First Secretary, Permanent Mission of the ROK to the UN in Geneva, and Com. Kim, Ministry of National Defense, Geneva, 16 November 2006; and response to Landmine Monitor questionnaire by the Permanent Mission of the ROK to the UN in New York, 16 April 2007.

⁸ Response to Landmine Monitor questionnaire by the Permanent Mission of the ROK to the UN in New York, 16 June 2008.

⁹ Ibid, 9 June 2009.

¹⁰ “S Korea to Deploy Remote-Controlled Mines: Official,” *Agence France-Presse*, 26 January 2009.

¹¹ See *Landmine Monitor Report 2007*, pp. 1,011–1,012 for details on the US Spider system.

¹² Response to Landmine Monitor questionnaire by the Permanent Mission of the ROK to the UN in New York, 9 June 2009.

¹³ See *Landmine Monitor Report 2006*, p. 958; *Landmine Monitor Report 2007*, pp. 868–869; and *Landmine Monitor Report 2008*, pp. 876–877.

¹⁴ In May 2005, South Korea stated that “there are about twice as many landmines in stockpile as those that are buried,” and the government estimated one million buried mines. Response to Landmine Monitor questionnaire by the Permanent Mission of the ROK to the UN in New York, 25 May 2005. Landmine Monitor reported that the stockpile includes 960,000 M14 mines that were made detectable before July 1999 in order to comply with CCW Amended Protocol II, and that South Korea also holds unknown numbers of self-destructing mines, including, apparently, more than 31,000 US ADAM artillery-delivered mines. See *Landmine Monitor Report 2001*, p. 544.

For many years, the US military has stockpiled about 1.1 million M14 and M16 non-self-destructing antipersonnel mines for use in any future war in Korea.¹⁵ The US military also keeps in South Korea a substantial number of self-destructing, scatterable antipersonnel mines. In 2005, the South Korean government reported that the US held 40,000 GATOR, 10,000 VOLCANO, and an unknown number of MOPMS mines.¹⁶

Most of the US mines in South Korea have been part of the more extensive War Reserve Stocks for Allies, Korea (WRSA-K). The WRSA-K consisted of munitions stored in South Korea but kept under US title and control, which would be made available to US and South Korean forces in case of an emergency. On 30 December 2005, US President George W. Bush signed Public Law 109-159, authorizing the sale of items in the WRSA-K to South Korea during a three-year period, after which the WRSA-K program would be terminated, which occurred at the end of 2008.¹⁷

In June 2008, the South Korean government told Landmine Monitor, “Landmines are excluded from the negotiations between the ROK and US” regarding sale or transfer of War Reserve Stocks.¹⁸ In June 2009, the South Korean government told Landmine Monitor, “AP mines were not included in the list of items for sale or transfer in the WRSA-K negotiations, and therefore, no AP-mines were bought or obtained.”¹⁹

It is not clear what has or will be done with the US antipersonnel mines from the WRSA-K. The law ending the program states that any items remaining in the WRSA-K at the time of termination “shall be removed, disposed of, or both by the Department of Defense.”²⁰ Moreover, US policy is to stop the use of non-self-destructing antipersonnel mines in South Korea in 2010.

But, according to one report, South Korea may still safeguard the antipersonnel mines for 10 years, without actually taking ownership of them. At an annual meeting between the South Korean Minister of National Defense and US Secretary of Defense in Washington, DC, on 17 October 2008, a memorandum was signed that, in addition to the stocks South Korea is acquiring from the US, would have South Korea store 89,000 tons (89 million kg) of weapons and ammunition for the US until 2018, including non-self-destructing landmines.²¹

Scope of the Problem

Contamination

The DMZ and the CCZ (which adjoins the southern boundary of the DMZ) remain among the most heavily mined areas in the world due to extensive mine-laying during the Korean War and in the 1960s, 1978, and 1988.²²

¹⁵ See *Landmine Monitor Report 1999*, p. 333. While US Army documents indicate that about half of those mines are stored in the continental US, the South Korean government has said the entire stock is located in South Korea. Response to Landmine Monitor questionnaire by the Permanent Mission of the ROK to the UN in New York, 25 May 2005. In its subsequent responses, the government indicated that information on US stocks is classified.

²² See *Landmine Monitor Report 2004*, p. 1,022.

South Korea reports that about one million mines are emplaced in 1,300 sites between the DMZ and the capital, Seoul; a level of contamination unchanged for several years.²³ South Korea had indicated in May 2006 that about 970,000 mines were emplaced in the southern part of the DMZ, about 30,000 mines in the CCZ, and about 8,000 mines in 25 military sites covering an area of some 3km² in the northern parts of Gyeonggi-do and Gangwon-do provinces, below the CCZ.²⁴ UXO, another legacy of the Korean War, is also present in many parts of the country, and an explosion in Gyeonggi-do province in November 2006 injured one man.²⁵

South Korea informed Landmine Monitor that the 1,300 mined sites cover a total area of about 32km²,²⁶ unchanged from the previous year but substantially more than the 21.8km² of confirmed minefields reported by the Ministry of National Defense in 2003.²⁷ At that time, the ministry also reported unconfirmed minefields covering an additional 90.7km². The South Korean army defines unconfirmed minefields as areas that are suspected to be mined, but for which there are no maps or other reliable information; it marks them with "Unconfirmed Minefield Danger" signs.²⁸

Casualties

In 2008, Landmine Monitor identified two men injured by landmines. On 25 January, a civilian was injured on the island of Gangwha²⁹ and in October, a South Korean soldier was injured in the DMZ.³⁰

Casualties continued to occur in 2009, when an adult man was killed due to an antipersonnel mine explosion on 25 April. He was reportedly in a minefield in the CCZ, just below the DMZ.³¹

The number of mine/ERW casualties is unknown but the Korea Research Institute for Mine Clearance stated in March 2009 that there are at least 500 civilian survivors.³² In 2007, the media reported that there were at least 1,000 civilian casualties and the Korean Campaign to Ban Landmines (KCBL) estimated there were 2,000 to 3,000 military casualties.³³ Landmine Monitor identified 63 mine casualties between 1999 and 2008 (six killed and 57 injured). At least 20 casualties were military personnel, including one American soldier injured in 2001.³⁴ Figures are likely incomplete as there is no comprehensive official data on mine casualties in South Korea.³⁵ The Ministry of National Defense only records military mine/ERW incidents.³⁶ Civilian casualties are identified mainly through the media.

²³ Response to Landmine Monitor questionnaire by the Permanent Mission of the ROK to the UN in New York, 9 June 2009. The number of emplaced mines is unknown; some sources have estimated there are two million mines in the DMZ. See *Landmine Monitor Report 2002*, p. 682.

Program Management and Coordination

South Korea does not have a civilian mine action program. The Ministry of Health, Welfare and Family Affairs (MIHWAF) is the lead ministry responsible for persons with disabilities.³⁷ In 2008, the MIHWAF initiated a five-year plan to implement a comprehensive set of disability policies.³⁸

Demining

South Korea has undertaken limited demining in the DMZ and CCZ but has concentrated most effort on demining military bases in rear areas. Clearance operations are conducted by the South Korean army.³⁹

In its latest CCW Article 13 report for the period 1 September 2007 to 31 August 2008, South Korea stated that demining by 53,000 troops covered 169km² and cleared 2,249 landmines.⁴⁰ Separately, South Korea told Landmine Monitor that demining operations in 2008 involved 38,000 troops and resulted in clearance of 104,000m² and removal of 1,470 mines, substantially less than in the two previous years (see table below). It also said that it spent KRW980 million (US\$891,955) in 2008, close to double the amount in 2007. South Korea said it planned to clear six sites covering about 170,000m² in 2009.⁴¹

South Korea's 2007 Article 13 report stated that demining work was underway on 14 "military bases or sites," including three unconfirmed minefields, and that the work would be completed by 2009.⁴² Its 2008 Article 13 report stated that mine clearance work was "currently in progress [on] 7 unconfirmed minefields. The work would be completed by 2009."⁴³

Mine clearance in South Korea⁴⁴

	2008	2007	2006
Area (m ²)	104,000	169,000	229,000
Mines cleared	1,470	2,300	7,800

Work on a 5.6km-long railway link below the DMZ (from Shintan-ri Station in Yeoncheon County, Gyeonggi-do province, to Daema-ri in Cheorwon county, Gangwon-do province) began in September 2008 as part of plans to reopen an inter-Korean railway. About 13% of the link had been completed by February 2009 when media reports said work had involved clearance of three antipersonnel mines, four antivehicle mines, and one unexploded bomb.⁴⁵

The government says there are no civilian demining companies in South Korea but that it is drafting legislation that will allow private companies to engage in mine clearance operations on private land.⁴⁶ Press reports in 2008 cited the Ministry of National Defense as saying the

legislation would be passed in September 2008,⁴⁷ while in March 2009 private sector sources said the bill would be introduced to parliament in June 2009.⁴⁸ In the meantime, unofficial reports say land speculators are buying mine-contaminated land inside the CCZ, having the land cleared, and selling it for a profit.⁴⁹

However, a private mine clearance research group, the Korea Research Institute for Mine Clearance, said that it conducted mine clearance operations at Dutayon, Yanggu-kun, Gangwon-do (a site inside the CCZ) between 14 March and 2 April 2008, clearing three antipersonnel mines, three antivehicle mines, and 12 ERW. The institute also said it conducted demining operations at Baekhak-myon, Yonchon-kun, and Gyeonggi-do on 10–20 April 2008, covering some 12,000m² and clearing two antipersonnel mines, 12 “illumination mines,” and seven antivehicle mines. The institute said it employed a clearance machine, the “Dove System,” which it had developed as more suitable to the Korean environment than foreign mine clearance machines.⁵⁰

Mechem deployed two MV-4 mini-flails and five mine detection dog teams to South Korea in March 2008 as subcontractor to Explosive Ordnance Disposal Technology Inc. (EODT), a US-based commercial company active in Afghanistan.⁵¹ EODT engaged Mechem on a US Corps of Engineers contract at Camp Casey but, as a result of contractual issues between EODT and the Corps of Engineers, the contract was terminated after four months—before Mechem’s assets became operational.⁵²

Risk Education

Since 2003, the government has reported providing mine/ERW risk education (RE).⁵³ In June 2009, it stated that “the military holds meetings with local people to provide specific information on landmines.”⁵⁴ It provides two types of RE: one for the armed forces and the other for civilians, mainly as community liaison prior to clearance.⁵⁵ In its latest CCW Article 13 report, South Korea indicated that there had been no changes to the way landmine information was disseminated.⁵⁶ South Korean NGOs dispute the government’s description of RE activities, which are believed to be limited to the placement of mine warning signs in the CCZ and displaying models of mines at the entrance gates to the CCZ.⁵⁷

In 2001, the KCBL provided RE information to children in primary schools close to the DMZ, and in 2004 the Chungaram Media Publishing Company published “Not Mines, But Flowers,” a Korean translation of a Japanese RE book for children.⁵⁸

Victim Assistance

The number of survivors is unknown, but civilian survivors are estimated to number at least 500.⁵⁹

⁵⁹ Emails from Kim Ki-Ho, Korea Research Institute for Mine Clearance, 22 and 23 March 2009.

Compared to other developed countries, the government of South Korea provides good quality healthcare services to its citizens.⁶⁰ Soldiers injured on duty receive free medical services and a monthly pension that depends on the degree of disability—estimated, for example, to be KRW1,040,000 (\$947) for a partial limb amputation.⁶¹ Civilian mine survivors, like all Korean citizens, are covered by the national health insurance system.⁶² In 2008, the MIHWAF “established a task force to introduce a long-term medical care system and opened a national rehabilitation research center to increase opportunities and access for persons with disabilities.”⁶³

Civilian mine survivors can apply for government compensation through the Ministry of National Defense Special Compensation Commission (SCC) and under the State Compensation Act, but just seven claims have been successful.⁶⁴ In 2008, one new claim was filed with the SCC and one claim was settled successfully with KRW200 million (\$182,032) awarded to a survivor and the survivor’s family.⁶⁵ A draft Special Act for Compensation of Mine Victims submitted to the National Assembly in November 2003 by the KCBL remained pending as of April 2009, as did a draft provincial law to assist landmine survivors and families of deceased casualties in Gangwon-do province.⁶⁶

In April 2008, the Anti-Discrimination Against and Remedies for Persons with Disabilities Act took effect. This act adopted a comprehensive definition of discrimination and it established penalties for deliberate discrimination of up to three years in prison and KRW30 million (\$27,305) in fines.⁶⁷ In early 2009, following media coverage of disability discrimination, the National Human Rights Commission of Korea issued a number of key decisions on opportunities in higher education and access to commercial buildings to protect the rights of disabled persons.⁶⁸

On 11 December 2008, South Korea ratified the UN Convention on Rights of Persons with Disabilities, but not its Optional Protocol.

Support for Mine Action

South Korea did not report international funding for mine action in 2008.

KYRGYZSTAN

Ten-Year Summary

The Kyrgyz Republic has expressed support for the goal of a mine-free world but insists it needs mines for border protection. Since 2002, it has abstained from voting on the annual pro-ban UN General Assembly resolution. In 2005, a military source indicated that various government agencies had stockpiles of several tens of thousands of antipersonnel mines. Kyrgyzstan has acknowledged that it used antipersonnel mines in 1999 and 2000 to prevent infiltration across its borders. Kyrgyzstan is affected by mines and explosive remnants of war (ERW), although the scope of the residual problem is not clear. Little progress has been made on demining in recent years. Mine/ERW risk education has primarily been delivered by the Kyrgyzstan Red Crescent Society, but no activities were reported in 2008. The number of mine/ERW casualties between 1999 and 2009 is unknown, but there were at least six casualties. No specific services for survivors exist.

Mine Ban Policy

Kyrgyzstan has not acceded to the Mine Ban Treaty. Officials have said that while Kyrgyzstan supports the goal of a mine-free world, it does not yet have necessary alternatives for border defense, and it lacks financial and technical resources to implement the treaty.¹ Kyrgyzstan has welcomed the decreasing use of antipersonnel mines around the world, and said that a step-by-step approach—beginning with mine clearance, then stockpile destruction—could prepare the basis for Kyrgyzstan to accede.²

On 2 December 2008, Kyrgyzstan was one of 18 countries to abstain from voting on UN General Assembly Resolution 63/42, calling for universalization and full implementation of the Mine Ban Treaty. It abstained or was absent from votes on similar General Assembly resolutions in previous years.³

Kyrgyzstan did not attend as an observer the Ninth Meeting of States Parties in Geneva in November 2008 or the intersessional Standing Committee meetings in May 2009.

Kyrgyzstan states that it has not produced or exported antipersonnel mines, but inherited a stockpile of mines from the Soviet Union.⁴ A military source told *Landmine Monitor* that the Ministry of Defense has tens of thousands of PMN and OZM-72 antipersonnel mines, Border Services have 1,000 to 2,000 antipersonnel mines, and most if not all of these mines are beyond their shelf-life date and are unsafe to use.⁵

Kyrgyzstan has acknowledged that it used antipersonnel mines in 1999 and 2000 to prevent infiltration across its borders, but maintains that these areas have since been demined (see Contamination section below).⁶

¹ See *Landmine Monitor Report 2008*, p. 882; and *Landmine Monitor Report 2004*, p. 1029.

² Statement of Kyrgyzstan, Standing Committee on the General Status and Operation of the Convention, Geneva, 8 May 2006. In March 2008, the ICBL sent a letter to the Ministry of Foreign Affairs urging Kyrgyzstan to join the treaty. The Ministry of Foreign Affairs forwarded the letter to Border Services and the Ministry of Defense. Border Services told the Ministry of Foreign Affairs that it has no objection to joining the Mine Ban Treaty. The Ministry of Defense did not respond. Telephone interview with official requesting anonymity, Ministry of Foreign Affairs, 30 March 2008.

³ Kyrgyzstan voted in support of pro-mine-ban UN General Assembly resolutions from 1996 to 1998 and was absent during the votes on these resolutions in 1999 and 2001. It abstained from voting in 2000, and from 2002 to 2008.

⁴ See *Landmine Monitor Report 2004*, p. 1029; and statement by Talantbek Kushchubekov, First Deputy Minister of Foreign Affairs, First Review Conference, Nairobi, 3 December 2004.

⁵ Interview with military source requesting anonymity, Bishkek, May 2005.

⁶ Statement of Kyrgyzstan, Standing Committee on the General Status and Operation of the Convention, Geneva, 8 May 2006.

Kyrgyzstan is not party to the Convention on Conventional Weapons. It has not signed the Convention on Cluster Munitions.

Scope of the Problem

Contamination

Kyrgyzstan is contaminated by landmines, mainly in the southern Batken province bordering Tajikistan and Uzbekistan, as a result of mine use by Uzbekistan's military between 1999 and 2000. It has been reported that rainfall and landslides caused some mines to shift.⁷ Kyrgyzstan is also contaminated with ERW, primarily UXO, in the Ferghana Valley region where Kyrgyzstan, Tajikistan, and Uzbekistan meet.⁸ When Kyrgyzstan was part of the Soviet Union, Soviet forces used Kyrgyzstan as a weapons testing ground, raising the possibility of additional residual UXO contamination.⁹ Casualties from ERW have continued to occur.¹⁰

The extent of residual mine contamination is uncertain. In 2003, Kyrgyz authorities estimated that Uzbek forces had mined approximately 42km of the 1,300km border¹¹ and around the Uzbek enclaves of Sokh and Shakhimardan located within Kyrgyzstan. The Shakhimardan enclave was said to have been demined in 2005.¹² Press reports have suggested that Uzbek troops partially cleared territory around the Sokh enclave in 2004–2005.¹³ Also in 2005, media reports cited Kyrgyz officials in Batken province as saying Kyrgyz border guards had checked previously mined areas of the border around the settlements of Ak-Turpak, Chonkara, and Otukchu, which had been cleared by Uzbek deminers, and had confirmed that they were now cleared.¹⁴

The head of Kyrgyzstan's Border Service was quoted in 2003 as acknowledging that Kyrgyzstan had also used landmines in mountain passes to stop cross-border movements by "bandits."¹⁵ A Ministry of Foreign Affairs representative stated that Kyrgyzstan laid "a small amount of mines" on its "southern" border, apparently with Uzbekistan. In a statement at the interessional Standing Committee meetings in May 2006, Kyrgyzstan claimed that all the mines it laid had been cleared, although no details were provided. Moreover, it was stated that due to unresolved border issues between its neighbors, Kyrgyzstan cannot consider demining separately from demarcation and delimitation of its borders.¹⁶ According to Danish Demining Group (DDG) in 2006, mines continue to pose a major risk to the civilian population and present an obstacle to agricultural development in the region.¹⁷

Casualties

In May 2008, two boys and one woman were killed and a man was seriously injured by ERW found at a military training field in Osh.¹⁸ In 2007, two men were injured trying to disassemble a landmine in Bishkek.¹⁹ No new mine/ERW casualties were identified in 2009 to 1 April. Boys are particularly at risk from ERW.²⁰

¹⁷ See *Landmine Monitor Report 2007*, p. 874.

¹⁸ See *Landmine Monitor Report 2008*, p. 884.

¹⁹ *Ibid.* These were the first mine casualties since 2003. See *Landmine Monitor Report 2004*, p. 1032.

²⁰ See *Landmine Monitor Report 2006*, p. 971.

The Kyrgyzstan Red Crescent Society (KRCS) recorded 16 mine/ERW casualties in Batken and Osh provinces (10 killed and six injured) between 1999 and May 2008, but figures are incomplete.²¹ In 2004, a media article stated that at least 11 Kyrgyz citizens had been killed by mines between 1999 and 2004.²² In 2001, it was reported that mines along the Kyrgyz-Tajik border had killed 20 people.²³

Program Management and Coordination

There is no formal mine action program in Kyrgyzstan. Clearance is the responsibility of the army and the border guards, although in the past DDG has been involved in demining. Clearance does not appear to have occurred since late 2006 when DDG left the country, reportedly because of the lack of agreement on delimitation and demarcation of Kyrgyzstan's borders with Tajikistan and Uzbekistan.²⁴ The Ministry of Emergency Situations has been responsible for mine/ERW risk education (RE) by government decree since 2001.²⁵

There is no victim assistance program or comprehensive casualty data collection mechanism in Kyrgyzstan. A National Coordination Council for Disability within the office of the Prime Minister includes representatives from relevant ministries and some NGOs.²⁶

Risk Education

The KRCS, which has been actively involved with RE since 2003, was the only known RE provider in Kyrgyzstan since DDG ended its activities in 2006. However, no activities were reported in 2008.²⁷ In the evaluation of the DDG project's impact, respondents stated their behavior had changed after RE training.²⁸

Victim Assistance

The number of survivors is unknown but is at least six. Disability services in Kyrgyzstan are inadequate and unaffordable for those without insurance. Village health committees have been developed with support from the Swiss Red Cross to improve primary healthcare.²⁹ Rehabilitation and inclusion should be available for registered persons with disabilities, but insufficient resources were available to meet program requirements.³⁰ Persons with disabilities had difficulty finding employment because of discrimination and high general unemployment. Kyrgyz legislation prohibits discrimination against persons with disabilities and mandates physical access to buildings and public transportation, but implementation is lacking.³¹ As of 1 July 2009, Kyrgyzstan had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol.

LAO PEOPLE'S DEMOCRATIC REPUBLIC

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Mainly UXO, including submunitions, some antipersonnel and antivehicle mines
Estimated area of contamination	Unknown; up to 25% of villages affected
Casualties in 2008	100 (2007: 100)
Estimated mine/ERW survivors	Unknown but at least 7,000
Demining in 2008	Clearance of mined areas: unknown Clearance of battle areas: 55.2km ²
Risk education recipients in 2008	At least 322,000
Progress towards victim assistance aims	Average
Support for mine action in 2008	International: \$12.7 million (2007: \$12.2 million)

Ten-Year Summary

In 2004 the Lao People's Democratic Republic (Lao PDR) decided that it would join the Mine Ban Treaty at some point, but did not set a timeline. It has shown increasing interest in acceding since 2007, when, for the first time, it voted in favor of the annual UN General Assembly resolution calling for universalization of the Mine Ban Treaty. It did so again in 2008. Lao PDR stated in 2008 that it has not used mines in decades, but acknowledged that it possesses a small stockpile.

Lao PDR has the world's worst problem of unexploded (cluster) submunitions, but after more than 12 years of UXO/mine action, there is no credible estimate for the total area contaminated in the country. Clearance productivity improved sharply after 2005 as a result of changes in clearance and survey methodologies and equipment, while the creation of a National Regulatory Authority (NRA) which became active in 2006 has improved coordination and started work creating a national database.

Between 1999 and 2008, the first phase of the Lao National Survey of UXO Victims and Accidents (conducted in 2008) found a total of 2,184 casualties (834 killed, 1,349 injured, and one unknown). In total, more than 50,000 casualties have been recorded since 1964. Risk education has been conducted in Lao PDR since 1994 mainly by UXO Lao and the World Education Consortium (WEC) with the Ministry of Education. Risk education initially aimed to build awareness of the dangers of UXO and mines but a new risk education strategy launched in 2008 focused on changing behavior through risk reduction.

Coordination of victim assistance has improved with the creation of the NRA's victim assistance unit. Service provision for mine/explosive remnants of war (ERW) survivors, including emergency and continuing care and physical rehabilitation, has become more accessible and available. However, it remains inadequate to meet the needs of the more than 7,000 survivors.

Mine Ban Policy

Lao PDR has not acceded to the Mine Ban Treaty. In May 2009, at the intersessional Standing Committee meetings in Geneva, a Ministry of Foreign Affairs spokesperson told States Parties that the government made a decision in 2004 to accede to the Mine Ban Treaty, but needed time to prepare to meet the obligations. He also said that Lao PDR is "now considering a voluntary

transparency report, which can help the international community deeper understand the facts and reality on the ground, as well as to demonstrate the desire and the intention of Lao PDR toward the goal and aspiration of this Convention."¹

Lao PDR participated in the Bangkok Workshop on Achieving a Mine-Free South-East Asia in April 2009, the second in a series of regional meetings convened in the lead-up to the treaty's Second Review Conference.

In December 2008, Lao PDR for the second consecutive year voted in favor of the annual UN General Assembly resolution (Resolution 63/42) calling for universalization and full implementation of the Mine Ban Treaty. In providing an explanation of its vote, Lao PDR said that it "supports the humanitarian endeavours of the Mine Ban Treaty... The Lao Government continues to express its interest in acceding to the Treaty. However, it still needs time and resources to prepare necessary conditions that would enable the country to accede to the convention and meet all provisions prescribed therein."²

Lao PDR sent observers to the Ninth Meeting of States Parties in Geneva in November 2008. The Lao delegation stated that the "general obligations of the convention do not cause any difficulties for the Lao Government; the implementation of Article 5 remains its only concern. Taking into consideration the report of the Analyzing Group, according to which 15 State Parties, less UXO-contaminated, but technically more advanced than the Lao PDR have been unable to meet the deadline for clearance, confirms the concerns of the Lao Government."³ Since 2004, the Lao government has cited the treaty's mine clearance obligation under Article 5 as an obstacle to accession.⁴

Lao PDR has also expressed concern regarding the possible diversion of resources from UXO clearance to a focus on antipersonnel mines. In June 2008, it stated that "it needs the assurance from the States Parties that, once the Lao PDR becomes signatory [to the Mine Ban Treaty] it will not be forced to abandon or stop its current UXO clearance operations."⁵ At the Ninth Meeting of States Parties in November 2008, it said, "Laos has much greater cluster munition contamination than landmine contamination, and the impacts of cluster munitions on the people are far greater, since most of the accidents recorded are caused by cluster munitions." Lao PDR stated that if new obligations arising from the Convention on Cluster Munitions were combined with those of the Mine Ban Treaty, it could "result in an overload for the Lao Government, whose resources are already limited."⁶

Lao PDR signed the Convention on Cluster Munitions in December 2008 and ratified on 18 March 2009.⁷ It is party to the Convention on Conventional Weapons and original Protocol II on landmines, but not Amended Protocol II or Protocol V on Explosive Remnants of War.

² Lao PDR Explanation of Vote on Resolution L.6, UN General Assembly, New York, 29 October 2008. The statement was made during the vote on the resolution when it was before the First Committee. Similarly, in June 2008, Lao PDR told States Parties that "the Lao Government is considering the eventuality of joining the Ottawa Convention." Statement by Amb. Maligna Saignavongs, NRA, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008.

³ Statement by Amb. Maligna Saignavongs, NRA, Ninth Meeting of States Parties, Geneva, 26 November 2008. Translation provided by Lao PDR.

⁴ See *Landmine Monitor Report 2004*, p. 1,034; and *Landmine Monitor Report 2008*, pp. 886–887.

⁵ Statement by Amb. Maligna Saignavongs, NRA, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008. He said, "If this is the case, the Lao Government will not be in a position to accept it, because our priority is UXO clearance; since most of the accidents are caused by UXO, particularly by cluster munitions."

⁶ Statement by Amb. Maligna Saignavongs, NRA, Ninth Meeting of States Parties, Geneva, 26 November 2008. Translation provided by Lao PDR.

⁷ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 103–105.

In 2008, Lao PDR acknowledged that it has used mines in the past “to protect its borders,” but said it has not used them for the past two decades. It also said that the government is not a producer or exporter of antipersonnel mines, but continues to hold a small stockpile.⁸

Scope of the Problem

Contamination

Lao PDR has the world’s worst contamination from unexploded submunitions but it also has extensive air-dropped and ground-fired UXO as well as antivehicle and antipersonnel mines. The cluster munition remnants date back to the Indochina War of the 1960s and 1970s when it experienced the heaviest aerial bombardment in history. The United States dropped more than two million tons (two billion kg) of bombs between 1964 and 1973,⁹ including more than 270 million submunitions. Clearance teams have found at least 186 types of munitions, including 19 types of submunition.¹⁰

After more than 12 years of UXO/mine action, there is no credible estimate for the total area contaminated in the country. Lao PDR lacks up-to-date information on the location and impact of ERW, the amount of land that has been cleared, or even the extent of land designated a priority for clearance.¹¹ The NRA says that 10 of Lao PDR’s 17 provinces are “severely contaminated” by ERW, affecting up to a quarter of all villages.¹² A 2002 evaluation by the Japan International Cooperation Agency estimated that 236.8km² of potential agricultural land was contaminated by UXO.¹³

Lao PDR is creating a comprehensive national database that will bring together a wide range of different datasets (see Data collection and management section below). In the meantime, the partial survey by Handicap International (HI), published in 1997, although acknowledged as out of date,¹⁴ remains the primary data source. It found that 15 of the country’s then 18 provinces—all those it surveyed—had districts significantly or severely affected by UXO and that, among the affected villages, 1,156 had large bombs ranging from 100 to 1,000kg.¹⁵

The extraordinary intensity of aerial bombing has tended to obscure the extent of other forms of contamination left by the war on the ground. Bombies (the local term for unexploded submunitions) accounted for little more than a quarter of items removed or destroyed in 2008,¹⁶ while UXO Lao reports that during 12 years of operations, ground forces munitions made up most (52%) of total items cleared and submunitions for a little under half (47%).¹⁷

All sides in the war laid antipersonnel mines, particularly along borders and around military bases and airfields. The HI survey found mines in all 15 provinces it surveyed, contaminating 214 villages,¹⁸ and clearance operators have estimated Lao PDR may have 1,000 minefields.¹⁹ The remote location of most minefields meant that mines had little impact, accounting for only

1% of the total items of ordnance cleared since 1996,²⁰ and 0.001% of items cleared in 2007.²¹ A fatal antivehicle mine incident in 2007 on land cleared by UXO Lao²² and the clearance of a minefield as part of an infrastructure project indicated mines may require greater attention as economic development progresses.²³

Casualties

In 2008, at least 100 new mine/ERW casualties were reported, including 30 killed, 69 injured, and one unknown. There is overlap in data provided by information providers; UXO Lao reported 89 casualties, and HI reported 19 casualties. HI and UXO Lao do not systematically collect casualty data. As such this cannot be taken as a full representation of all casualties that could have occurred during this period and extensive under-reporting of casualties is assumed.²⁴

At the time of writing, the NRA was undertaking a two-phase survey of all mine/ERW casualties in the country from 1964 onwards. This survey had been completed for the period to the end of 2007.²⁵ Only incomplete data had been compiled for 2008 onwards and was not released by the NRA for publication in Landmine Monitor. Available data from the survey analyzed by the NRA suggested that the total number of mine/ERW casualties would probably exceed 300 for 2008.²⁶

From the data supplied by UXO Lao and HI, boys were the largest casualty group (47) followed by men (30), girls (16), and women (6); the age of one male casualty was not reported. Most casualties were caused by ERW (90), including 57 submunition casualties. An unspecified mine caused one casualty, and unknown devices nine. The majority of casualties occurred while digging (nine), followed by burning and tampering with explosive devices (seven), and cutting vegetation (four). Casualties also occurred while burning vegetation to clear land (two), playing (two), scrap metal collection (one), and fishing/hunting (one). For 74 casualties the activity at the time of the incident was not reported.

Casualties continued to occur in 2009, with at least 37 (12 killed and 25 injured) reported by UXO Lao as of 30 May 2009, including 25 adults and 12 children. Males made up the majority of 37 casualties (33).²⁷

The NRA data from the first phase of the Lao National Survey of UXO Victims and Accidents that showed from 1999–2007, annual casualties were lowest in 2001 (128) and highest in 2004 (279), though the NRA predicts this figure may have been exceeded in 2008.²⁸ These trends could

²⁰ GICHD, "Lao PDR Risk Management and Mitigation Model," December 2006, p. 24. The study found that some 5,700 mines had been disposed of, compared with 718,000 pieces of ordnance.

²¹ NRA, "UXO Sector Annual Report 2007," Vientiane, undated but 2008, p. 10.

²² The incident occurred on 27 October 2007 when a tractor working on a site in Xieng Khouang province detonated a US-made M19 plastic antivehicle mine. The area had been extensively used in recent years for grazing and cultivation and extensively transited by vehicles, including tractors. A UXO Lao team had checked the site a month earlier to a UXO-free, not metal-free, standard, recovering 22 items of UXO, including three submunitions. NRA, "Accident Investigation Report," 2 November 2007.

²³ Telephone interview with Tim Horner, NRA/UNDP, 11 May 2008.

²⁴ Data supplied to Landmine Monitor by email from Edwin Faigmane, Technical Advisor, UXO Lao/UNDP, 10 June 2009; and "HI Individual Casualty Reports," provided by Kim Warren, UXO Program Coordinator, HI, 9 June 2009.

²⁵ As of 30 March 2009, 217 casualties for 2008 have been entered into the NRA database from 40,000 of the 50,136 survey casualty forms collected in Phase I. Based on the data gathered, the NRA estimates there have been 51,598 ERW/mine casualties in Lao PDR since 1964 and around 300 casualties in 2008. The first phase of the survey was carried out between February and October 2008. As a result not all data for casualties that could have occurred in 2008 was collected. The second phase of the data collection will complete the surveying for 2008 and verify all data collected by operators in 2008 and 2009. Implementation of this phase began in June 2009. Response to Landmine Monitor questionnaire by Michael Boddington, VA Technical Advisor, NRA, 31 March 2009; and email, 8 June 2009.

²⁶ Email from Tim Horner, UNDP/NRA, 5 August 2009.

²⁷ It should be noted again UXO Lao does not systematically collect casualty data and as such this data will only represent a limited number of the casualties that might have occurred during this period. Email from Edwin Faigmane, UXO Lao/UNDP, 10 June 2009.

²⁸ Data supplied to Landmine Monitor by email from Saysomvang Sounvannavong, VA Database Officer, NRA, 11 June 2009.

be attributed to the drop and subsequent rise in the price of scrap metal.²⁹ The NRA provided detailed information to Landmine Monitor in June 2009 on 1,866 mine/ERW casualties (725 killed and 1,141 injured) that occurred from 1999–2007.³⁰ Subsequently, the NRA identified a further 329 casualties for this time period, where the annual breakdown was not provided.³¹ As this was the first nationwide victim survey, the NRA's figures are probably more accurate than casualty statistics reported in previous Landmine Monitor reports. Therefore, based on these latest statistics, Landmine Monitor has identified 2,295 casualties (915 killed, 1,379 injured, and one unknown) from 1999–2008 in Lao PDR.

Preliminary results of the first phase of the Lao National Survey of UXO Victims and Accidents found that 50,136 mine/ERW casualties occurred between 1964 and 2008; these results are, however, partial. Verification of phase one surveying was conducted in October 2008, with 204 of the villages revisited. An average under-reporting of 21% was discovered; not all casualties were reported by villagers in the survey's first round.³² The second phase of the data collection is expected to lead to complete results for 2008 and verification of all data collected by operators in 2008.³³ Extrapolations indicate that there could be 51,598 casualties, including 31,724 that occurred during the conflict period (1964–1973)³⁴ and 19,874 casualties in the post-conflict years from 1974 to 2008 (with partial results).³⁵

The type of devices causing the largest number of casualties since 1964 follows clear patterns. During the conflict years (1964–1973) mines were the main cause, followed by large bombs, and cluster munitions. In the decade directly following the conflict (1974–1983), mines (1,941) and cluster munitions (1,783) again caused the most casualties. From 2004–2007, submunitions were the largest cause (374 casualties), followed by unknown devices (162), and mines (161).³⁶

Risk profile

People are at risk from cluster submunitions, mines, and other ERW in a quarter of all villages throughout Lao PDR and in 15 out of 17 provinces,³⁷ with most incidents occurring in Xieng Khouang and Savannakhet.³⁸ Research reveals a high level of awareness among both adults and children, however, they continue to interact with UXO on a daily basis.³⁹ A Mines Advisory Group (MAG)/UNICEF needs assessment in 2006 found that “while contributing factors of voluntary exposure were often rooted in poverty, it was rarely perceived by communities or individuals as the only option. More commonly, intentional UXO risk-taking was found to be based on a rational decision-making process involving weighing the potential costs and benefits of a range of available options.”⁴⁰

²⁹ Richard Moyes and Lamphane Vannachack, “A Study of Scrap Metal Collection in Lao PDR,” GICHD, Geneva, September 2005, p. 12; and response to Landmine Monitor questionnaire by Michael Boddington, NRA, 31 March 2009.

³⁰ Data supplied to Landmine Monitor by email from Saysomvang Sounvannavong, NRA, 11 June 2009.

³¹ Email from Tim Horner, UNDP/NRA, 5 August 2009.

³² At the end of March 2009, 41,000 surveys of individual casualty data had been entered into data management system and verified. All results recorded here are based on this data, extrapolated to a total of 51,598 casualties. Data and analysis provided by response to Landmine Monitor questionnaire by Michael Boddington, NRA, 31 March 2009.

³³ Email from Michael Boddington, NRA, 8 June 2009.

³⁴ Although fighting ceased in early 1973, the data provided by the NRA takes the whole of 1973 as a conflict year.

³⁵ Response to Landmine Monitor questionnaire by Michael Boddington, NRA, 31 March 2009.

³⁶ Ibid.

³⁷ See *Landmine Monitor Report 2008*, p. 888.

³⁸ Ibid, p. 894.

³⁹ See *Landmine Monitor Report 2008*, p. 896; Jo Durham, “Needs Assessment in Lao PDR,” *Journal of Mine Action*, Issue 11.1, Summer 2007, maic.jmu.edu; and HI, “Summary of Village Feasibility Survey,” Vientiane, February 2009. However, UXO Lao reported that 28% of casualties for whom they collected information in 2008 were unaware of the related dangers of UXO. However, this information was only collected in areas where UXO Lao operated, and thus under-reporting could be assumed as it did not cover all ERW/mine affected areas.

⁴⁰ Jo Durham, “Needs Assessment in Lao PDR,” *Journal of Mine Action*, Issue 11.1, Summer 2007, maic.jmu.edu.

In almost all the villages surveyed in January 2009 evidence was found of scrap metal collection⁴¹ and the MAG/UNICEF survey found that half of all children surveyed were engaged in this activity.⁴² Scrap metal collection was the cause of 32% of incidents reported by UXO Lao in 2008.⁴³ However, according to a 2008 MAG knowledge, attitude, and practice survey in Xieng Khouang of scrap metal dealers, the economic slump has resulted in a drop in the price of scrap metal and a decrease in the number of dealers.⁴⁴

Socio-economic impact

Lao PDR's National Socio-Economic Development Plan 2006–2010 observes that “there appears to be a significant correlation between the presence of UXO and the prevalence of poverty.” It identifies UXO as “one of the major security challenges facing the poor communities in terms of access to land and markets. It is also a major risk, especially for children.”⁴⁵

UNDP has declared that “UXO/Mine Action is the absolute pre-condition for the socio-economic development of Lao PDR.”⁴⁶ UNDP reports that as a result of submunition contamination “economic opportunities in tourism, hydroelectric power, mining, forestry and many other areas of activity considered main engines of growth for the Lao PDR are restricted, complicated and made more expensive.”⁴⁷ The Nam Theun 2 hydroelectric dam, one of the country's biggest economic development projects, spent more than US\$16.7 million on UXO clearance between February 2003 and October 2007.⁴⁸

The HI survey noted that UXO contamination “limited agricultural and forest-based activities and increases the cost of rural infrastructure projects.”⁴⁹ An independent UXO action sector evaluation in 2008 suggested it would take 16 years at current clearance rates to clear all potential rice paddy land in the 47 poorest districts and “a proportion of” potential upland paddy land.⁵⁰

UXO also poses a significant threat because of its value as scrap metal. UNDP reported a sharp rise in UXO-related casualties in 2004 and commented that “the growing scrap trade, facilitated by the ubiquitous presence of cheap and effective Vietnamese metal detectors, often rented out by scrap merchants, is a significant driver of this change.”⁵¹

Program Management and Coordination

Mine action

The government created the National Regulatory Authority by decree in 2004 but did not appoint a director until December 2005, and it became active in 2006.⁵² UXO Lao, a civilian government body, had primary responsibility for coordinating and regulating all UXO action as well as clearance until 2004, and it remains by far the largest clearance operator in Lao PDR.⁵³

⁵³ See *Landmine Monitor Report 2007*, p. 881.

The NRA's role includes setting policy, coordinating and regulating the mine action sector, accrediting operators, setting standards, and conducting quality management. It also has the mandate to serve as the technical focal point for matters relating to international disarmament treaties. It reports to the Deputy Prime Minister and a Board of Directors comprising nine government ministries, including defense, foreign affairs, security, and planning and development.⁵⁴

The NRA employed 25 national staff and seven international advisors in 2008, under the management of the NRA Director, Maligna Saignavongs, and a chief technical advisor.⁵⁵ The NRA has two sections: Operations, with units handling clearance, RE, victim assistance (VA), and information management; and Policy, Administration and Standards. With US Department of State funding, ArmorGroup provided a technical advisor for standards and quality management, who conducts desk evaluations and accreditation of operators. The NRA coordinates sector-wide activity through technical working groups for clearance, RE, and VA, as well as a "Sector Working Group" involving mine action organizations and donors which facilitates discussion on design and implementation of the clearance program.⁵⁶ NRA priorities for 2009 included a review of strategy to prepare for drafting a new 10-year plan and a pilot program to open two provincial offices, as well as preparing for the First Meeting of States Parties to the Convention on Cluster Munitions, scheduled for November 2010.⁵⁷

Risk education

The NRA's RE unit is responsible for the accreditation, coordination, and monitoring of all mine/ERW RE activities, and an RE officer was appointed in January 2008.⁵⁸ A technical advisor was funded through MAG from March 2007 to December 2008.⁵⁹ A mine risk education (MRE) Technical Working Group (TWG) met bimonthly.⁶⁰

Standards for RE were developed by the NRA and the MRE TWG in 2008 and were enforced in January 2009.⁶¹ They outline four components: data collection, public information dissemination, education and training, and community initiatives.⁶² Community liaison is no longer included in standards, but RE must be integrated with other ERW/mine action activities.⁶³ Monthly activity reports are submitted to the NRA, and have been entered into the Information Management System for Mine Action (IMSMA) since January 2009.⁶⁴ The NRA conducted informal monitoring visits in 2008,⁶⁵ and a "Monitoring Framework for the NRA MRE unit" was finalized in November 2008.⁶⁶

⁶⁶ Email from Thongdy Phommavongsa, NRA, 20 March 2009; and NRA, "Monitoring Framework for the NRA MRE Unit," Vientiane, November 2008.

The mine action strategy for 2003–2013 included “delivering RE training to all UXO/mine-affected communities”⁶⁷ A national RE strategy for 2007–2010 was developed by the NRA and the TWG, based on needs assessments and evaluation recommendations, and approved in January 2008.⁶⁸

Victim assistance

The NRA's VA unit is responsible for VA policy development, sector coordination, and liaison between stakeholders, to ensure all mine/ERW survivors' needs are met.⁶⁹ In 2008, the unit focused on the casualty survey and the establishment of a casualty database. The NRA reported that information compiled by the nationwide casualty survey will provide the sector with a comprehensive basis for developing a VA strategy (which had originally been planned for 2008).⁷⁰

The unit continued to coordinate VA through bimonthly meetings of the VA TWG. The working group's role includes coordination of VA programs, resource mobilization, and facilitating relations between government, operators, and donors.⁷¹ Throughout 2006–2008, the VA TWG worked to develop the VA section of the first Lao PDR National Mine Action Standards.⁷² An international technical advisor continued to support the unit.⁷³

Responsibility for providing services to persons with disabilities is divided between the Ministry of Health and the Ministry of Labour and Social Welfare.⁷⁴

Data collection and management

The NRA is creating a national UXO database that will combine the latest demographic data, US bombing data, records of operators' clearance, victim data collected in a survey undertaken in early 2008, and data on clearance related to major infrastructure, development, and commercial projects.⁷⁵

The NRA installed the latest version (5.02) of IMSMA with assistance from the Geneva International Centre for Humanitarian Demining (GICHD) in July 2007, but technical difficulties delayed bringing it into operation until 2008.⁷⁶ The NRA started entering results of a victim survey in March 2008 and UXO Lao clearance data in March 2009.⁷⁷ In January 2009, the NRA instructed operators to submit monthly completion reports in an IMSMA-compatible format. Accessing information in the database, however, remains problematic.⁷⁸ The NRA has hired a computer specialist to facilitate access to data.⁷⁹

In 2008, the NRA established the Lao Victim Information Service (LVIS) to store information collected by the national casualty survey.⁸⁰ The NRA planned to use IMSMA as the analytical and reporting tool for the LVIS.⁸¹

The first phase of the Lao National Survey of UXO Victims and Accidents covering 95% of all villages in Lao PDR found that casualty figures quoted in previous years could represent as little as 40% of actual casualties.⁸² In previous years, operators (including UXO Lao and HI) reported incidents only from the areas where they operated.

Plans

Strategic Mine Action Plan

A National Strategic Plan for the UXO Programme 2003–2013, “The Safe Path Forward,” adopted by government decree in April 2004,⁸⁵ laid down broad objectives for the UXO action sector:⁸⁶

- clearance of not less than 180km² of high and medium priority land by UXO Lao alone;
- reduction of UXO/mine casualties to fewer than 100 per year;
- deliver RE training to all UXO/mine-affected communities; and
- develop a national database on mine/UXO incidents.

⁸³ Response to Landmine Monitor questionnaire by Michael Boddington, NRA, 31 March 2009; and email from Michael Boddington, NRA, 8 June 2009.

⁸⁴ Email from Michael Boddington, NRA, 8 June 2009.

⁸⁵ Prime Minister’s Decree No. 33, 29 April 2004.

⁸⁶ “The Safe Path Forward, National Strategic Plan for the UXO Programme 2003–2013,” Vientiane, 29 April 2004, pp. 2, 4.

However, the plan predated the creation of the NRA and has been largely overtaken by developments in the sector, including an overhaul of UXO Lao's clearance methodology leading to higher productivity, NRA initiatives to develop the database, and Lao PDR's ratification of the Convention on Cluster Munitions in 2009. An evaluation of the UXO action sector in 2008, conducted for UNDP, found that the sector did not consider the issue of spot tasks at all, and the absence of performance standards for such tasks meant their importance was underrated.⁸⁷

The NRA, in consultation with UNDP, UXO Lao, and other stakeholders, reviewed the strategy in 2009 and drafted a new 10-year strategic plan for 2010–2020 that would overlap with, and feed into, the next five-year National Socio-Economic Development Plan.⁸⁸ In the meantime, Lao PDR has set the goal of removing the UXO threat in the country's 47 poorest districts by 2020 as part of a strategy to remove itself from the lower ranks of the Least Developed Countries by that deadline.⁸⁹

Integration of mine action with reconstruction and development

The 2008 evaluation noted that “the strategy for UXO is not fully aligned and integrated with national socio-economic development and poverty alleviation strategies.” It also observed that the government's development partners and commercial investors have failed to take account of the effects of UXO contamination and “there is still much work to be done to integrate UXO planning into wider development efforts that require use of contaminated land.”⁹⁰

National ownership

Commitment to mine action and victim assistance

The Lao PDR government identifies UXO clearance as an integral part of its poverty reduction strategy, with national operator UXO Lao the biggest of the clearance organizations. The government's contribution to UXO and mine clearance is limited to in-kind contributions; funding is provided by foreign donors (78% of total funding of \$20.8 million for the sector in 2007) or through private sector investment projects (22%).⁹¹ Donors have expressed disappointment at the low level of government financial support for the sector, and some take the view that the government should demonstrate its commitment to the sector by also committing funds from the national budget.⁹²

National mine action standards/Standing operating procedures

Lao PDR's first national UXO/mine action standards, based on the International Mine Action Standards (IMAS), were completed in English, distributed to all operators, and posted on the NRA website in December 2006. The chair of the NRA's board⁹³ approved the 24 chapters of national standards in a decree issued on 8 January 2009. In view of the prevailing focus on clearing UXO, the NRA requires operators undertaking any demining task to submit a workplan for approval.⁹⁴

Program evaluations

An independent evaluation commissioned by UNDP and completed in July 2008 examined the progress of the UXO sector towards achieving objectives, the role of the NRA, the effectiveness of UXO Lao, and government and donor support. The evaluation found UXO Lao had exceeded the area clearance targets set out in the “Safe Path Forward” in 2003–2006 and was on course

⁹³ Lt.-Gen. Douangchai Phichith, Deputy Prime Minister and Minister of National Defense.

⁹⁴ Interview with Tim Horner, NRA/UNDP, Vientiane, 6 April 2009.

to achieve overall targets by 2013 but questioned the appropriateness of the plan's targets and priorities.⁹⁵ The evaluation called for greater study of how much of the land contaminated by UXO could be developed for agriculture as a basis for planning and prioritization.⁹⁶ It also recommended greater emphasis on roving tasks, developing a simple system of priority-setting that addressed priorities of development and poverty reduction, and the definition of an exit strategy for the NRA and UXO Lao.⁹⁷

It found the prioritization process "complicated, unwieldy and as a result rather unresponsive" and noted that there is no set of criteria or national principles to guide task selection. It also reported a "prevalent sense of risk averseness" among UXO Lao managers in dealing with aircraft bombs, resulting in a backlog of such roving tasks, and found that an increase in roving tasks by UXO Lao appeared to be "critical" to address the problems of UXO incidents among intentional risk takers.⁹⁸ The evaluation also described as a "significant shortfall" a lack of quality management capacity in UXO Lao.⁹⁹

The study commended the NRA's introduction of national standards but noted it lacked the capacity to fulfill its designated role in conducting external quality assurance on clearance operations, has yet to establish regulatory control over activities on projects managed by government agencies, and concluded that in its present form, totally dependent on donor funding, the NRA is not sustainable.¹⁰⁰ The evaluation commented that "some donors are disappointed with the low level of financial support from Government for the projects and programme activities in the sector."¹⁰¹

Battle Area Clearance

UXO Lao, set up in 1996 and operating in nine provinces, represents the main UXO clearance capacity. In 2008, it worked with approximately 1,000 staff, including 11 international advisers.¹⁰² Other organizations engaged in UXO clearance included the international NGOs, HI, MAG, and the Swiss Foundation for Mine Action (FSD), and three commercial companies, BACTEC, Milsearch, and Phoenix Clearance. Norwegian People's Aid, which had provided technical advisors to support UXO Lao, signed a Memorandum of Understanding with Lao PDR in 2009 with a view to operating its own clearance teams. The army undertakes clearance operations in border areas and has taken on commercial tasks linked to road development and rural electrification, but little is known about the scope, quality, or results of its activities.

Identification of hazardous areas

The NRA reported technical survey by demining NGOs on a total of 2.7km² of land in 2008. However, the emphasis in Lao PDR is not on surveying contaminated areas but on access to full US bomb strike data. The Lao PDR and UNDP funding request prepared at the end of 2008 also calls for a geophysical survey of 2,000km of roads.¹⁰³

UXO/mine clearance in 2008

Operators reported total area clearance of 54.09km² in 2008 (see table below), 29% more than in 2007.¹⁰⁴ The NRA reported a further 2.74km² that was released through enhanced technical survey.¹⁰⁵

⁹⁵ Robert Griffin, Robert Keeley, Phetdavanh Sayyasouk, "UXO Sector Evaluation Lao PDR, June–July 2008, Final Report," July 2008, p. 44.

⁹⁶ The evaluation cites an estimate by JICA that only some 23,680 hectares (236.8km²) of land with agricultural potential was contaminated by UXO. Robert Griffin, Robert Keeley, Phetdavanh Sayyasouk, "UXO Sector Evaluation Lao PDR, June–July 2008, Final Report," July 2008, p. 9.

⁹⁷ *Ibid.*, p. 77.

⁹⁸ *Ibid.*, p. 4.

⁹⁹ *Ibid.*, p. 64.

¹⁰⁰ *Ibid.*, pp. 38–40, 49–50.

¹⁰¹ *Ibid.*, p. 71.

¹⁰² Interview with Edwin Faigmane, UXO Lao/UNDP, 8 April 2009.

¹⁰³ Government of Lao PDR and UNDP, "The Scourge of Cluster Munitions in the Lao PDR: Meeting Treaty Obligations and Scaling Up the Response," Vientiane, 13 November 2008, p. 9.

¹⁰⁴ See *Landmine Monitor Report 2008*, p. 892.

¹⁰⁵ NRA, "UXO Sector Annual Report 2008," Vientiane, undated but 2009, p. 10. The NRA figure included release by UXO Lao of 2km² through technical survey. UXO Lao reported a higher figure.

UXO Lao continued to raise the amount of land it cleared, although at a lower rate (about 4%) than in the previous year (about 20%) when productivity registered the immediate gains of operational reforms and acquisition of new equipment.¹⁰⁶ UXO Lao also attributed the lower rate of growth to the deployment of clearance teams on more remote tasks than previously. However, as evidence of better task selection and evaluation, UXO Lao reported that only around 5% of clearance tasks failed to yield any UXO in 2008 compared with around 30% four years earlier.¹⁰⁷ UXO Lao embarked on land release as a result of desk appraisal and survey in 2007 when it released 0.4km². In 2008 UXO Lao reported it released 3.8km² through technical survey.¹⁰⁸ UXO Lao has also field tested and started applying the prioritization model developed by GICHD as a tool for accelerating land release and concentrating clearance assets on contaminated land. UXO Lao approved a standing operating procedure for use of this tool at the end of 2008.¹⁰⁹

UXO Lao, following up recommendations in the UNDP-commissioned evaluation, planned to set up 27 roving teams in 2009 to cover every poor or very poor district in the nine provinces in which it already operates, as well as three other provinces.¹¹⁰ UXO Lao intended to dedicate nine of the teams to the destruction of big bombs in the nine provinces. It estimated the overall cost of the program over three years at \$6 million. As of April, however, UXO Lao had yet to attract the funding required to put this proposal into action.¹¹¹ A UNDP management response to the evaluation accepted the need for extra roving capacity but said it would not be “at the expense of clearance tasks which are critical to support the implementation of the National Socio-Economic Development Plan.”¹¹²

Battle area and mine clearance in 2008¹¹³

Operator	Area cleared (km ²)	Total UXO removed/destroyed	Unexploded submunitions destroyed	Mines cleared and destroyed
BACTEC	8.62	1,380	826	1
FSD	0.58	5,045	945	1
HIB	0.34	1,442	756	0
MAG*	3.64	37,133	8,244	8
Milsearch	10.60	1,294	730	1
Phoenix	3.77	1,650	1,030	22
UXO Lao	26.54	68,214	32,475	137
Total	54.09	116,158	45,006	170

*MAG also cleared 60,330 items of small arms ammunition.

¹⁰⁶ See *Landmine Monitor Report 2008*, p. 892. UXO Lao expected to take delivery of 150 new detectors in 2009, thereby completing its equipment upgrade plan.

¹⁰⁷ Interview with John Dingley, Senior Technical Advisor, UXO Lao, in Geneva, 25 March 2009.

¹⁰⁸ UXO Lao, “Annual Report 2008,” Vientiane, undated but 2009, p. iv; and email from Edwin Faigmane, UXO Lao, 1 September 2009.

¹⁰⁹ Interview with John Dingley, UXO Lao, Vientiane, 8 April 2009.

¹¹⁰ UXO Lao already operates in Luang Prabang, Huapanh, Xieng Khouang, Khammouane, Savannakhet, Saravane, Sekong, Champassak, and Attapeu. UXO Lao proposed that three roving teams in Luang Prabang would also cover Phongsali and Oudomxay provinces and two teams in Khammouane would also cover Bolikhamxay.

¹¹¹ Interviews with John Dingley and Edwin Faigmane, NRA, Geneva and Vientiane, 23 March and 8 April 2009; Government of Lao PDR and UNDP, “The Scourge of Cluster Munitions in the Lao PDR: Meeting Treaty Obligations and Scaling Up the Response,” Vientiane, 13 November 2008, pp. 10–11.

¹¹² “UNDP Management Response, UXO Sector Evaluation Lao PDR,” Vientiane, 16 January 2009, p. 18.

¹¹³ Unless otherwise specified, data provided by Khammoungkhoun Southivong, Information Management Officer, NRA, 7 April 2009; see also UXO Lao, “Annual Report 2008,” Vientiane, undated but 2009, p. 3; and emails from Nigel Orr, Program Manager, FSD, 4 March and 10 May 2009; Kim Warren, HI, 25 March 2009; David Hayter, Country Program Manager, MAG, 3 April 2009; and from Gregory Cathcart, MAG, 16 and 17 June 2009.

MAG, the largest of the NGO operators with 172 staff, 10 clearance teams, and one explosive ordnance disposal team, also reported a slight increase in the area cleared, helped by switching from two-person to one-person lane drills. It recorded a more than six-fold rise in UXO items destroyed as a result of MAG's engagement in clearing UXO accumulated at a scrap metal foundry in Xieng Khouang province. This project alone accounted for some 85,773 of the small arms ammunition and UXO items destroyed in 2008, including 60,330 rounds of 20mm projectiles. MAG planned in 2009 to add four technicians to each clearance team, expanding capacity without the need to buy more vehicles.¹¹⁴

Among other NGOs, FSD, operated with 71 staff in three teams in Savannakhet and Sekong, and more than doubled the area cleared, a result it attributed to increased staff experience and better coordination and planning. It also obtained funding for a fourth team but as of March 2009 still awaited government approval of amendments to its Memorandum of Understanding.¹¹⁵ HI (54 staff) undertook area clearance and roving tasks in 29 villages of Savannakhet and also reported increased area clearance and roving tasks. HI hired a technical advisor every two to three months to conduct quality control and staff refresher training.¹¹⁶

Among the commercial operators, BACTEC continued to work under contract to OZ Minerals on its Sepon gold and copper mining project. It also undertook pathfinder tasks for Australian Survey Company and Salamander Energy plc.¹¹⁷ Milsearch, a joint venture between Australian company Milsearch Pty and Bolisat Phathana Khet Phoudoi Group (BPKP), which works under the Lao PDR Prime Minister's Office, supported exploration by Phu Bia Mining, undertaking clearance tasks related to the Nam Theun 2 Hydropower Project.¹¹⁸ Phoenix PCL also undertook clearance tasks linked to Nam Theun 2 and as of April 2009 had some 70 operators working on five contracts.¹¹⁹

Risk Education

RE was conducted in the nine most contaminated provinces: Xieng Khouang, Huaphan, Luang Prabang, Khammouan, Savannakhet, Salavan, Sekong, Champasak, and Attapeu, and was expanded to new communities within these provinces.¹²⁰

A national RE strategy launched in 2008 encouraged a shift from the information/education communication model that had evolved since 1999 to a behavior change communication approach based on discussions of options and minimizing risk for intentional adult risk takers. The approach for children was to continue to discourage any risk taking.¹²¹ Further studies on the strategy were conducted in 2008 by HI,¹²² MAG,¹²³ and FSD with Care Australia.¹²⁴

MAG, HI, and FSD adopted the new strategy in 2008, and World Education/Consortium (WEC) was in the process of adapting it in 2009. HI and MAG used community liaison teams as part of an integrated approach to clearance and RE, with MAG focusing on reducing risk in

the scrap metal trade.¹²⁵ However, UXO Lao Community Awareness teams continued to use the old method in 2008.¹²⁶

WEC and the Ministry of Education started to implement a plan for sustainable UXO risk education in all primary schools in 2008, putting RE in the school curriculum and training teachers in the nine most affected provinces, building on the RE that had been conducted in schools for 10 years.¹²⁷

In November 2008, FSD and Care Australia started an RE project in Sekong as part of their UXO risk reduction strategy focused on children and the scrap metal trade. They conducted training to start RE activities in 2009.¹²⁸ Phoenix PCL also reportedly conducted RE in 2008 in Khammouane province,¹²⁹ but details were not available.

The NRA RE unit, funded by UNICEF, organized three training courses for RE operators focusing on behavioral change techniques¹³⁰ and a workshop to develop an RE radio broadcasting plan.¹³¹

Activities in 2008¹³²

Organization	Type	Type of activity	Location	No. of beneficiaries
UXO Lao	Government	Mobile community awareness teams	Luang Prabang, Huaphanh, Xieng Khouang, Khammuane, Savannakhet, Saravane, Sekong, Champasack, and Attapeu	145,332 people (including 69,417 children) in 601 villages
HI	NGO	Community-based RE volunteers network, parent-to-child education	Savannakhet province	16,500 people in 36 villages
WEC and Ministry of Education	NGO and government	School-based RE	Provinces: Xieng Khouang, Huaphanh, Luang Prabang, Khammouane, Savannakhet, Salavan, Sekong, Champasak, and Attapeu	4,890 teachers, 155,244 children in 533 primary and 1,077 village schools
MAG	NGO	Community liaison; participatory safety training to scrap metal collectors in the foundry project	Vientiane, Xieng Khouang, Khammuane, Savannakhet, and Champasack Huaphanh	Not available

¹³⁰ Emails from Thongdy Phommavongsa, NRA, 24 March 2009; Heuangphachanh Panpadith, UXO Lao, 23 March 2009; and Kim Warren, HI, 23 March 2009.

¹³¹ Email from Thongdy Phommavongsa, NRA, 20 March 2009.

¹³² Emails from Barbara Lewis, UXO Program Coordinator, WEC, 31 March 2009; Kim Warren, HI, 20 March 2009; and Stefan De Coninck, FSD, 12 April 2009; and response to Landmine Monitor questionnaire by Gregory Cathcart, MAG, 29 April 2009.

The NRA also reprinted RE materials that had been developed in 2007 in additional ethnic languages, and 30,000 RE materials for the UXO School Curriculum project.¹³³

A UXO/mine action sector evaluation in 2008 reported that “basic knowledge of UXO and UXO risks is widespread and general education efforts are likely to be yielding diminishing returns.”¹³⁴ It recommended that donor support be shifted from education-based RE to expansion of roving clearance. RE stakeholders responded that “Education-based activities can be very different in strategy and outcome than simply raising community awareness. This recommendation is not therefore based on current MRE approaches.”¹³⁵

Several needs assessments conducted over the last few years contributed to this new strategic direction. A risk assessment conducted by UNICEF, MAG, and the Lao Youth Union in 2006 found that a new approach to RE was needed which would “require a change from zero-risk to risk minimization and recognition of the often valid risk assessment processes and risk reduction strategies indigenous communities employ.”¹³⁶ Key recommendations were to establish a process for engaging stakeholders, revise RE messages, strategies and information management systems, develop risk reduction strategies for children and young people, scrap metal collectors, people who dismantle UXO, and for farmers.¹³⁷

A GICHD study in February 2007 also noted that although most victims had knowingly engaged in hazardous activity, “Community Awareness seemed largely to target unintentional risk-taking and not necessarily among the highest risk groups.”¹³⁸ The needs assessment fed into the workshop held in October 2006 to develop the new strategic plan for January 2007 to December 2010 and new standards.¹³⁹

Victim Assistance

The total number of mine/ERW survivors is unknown, but is estimated to be at least 7,000.¹⁴⁰ In 2008, services and infrastructure in Lao PDR continued to be insufficient to meet their needs. Survivors predominantly live in the poorest, most isolated, and rural parts of the country, resulting in high levels of inaccessibility to medical services.¹⁴¹ The cost of surgery and medical care is very high compared to the annual income of a rural family and is the main reason survivors have not accessed medical assistance.¹⁴²

Emergency medical care throughout Lao PDR remains inadequate to meet needs, although progress has been achieved in this area. Some 96% of all villages in the country have a trained village health volunteer who is supplied with a medical kit.¹⁴³ Between 2001 and 2008, an Asian Development Bank project with the Ministry of Health improved the spread of primary health care services in eight northern provinces, working with hospitals to renew equipment and supplies, train staff and volunteers, and support the village volunteer network. At the end of the project in December 2008, it was reported that almost all villages in the eight provinces were within two hours of health assistance.¹⁴⁴

¹⁴⁴ Asian Development Bank, “Projects: Primary Health Care Expansion–Lao People’s Dem Rep,” 2008, pid.adb.org.

Physical rehabilitation services are reasonably well-developed and run by the government in association with the Cooperative Orthotic and Prosthetic Enterprise (COPE). However, they remain centralized and not easily accessible for survivors from remote villages.¹⁴⁵

There is only limited psychosocial support for mine/ERW survivors.¹⁴⁶ Social and economic reintegration programs for mine/ERW survivors are limited.¹⁴⁷ Although there are some educational and vocational training opportunities for a small number of mine/ERW survivors, employment opportunities remain limited and laws on employment quotas for persons with disabilities are not enforced.¹⁴⁸

Lao PDR has no specific laws prohibiting discrimination against persons with disabilities. The Ministry of Labour and Social Welfare has established regulations protecting persons with disabilities from discrimination and requiring accessible buildings. However, these policies do not have the force of law.¹⁴⁹ Lao PDR has signed the UN Convention on the Rights of the Person with Disabilities, but had not ratified as of 1 July 2009. It has not yet passed the Decree on the Rights of the Persons on Disabilities that was drafted at the beginning of 2008.¹⁵⁰

Victim assistance activities

WEC financially supported the initial medical treatment and continuing medical care of 74 mine/ERW survivors in five provinces in 2008, through a fund that has helped 650 survivors access medical treatment since its inception in 1995. WEC also provided training in emergency medical care in 2008 to health staff in two mine/ERW-affected provinces. WEC coordinated a project that provided animal husbandry and veterinary training to 33 mine/ERW survivors in Xieng Khouang province in 2008. Follow-up activities with mine/ERW survivors in Xieng Khouang who received training indicated that their income had increased.¹⁵¹

The HI community-based rehabilitation project continued in coordination with a number of government ministries in 2008. Working in Savannakhet province with 30 villages, the project provided support to 365 beneficiaries in 2008.¹⁵²

The ICRC Special Fund for the Disabled (SFD) program expanded support to the Cooperative Orthotic and Prosthetic Enterprise at the beginning of 2008. This included provision of materials to all five physical rehabilitation centers and subsidizing the costs of poor beneficiaries to the center in Pakse province and the National Rehabilitation Center in Vientiane.¹⁵³ To develop sustainable and locally led rehabilitation services, in 2008, COPE collaborated with the Ministry of Health and the College of Health Care Technology to determine whether training for health care professionals can be developed.¹⁵⁴

In 2008, the Association for Aid and Relief Japan worked with the Ministry of Health to expand operations to six new target provinces in northern Lao PDR. Wheelchair Assessment Training was provided to Lao staff working in provincial hospitals of each province. The distribution of wheelchairs and tricycles to the northern area started gradually in December 2008.¹⁵⁵

The Lao Disabled People's Association, a self-help, membership based organization, continued to work in 2008 in 11 provinces to promote inclusion of people with disabilities in society.¹⁵⁶

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates for fulfilling mine action needs (including RE and VA) in Lao PDR. Overall cost estimates (totaling roughly \$5.1 million) presented in the 2003–2013 strategic plan have been rendered invalid by the expansion in recent years of the mine action sector and related costs and budgets.¹⁵⁷ In its 2008 annual report, UXO Lao reported an annual budget for 2008 of \$6,318,035 and actual expenditures of \$6,795,781.¹⁵⁸ The UXO Lao 2009 Work Plan estimates costs for 2009 totaling \$6,859,494.¹⁵⁹ COPE's 2008–2013 plan in support of VA reportedly includes a cost estimate of \$5.38 million.¹⁶⁰

The NRA coordinates and reviews implementation of the National Strategic Plan for the mine/UXO action sector. Among its financial duties, the NRA manages mine/UXO action assets transferred from the government to mine action operators, acts as the formal depository for funding agreements between donors and mine action operators, and approves commercial investment projects involving mine action.¹⁶¹ Identifying future funding strategies was among the priority tasks defined for the NRA as of July 2007.¹⁶² In October 2006, the NRA established a government-donor UXO Sector Working Group.¹⁶³

National support for mine action

No mine action funding was reported by the government of Lao PDR in 2008 or 2007 except in-kind support.

International cooperation and assistance

In 2008, eight countries and the European Commission (EC) reported providing \$12,745,518 (€8,655,112) to mine action in Lao PDR, approximately 4% more than in 2007. Funding at 2008 levels remains higher than budget estimates reported in the 2003-2013 strategic plan, but remains insufficient to address the full range of mine/UXO action and VA needs.

New Zealand reported supporting MAG clearance operations in Lao PDR during 2008 but did not report the value of its support.¹⁶⁴

As of May 2008, UXO Lao reported secured funding of \$4.2 million for 2008. Government donors included Australia, Germany, Ireland, Japan, Luxembourg, Poland, Switzerland, the UK, and the US.¹⁶⁵ International funding reported by donors above may include multiyear funds, accounting for the difference.

LEBANON

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Antipersonnel and antivehicle mines, submunitions, other UXO
Estimated area of contamination	74km ² of mined areas 15.81km ² of battle areas, including significant areas with cluster munition remnants
Casualties in 2008	28 (2007: 130)
Estimated mine/ERW survivors	Unknown but at least 2,720
Demining in 2008	119,918m ² of mined areas 10km ² of cluster munition remnant areas
Risk education recipients in 2008	425,000
Support for mine action in 2008	International: \$27.8 million (2007: \$28.3 million) National: \$5.5 million (2007: \$5.5 million)

Ten-Year Summary

The Republic of Lebanon's progress toward joining the Mine Ban Treaty was set back by the 2006 conflict between Israel and Hezbollah. Lebanon has abstained from voting on the annual pro-Mine Ban Treaty UN General Assembly resolution, but has been a regular participant in treaty-related meetings. Israel used antipersonnel mines in Lebanon prior to its May 2000 withdrawal. The UN Mine Action Coordination Centre for Southern Lebanon (MACC SL) accused Israel of using antipersonnel mines in its conflict with Hezbollah in 2006. It appears Hezbollah used antipersonnel mines in ambushes on the UN Interim Force in Lebanon (UNIFIL) in 2006. Fatah al-Islam used explosive booby-traps in a Palestinian refugee camp in 2007.

Lebanon is contaminated with mines and explosive remnants of war (ERW), especially cluster munition remnants, as a legacy of 15 years of civil conflict which ended in 1990 and conflict with Israel. The 2006 conflict resulted in up to 500,000 unexploded submunitions being scattered across more than 1,000 cluster strike sites. At the beginning of 2009, the UN and NGOs reported major funding shortages to clear the remaining submunitions, which have resulted in closing operations and less clearance. The Lebanese National Mine Action Authority, a government body, is responsible for mine action policy. MACC SL was handed over from the UN to the Lebanese government and became the Regional Mine Action Center (RMAC) in January 2009.

From 1999 to 2008, Landmine Resource Center (LMRC) of Balamand University and MACC SL reported a total of 511 mine/ERW casualties (100 killed and 411 injured). During the same period, Landmine Monitor identified 703 mine/ERW casualties (120 killed, 567 injured, and 16 unknown). The additional casualties in the Landmine Monitor total were identified through media reports and information from the Lebanon Mine Action Center (LMAC).

Risk education (RE) has been primarily conducted by national NGOs with support from LMRC, Norwegian People's Aid (NPA), and UNICEF, and under the coordination of LMAC. It has mainly been implemented through community-based activities by volunteers, with a focus on school-based RE from 2004, as well as use of mass media. Emergency RE was delivered following the Israeli withdrawal from south Lebanon in 2000, the war with Israel in 2006, and the conflict in Nahr al-Bared Palestinian camp in the north.

Victim assistance services in Lebanon have grown in scope and quality since 1999. The provision of emergency healthcare, including emergency transport, and continuing healthcare have been expanded and improved. The targeting and reach of rehabilitation services have increased. Social and economic integration projects have also assisted many survivors and their families. However, the cost of services and transport, and lack of awareness of services available are barriers for survivors to access such services. Coordination, although still problematic, has improved with the establishment of the National Steering Committee on Victim Assistance, providing a platform for mostly local NGOs to share information and begin coordinated planning.

Mine Ban Policy

Lebanon has not yet acceded to the Mine Ban Treaty. Positive movement toward joining the treaty in 2005 and 2006 was set back by the July–August 2006 conflict between Israel and Hezbollah.¹ Lebanon has long held the position that it is unable to join the treaty due to the continuing conflict with Israel, and the 2006 war heightened concerns about the security of its southern border.² Accession is still under consideration, although regional politics and the unstable internal political situation may hinder steps forward. Lebanon's signature of the 2008 Convention on Cluster Munitions has given rise to hopes that it will also join the Mine Ban Treaty.

On 2 December 2008, Lebanon abstained from voting on UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty, as it has with similar resolutions in previous years.³ In explaining its vote, Lebanon said it respected the treaty, but had not acceded to it due to self-defense concerns emanating from Israel's "aggression."⁴

A Lebanese army representative attended the Ninth Meeting of States Parties in Geneva in November 2008, where he provided a statement detailing LMAC's activities. LMAC's director participated in the intersessional Standing Committees meetings in Geneva in May 2009, but made no statements.

Lebanon is not party to the Convention on Conventional Weapons.

Lebanon signed the Convention on Cluster Munitions on 3 December 2008, but had not yet ratified it as of 1 July 2009.⁵

Production, transfer, stockpiling, and use

In November 2004, Lebanon confirmed that it "has never produced or exported antipersonnel mines."⁶ The Lebanese Armed Forces (LAF) stockpile an unknown number of antipersonnel mines. In March 2008, LMAC's director told Landmine Monitor that the stockpile consists

¹ See *Landmine Monitor Report 2007*, p. 892; *Landmine Monitor Report 2006*, pp. 987–988; and *Landmine Monitor Report 2005*, p. 799. The Ministry of Foreign Affairs in late 2005 initiated a process of consultations with the Lebanese Armed Forces, Ministry of National Defense, and the NDO regarding the ramifications of and procedures for accession to the Mine Ban Treaty. This process was, at the time, expected to lead to a recommendation to the government that Lebanon accede. In its 2005 annual report, the NDO reported that it had completed position papers recommending the submission of a voluntary Mine Ban Treaty Article 7 transparency report. In June 2006, the ICBL's Diplomatic Advisor undertook a special advocacy mission to Lebanon. The Prime Minister and army chief told him they were not averse to accession to the Mine Ban Treaty. The Minister of Foreign Affairs said that Lebanon was giving serious consideration to accession, that inter-ministerial consultations were underway, and it was only a matter of a time until Lebanon accedes to the treaty.

² See for example, Statement by Amb. Michel Haddad, First Review Conference, Nairobi, 3 December 2004. The ambassador cited the "failure of the Government of Israel to submit all the maps showing the deployment of landmines" and the "continued occupation by Israel of parts of Southern Lebanon."

³ Lebanon voted in support of the annual pro-mine ban resolutions in the UN General Assembly in 1996, 1997, and 1998. In December 1999, it became the first and only country to ever vote against the annual resolution. It abstained from voting each year from 2000 to 2004. In October 2005, Lebanon voted in favor of the resolution in the UNGA First Committee, but it was subsequently absent from the final vote. Since 2006, Lebanon has continued to abstain from the vote.

⁴ UN Department of Public Information, Sixty-third General Assembly, First Committee, 20th Meeting (PM) GA/ DIS/3378, 29 October 2008. The remarks were made following the vote on the resolution in First Committee.

⁵ For details on cluster munition policy and practice, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 105–107.

⁶ Statement by Amb. Michel Haddad, First Review Conference, Nairobi, 3 December 2004.

of a small quantity of mines, which he described as being lower than the maximum number permitted by the Mine Ban Treaty for training purposes.⁷

MACC SL accused Israel of using antipersonnel mines during the conflict with Hezbollah in 2006, a charge Israel denied. In addition, it appears a local Hezbollah commander ordered the use of antipersonnel mines as part of ambushes on UNIFIL troops on at least two occasions in 2006.⁸

In May and June 2007, the non-state armed group Fatah al-Islam used antivehicle mines and explosive booby-traps in the Palestinian refugee camp at Nahr al-Bared.⁹

Scope of the Problem

Contamination

Lebanon is contaminated with mines and ERW, especially cluster munition remnants, as a legacy of 15 years of civil conflict which ended in 1990 and of conflicts with Israel. The 2006 conflict between Hezbollah and Israel resulted in heavy new contamination in southern Lebanon with 1,073 confirmed cluster strike sites containing an estimated 500,000 unexploded submunitions as well as other types of UXO.

The estimates of the total area contaminated with cluster munition remnants have changed over the three years since August 2006. The original estimated area was 34km².¹⁰ In December 2008, MACC SL reported the total contaminated area to be 48km², but in May 2009 LMAC revised the figure down to 35.36km², of which 15.81km² of suspected hazardous areas (SHAs) remained to be cleared.¹¹ With 45% of the SHAs cleared, some 236,000 unexploded submunitions and items of UXO had been found and destroyed as of May 2009 (see table below). In addition, 5,794 landmines were destroyed as part of the Operation Emirates Solidarity (OES) and Al Aadeisse project, which coincided with the clearance of cluster munitions.¹²

Of the remaining land to clear, 2.5km² is within 50m of the last submunition found and 42 locations covering 200,000m² will not be cleared because the owners of the land refuse to authorize clearance.¹³ As of May 2009, 260 locations were designated as high and medium priority for clearance based on the seasonal agricultural growing cycle, as farming is the main occupation in southern Lebanon.¹⁴

On 14 May 2009, UNIFIL announced that the Israeli Defense Forces had handed over technical strike data and related maps on the cluster munitions they had used in Lebanon during the 2006 conflict. Mine clearance organizations said their work had been hampered by the lack of records from Israel and welcomed the handover. Brigadier-General Mohammed Fehmi, LMAC's director, however, told *IRIN*, "If the Israelis had sent those maps in 2006 when we

⁷ Interview with Col. Mohammed Fehmi, Director, LMAC, Beirut, 3 March 2008 [Colonel Fehmi was subsequently promoted to Brigadier General. His rank at the time of the citation is used throughout this report]. The Mine Ban Treaty requires destruction of all stockpiled antipersonnel mines, but allows retention of "the minimum number absolutely necessary" for training purposes. States Parties have generally agreed the number retained, if any, should be in the hundreds or thousands, and not tens of thousands.

⁸ See *Landmine Monitor Report 2007*, pp. 893–894. Based on photographic evidence provided to Landmine Monitor in 2007, it appears that Hezbollah used captured or recovered Israeli No. 4 type antipersonnel mines, M18A1 Claymore mines, and tripwire assemblies of unknown origin.

⁹ The booby-traps caused Lebanese military casualties. The use of explosive booby-traps that are victim-activated is prohibited under the Mine Ban Treaty because they function like antipersonnel mines. See *Landmine Monitor Report 2007*, pp. 894–895.

¹⁰ MACC SL, "Annual Report 2006," 22 March 2007, p. 2.

¹² See *Landmine Monitor Report 2007*, p. 895; presentation by Brig.-Gen Mohammed Fehmi, LMAC, to the ISG, Beirut, 14 May 2009; and email from Allen Kelly, Chief of Operations and Plans, UNMACC, 8 September 2009.

¹³ Presentation by Brig.-Gen. Mohammed Fehmi, LMAC, to the ISG, Beirut, 14 May 2009. This is designated as declined/declaimed land, indicating that the land will not be cleared at this time as per the landowners' instructions, due to crops, etc. Email from Allen Kelly, UNMACC, 8 September 2009.

¹⁴ Presentation by Brig.-Gen. Mohammed Fehmi, LMAC, to the ISG, Beirut, 14 May 2009; and email from David Horrocks, Country Program Manager, MAG, 4 August 2009.

requested them we could have saved a lot of casualties. After three years what are these maps for?"¹⁵

In February 2009, countering earlier assertions by the UN that the south would be freed of contamination from cluster munition remnants, first by the end of 2007, and then by the end of 2008, Lieutenant-Colonel Hassan Fakeeh, the head of RMAC, stated that a further two years would be needed to "minimize" the problem.¹⁶ A UNDP job advertisement posted in July 2009 for a quality assurance (QA) officer to work with mine action personnel in Lebanon on landmine clearance claimed that the cluster munition problem would be "largely mitigated" by mid-2010.¹⁷ Mines Advisory Group's (MAG) program manager for Lebanon, however, was quoted by *IRIN* as saying that 20 demining teams clearing 800m² per working day would take eight years to clear the remaining estimated 16km².¹⁸ In May 2009, because of funding constraints LMAC was planning for only 14 battle area clearance (BAC) teams across southern Lebanon (down from more than 50 in June 2008).¹⁹

The landmine problem, which has been overshadowed by the 2006 conflict, was defined by the 2002–2003 Landmine Impact Survey (LIS), based on which Lebanon estimated that 150km² of land was affected by mines and UXO. In early 2009, however, LMAC increased the estimate for the total mined area to 165km². As of May 2009, 91km² had been released, leaving 74km² to be addressed.²⁰ LMAC has recorded 2,314 hazardous areas in its three regional areas of operation: El Jenoub (Mount Lebanon), Jabal Lubnan, and Nabatiye.²¹

Number of Hazardous Areas as of May 2009

Area of Operation	No. of SHAs	Mined Areas	Minefields	Total
El Jenoub	254	172	225	651
Jabal Lubnan	18	71	42	131
Nabatiye	489	211	832	1,532
Total	761	454	1,099	2,314

By the end of 2008, there were still landmines in the south along the UN-delineated Blue Line between Lebanon and Israel, and in areas north of the Litani river, in the Bekaa valley, and across Mount Lebanon. MACC SL estimated that about 375,000 landmines remained along the Blue Line and up to about 3km inside Lebanese territory, covering an area of more than 7km². It was reported that in 2008 UNIFIL cleared 14 mined areas along the Blue Line.²²

In May 2007, fighting between the Lebanese army and the armed Islamist group Fatah al-Islam in Nahr al-Bared Palestinian refugee camp resulted in UXO contamination and the laying of booby-traps by Fatah al-Islam, including antivehicle mines.²³ In April 2008, MAG conducted a rapid risk assessment for survey teams and found that while all areas of the camp were contaminated with UXO the level of risk was highest in the center of the camp.²⁴ The survey

was later used by the UN Relief and Works Agency (UNRWA) for planning purposes. Handicap International (HI) began explosive ordnance disposal (EOD) operations at the surface level in October 2008 and as of 21 April 2009, HI had cleared one of the eight zones in Nahr al-Bared Old Camp and found and destroyed 6,000 items. During this period one HI employee and two members of a local NGO were injured by uncontrolled detonations; one of the local NGO staff was badly injured and neither were wearing protective equipment.²⁵

On 14 July 2009, a Hezbollah underground weapons depot in the village of Khirbet Silim, about 16km north of the Israeli border, exploded. There were no casualties. The depot was located in an abandoned building and had been guarded by Hezbollah militia.²⁶ Alain Le Roy, the Under Secretary General for Peacekeeping Operations, told the UN Security Council in July 2009 that Hezbollah had been storing the weapons. According to Le Roy, the storage facility did not contain old ammunition reserves as Hezbollah claimed, but was instead full of weapons that were “actively maintained.”²⁷ During the investigation, which uncovered three houses suspected of containing weaponry that survived the explosion, 14 UNIFIL personnel were slightly injured when clashes broke out between UNIFIL and local residents, who opposed the UN’s role in the investigation. One Lebanese soldier was reported injured by an explosive during the investigation.²⁸

Casualties²⁹

In 2008, Landmine Monitor identified at least 28 new mine/ERW casualties in Lebanon (two killed and 26 injured). LMRC recorded 20 of the casualties³⁰ but noted that the data supplied for 2008 to May 2009 was incomplete, as they had not completed verifying all incidents with LMAC.³¹ MACC SL reported one clearance accident in 2008—a male Belgian UNIFIL deminer was killed by a submunition during clearance operations in Aytarun in southern Lebanon.³² The UN Mine Action Coordination Centre (UNMACC) reported they could only provide Landmine Monitor with data on UNIFIL clearance accidents and not on overall casualties, due to LMAC taking over responsibility of all reporting of casualties from January 2009 onwards.³³ Landmine Monitor analysis of media reports identified seven additional casualties.

Based on the ongoing victims’ survey (conducted by LMAC), total mine/ERW casualties between 1 January 2008 and 1 May 2009 were 54 (50 killed and 4 injured; 39 men and 15 boys). Cluster submunitions caused 36 casualties, antipersonnel mines six, antivehicle mines two, other ERW seven, and unknown devices three. The most common activity at the time of the incident was reported as agriculture (37). Nine of the casualties were clearance operators (eight civilians and one LAF member).³⁴ LMAC was unable to provide calendar year data, despite repeated requests.³⁵

²⁹ Unless otherwise stated, data provided by Habbouba Aoun, Coordinator, LMRC, 6 July 2009; Tekimiti Gilbert, Programme Manager, UNIFIL, 17 July 2009; and Landmine Monitor media monitoring from January 2008–May 2009.

³⁰ Data provided by Habbouba Aoun, LMRC, 6 July 2009. An additional eight casualties (one killed and seven injured) were identified in media reports and/or reports from UNIFIL.

³¹ Emails from Habbouba Aoun, LMRC, 6 July 2009 and 20 July 2009.

³² Email from Tekimiti Gilbert, UNIFIL, 17 July 2009.

³³ Email from Tekimiti Gilbert, UNIFIL, 9 June 2009.

³⁴ Emails from LMAC, 5 and 7 September 2009.

³⁵ Landmine Monitor sent emails to Col. Fares, IMSMA and Mine Victim Assistance Section Head, LMAC, requesting data on 26 May 2009, 12 June 2009, 3 July 2009, 7 July 2009, 9 July 2009, and 21 July 2009.

The number of casualties reported in 2008 is a significant decrease compared to the 130 mine/ERW casualties recorded in 2007 (37 killed and 93 injured) and the 207 casualties reported in 2006 (31 killed and 176 injured). Under-reporting is assumed for 2006 to 2008. LMRC said that its data was incomplete, due to an unfinished verification process.

Mine/ERW casualties continued in 2009, with Landmine Monitor identifying five casualties, including two people killed and three injured, as of 31 May. Landmine Monitor identified three of the casualties through analysis of media reports. LMRC reported two of the casualties.³⁶ Four of the casualties were men and one was a boy. Two were injured by antipersonnel mines: submunitions caused the remaining three casualties. One civilian clearance operator was injured in January by a submunition during operations. Again, under-reporting of casualties is likely.

The total number of casualties in Lebanon is unknown. LMAC reported that from 1975 to June 2009 there were a total of 3,857 mine/ERW casualties (960 killed and 2,897 injured) in Lebanon.³⁷ As of July 2009, LMRC had records on 2,720 living survivors.³⁸ From 1999 to 2008, LMRC and MACC SL reported a total of 511 mine/ERW casualties (100 killed and 411 injured). Data on historical casualties supplied by LMRC to Landmine Monitor in 2009 is inconsistent with data supplied by the same organization in previous years. The discrepancies are reportedly due to the ongoing verification process.³⁹ During the same 10-year period, Landmine Monitor identified 703 mine/ERW casualties (120 killed, 567 injured, and 16 unknown). The additional casualties in the Landmine Monitor total were identified through media reports and information from LMAC.⁴⁰

Risk profile

Southern Lebanon, Nabatiye, and west Bekaa are the main areas contaminated by mines, cluster munition remnants, and ERW, and there are also areas affected by mines in Mount Lebanon. Nahr al-Bared still has contamination inside the camp area, especially farmers and shepherds, who are compelled by economic necessity to farm or graze animals on contaminated land. Most casualties are adult males, followed by children of both genders.⁴¹ An assessment in 2007 found that there was a generally high level of awareness about mines and submunitions, although only half of the respondents were able to correctly describe them, or recognize a dangerous area. Almost all mined areas are marked and fenced.⁴²

Socio-economic impact

A study of the economic impact of cluster munition contamination in Lebanon found that two-thirds of the area affected in 2006 was agricultural, representing close to 5% of all agricultural land in southern Lebanon. It estimated current and projected losses of agricultural production would total between US\$22.6 million and \$26.8 million.⁴³

³⁶ Data provided by Habbouba Aoun, LMRC, 6 July 2009.

³⁷ Email from Lt.-Col. Fares, LMAC, 11 June 2009.

³⁸ Email from Habbouba Aoun, LMRC, 9 July 2009.

³⁹ Ibid.

⁴⁰ For 1999, *Landmine Monitor Report 2000* cites a variety of reports for various sources on casualties. However, it is impossible to know whether some of these may overlap. Therefore, for this report, Landmine Monitor has used the *Agence France-Presse* report of 20 casualties (five killed, 15 injured). See *Landmine Monitor Report 2000*, p. 949. For 2000, *Landmine Monitor Report 2001* and *Landmine Monitor Report 2002* both reported 113 casualties (14 killed and 99 injured), but *Landmine Monitor Report 2004* reported 119 casualties. Therefore, for this report, Landmine Monitor has counted 199 casualties (14 killed, 99 injured, and six unknown). For 2001, *Landmine Monitor Report 2002* reports 90 casualties (18 killed and 72 injured), but *Landmine Monitor Report 2004* reports 93 casualties. Therefore, for this report, Landmine Monitor has counted 93 casualties (18 killed, 72 injured, and three unknown) for 2001. For 2002, *Landmine Monitor Report 2003* reported 42 casualties (four killed and 38 injured), but *Landmine Monitor Report 2004* updated the figure to 49 casualties. Therefore, for this report, Landmine Monitor has counted 49 casualties (four killed, 38 injured, and seven unknown) for 2002. For 2003, *Landmine Monitor Report 2004* and *Landmine Monitor Report 2005* report that there were 26 casualties but then break it down into three killed and 24 injured, which totals 27. Therefore, for this report, Landmine Monitor has counted 27 casualties (three killed and 24 injured) for 2003.

⁴¹ Email from Lt.-Col. El Cheikh, Acting Head of the MRE section, LMAC, 27 April 2009.

⁴² Interview with Brig.-Gen. Mohammed Fehmi, LMAC, in Geneva, 29 May 2009.

⁴³ Greg Crowther, "Counting the cost: the economic impact of cluster munition contamination in Lebanon," *Landmine Action*, May 2008, pp. 3–4.

MACC SL reported at the end of 2008 that largely due to the extensive clearance operations since the cease-fire in August 2006, casualty rates had dropped dramatically and that southern Lebanon had avoided a potential disaster. Still, cluster munitions and other UXO continue to pose a threat to communities and impede agriculture, the main source of income for many people in the area.⁴⁴

A World Bank report estimated the economic cost of cluster munitions in terms of mortality and morbidity in Lebanon ranged from \$10 million to \$86 million. Indirect costs include immediate and ongoing health care, the emotional and psychological impact of incidents on both victims and the victim's family, and the impact on households from the loss of income and its effects on women and children.⁴⁵

Program Management and Coordination

Mine action

The Lebanese Mine Action Authority (LMAA), an interministerial body established in 1998 by the Council of Ministers is chaired by the Minister of Defense. The LMAA is responsible for the Lebanon National Mine Action Program.⁴⁶ LMAC, under the command of the Deputy Chief of Staff for Operations of the LAF, is the coordinating body for all mine action in Lebanon and is responsible for implementing and coordinating the Mine Action Program.⁴⁷ The LAF implements the End-State Strategy for Mine Action in Lebanon (ESS).⁴⁸ The ESS was designed in partnership with the Ministry of National Defense and the UNDP mine action capacity building project in 2003–2004 and contains the assumptions for mine action planning and the desired description of Lebanon at the end of clearance operations.⁴⁹

As planned, in January 2009 MACC SL transitioned from UN management to the newly constituted RMAC and was relocated from Tyre to Nabatiye.⁵⁰ RMAC took responsibility for all clearance operations in the south except for those conducted by UNIFIL, whose operations are coordinated by UNMACC.⁵¹ MACC SL, a joint operation between the UN Mine Action Service (UNMAS), LMAC, and the United Arab Emirates (UAE), was established in 2001 and had been responsible for coordinating clearance below the Litani river; in Area 6, an area north of the Litani comprising Hasbaya and Nabatiye in Nabatiye governorate; and in Jezzine in South governorate.⁵² With the transition the LAF would continue as part of the new RMAC in Nabatiye and the remaining UNMACC staff would support UNIFIL in BAC, mine clearance, and EOD operations. The UN planned to support the transition through donations of capital, equipment, and in-kind donation of civilian staff on UN contracts through 2009.⁵³

Risk education

LMAC coordinates and supervises RE. A National Steering Committee on Mine Risk Education represents the various professional and political groups in the country, and the members work in the communities they represent. The ministries of education and of social affairs are also members. There were no new members in 2008.⁵⁴ The committee met regularly until May

⁵⁴ Email from Lt.-Col. El Cheikh, LMAC, 27 April 2009.

2008, when the unstable political situation prevented activities from taking place. They did not resume until early 2009.⁵⁵ Local law prevents international organizations from conducting RE in Lebanon.⁵⁶ Oversight of RE is conducted by LMAC, which conducts weekly field visits,⁵⁷ and LMRC.⁵⁸

Technical and financial support to the RE steering committee was provided by NPA and UNICEF,⁵⁹ while LMRC continued to provide training support and donor liaison to committee members.⁶⁰ UNICEF provided \$7,000 in funding for 2008, and was transitioning out of RE in 2009, although it planned to maintain an emergency response RE capacity.⁶¹ NPA contributed \$76,000 to RE activities in 2008 and planned to continue RE in Lebanon until the end of 2011.⁶²

Victim assistance

LMAC took full responsibility for mine action coordination in Lebanon at the beginning of January 2009, including victim assistance (VA).⁶³ The National Steering Committee on Victim Assistance offered information-sharing opportunities among operators and is coordinated and chaired by the LMAC Information Management System for Mine Action (IMSMA) and Mine Victim Assistance Section Head. However, NGOs have criticized the committee for its lack of VA planning.⁶⁴ Although there are positive activities for mine/ERW survivors undertaken at the local level in Lebanon, it was reported that these successes remained localized and were not translated into achievements and coordination at the national level.⁶⁵

Data collection and management

The Information Management section of LMAC is responsible for the management of mine action data. Its database, using IMSMA software, includes data from the 2002–2003 LIS as well as the results from the technical survey project that began in 2005 following the LIS (see Strategic mine action plan section below).⁶⁶ RE activities are recorded in IMSMA.⁶⁷

LMAC is the national repository for mine/ERW casualty data in Lebanon. In 2009, steps were taken by LMAC to consolidate mine/ERW casualty data collected by various operators in Lebanon. From 1 January 2009, LMAC assumed sole responsibility for mine action activities in Lebanon, including the collation and distribution of casualty data. As such, all requests for statistical information on casualties should be directed to the LMAC IMSMA and Mine Victim Assistance Unit.⁶⁸ Casualty data from MACC SL and LMRC from 2000 to 2009 were reportedly being consolidated into IMSMA in June 2009. However, data from casualties prior to August 2006 remained in a database managed by LMRC and Landmine Monitor was referred by LMAC to receive all data from this period from this database.⁶⁹

LMAC collected casualty data in 2008 and 2009 through LMAC community liaison officers, army intelligence units of each governorate, and received information through LMRC and MACC SL. LMAC regularly distributes casualty data to operators and answers requests for information.⁷⁰ LMRC collected casualty data in 2008 through a network, covering the whole

country, of trained data collectors, social workers, and university students majoring in public health.⁷¹ LMRC also maintained a comprehensive database of survivor information that has been used as the information base for planning VA projects.⁷²

In 2008 and into 2009, LMAC conducted phase one of a mine/ERW casualty survey. Phase one verified the IMSMA database of mine/ERW casualties that occurred from the end of the July–August 2006 conflict. The survey also aims to provide LMAC with comprehensive information (including assistance received) on each survivor in the country. Data collection for phase one was completed in July 2009 but the results were not available for this edition of Landmine Monitor. LMAC was seeking funding for two additional phases of the survey.⁷³ Phase two would cover casualties from 2000 to August 2006, and phase three, casualties prior to 2000.⁷⁴

Plans

Strategic mine action plan

In 2007, Lebanon adopted a Long Term Plan for 2008–2012 to reflect the results of the 2006 conflict and clearance scheduled for 2007. A primary goal was to implement technical surveys and eliminate the impact in all high- and medium-impacted communities identified in the 2002–2003 LIS by 2011.⁷⁵ The LIS identified 28 high-impacted communities and 164 medium-

⁷¹ Response to Landmine Monitor questionnaire by Habbouba Aoun, LMRC, 1 June 2009.

⁷² Ibid.

⁷³ Phase 1 of the casualty survey was supported by NPA, which most probably will be able to cover the needed funds for phase 2. Email from Khaled Yamout, NPA, 5 September 2009.

⁷⁴ Telephone interview with Lt.-Col. Fares, LMAC, 7 July 2009.

⁷⁵ NDO, “Long Term Plan 2008–2012,” Beirut, p. 9.

impacted.⁷⁶ LMAC stated they have technical survey and coordination capacity to clear all high- and medium -impacted communities in five years, assuming sufficient support from donors.⁷⁷

The End State Strategy, which has as its goal to make Lebanon “impact free,” was established in 2004 to combine the humanitarian need to save lives and to support national development plans.⁷⁸ It provides 12 implementation guidelines and direction for associated long-term and annual plans.⁷⁹

An annual RE action plan was produced for 2007–2008. It included community campaigns, media activities, training in RE, school-based RE, summer activities, and evaluations.⁸⁰

LMAC’s Long Term Plan, revised in 2008 and covering 2008–2012, aims to develop VA standards and guidelines, an accreditation system for members of the national steering committee, adequate coordination mechanisms to avoid duplication, a transparent monitoring and evaluation system, and a comprehensive five-year plan with indicators.⁸¹ LMAC is reportedly creating a monitoring system for VA projects.⁸² LMAC reported having “technical issues” in implementing the plan, resulting in cancelling or combining some programs.⁸³ LMRC reported that the plan was yet to be implemented by the National Steering Committee on Victim Assistance.⁸⁴

Integration of mine action with reconstruction and development

The Lebanese Council for Development and Reconstruction (CDR) is the government’s coordinating agency for development projects. UNDP and CDR jointly support the post-conflict socio-economic rehabilitation in southern Lebanon, in which mine and ERW-affected communities receive assistance in developing businesses, rebuilding infrastructure, and training of human resources.

In September 2008, MACC SL received on behalf of all humanitarian operators in Lebanon the Office of the UN High Commissioner for Refugees’ annual Nansen Refugee Award, based on their contribution to the safety and security of internally displaced persons and returnees in Lebanon and the safe delivery of humanitarian assistance. In December, MACC SL used the \$100,000 prize money to purchase and distribute 300 cows to seven agricultural communities in southern Lebanon.⁸⁵

National ownership

Commitment to mine action and victim assistance

Lebanon appears generally committed to mine action. It has adopted a national mine action policy, a five-year plan, and has taken over responsibility for coordination and management of mine action in Lebanon. The Ministry of National Defense took over responsibility for coordination of the south from the UN at the beginning of 2009.

National management

Lebanon’s program is nationally managed with continuing UN support. UNDP has supported LMAC’s institutional development through the provision of an international technical advisor and national information technology and administration staff since 2001.⁸⁶ UNMAS managed MACC SL from 2001 until it was handed over to the government in January 2009 and converted

⁸⁶ Interview with Allan Poston, UNDP, Beirut, 4 March 2008.

into the RMAC. In 2009, UNMAS continued to provide technical advice to the RMAC as required through the UNMACC and in July, UNDP was recruiting a specialist in quality management to provide technical advice to the RMAC and the LMAC.⁸⁷ UNMAS employed a transition officer from the then MACC SL to facilitate the transition to national ownership.⁸⁸ On 11 July 2009, UN Secretary-General Ban Ki-moon presented UNMACC staff with a UN 21 award—an award that recognizes excellence in the delivery of UN organization programs and services—for its efforts in response to the 2006 conflict.⁸⁹

National mine action legislation

In May 2007, the National Demining Office (NDO), the body that preceded LMAC, approved the mine action policy that set the organizational structure for mine action and gave NDO the responsibility for the management of the mine action program. The policy document includes the mine action structure, authorized bodies for mine clearance operations, the creation of the International Support Group (ISG)—consisting of representatives from UNDP, the World Bank, the International Monetary Fund, the Poverty Reduction Support Grants program, ambassadors from donor countries, demining regulations, and monitoring guidelines. It also states that Lebanon aspires to join the Mine Ban Treaty.⁹⁰

National mine action standards/Standing operating procedures

Mine and ERW clearance is conducted according to the National Technical Standards and Guidelines (NTSG), which are said to be based on the International Mine Action Standards. Mine clearance operators are accredited based on their adherence to the NTSG.⁹¹ A final draft of national RE standards was being reviewed by LMAC as of May 2009.⁹² National VA standards and guidelines were developed during 2008 and 2009, under the supervision of the LMAC, with technical support from LMRC and funding from World Vision.⁹³

Program evaluations

An UNMAS review of emergency clearance coordinated by MACC SL in 2007 concluded that the overall response was rapid and effective, despite a lack of early contingency planning, and that the UN rapid response framework was well suited to large-scale, high-profile emergencies. The review identified a need to improve coordination between UN agencies with mine action responsibilities and for increased emphasis on RE, which was found to have been overwhelmed by the rush of returnees immediately after the 2006 conflict.⁹⁴

LMAC hired a consultant to evaluate VA in Lebanon in May 2009. The results were not available as of June 2009.⁹⁵

Demining and Battle Area Clearance

With support from UNDP and UNMAS, Lebanon has made significant progress in clearing mined and battle areas following armed conflicts since 1975. Prior to the 2002–2003 LIS that serves as the baseline for the landmine problem in Lebanon, the Lebanese Armed Forces cleared 20km² of land, destroying in the process 40,000 antipersonnel mines, 5,500 antivehicle mines, and 60,000 items of UXO from 1990–2003. Considerable mine and unexploded submunition

contamination remains, however, with earlier predictions that clearance of cluster munition remnants would already have been completed proving ill-founded.

Resources for clearing submunitions reduced significantly in 2008, as a result of funding constraints, and LMAC projected further decreases in 2009. At the end of 2008, HI closed its operations due to a lack of funding.⁹⁶ BACTEC followed in March 2009, also due to a lack of funding.⁹⁷ The Swiss Foundation for Mine Action (FSD) closed its program at the end of 2008, but returned in April 2009 with new funding from the Swiss Federal Department of Foreign Affairs for four months to resume clearing submunitions.⁹⁸ However, at the end of July FSD left again due to lack of funding.⁹⁹ It was also reported that the Swedish Rescue Services Agency (SRSA) was running short of funds and might have to close its operations by September 2009.¹⁰⁰

Battle area clearance in 2008

In December 2008, MACC SL reported that 42.5km² of the 48.1km² of battle areas in southern Lebanon had been cleared including 10km² in 2008.¹⁰¹ On 14 May 2009, LMAC revised the contaminated area down to 35.4km² and claimed that 15.9km² remained to clear. LMAC estimated that approximately 10% of the remaining area requires sub-surface clearance. They also reported a considerably higher number of cluster munition remnants than those previously reported by MACC SL, particularly in the number of munitions found by the LAF.¹⁰²

Summary of cluster munition remnants problem as of May 2009

Contaminated Area	35.36km ²
Area Cleared	19.55km ²
Area Remaining	15.81km ²
Cluster munitions found	194,447
Mines found	5,794
UXO found	41,051

Number and type of item found during clearance of cluster submunitions as of May 2009

Organization	Unexploded submunitions destroyed	Mines destroyed	Other UXO destroyed
LAF	106,578	370	35,686
UNIFIL	28,068	302	3,491
NGOs	32,975	24	781
Commercial Companies	25,263	5,098	1,042
New Zealand Defense Force	1,563	0	51
Total	194,447	5,794	41,051

In 2008, mine clearance consisted of clearing 119,918,000m².¹⁰³ All mine clearance activities were suspended in July 2006 in response to the priority in locating cluster munition strikes and clearing submunitions.¹⁰⁴ MAG reported that it restarted its mine clearance operation in May 2007 with one technical survey team and two mine detection dog teams, in Mtolle, in the

¹⁰⁴ UNMAS, "Annual Report 2006," New York, May 2007, p. 48.

Chouf Mountains in central Lebanon with funding provided by the United Kingdom and in 2008 cleared 47,729m². From January to June 2009, MAG cleared another 14,675m². During clearance operations nine Israeli No. 4 mines were found.¹⁰⁵

BACTEC cleared more than 70,000m² in the Al Aadeisse mined areas, adjacent to the Blue Line, from July–September 2008, and destroyed 4,569 mines in the process. Al Aadeisse is considered cleared. It was also reported that UNIFIL cleared 14 mined areas adjacent to the Blue Line.¹⁰⁶

In October 2008, HI began EOD operations to remove 500,000m³ of rubble in the Nahr al-Bared refugee camp at the surface level under a contract with UNRWA that runs until March 2010.¹⁰⁷ Four teams work in conjunction with a rubble removal contractor to clear Nahr al-Bared Old Camp and adjacent areas of explosive ordnance. The project includes the provision of UXO awareness briefings to all UN staff, contractors, camp residents, and others authorized to enter the camp. As of 21 April 2009, HI had cleared one of the eight zones in the Old Camp and found and destroyed 6,000 items. LMAC is responsible for external QA and issues completion reports before the area is handed over to UNRWA for planning the return of people displaced from the camp and supporting humanitarian relief and development projects.¹⁰⁸

Operation Emirates Solidarity project

When Israel withdrew from southern Lebanon in May 2000 it left behind some 400,000 landmines. The UAE has supported clearance in this area since 2001 through the OES project. In 2005, five of the six areas had been cleared and, after the 2006 conflict, the UAE continued the project.¹⁰⁹ The clearance of Area 6, the last remaining area, was completed in March 2008. A total of 648,442m² was cleared.¹¹⁰

Quality assurance/Quality control

Each organization has its own internal quality management system. External quality control is conducted by LMAC or RMAC depending on the area of operation.¹¹¹ QA is conducted during clearance operations as well as after they are completed, based on the Standing Operating Procedures for Quality Control. Two major factors considered in the sampling size are the level of accreditation of the demining operator and how the land will be used after clearance is completed.

N/A = not available

Risk Education

RE activities are conducted by national NGOs.¹¹³ Activities included presentations to farmers and their families and RE by school students, including plays.¹¹⁴ RE activities covered all contaminated areas in Lebanon, including north of the Litani river.¹¹⁵ All communities in the south received RE, and the majority of communities in the rest of the country although to a lesser degree, as these were of lower priority.¹¹⁶ RE was also delivered to Palestinians and Lebanese in the Nahr al-Bared Palestinian refugee camp.¹¹⁷

RE was delivered by the following members of the steering committee: Al-Jarha Association for the War Wounded and Disabled in Lebanon (Al-Jarha Association), Islamic Risala Scouts Association, Lebanese Welfare Association for the Handicapped (LWAH), Vision Association, Welfare Association for the Handicapped in Nabatiye, the Islamic Health Council, and Lebanese Association for Health and Social Care. The military also delivered RE through LMAC. In addition, INTERSOS and World Vision contributed to RE.¹¹⁸

¹¹² Ibid, pp. 2, 6; and presentation by Brig.-Gen. Mohammed Fehmi, LMAC, to the ISG, Beirut, 14 May 2009; and MACC SL, “Quarterly Report October–December 2008,” p. 6.

¹¹³ Most of the RE activities conducted by local NGOs were funded by NPA, which remains the main donor for RE activities in Lebanon. Email from Khaled Yamout, NPA, 5 September 2009.

¹¹⁴ Email from Habbouba Aoun, LMRC, 17 March 2009.

¹¹⁵ Email from Lt.-Col. El Cheikh, LMAC, 27 April 2009.

¹¹⁶ Interview with Brig.-Gen. Mohammed Fehmi, LMAC, in Geneva, 29 May 2009.

¹¹⁷ Ibid.

¹¹⁸ Email from Lt.-Col. El Cheikh, LMAC, 27 April 2009.

Approximately 425,000 people received RE in 2008 in Nabatiye, Tyre, Bint Jbeil, Hasbaya, Rashia, and West Bekaa. This figure consists of beneficiaries of community-based activities, including people who attended a large exhibition organized by Al-Jarha Association in August 2008, and school students: 69,492 of these beneficiaries were reached by LMRC.¹¹⁹ New groups provided with training by LMRC included social workers in the south, and youth activists in an NGO that was to start RE in 2008.¹²⁰ Awareness messages were also delivered through the media. The army distributed flyers at military checkpoints.¹²¹

LMRC worked on integrating RE messages into the school curriculum and conducted training of teachers¹²² with the support of UNICEF and NPA.¹²³ By 2010, RE is expected to be part of the school curriculum, and will consist of RE sessions for about five to six hours a year.¹²⁴ Materials were developed but not printed. In October 2008 five training courses with teachers to test RE messages took place. Refresher training that had been planned was postponed.¹²⁵

LMAC has community liaison officers in the south regional office (RMAC). In addition, clearance organizations have a community liaison capacity, and the members of the RE steering committee also provided information on contamination to LMRC.¹²⁶

A needs assessment conducted by LMRC with UNICEF found that communities have sufficient knowledge about risks but adoption of safe behavior was “limited.”¹²⁷ According to UNICEF, RE has been effective, as evidenced by a consistent decrease in the number of casualties, but it needs to be institutionalized (such as through the education curriculum) and awareness techniques could be revamped.¹²⁸

RE activities in Lebanon were severely hampered by political insecurity and violence in May 2008, which prevented the implementation of many of the recommendations made in the assessment.¹²⁹ These were: development of measurable objectives; improvement of communication skills; introduction of participatory techniques; and revision of RE materials. The problem of conflicting messages being given by UNIFIL reported last year was resolved, and UNIFIL only conducted limited RE in their areas of operation.¹³⁰

Over the last 10 years RE has been conducted primarily by national NGOs working firstly with the mine awareness committee established at Balamand University by LMRC from 1999 to 2001, then through the National Mine Risk Education Committee headed by LMRC (until 2007, the NDO). The military delivered RE in the early stages, and emergency RE following the 2006 war, but from 2004 their role was primarily in coordination, monitoring, and supervision. Community liaison has been conducted by LMRC, MACC SL, and mine clearance operators. Training support for RE was provided by LMRC, with technical and financial support by UNICEF and NPA, and by the ICRC for the Lebanese Red Cross.

RE has primarily been focused on the south, particularly when emergency RE was required after the May 2000 withdrawal of Israel from southern Lebanon, resulting in the return of civilians to former military areas, and after the July–August 2006 war when the south became heavily contaminated with cluster munitions and other UXO affecting around 150 communities.¹³¹ In 2003, RE also started to be conducted in Mount Lebanon and Batroun, and in 2004 in other parts

of the north. Emergency RE was also provided following the May 2007 crisis in Nahr al-Bared Palestinian refugee camp in the north.

Methods of delivering RE include community meetings, lectures, workshops, discussion sessions, distribution of materials, and the use of mass media. Since 2004, school-based RE in mine-affected areas received strong emphasis. RE has been primarily delivered through NGO volunteers who receive a stipend for travel. By 2004 there were 250 volunteers, increasing to 318 in 2006. RE reached 500,000 beneficiaries from mid-2002 to mid-2003, and one million from mid-2003 to mid-2004. Needs assessments have been conducted region by region, prior to implementation.¹³²

An UNMAS/UNIFIL evaluation in February 2002 and a Geneva International Centre for Humanitarian Demining evaluation in March 2002 emphasized the need to stop producing awareness literature and introduce more interactive and participatory RE. The 2002–2003 LIS found people had been exposed to RE, and in January 2004 a UNICEF external evaluation found that people remembered messages and methods and found them appropriate, but called for RE to be more focused on schools through trained teachers.

Victim Assistance

The total number of mine/ERW survivors in Lebanon is unknown, but is at least 2,720.¹³³ There are reportedly adequate human resources and medical facilities to meet the needs of mine/ERW survivors in Lebanon but the cost of treatment and the location of facilities remained a barrier for some. Both private and government emergency medical facilities were reportedly within a 30-minute drive from all communities in mine/ERW-affected areas.¹³⁴ But not all hospitals in these areas were sufficiently equipped to provide survivors with adequate medical care.¹³⁵

The cost of services remained prohibitively high for many. The Ministry of Public Health provides free medical care for all mine/ERW victims who are Lebanese citizens. However, it was reported that when medical costs become too expensive, financial support However, it was reported that when medical expenses for some services become too high, the Ministry can decide to not pay for the service.¹³⁶ Holders of disability pension cards are eligible for free health care at government medical centers. But, in some cases, the benefits do not cover any or all of the costs.¹³⁷ Non-Lebanese nationals are not eligible for government support.¹³⁸ Government services for mine/ERW survivors have also been criticized for not treating cases holistically, with little to no coordination across the range of services required by a mine/ERW survivor, from physical rehabilitation to economic and social reintegration.¹³⁹

There are a variety of programs and initiatives for persons with disabilities, including mine/ERW survivors in Lebanon, although the sector continued to rely heavily on international funding. A peak in international support for mine action followed the 2006 conflict, but this funding had significantly decreased by the end of 2008. LMAC reported that inequalities in the distribution of services prevented Lebanon from meeting the needs of all survivors, although sufficient national capacity exists.¹⁴⁰ NGOs involved in VA reported a significant decrease in international funding for VA in 2008, resulting in a reduction of the number and scope of

¹⁴⁰ Email from Lt.-Col. Fares, LMAC, 11 June 2009.

programs.¹⁴¹ The majority of government funds for mine action were allocated to clearance; only a small amount of funding went to VA.¹⁴²

The ministries of social affairs and public health manage physical therapy services. More than 100 health centers throughout Lebanon provided physiotherapy services. A number of NGOs also provided comprehensive physical rehabilitation for mine/ERW survivors, including the distribution of assistive devices.¹⁴³ However, rehabilitation services were reportedly concentrated in major towns and lacking in the most economically disadvantaged, mine/ERW-affected areas.¹⁴⁴

Limited psychological support was available through the Ministry of Social Affairs and some NGOs, although it was often expensive and consequently unaffordable for some survivors.¹⁴⁵

Numerous NGOs coordinated economic integration projects in 2008, including vocational training and income-generating projects. Yet unemployment among persons with disabilities remained high, reportedly due to discrimination from employers.¹⁴⁶ Many income-generating projects were destroyed in the conflict in 2006, and have yet to be re-established.¹⁴⁷ The UNDP National Human Development Report for Lebanon for 2008–2009 reported that in Lebanon “being disabled increases the likelihood of poverty.”¹⁴⁸ More than 41% of people with a disability live on less than the country’s average monthly wage, 38% are illiterate, and 69% do not have health insurance.¹⁴⁹ Only 5% complete secondary school and only 3% graduate from university. UNDP reported this was mainly due to the failure to integrate students with disabilities into mainstream schools.¹⁵⁰

In 2008, a network of disability organizations advocated for implementation of the disability legislation passed by the Lebanese government in 2000. An implementing decree had been drafted by the government but had not passed as of June 2009. On the 14 June 2007, Lebanon signed the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol, but as of 29 June 2009 had not ratified either instrument.

Victim assistance activities

The members of the National Steering Committee on Victim Assistance run the majority of programs assisting mine/ERW survivors. Due to the large number of NGOs working with mine/ERW survivors in Lebanon this report may be incomplete and only organizations that provided information to Landmine Monitor have been included.¹⁵¹

NPA financially supports VA projects implemented by local NGO members of the VA steering committee. NPA is the only organization in the VA National Committee that funds VA projects and in 2008 in provided \$185,000 to VA activities. NPA also provides technical support to local NGOs to implement VA activities. Direct support to victims is only provided in special cases. Many of the activities mentioned by the local NGOs are supported by NPA.¹⁵²

¹⁵¹ More information regarding VA and other service providers in Lebanon is available on the website of the Lebanon-Support portal, www.lebanon-support.org.

¹⁵² Email from Khaled Yamout, NPA, 5 September 2009.

NPA's program aims to enhance the participation of mine/ERW survivors in society and increase the application of laws and policies concerning the rights of persons with disabilities. Through its partners it provided: artificial limbs and mobility devices to 160 survivors, funding to cover full medical costs for 18 survivors, income-generating projects for 20 survivors, and funding to cover educational costs for 12 survivors. NPA also supported sporting activities to enhance the social status of survivors, involving 15 survivors. In west Bekaa, 130 mine survivors have had access to a newly adapted center.¹⁵³

The Lebanese Welfare Association for the Handicapped provided services to 536 mine/ERW survivors (including 22 new survivors) in 2008. Services included: assisting 126 survivors with continuing medical care, providing 20 with prosthetics and devices, three with physical rehabilitation, 163 with psychological support (predominantly through peer support), 12 with social and sporting activities, 19 with economic integration and education support, 105 with non-medical aid, and 139 home visits.¹⁵⁴

Al-Jarha Association worked with some 300 mine/ERW survivors and their families in 2008.¹⁵⁵ They provided social assistance, continuing medical care, physical rehabilitation and provision of artificial limbs, economic programs, and vocational and life-skills training. Funding came from local donations and NPA. There was an increase of the numbers of survivors who participated in vocational training in 2008 compared to previous years. Al-Jarha Association reported that a key challenge was a lack of sufficient funding to meet survivors' needs.¹⁵⁶

The World Rehabilitation Fund (WRF) in 2008 provided technical and material assistance to the Jezzine Landmine Survivor Development Cooperative. The cooperative governs and organizes the business activities of its members. In 2008, the cooperative moved towards financial and organizational autonomy with the gradual transfer of assets and operational functions to members from WRF. In 2008, 173 mine/ERW survivors received material and/or capacity-building support through WRF, including 10 people who were injured by mines/ERW in 2008.¹⁵⁷

In 2008, World Vision Lebanon involved 47 mine/ERW survivors in an income-generating project and assisted child mine/ERW survivors through a summer camp. They also implemented an awareness campaign targeting 10,000 people in southern Lebanon, to break down negative stereotypes of mine/ERW survivors and encourage the government to sign the Convention on Cluster Munitions. World Vision concluded its VA program in February 2009.¹⁵⁸

In February 2008, LMRC concluded a project with the Islamic Risala Scouts Association, funded by Austcare, which provided 15 survivors with computer training and English language classes. LMRC promoted mental health sessions with psychologists for mine/ERW survivors in 2008, working directly and indirectly with 450 survivors.¹⁵⁹

The Swiss Foundation for Demining (FSD) covered the cost of continuing medical care for 24 mine/ERW survivors in 2008, psychological support to three survivors, economic assistance to three, and education support for two. The organization reported that a decrease in international funding had reduced the scope of their VA projects significantly.¹⁶⁰

INTERSOS facilitated economic assistance to survivors and their families from 2006 to March 2008. There are no plans to re-establish the VA component of their mine action program.¹⁶¹

Support for Mine Action

Landmine Monitor is not aware of comprehensive long-term cost estimates for meeting mine action needs (including RE and VA) in Lebanon. The Long Term Plan 2008–2012 for mine action, however, provides a detailed resource mobilization strategy for the five-year period, and highlights the resource mobilization strategy as one of two principle elements for achieving its overall mine action goals, along with yearly Integrated Work Plans (IWPs).¹⁶² The priorities of the Long Term Plan—national technical survey; capacity building and maintenance; mine action coordination; VA; and RE—are to be fulfilled through the annual workplans based on available resources for each year.¹⁶³

In July 2008, MACC SL reported a cost estimate for 2008 of \$10.77 million (approximately €7.31 million) to cover operational expenses and “achieve key clearance objectives” of cluster munition strike areas in southern Lebanon, ending the need for large-scale international financial assistance to related programs.¹⁶⁴

MACC SL costs were covered largely by UNIFIL’s peacekeeping assessed budget, UNMAS Voluntary Trust Fund for Assistance in Mine Clearance (UNVTF), UN Trust Fund for Human Security, UN Rapid Respond Plan contributions, the UAE OES project, and bilateral funding.¹⁶⁵

National support for mine action

There is no national budget for mine action in Lebanon. Mine action costs are covered at the national level through the LAF budget. LMAC reported mine action funding by the government of Lebanon totaling \$5.5 million (approximately €3.7 million) in 2008. Overall national support included administrative support to LMAC and the LAF engineering regiment, other logistical support, provision of personnel, coordination support, and inter-ministerial support to the Lebanon National Mine Action Program.¹⁶⁶ Lebanon reported \$5.5 million in national funding in 2007.

International cooperation and assistance

In 2008, 15 countries and the European Commission (EC) reported providing \$27,768,535 (€18,856,808) to mine action in Lebanon. Reported international mine action funding in 2008 was approximately 2% less than reported in 2007. As of November 2008, Lebanon cited overall resource mobilization and competition with other regional mine action programs as reasons for a funding shortfall and to weak support to victim assistance.¹⁶⁷ MACC SL reported funding shortages resulted in the closure of two of seven NGO demining programs in the last quarter of 2008.¹⁶⁸ The number of active clearance teams operating in southern Lebanon reportedly fell from 44 to 29 in 2008 and LMAC projected in May 2009 that by October there would be only 14 BAC teams.¹⁶⁹

LIBYA

Ten-Year Summary

The Socialist People's Libyan Arab Great Jamahiriya has consistently stated that it cannot join the Mine Ban Treaty and in recent years has called for its revision. It has abstained from voting on every annual pro-ban UN General Assembly resolution since 1998, however it has participated in many Mine Ban Treaty and other landmine-related meetings. In 2004, a Libyan official stated that Libya no longer has a stockpile of antipersonnel mines.

Little clearance has taken place in Libya since 1999 and little is known about the precise extent of the problem, although the UN initiated support to the mine action program in Libya in 2009.

For the first time since reporting started, Landmine Monitor identified casualties in Libya in 2008 and 2009. No systematic mine/explosive remnants of war (ERW) risk education activities were conducted in Libya between 1999 and 2008 despite mention of frequent casualties. Throughout the period, Libya placed responsibility for assisting mine/ERW survivors on those having placed landmines, but little is known about actual services provided.

Mine Ban Policy

Libya has not acceded to the Mine Ban Treaty. In November 2008, Libya attended as an observer the Ninth Meeting of States Parties in Jordan, and called for revision of the treaty in order to facilitate the accession of all countries.¹ It again repeated that a key reason it has not joined is because the treaty does not require states that have planted mines in the past to pay for clearance and compensate for damages.²

Libya has also said in the past that it would require too much money and human resources to fulfill the treaty's clearance obligations. More generally, it has said that it has the legal right to defend itself and to protect the security of its vast borders, sometimes declaring that mines are important obstacles to infiltration and illegal immigration.³

Libya attended the intersessional Standing Committee meetings in May 2009, but made no statements. In November 2008, the Gaddafi International Charity and Development Foundation (Gaddafi Foundation) organized an international conference on demining and development in cooperation with UNDP and Libya's National Anti-mines and Cultivation Programme.⁴

On 2 December 2008, Libya was one of 18 states to abstain from voting on UN General Assembly Resolution 63/42, which promotes the universalization and full implementation of the Mine Ban Treaty.⁵ It has abstained from voting on similar resolutions every year since 1998.

¹ Statement of Libya, Ninth Meeting of States Parties, Geneva, 26 November 2008. It made similar remarks the previous year. See Statement of Libya, Eighth Meeting of States Parties, Dead Sea, 18 November 2007.

² Other statements to this effect include: Statement of Libya, Eighth Meeting of States Parties, Dead Sea, 18 November 2007; statement of Libya, Addressing the Human Costs of Anti-personnel Landmines and Explosive Remnants of War, Seminar for States of the Maghreb, Tunis, Tunisia, 9–10 September 2007; Libya's explanation of vote on A/C.1/62/L.39 (UNGA 62/41); and, "Gathafi asking France to pay compensation for colonial crimes in Algeria," *Alkhabar* (Algiers), 9 December 2007.

³ See *Landmine Monitor Report 2007*, p. 917. In October 2007, Libya's President Muammar al Gaddafi strongly criticized the treaty saying it is "a faulty and flawed instrument. It must be reviewed. Otherwise, the states that hastened to adhere to it must withdraw from it." He noted that while mine clearance, victim assistance, and the rehabilitation of affected environments are positive elements of the treaty, the prohibition of production and use of mines, as well as the requirement to destroy stockpiles, are not acceptable. He asserted that mines "are the means of self-defense of the weak countries." Speech by President Muammar al Gaddafi, "The 1997 Ottawa convention must be reviewed," 17 October 2007, www.algathafi.org.

⁴ "Libya organizes conference on land mines," *BBC Monitoring Middle East*, 3 November 2008.

⁵ Libya reiterated its objections to the treaty in its explanation of its vote. Explanation of vote on draft Resolution A/C.1/62/L.39.

Libya has stated in the past that it has never produced or exported antipersonnel mines, and that it no longer has a stockpile of antipersonnel mines.⁶ Libya imported mines from the former Soviet Union, including POMZ-2 and POMZ-2M antipersonnel fragmentation mines, as well as from the former Yugoslavia, including PMA-3 blast mines.⁷ Libya is not known to have used antipersonnel mines since its war with Chad from 1980–1987.

Libya is not party to the Convention on Conventional Weapons. It has not signed the Convention on Cluster Munitions.⁸

Scope of the Problem

Contamination

Libya is contaminated with mines and ERW, mainly UXO, as a result of the World War II campaign in North Africa, as well as wars with Egypt in 1977 and Chad from 1980–1987. The borders with Chad, Egypt, and Tunisia are affected by mines and UXO, as are areas in the north and south of the country.⁹ Minefields are said to exist in deserts, ports, and urban areas.¹⁰ The precise extent and impact of the problem are, however, not known as no nationwide survey has been conducted.¹¹

Casualties

In July 2008, Landmine Monitor identified three casualties, all police officers who were killed when mines being transported in their vehicle exploded near Tobruk.¹² These are the first casualties Landmine Monitor has been able to confirm since 1999, despite reports of frequent casualties.¹³ There were no official records or confirmations of additional casualties in 2008.¹⁴ During a demining conference in November 2008, however, one speaker noted that casualties had occurred during clearance conducted by the Libyan Army and the De-mining Society (also known as the Anti-Mines Association). No further details were made available.¹⁵

Casualties continued to be reported in 2009, with at least seven people killed and five injured in one incident on the Libyan side of the border with Niger. The incident occurred when a vehicle transporting approximately 30 Gambians, allegedly trying to reach Europe, drove over a landmine. At least nine of the casualties were young males; details about the others were unknown.¹⁶

The total number of mine/ERW casualties in Libya is not known. The De-mining Society and the Libyan Civil Defense Department had registered 1,852 mine casualties by the end of 2006. Previous estimates were around 12,000, with the Libyan Police reporting 11,845 casualties between 1940 and 1995 (6,749 killed and 5,096 injured) and the Libyan Jihad center reporting 12,258 (3,874 killed and 8,384 injured) between 1952 and 1975.¹⁷

Program Management and Coordination

Mine Action

Libya does not yet have a fully fledged mine action program, despite the announcement in 2005 of a “national campaign” to remove landmines along the borders with Egypt and Chad. In a conference in November 2008, however, Libya took further steps towards establishing a civilian mine action program.¹⁸ The interministerial committee of the national program for demining and land reclamation serves as the national mine action authority in Libya.¹⁹ It is not known what decisions this committee has taken.

On 25 May 2008, the De-mining Society of the Gaddafi Foundation signed a Letter of Intent with UNDP in Libya. The agreement provides for cooperation on various aspects of mine action, including victim assistance, and the creation of an information management system.²⁰ The De-mining Society reported signing a number of other agreements: with the army’s engineering department; with the German organization the Santa Barbara Foundation; with a commercial company on clearance for the benefit of oil companies in Libya; and with the Swiss Foundation for Mine Action (FSD).²¹

UNDP announced plans to conduct capacity-building in 2009 to support the De-mining Society and the Libyan government in mine action activities.²² It sought to hire a chief technical advisor to support the nascent mine action program; the deadline for applications was 15 July 2009.²³

The May 2008 Letter of Intent between the De-mining Society and UNDP stipulated that support be provided to initiatives rehabilitating mine survivors, and included provisions on mine/ERW risk education (RE). The letter noted that UNDP’s resident representative and the De-mining Society’s director would be in charge of coordinating the projects but that implementation was subject to adequate funding.²⁴ For victim assistance, no progress has been reported since the signature of the letter. For RE, a strategic plan was reportedly developed, including establishment of “communication groups,” information dissemination, and development of a database to track activities.²⁵ A general assembly was held in March 2009 to discuss budget and project implementation for 2009–2010.²⁶

The Social Solidarity Fund is responsible for providing rehabilitation services and assistance to persons with disabilities.²⁷

Data collection and management

There is no public data collection mechanism to record mine/ERW incidents, and casualties are rarely reported in the media. No progress appears to have been made on implementing the Letter of Intent between the De-mining Society and UNDP, which stated that technical assistance

would be provided to “strengthen statistical data collection, and [to set up] information management systems in the domain of mines.”²⁸ The establishment of a “Libyan information national center to compile information and statistics on mines and their victims” was also one of the recommendations of the International Conference on De-mining for Development held in November 2008.²⁹

In February 2007, the Geneva International Centre for Humanitarian Demining (GICHD) signed a Cooperation Memorandum with Libya in which GICHD offered to provide technical assistance and training for Libyan mine action personnel. The memorandum also envisaged discussion as to the possible installation of the Information Management System for Mine Action in Libya.³⁰ No specific progress has occurred since.³¹

Plans

Strategic mine action plans

There is no strategic mine action plan in place, although there are said to be plans to adopt national mine action standards, conduct survey and capacity-building in demining, as well as to establish victim assistance and RE programs.³²

National mine action standards

Draft national standards were prepared with UNDP assistance and were due to be presented to the General People’s Committee for approval before the end of 2009.³³

National ownership

Libya has announced a number of abortive efforts in mine action over the past few years, but as of July 2009, a mine action program appeared to be in the early stages of development.

Demining and Battle Area Clearance

The Ministry of Defense and the Civil Protection Unit, located within the Ministry of Interior and Justice, each have responsibilities for various aspects of mine action. The Ministry of Defense is reported to clear areas serving either a military or civilian development purpose. The Civil Protection Unit has carried out clearance in affected communities.³⁴

The Ujanga Kbeer demining project, which was conducted by Chad’s National Demining Office (Haut Commissariat National de Déminage, HCND) and the De-Mining Society, started on 1 August 2008 and ended 31 January 2009.³⁵ By the end of 2009, the second stage of the De-mining Society’s demining project in Chad was due to start in the Doum valley.³⁶ Demining along the Libyan border with Egypt was also said to be a priority for the De-mining Society as of June 2009.³⁷

The results of these demining efforts have not been reported in detail, although the De-mining Society claimed that clearance along the border with Egypt had led to the removal of 77,645 antipersonnel mines and 45,483 antivehicle mines.³⁸

³⁷ *Ibid.*

³⁸ *Ibid.*

Risk Education

As in 2007, no mine/ERW RE activities were reported in 2008. In 2006, the De-mining Society and the ministries of interior and defense reported RE activities.³⁹ In 1999, Libya also stated that it provided mine awareness and training programs to warn people about the dangers of mines.⁴⁰ A general awareness campaign was launched in June 2008, but it did not include specific RE messages.⁴¹

Victim Assistance

As in previous years, Libya called upon those who had used mines in Libya to “provide... assistance to the victims, and to rehabilitate them” in its statement to the Ninth Meeting of States Parties.⁴² The final declaration of a November 2008 conference in Libya called for the same.⁴³ Italy included support to victim assistance compensation claims of survivors or families of those killed due to landmines in a friendship agreement signed with Libya in 2008 and ratified in 2009.⁴⁴ The agreement further noted that Italy will carry out some special initiatives to benefit the people of Libya, including “treatment in Italian institutions of mine/ERW survivors who cannot receive adequate treatment in the Benghazi rehabilitation center.”⁴⁵

Very few specialized services for persons with disabilities are available. The Libyan government provides free healthcare to all citizens and has achieved high basic health coverage.⁴⁶ Two of the Gambians injured in 2009 were treated in the Libyan town of Sabha. A third person was first treated in Niger and then transferred to Dakar, Senegal. The deceased were said to be buried at the site of the incident.⁴⁷

The Benghazi Rehabilitation Center, run by the Social Solidarity Fund, is one of the main physical rehabilitation centers in Libya. Italy’s support to the center since 2000 has covered renovations, training, and strategic planning assistance. The center has been unable to operate at full capacity due to a lack of qualified staff, materials, and a data management system.⁴⁸ On 31 December 2008, the Italian Directorate for Development Cooperation ended its support to the center due to a lack of funding.⁴⁹ In total, the Italian government provided US\$6,495,000.⁵⁰

People with a permanent disability receive a pension,⁵¹ and Libyan law protects the rights of persons with disabilities and their right to access services was generally protected.⁵² Libya signed the UN Convention on the Rights of Persons with Disabilities, but not its Optional Protocol, on 1 May 2008. As of 1 July 2009, the convention had not been ratified.

MICRONESIA

Ten-Year Summary

The Federated States of Micronesia (FSM) has not yet acceded to the Mine Ban Treaty, but has shown support since 2005. From 2005–2008, the FSM voted in favor of the annual pro-Mine Ban Treaty UN General Assembly Resolution: it had previously abstained. The FSM attended annual meetings of the Mine Ban Treaty in 2005 and 2008. A draft resolution approving accession has been awaiting congressional approval since mid-2008.

Mine Ban Policy

The FSM has not yet acceded to the Mine Ban Treaty. In December 2008, the FSM informed a regional legal meeting that the government was “very close to fulfilling its internal legal requirements in order to accede to the Mine Ban Convention.”¹

A draft resolution approving accession has been awaiting congressional approval since mid-2008.² In November 2008, an FSM official attending the Ninth Meeting of States Parties in Geneva stated that the FSM Congress would shortly pass a resolution that would help fulfill its internal legal requirements to accede to the Mine Ban Treaty.³

Earlier, in November 2005, an FSM representative told the ICBL that legal measures to approve accession were being drafted, and that the United States, which has a Compact of Free Association with the FSM, had given the green light to accession.⁴

On 2 December 2008, the FSM voted in favor of UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty. It has voted in support of the annual resolution since 2005, while previously it abstained every year from 1997–2004. The FSM did not attend the Mine Ban Treaty intersessional Standing Committee meetings in May 2009. In August 2008, the FSM attended a Mine Ban Treaty workshop held in Palau.⁵

The FSM has stated that it has never used, produced, or stockpiled antipersonnel mines.⁶

The FSM has not yet signed the Convention on Cluster Munitions and is not party to the Convention on Conventional Weapons.

In August 2008, the FSM noted that while there are no known mined areas in the FSM, the four FSM states are affected by explosive remnants left over from World War II.⁷

³ Statement by Johnson Asher, Assistant Attorney General for the FSM, Ninth Meeting of States Parties, Geneva, 26 November 2008. Prior to this, the only Mine Ban Treaty meeting it ever attended was the Sixth Meeting of States Parties in Zagreb in November 2005.

⁴ Email from Amb. Satnam Jit Singh, Diplomatic Advisor, ICBL, reporting on his meeting with Martin Zvachula, Second Secretary, Permanent Mission of the FSM to the UN in New York, at the Sixth Meeting of States Parties, Zagreb, 28 November–2 December 2005. In July 2005, a government official informed Landmine Monitor that the Executive Branch had completed a review of the treaty and expected to submit it to Congress in September 2005. Prior to that statement, the FSM had not expressed any support for the treaty.

MONGOLIA

Ten-Year Summary

Mongolia has regularly participated in Mine Ban Treaty meetings since 2002. In September 2004, the government announced a Program of Action aimed at accession to the Mine Ban Treaty in 2008. In a key step in December 2006, parliament passed an amendment to the State Secrecy Law which permitted Mongolia to make information publicly available on antipersonnel mines, including stockpiles. In 2007, Mongolia issued a voluntary Article 7 transparency report that revealed Mongolia possesses a stockpile of 206,417 antipersonnel mines.

Mongolia is affected by explosive remnants of war (ERW) and possibly antivehicle mines, but is not believed to be affected by antipersonnel mines. Between 1999 and 2008, Landmine Monitor identified nine ERW casualties (two killed and seven injured). During this period, there have not been specific services for mine/ERW survivors. There has been a lack of availability of services more generally for persons with disabilities. Awareness-raising by disability organizations resulted in Mongolia's ratification of the Convention on the Rights of Persons with Disabilities in May 2009.

Mine Ban Policy

Mongolia has not acceded to the Mine Ban Treaty and did not fulfill its objective, announced in 2004, of joining the treaty in 2008 through a step-by-step approach.¹

Mongolia attended as an observer the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008, where it stated that it “firmly denounces the use, production, stockpiling and transfer of antipersonnel mines and fully supports the efforts being undertaken by the international community to ban this dangerous weapon.” However, it said that accession “is still a challenge,” citing “in particular, a lack of financial, technical and human resources necessary for stockpile destruction.” It said that “cooperation and assistance in this area... would be invaluable for us, perhaps, prior to Mongolia's actual accession.”² In an interview with Landmine Monitor, Mongolia voiced concern about whether it would receive international assistance for both stockpile destruction and clearance of areas contaminated with unexploded ordnance, especially Soviet-era firing ranges.³

A document obtained by Landmine Monitor dated November 2008 stated that the Ministry of Defense still has a number of concerns regarding accession to the Mine Ban Treaty, as well as Amended Protocol II on landmines and Protocol V on Explosive Remnants of War of the Convention on Conventional Weapons.⁴ These included the possible need for alternatives to landmines, in order to ensure the security of the country given its vast and sparsely populated territories; the need for sufficient aid and technical assistance to ensure that all treaty requirements can be met; and the integration of Mongolia's existing efforts to clear ERW with new treaty obligations. Additionally, a representative of the Mongolian Armed Forces told Landmine Monitor that Mongolia needs to consider that the country's two powerful neighbors have not acceded to the Mine Ban Treaty.⁵

¹ See *Landmine Monitor Report 2005*, p. 819, and *Landmine Monitor Report 2006*, pp. 1,011–1,012, for details of Mongolia's 2004–2008 Program of Action aimed at accession.

² Statement by Gunaajav Batjargal, Deputy Director, Department of Multilateral Cooperation, Ministry of Foreign Affairs and Trade, Ninth Meeting of States Parties, Geneva, 26 November 2008.

³ Interview with Gunaajav Batjargal, Ministry of Foreign Affairs and Trade, in Geneva, 27 November 2008.

⁴ Correspondence between the Department of Strategic Management and Planning of the Ministry of Defense and the Department of Multilateral Cooperation of the Ministry of Foreign Affairs and Trade, dated November 2008.

⁵ Interview with Col. L. Gantumur, Management and Support Division, General Staff of the Mongolian Armed Forces, Ulaanbaatar, 29 March 2009.

Mongolia voted in support of UN General Assembly Resolution 63/42 on 2 December 2008, calling for universalization and full implementation of the Mine Ban Treaty. It has voted in favor of every annual pro-ban UN General Assembly resolution since 1998, except in 2005 when it was absent.

In March 2009, a Ministry of Foreign Affairs official told Landmine Monitor that there was no collaborative plan of action among ministries regarding how to proceed now with the step-by-step agenda for joining the Mine Ban Treaty. He indicated that such a plan should be initiated by the Ministry of Defense.⁶ A Ministry of Defense official confirmed that no collaborative plan of action had yet been developed.⁷

Representatives of the government of Canada and the Mine Ban Treaty's Implementation Support Unit undertook a mission to Mongolia in April 2009 in order to encourage accession.

Mongolia attended the intersessional Standing Committee meetings in May 2009, where it expressed its support for the treaty, but said that "due to particular considerations related to our national security and some specific circumstances of the country, Mongolia has not joined.... As a future consideration, we are drafting an interagency action plan to implement its step-by-step accession to the Mine Ban Treaty, which will coordinate agencies activity, and to create legal, financial and technological foundation for it."⁸

It further said, "Mongolia is considering its economic, technological and financial realities to implement this strategy...considering that our country has very limited [resources].... Therefore, for us the cooperation, assistance and support through both bilateral channels and international organizations are fully appreciated."⁹

The ICBL's Diplomatic Advisor conducted an advocacy mission to Mongolia from 30 June to 2 July 2009, where he met with the ministers of foreign affairs and defense, and other high level officials.¹⁰ Both ministers acknowledged with a sense of regret that Mongolia had not met the objective of acceding to the treaty in 2008, and both pledged support for accelerating the process. Discussions with the armed forces, however, confirmed that some reservations on the issue remained. At the same time, the military was preparing a stockpile destruction plan, in case the political leadership of the country decided to go ahead with accession.

Mongolia is party to the Convention on Conventional Weapons, but not its Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. Mongolia has not signed the Convention on Cluster Munitions.¹¹

Use, stockpiling, production, and transfer

Mongolia issued a voluntary Article 7 report in August 2007.¹² The report revealed a stockpile of 206,417 antipersonnel mines, inherited from the Soviet Union.¹³ In May 2009, Mongolia said that it had invited experts from the Geneva International Centre for Humanitarian

⁶ Telephone interview with Sh. Rinchinmayadag, International Organizations Department, Ministry of Foreign Affairs and Trade, 27 March 2009.

⁷ Interview with Col. L. Gantumur, Mongolian Armed Forces, Ulaanbaatar, 29 March 2009.

⁹ Ibid.

¹⁰ Email from Amb. Satnam Jit Singh, Diplomatic Advisor, ICBL, 5 July 2009, with detailed reporting on his mission and various meetings. Others he met with included the Foreign Policy Advisor to the President, the National Security Policy Advisor to the President, the Chair of the Standing Committee of Parliament on Defense and Foreign Affairs, the Deputy Chief of the General Staff, and the Head of the Strategic Policy Department of the Ministry of Defense.

¹¹ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 221.

¹² The report is undated, with the reporting period listed as "2007 to 2008." Mongolia has stated it submitted the report in August 2007, and it is listed by the UN as received in 2007. Statement by Col. L. Gantumur, Mongolian Armed Forces, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 May 2009. All forms are marked "not applicable" except Form B on types and quantities of stockpiled antipersonnel mines and Form H on technical characteristics of stockpiled mines.

¹³ Voluntary Article 7 Report (for the period 2007–2008), Form B cites: 40,331 POMZ-2; 83,028 PMN-2; 996 PMN; 48,891 PMD-6; 29,997 OZM-72; 2,000 MON-50; 601 MON-100; and 573 MON-200 antipersonnel mines.

Demining to investigate the technical quality of its mine stocks and advise on destruction methods, sites, and costs.¹⁴

Mongolia reiterated to Mine Ban Treaty States Parties in November 2008 and May 2009 that it “has never deployed and will never deploy landmines on its territory,” and that it will not produce, transfer, or acquire them.¹⁵

Scope of the Problem

Contamination

Mongolia is not believed to be affected by antipersonnel mines. In its only voluntary Article 7 report to date, Form C on the location of mined areas was marked as “Not Applicable.”¹⁶ Mongolia has an extensive problem with ERW, including both UXO and abandoned explosive ordnance.¹⁷ In 2008, abandoned antivehicle mines were reportedly discovered on several occasions.¹⁸

Casualties

Landmine Monitor identified two ERW casualties (both boys, both injured) in Mongolia in 2008, through media reports.¹⁹ Additional incidents related to firearms and other explosives were identified through media reports, but insufficient information was provided to determine if the incidents were caused by ERW. The Ministry of Defense reported that there could be as many as 34 casualties in 2008, although there is no mechanism in place to collect mine/ERW casualty data.²⁰

The two casualties identified in 2008 are a slight decrease from three reported casualties (one killed and two injured) in 2007.²¹ The government reported that there were “about 10–15 casualties,” all injured, between 2006 and 2008.²² No casualties were confirmed in 2009 as of 31 May.

Between 1999 and 2008, through media reports, Landmine Monitor identified nine casualties (two killed and seven injured), all as a result of ERW.²³ It is likely that other casualties were not reported. Government estimates for specific years within this period suggest a higher total (see above).

Program Management and Coordination

There is no mine action program in Mongolia, and there are no specific services for mine/ERW victims. The Ministry of Social Welfare and Labor coordinates the National Program to Support Persons with Disabilities. Mongolia also has a National Coordination Council on Disability, an interministerial body that includes representatives of the Mongolian Federation of Disabled People’s Organizations.²⁴

Mongolia's national disability action plan is based on the actions set out by the Biwako Millennium Framework, established as part of the Asian and Pacific Decade of Disabled Persons 2003–2012. The government tracks activities implemented in the field of disability within this framework.²⁵

Data collection and management

No government agency collects data on mine/ERW casualties although the Mongolian Armed Forces stated that they were aware of casualties in recent years.²⁶ Landmine Monitor casualty data is gathered from local media reports.

Victim Assistance

The total number of survivors is unknown, but there has been at least six since 1999. There have been no specific services for mine/ERW survivors over the last 10 years, nor does the situation warrant specific attention. In its most recent voluntary Article 7 report, Mongolia indicated “Not Applicable” in Form J.²⁷ Services for persons with disabilities are under-developed. The healthcare system lacks trained staff, equipment, and medicines, and suffers from uneven availability of services in rural areas, where some hospitals do not have doctors.²⁸ Despite laws prohibiting discrimination in employment, only one in four persons with disabilities was employed.²⁹ While pensions for persons with disabilities were increased in 2007, the government recognized in 2008 that increases had not kept pace with inflation and that pensions were insufficient to live on.³⁰

On 13 May 2009, Mongolia ratified the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol. Adherence followed an awareness campaign led by the National Human Rights Commission with the support of 27 local disability organizations.³¹

MOROCCO

Ten-Year Summary

The Kingdom of Morocco has not joined the Mine Ban Treaty but has taken an active interest in it, participating as an observer in every annual Meeting of States Parties, as well as nearly every intersessional Standing Committee meeting. In February 2001, Moroccan officials for the first time claimed that Morocco no longer uses or stockpiles antipersonnel mines. After abstaining on the annual pro-Mine Ban Treaty UN General Assembly resolution from 1997–2003, Morocco has since voted in support. Morocco has submitted three voluntary Article 7 reports since 2006.

Since January 2007, Morocco has been engaged in a major demining operation in areas under its control in the disputed Western Sahara in the south of the country. Almost 10,000 personnel are said to be engaged in the effort, although questions remain about the clearance figures reported as well as the efficiency of the procedures being used.

Between 1999 and 2008, Landmine Monitor identified 18 mine/explosive remnants of war (ERW) casualties in Morocco (seven people killed and 11 injured). No mine/ERW risk education was reported outside the Moroccan-controlled areas of Western Sahara in 2007–2008. Casualty data collection remained inadequate throughout the period.

Mine/ERW survivors in Morocco had access to the same services as other persons with disabilities. Some disability services had reportedly improved since 2007, although services were inaccessible to many mine/ERW survivors, who are mostly nomadic people. The health system lacked staff and resources. Psychological support services were inadequate. Morocco ratified the Convention on the Rights of Persons with Disabilities in early 2009. In 2008, national legislation to protect the rights of persons with disabilities was not adequately enforced.

Mine Ban Policy

Morocco has not acceded to the Mine Ban Treaty. An ICBL delegation visited Morocco from 26–29 October 2008.¹ Officials told the delegation that the dispute over Western Sahara was the only obstacle preventing Morocco from acceding to the Mine Ban Treaty.² Morocco also stated this in response to a Landmine Monitor questionnaire in May 2009.³

Morocco attended as an observer the Ninth Meeting of States Parties in Geneva in November 2008, where it stated that it has been voluntarily implementing the Mine Ban Treaty's provisions on demining, stockpile destruction, mine risk education, and victim assistance. Morocco made a similar statement to the intersessional Standing Committee meetings in Geneva in May 2009.

In April 2009, Morocco submitted its third voluntary Article 7 report, covering calendar year 2008.⁴ As with the previous submissions, the report omits Form B (stockpiled antipersonnel mines). In May 2009, Morocco told Landmine Monitor that it does not include Form B because it has no stocks.⁵ Under national measures, the report cites existing laws governing the production,

¹ The delegation was comprised of Tamar Gabelnick, Treaty Implementation Director, ICBL, and Ayman Sorour, director of ICBL member NGO Protection. They met with government officials and military representatives in Rabat and Agadir in the south, and also undertook field visits to Guelmim and Dakhla to review mine clearance, victim assistance, and risk education activities. ICBL, "Mission Report: Morocco, 26–29 October 2008."

² Interview with Gen. Ben Elias, RMA, and the two generals heading the second and third military zones, Agadir, 27 October 2008; interview with Nasser Bourita, Director, Department of International Organizations, Ministry of Foreign Affairs, Rabat, 29 October 2008.

³ Permanent Mission of Morocco to the UN in Geneva, "Response to Questions from the Canadian NGO Mines Action Canada," 18 May 2009.

⁴ The previous reports were submitted in April 2008 for calendar year 2007 and August 2006 for the period from September 2005 to September 2006.

⁵ Permanent Mission of Morocco to the UN in Geneva, "Response to Questions from the Canadian NGO Mines Action Canada," 18 May 2009.

use, stockpiling, and transfer of explosives, munitions, and weapons from 1914 (as modified in 1934 and 1954) and 1958, as well as a 2003 anti-terrorism law.⁶

On 2 December 2008, Morocco voted in favor of UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty. This was Morocco's fifth consecutive vote in favor of the annual pro-ban resolution. From 1997–2003, Morocco abstained from voting on the resolution.

Morocco is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. It submitted its annual report required by Article 13 of the protocol. Morocco is not a party to CCW Protocol V on Explosive Remnants of War.

Morocco has not signed the Convention on Cluster Munitions.⁷

Use, stockpiling, production, and transfer

Morocco has acknowledged extensive use of mines in the past, most notably at the berms (earthen walls about three meters high) it built from 1982 to 1987 to secure the northwestern corner of Western Sahara. In the past decade, Morocco and the Polisario Front (the Popular Front for the Liberation of Saguia el Hamra and Río de Oro) have periodically traded accusations of new mine use, but both have denied it.⁸ In October 2008, Moroccan officials told the ICBL delegation that Polisario rebels were still laying mines.⁹ In May 2009, however, Morocco told Landmine Monitor that it did not have any information about Polisario mine use in 2007 or 2008.¹⁰

Also in May 2009, in response to the question from Landmine Monitor, "Does Morocco reserve the right to use antipersonnel mines in the future?" Morocco replied, "Non."¹¹ Morocco stated that it stopped the use and stockpiling of antipersonnel mines in 1987 and reaffirmed that it has never produced antipersonnel mines.¹² In July 2006, Morocco told Landmine Monitor that it stopped using antipersonnel mines at the time of the Western Sahara cease-fire in 1991 and that it no longer stockpiled antipersonnel mines, except for training purposes.¹³

In May 2009, Morocco confirmed that it still possesses antipersonnel mines that are used for training its army to take part in peacekeeping operations.¹⁴ Its voluntary Article 7 report submitted in April 2009 does not provide the number of retained mines, which it describes as "inert."¹⁵

Morocco has said on several occasions that it has never produced or exported antipersonnel mines, and that it stopped importing them prior to entry into force of the Mine Ban Treaty in March 1999.¹⁶

⁶ Voluntary Article 7 Report, Form A, April 2008.

⁹ ICBL, "Mission Report: Morocco, 26–29 October 2008."

¹⁰ Permanent Mission of Morocco to the UN in Geneva, "Response to Questions from the Canadian NGO Mines Action Canada," 18 May 2009.

¹¹ Ibid.

¹² Ibid. It also said this in statement of Morocco, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 May 2009. It stated this date in its May 2009 response to the Landmine Monitor questionnaire as well.

¹³ Response to Landmine Monitor questionnaire by Morocco, July 2006. In its statement to the First Review Conference of the Mine Ban Treaty on 3 December 2004, Morocco included a claim that it had not used antipersonnel mines since entry into force of the treaty in 1999. Morocco first claimed in February 2001 that it does not use, produce, import, or stockpile antipersonnel mines, and has repeated that on several occasions. See, for example, *Landmine Monitor Report 2004*, p. 1,071.

¹⁴ Statement of Morocco, Standing Committee on the General Status and Operation of the Convention, Geneva, 25 May 2009. Morocco also said it only kept mines for training in 2007. ¹⁵ Voluntary Article 7 Report, Form D, April 2009.

¹⁶ See for example, interview with the Moroccan delegation to the Eighth Meeting of State Parties, Dead Sea, 19 November 2007, and statement of Morocco, Addressing the Human Costs of Anti-personnel Landmines and Explosive Remnants of War, Seminar for States of the Maghreb, Tunis, Tunisia, 9–10 September 2007.

Scope of the Problem

Contamination

Morocco is significantly contaminated with mines and ERW, especially in the territory it controls in Western Sahara, where it has mined the berms it constructed. It claims to monitor the mined areas and to have records of where the mines were laid.¹⁷

The exact extent of contamination is not known but according to the British NGO Landmine Action, Western Sahara is one of the most heavily mined territories in the world.¹⁸ Morocco has claimed that 120,000km² are contaminated.¹⁹ In its latest voluntary Article 7 transparency report, Morocco identified the following areas as being mined by Polisario: Douiek, Gor Lbard, Itgui, Lagounia, Jdiriya, Gerret Auchfaght, Glibat Jadiane, Imlili, Bir Anzarane, Tarf Mhkinza, and Gor Zalagat.²⁰ Following the death of a senior Moroccan dignitary due to a landmine, Morocco embarked on a major demining effort in January 2007. Morocco has declared it will clear all the mines it has laid as soon as the conflict is resolved.²¹

Casualties

Landmine Monitor identified five mine/ERW casualties in Morocco in 2008. Two people were killed and three injured in three incidents. Two casualties were caused by an antivehicle mine (both men), and one adult (gender unknown) and two boys were injured by unknown devices (reportedly mines).²² There were also 19 casualties in Moroccan-controlled Western Sahara.²³

This represented an increase from the one mine casualty identified in 2007 in southern Morocco, in addition to 29 casualties in Moroccan-controlled Western Sahara.²⁴

Morocco reported 11 mine/ERW casualties (three killed and eight injured) in 2008 in Moroccan-controlled Western Sahara. Details, including the location of incidents, were not reported.²⁵ Landmine Monitor identified 19 casualties (eight killed, 10 injured, and one unknown) in Moroccan-controlled Western Sahara.²⁶

Landmine Monitor did not identify mine/ERW casualties in Morocco in 2009, as of 29 June 2009.

Between 1999 and 2008, Landmine Monitor identified 18 mine/ERW casualties in Morocco (seven killed and 11 injured).²⁷ Due to a lack of accurate data collection in Morocco, this total is likely to under-represent the problem.

²⁶ CODESA, "Report on the violations of human rights in Western Sahara 2007," La'Youn, 2008, p. 45, www.arso.org. For further details see report on Western Sahara in this edition of Landmine Monitor.

²⁷ Landmine Monitor analysis of casualty data provided by email from Tammy Hall, MINURSO MACC, 29 June 2009 (five casualties in 2008); *Landmine Monitor Report 2008*, p. 938 (one casualty in 2007); *Landmine Monitor Report 2007*, p. 930 (one casualty in 2006); and *Landmine Monitor Report 2006*, p. 1,018 (nine casualties in 2005; one in 2004 and one in 2003).

The cumulative number of mine/ERW casualties in Morocco is not known. In late 2008, the UN reported that since 1975 the Royal Moroccan Army (RMA) has recorded 2,171 casualties, including 541 people killed.²⁸ In July 2008, Morocco reported that a total of 2,187 casualties (544 killed and 1,643 injured) had been recorded since 1975. Presumably these figures include both casualties of incidents which occurred in Western Sahara and some survivors living in Western Sahara, although this distinction was not reported. Morocco has reported that between March 2000 and March 2001 authorities registered 51 military antivehicle mine and ERW casualties in Western Sahara. The total number of military casualties in Morocco is not known.

In addition, at least four Moroccans were injured while they tried to cross a minefield on the Greek-Turkish border in 2004. The number of Moroccan casualties from mine incidents in Greece may be significantly higher, as the nationality of many mine casualties on the Greek-Turkish border remains unknown.²⁹

Program Management and Coordination

Mine action

Morocco does not have a national mine action authority or mine action center. All demining is carried out by the RMA.

Victim assistance

The Department for Prevention and Social Integration of People with Disabilities in the Ministry of Social Development, Family and Solidarity is the focal point for disability issues. The department is responsible for coordination of government programs for persons with disabilities and support to civil society activities for the integration of persons with disabilities, including program evaluations.³⁰

Data collection and management

Until 2009, the RMA used its own information management system to record demining data. In March 2009, the Geneva International Centre for Humanitarian Demining installed the latest version of the Information Management System for Mine Action (IMSMA).³¹

Information on mine/ERW casualties is recorded by the RMA, the UN Mission for the Referendum in Western Sahara (MINURSO) Mine Action Coordination Center (MACC) and civilian authorities, as well as by local organizations that were encouraged to report casualties to the RMA. In 2008, for the first time, Morocco reported annual casualty data in its voluntary Article 7 report, but the data lacked detail.³²

In 2009, MINURSO continued to record information on mine/ERW incidents, including in Moroccan-controlled Western Sahara, but was not yet entering the data into IMSMA as of June.³³ It was not reported if the RMA was using IMSMA to record casualty data. A number of groups record mine/ERW casualties in Moroccan-controlled Western Sahara, including the Collective of Saharawi Human Rights Defenders El-Aaiun Western Sahara (Collectif des défenseurs saharouis des droits de l'homme El-Aaiun Sahara Occidental, CODESA), the provincial offices of the Moroccan Red Crescent Society (MRCS), and local authorities.

³² Voluntary Article 7 Report, "Annex," 13 May 2009.

³³ Telephone interview with Tammy Hall, MINURSO MACC, 29 June 2009.

Plans

Strategic mine action plans

There does not appear to be a strategic plan for the demining operation, although efforts to make one continued as of May 2009.³⁴ In 2009, a 10-year national action plan for the integration of persons with disabilities was reportedly still being finalized.³⁵ No planning specifically for risk education was reported.

Integration of mine action with reconstruction and development

There is no evidence of a link between the demining effort and broader development work, although in May 2009 Morocco declared that the released areas were “opened for the diverse activities of the population.”³⁶

National ownership

Commitment to mine action and victim assistance

Despite not being a State Party to the Mine Ban Treaty, Morocco has embarked on a major clearance effort. All demining operations have been funded from national sources, although the cost of the demining operations is not known. Morocco’s demining operations are fully under national management.

National mine action legislation and standards/Standing operating procedures

No national mine action legislation or standards have been adopted in Morocco, but Morocco has claimed that “normal safety and environmental protection standards have been followed.”³⁷

Demining and Battle Area Clearance

As noted above, all demining is carried out by the RMA manually, with 10,000 personnel said to be engaged in the effort, although there are only 400 detectors between them.³⁸ This raises serious questions both about the procedures being used and the accuracy of the clearance figures being reported.³⁹ Morocco has also stated that the clearance effort is conducted in collaboration with MINURSO observers and in accordance with Military Agreement No 3,⁴⁰ which covers the exchange of mine-related information, the marking of mined areas, and the clearance and destruction of mines and ERW.⁴¹

Morocco has reported that clearance in 2008 covered 422km² and resulted in the destruction of 278 antipersonnel mines, 160 antivehicle mines, and 2,734 items of UXO.⁴² MINURSO observed the destruction by the army of 70 antipersonnel mines, 62 antivehicle mines, and 1,644 pieces of “large-caliber” UXO.⁴³ Operations were conducted in the north of the region at Akka, Tuizgui, Mahbes, and Farcia; in the center at Ilaouza, Smara, Amgala, and Guelta;

⁴³ “Report of the Secretary-General on the situation concerning Western Sahara,” (New York: UN Security Council, 13 April 2009), S/2009/200, para. 30.

and in the south at Oum Dreiga, Beggari, Aousserd, Tichla, and Bir Guendouz.⁴⁴ As with the previous year's reported clearance figure of 256km², it is likely that a major percentage of the area reported as cleared was actually released by other means, such as cancellation or reduction by technical or non-technical survey.⁴⁵

Risk Education

No risk education activities were reported to have occurred in Morocco outside Western Sahara from 1999 to 2008.

Victim Assistance

The total number of survivors is not known, although 1,643 people injured by mines/ERW have been recorded by Morocco since 1975. The number of mine/ERW survivors still alive and living in Morocco, as distinct from Western Sahara, was not reported.

Morocco reported that assistance to mine/ERW survivors was made available at facilities in La'Youn (in Moroccan-controlled Western Sahara) and the Military Hospital in Guelmim in 2008.⁴⁶ Casualty data indicates that survivors also receive emergency medical care at Assa hospital in Morocco and in Dakhla and Al Farcia Hospitals in Moroccan-controlled Western Sahara.⁴⁷ In 2008, Guelmim Military Hospital's director claimed they could manage trauma cases, although the surgeons had no specific trauma care training. The military reportedly covers payment for the care of landmine survivors; otherwise, a system of payment either from the patient directly or through health insurance exists at the hospital.⁴⁸

Mine/ERW survivors reportedly receive the same healthcare treatment as other persons with disabilities. Medical care should be free for disability cardholders. Such cards are often difficult to obtain by mine/ERW survivors, who are usually nomads without the required paperwork. Similarly, although Morocco provides free or heavily subsidized prostheses to poor persons with disabilities, the complicated application process deters many mine/ERW survivors. It involves sending a "handwritten application" to the Minister of Social Development, Family and Solidarity and producing three or four separate certificates as well as personal identification.⁴⁹

Shortages of staff and resources affect most Moroccan hospitals. There was a severe lack of qualified personnel able to provide psychological assistance in the health system, and only 14 psychologists for hospital patients throughout the country.⁵⁰

In 2009, a mine survivors' association called specifically for increased healthcare services and monetary compensation.⁵¹ In principle mine/ERW survivors are entitled to financial aid or compensation, but these were not usually provided.

Morocco has legislation regarding persons with disabilities.⁵² Reportedly, the government did not effectively implement laws ensuring access to buildings for persons with disabilities. Despite efforts by the Ministry for Social Development, Family, and Solidarity to integrate persons with disabilities into society, in practice integration was largely left to private charities and families supporting persons with disabilities.⁵³

On 8 April 2009, Morocco ratified both the UN Convention on the Rights of Persons with Disabilities and its Optional Protocol. In May 2009, the national Advisory Council on Human Rights and Handicap International held a seminar on the implementation of the convention and its protocol. The seminar assessed national initiatives for persons with disabilities in relation to the requirements of the convention and made recommendations for improved implementation.⁵⁴

Victim assistance activities

Morocco reported providing assistance to eight survivors in 2008, at facilities in La'Youn and the Military Hospital in Guelmim. As in 2007, assistance reportedly included the provision of medical services, financial support, and socio-economic reintegration, as well as other contributions.⁵⁵ The Guelmim hospital, which was fully functional since January 2007, had assisted two or three mine survivors by October 2008.⁵⁶

In 2008, the ICRC Special Fund for the Disabled continued to support a project at the Ministry of Health Prosthetic and Orthotic School in Marrakech with training, materials, and monitoring. A new intake of students for the three-year prosthetics course started in September 2008. Reportedly, the production of prostheses significantly increased with the additional trainees.⁵⁷

MYANMAR/BURMA¹

2008 Key Data

Mine Ban Treaty status	Not a State Party
Use	Government and NSAG use continued in 2008 and 2009
Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	Extensive
Casualties in 2008	721 (2007: 438)
Estimated mine/ERW survivors	Unknown but at least 2,019
Support for mine action in 2008	\$1 million (2007: \$185,000)

Ten-Year Summary

The Union of Myanmar has remained outside efforts to ban antipersonnel mines. Government forces and armed ethnic groups have used antipersonnel mines regularly and extensively throughout the last decade. Between 2003 and 2007, six insurgent groups agreed to ban antipersonnel mines. Myanmar remains one of the few countries still producing antipersonnel mines.

Continuing hostilities between the Myanmar government and ethnic minority armed opposition groups have increased mine contamination, but political conditions have not permitted any humanitarian mine clearance program. The precise extent of mine or explosive remnants of war (ERW) contamination, although significant, remains unknown.

Landmine Monitor identified 2,325 casualties (175 killed, 2002 injured, and 148 unknown) from 1999 to 2008. Despite this high level of casualties, mine/ERW risk education was either non-existent or inadequate in areas with reported casualties. Assistance to mine/ERW survivors and persons with disabilities in Myanmar is marginal due to many years of neglect of healthcare services by the ruling authority. Myanmar governing authorities have not developed a victim assistance program or strategy.

Mine Ban Policy

Myanmar has not acceded to the Mine Ban Treaty. Myanmar was one of 18 countries that abstained from voting on UN General Assembly Resolution 63/42 on 2 December 2008, which called for universalization of the Mine Ban Treaty. It has abstained on similar annual resolutions since 1997.

Myanmar has rarely participated in Mine Ban Treaty-related meetings, but did attend the Bangkok Workshop on Achieving a Mine-Free South East Asia, from 1–3 April 2009. This was the second in a series of regional meetings convened in the lead-up to the treaty's Second Review Conference. At the workshop Myanmar stated, "Myanmar believes that the indiscriminate use of anti-personnel mines created the deaths and injuries to the innocent civilians in the affected areas. Transfers and exports of antipersonnel mines contribute to their proliferation and increase chances of an indiscriminate use consequently. Therefore, Myanmar maintains that a step-by-step approach would be most appropriate way to deal with the issue. We also believe that the transfer and exports of anti-personnel mines should be addressed together with the total ban on

¹ The military junta ruling the country changed the name from Burma to Myanmar. Many ethnic groups within the country and a number of states still prefer to use the name Burma. Internal state and division names are given in their common form, or with the ruling State Peace and Development Council (SPDC) designation in parentheses, for example, Karenni (Kayah) state.

use of anti-personnel mines.... To establish mine control scheme in the remote and delicate areas, peace is the most essential element for us.”²

Myanmar did not attend as an observer the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008 or the intersessional Standing Committee meetings in May 2009.

Myanmar is not party to the Convention on Conventional Weapons and has not signed the Convention on Cluster Munitions.

In March 2009, the UN Special Rapporteur on the situation of human rights in Myanmar (UN Special Rapporteur) drew attention to the use of antipersonnel mines as a serious threat to the lives of villagers. The UN Special Rapporteur called for a moratorium on the use of landmines and accession to the Mine Ban Treaty, and encouraged authorities to seek international support for mine clearance and victim assistance.³

The Halt Mine Use in Burma campaign, which was launched by the ICBL in 2003, distributed 1,200 copies of the Burmese-language translation of the Myanmar chapter of *Landmine Monitor Report 2008*. In 2009, Landmine Monitor collaborated with the UN Office for the Coordination of Humanitarian Affairs to produce a general map of townships with known mine pollution.⁴

Use

The Myanmar Army (Tatmadaw) and non-state armed groups (NSAGs) have used antipersonnel mines consistently throughout the long-running civil war and continued to use mines in 2008 and 2009.

The UN Special Rapporteur has reported on the use of landmines, citing among other evidence, a meeting with a 13-year-old boy who had been blinded by an antipersonnel mine, and who explained how mines had been laid near his village.⁵

The Free Burma Rangers (FBR), an organization that supports 49 teams⁶ providing medical and other assistance to internally displaced persons (IDPs) in some conflict areas, has reported numerous specific incidents of use of antipersonnel mines by the Myanmar Army. For example, it reported that on 7 January 2009 army units laid six landmines between Bu Koh and Gay Lo villages in southern Karenni (Kayah) state.⁷

The FBR reported that in 2008, the Myanmar Army’s Military Operations Command 10 was responsible for the following: on 5 September 2008, troops on patrol laid landmines in the Hsaw Wah Der area;⁸ on 3 May 2008, the Myanmar Army’s Light Infantry Battalion (LIB) 364 laid landmines in Sho Ko village;⁹ and on 13 April 2008, troops from LIB 363 placed numerous landmines in Ler Ker Der Kho, K’Yeh Yu, Sho Koh, Pra Mu Der, Haw Law Gaw Lu Der, and

⁹ FBR, “Burma Army Attacks Villages in Eastern Burma as they Obstruct Relief to Cyclone Victims in the South,” 29 May 2008, www.freeburmarangers.org.

Naw Kwe Koh villages and in the trails and farms surrounding them.¹⁰ According to the FBR, all these operations resulted in civilian injuries or deaths from the mines.

According to the Karen Human Rights Group (KHRG), in July 2008, members of LIB 256 warned villagers in the Mae Wah tract of Hpapun township not to travel outside their villages to farm their fields because the battalion had planted landmines on the road leading to the fields. Some days later, a villager's cow was injured by one of these mines.¹¹

According to an official document obtained by Landmine Monitor, Northern Commander Major General Soe Win instructed troops in November 2008 to counter insurgent attacks by using landmines.¹²

During late 2008, tensions increased between Myanmar and Bangladesh, resulting in the movement of troops to the border. While there were some allegations of new mine laying by the army, Landmine Monitor investigations could not confirm any new use of mines during the mobilization.

State production, transfer, and stockpiling

Myanmar Defense Products Industries (Ka Pa Sa), a state enterprise at Nyaung Chay Dauk in western Pegu (Bago) division, produces fragmentation, blast, and non-detectable antipersonnel landmines.¹³ Authorities in Myanmar have not provided any information on the types and quantities of stockpiled antipersonnel mines.

Landmine Monitor has reported that, in addition to domestic production, Myanmar has obtained and used antipersonnel mines of Chinese, Indian, Italian, Soviet, United States, and unidentified manufacture.¹⁴ Two mine types not previously known to have been used in the country were identified in this reporting period: the US-made M26 bounding antipersonnel mine and the Italian-made VAR40 non-detectable antipersonnel mine.¹⁵ It is not known when or how the mines were obtained.

Myanmar is not known to have exported antipersonnel mines, but has no formal moratorium or export ban in place.

Non-state armed group use, production, transfer, and stockpiling

Many ethnic rebel organizations exist in Myanmar. Landmine Monitor has identified at least 17 NSAGs that have used antipersonnel mines since 1999. Some of these groups have ceased to exist or no longer use mines.

Six current and former armed opposition groups have unilaterally renounced the use of antipersonnel mines by signing the Deed of Commitment administered by the NGO Geneva Call.¹⁶ These include the Chin National Front/Army (CNF/A), which Landmine Monitor had

¹³ Myanmar produces the MM1, which is modeled on the Chinese Type-59 stake-mounted fragmentation mine; the MM2, which is similar to the Chinese Type-58 blast mine; a Claymore-type directional fragmentation mine; and a copy of the US M14 plastic mine.

¹⁴ See *Landmine Monitor Report 2004*, p. 938. The mines include: Chinese Types-58, -59, -69, -72A; Soviet POMZ-2, POMZ-2M, PMN, PMD-6; US M14, M16A1, M18; and Indian/British LTM-73, LTM-76.

¹⁵ KHRG, "News Bulletin, #2008-B11," 20 October 2008, p. 2, www.khr.org; photographs provided by email from Stephen Hull, Researcher, KHRG, 10 December 2008; and FBR, "Burma Army Using New Landmines Against Villagers in Northern Karen State," 19 December 2008, www.freeburmarangers.org. Identification of the mine type in both cases was done by Landmine Monitor.

¹⁶ The Lahu Democratic Front (LDF), Palaung State Liberation Army (PSLA), and Pa'O Peoples Liberation Organization (PPLO)/Pa'O Peoples Liberation Army (PPLA) renounced use in April 2007. The Chin National Front (CNF)/ Chin National Army (CAN) renounced use in July 2006. The Arakan Rohingya National Organization (ARNO) and the National United Party of Arakan (NUPA), both now militarily defunct, renounced use in December 2003. See Geneva Call, "NSA Signatories," www.genevacall.org.

identified as both a producer and user of antipersonnel mines.¹⁷ In 2008, the CNF/A told Geneva Call that it had completely destroyed its stockpile of mine components.¹⁸

On 8 February 2009, Colonel Yawd Serk, leader of the Shan State Army (SSA) South, is reported to have stated, "The SSA don't use landmines. They only endanger both ourselves and our people. Only the Burma Army uses them."¹⁹ Landmine Monitor has received many reports that the SSA has used mines both during operations and for perimeter defense of their camps. Requests to the SSA from Landmine Monitor for clarification of the statement were not answered.

General Saw Mutu Say Pho, Commander-in-Chief of the Karen National Liberation Army (KNLA), confirmed to Landmine Monitor in February 2009 that the KNLA has used landmines and would continue to do so. He stated that the KNLA was increasing its use of command-detonated mines.²⁰

Use

Armed conflict between different ethnic armed groups and the army appeared to decline during 2008 and early 2009, but the KNLA, the Karenni Army, and the Democratic Karen Buddhist Army (DKBA) continued to use antipersonnel mines. The Landmine Monitor believes at least a dozen other armed groups, some with non-hostility pacts with the ruling authorities, continue to possess mines, have not renounced use, and may make limited use of the weapon.

The Myanmar Army stated that it recovered mines from surrendering soldiers from the SSA during 2007 and blames most mine casualties on use by insurgents.²¹ In April 2009, both the SSA and KNLA denied allegations by the government that they were primarily responsible for mine use in the country.²²

A Karen development organization stated that the KNLA had laid mines along a road in central Karen (Kayin) state in early 2009. Villagers caught in fighting between the KNLA and DKBA protested in October 2008 when KNLA forces operating in Dta Greh township, Pa'an district, wanted to deploy landmines in order to obstruct the DKBA's operations. The villagers feared retribution from the DKBA if they were injured by KNLA mines in the vicinity of their villages. The KNLA agreed not to plant landmines in the area.²³

On 11 October 2008, the DKBA laid landmines in a village close to the Thai border after an attack. A Thai soldier was wounded by a landmine from this attack when his unit inspected damage to the area.²⁴

Production, transfer, and stockpiling

Landmine Monitor has previously reported that the KNLA, DKBA, Karenni Army, and the United Wa State Army have produced blast and fragmentation mines. Some also make Claymore-type directional fragmentation mines, mines with antihandling fuzes, and explosive booby-traps. Armed groups in Myanmar have also acquired mines by lifting army-laid mines from the ground, seizing army stocks, and from the clandestine arms market.²⁵ Although some former combatants have non-hostility pacts with the ruling authorities, they have not disarmed

and some still possess antipersonnel mines.²⁶ The Palaung State Liberation Army, which has a non-hostility pact with the ruling authorities, turned in 35 mines in 2008 as part of a wider surrender of arms.²⁷

Scope of the Problem

Contamination

Landmines in Myanmar are concentrated on its borders with Bangladesh and Thailand, and in eastern parts of the country as a result of post-independence struggles for autonomy by ethnic minorities. Some 23 townships in Chin, Karen, Karenni, Mon, Rakhine, and Shan states, as well as in Pegu and Tenasserim (Tanintharyi) divisions²⁸ suffer from some degree of mine contamination, primarily from antipersonnel mines. Karen state and Pegu division contain the most heavily mine-affected areas. Myanmar is also affected by ERW, including ordnance used in World War II.²⁹

Ethnic minority communities in eastern states bordering Thailand and humanitarian organizations reported that government troops continued to use mines in 2008 and 2009 as part of an offensive against minority anti-government armies, adding to the problem in what was already believed to be the most mine-affected part of the country.³⁰

No estimate exists of the extent of contamination, but Landmine Monitor has identified mined/hazardous areas in the following townships during 2008 or early 2009: every township in Kayin (Karen) state: Thandaung, Hlaingbwe, Hpapun, Myawady, Kyain Seikgyi, and Kawkareik; Mese, Hpasawang, Loikaw, and Demoso townships in Kayah (Karenni) state; Thanbyuzayat, Thaton, and Ye townships in Mon state; Tantabin, Kyaukkyi, and Shwekyin townships in Bago (Pegu) division; Maungdaw township in Rakhine state; Mongpan, Mawmai, Hsihseng, and Tachilek townships in Shan state; and Thayetchaung, Thanintharyi, Dawei, Bokepyin, and Yebyu townships of Tenasserim division.

Landmine Monitor has also identified additional suspected hazardous areas in Hakha, Htantlang, Kanpetlet, Madupi, and Paletwa townships of Chin state; Bawlakhe and Shadaw townships of Karenni state; Buthidaung township of Rakhine state; and Namhsan, Namtu, and Nanhkan townships in Shan state.³¹

Casualties³²

In 2008, at least 721 new mine/ERW casualties were reported in Myanmar (89 killed and 632 injured), based on state and independent media reports, information provided by NGOs and other organizations, and some records obtained by Landmine Monitor.

²⁶ About a dozen armed organizations have agreed verbally to cease hostilities with the SPDC. Although frequently referred to as “ceasefire groups,” none have signed a formal ceasefire protocol leading to a negotiated settlement. All maintain their arms, including any stockpile of antipersonnel landmines.

²⁷ Interview with Mai Aik Pone, General Secretary, Palaung State Liberation Front, 20 February 2009.

²⁸ Burma has states and divisions, which are virtually identical sub-state level administrative districts. States are the “home area” of ethnic groups, and are always named after one; other areas which are not seen as the home area of a specific ethnic group are called divisions.

²⁹ Mann Thar Lay, “Mandalay workers uncover WWII bomb,” *Myanmar Times*, Volume 23, No. 455, 26 January–1 February 2009, www.mmftimes.com.

³⁰ See Use section of this report.

³¹ Survey conducted by Landmine Monitor between February and May 2009. Data sources included casualty information, sightings of mine warnings and use reports by NGOs and other organizations, and interviews with field staff and armed forces personnel. Survey included casualty data from January 2007 to present and other informants from January 2008 to present.

³² Unless noted otherwise, Landmine Monitor analysis of 24 media reports published by the *New Light of Myanmar* between 1 January and 31 December 2008; interview with staff from the Back Pack Health Worker Team, Mae Sot, 26 March 2008; information from published and unpublished sources, provided by email from KHRG, 4 March 2008; and information provided by the ICRC’s War Wounded Program.

Landmine Monitor obtained more detailed information about the 213 civilian casualties (30 killed and 183 injured) than the military casualties. Most of the civilian casualties were male (172), including six boys; 12 were female, including two girls; and 29 were of unknown gender. Antipersonnel mines caused the vast majority of civilian casualties (191), antivehicle mines caused 11, and unknown or unconfirmed devices caused 11. For the majority of civilian casualties, the activity at the time of incident was unknown (154). Where the activities were known, the most common were collection of water or forest products (21), travel (15), agricultural activity (9), and portering or forced labor (8). At least two civilians were injured by antipersonnel mines during “atrocities” demining—the use of forced labor for mine clearance—in 2008.³³

Throughout 2008, media articles appeared in the *New Light of Myanmar*, the newspaper run by the ruling authority, providing details for 34 mine/ERW casualties. The KHRG reported 18 new mine casualties in 2008 from the areas of the country they monitored.³⁴ The ICRC’s War Wounded Program reported 71 mine survivors. In July 2008, a medic working with Back Pack Health Worker Teams was injured by an antipersonnel mine while traveling in Hsihseng township in southern Shan state. He was taken to Mae Hong Son hospital in Thailand to receive treatment. Another organization supported him financially to receive a prosthetic.³⁵

Landmine Monitor received information on 508 military casualties in 2008 (59 killed and 449 injured). In previous years Landmine Monitor has not received reports of military casualties from the State Peace and Development Council (SPDC). During a military briefing for the ruling authority soldiers, the Northern Command Divisional Commander, Major General Soe Win, stated that from January to April 2008, 18 soldiers died and 174 were injured in 171 landmine incidents; and from May to August 2008, nine soldiers died and 97 were injured in 94 landmine incidents. The commander warned soldiers to be more vigilant for insurgent-laid mines during operations.³⁶ One news report placed the number of military personnel who have lost limbs over the past two decades in combat near to 10,000, stating, “Most of the soldiers were injured by landmines.”³⁷

The reported number of mine/ERW casualties in 2008 is an increase compared to the 438 casualties reported in 2007 (47 killed, 338 injured, and 53 unknown), and the 243 casualties reported in 2006 (20 killed and 223 injured). It is not possible to reach firm conclusions from this data about trends in casualty figures due to the lack of systematic data collection, the reluctance of all combatant groups to share information for security reasons, and the restrictions on local and international organizations on movement, surveying, and access to many mine/ERW-affected areas.³⁸

Landmine Monitor identified at least 2,325 casualties (175 killed, 2,002 injured, and 148 unknown) between 1999 and 2008.³⁹

Casualties continued to be reported in 2009, with 19 casualties (two killed and 17 injured) as of 31 May 2009. The two fatalities were adult men. Of those injured, 13 were adult men, two were boys, and two were adult women. All reported incidents were caused by antipersonnel mines. Eight incidents occurred when collecting water or forest products, six during travel, four during portering or forced labor, and one during agricultural activity. The *New Light of*

³⁹ See previous editions of Landmine Monitor.

Myanmar reported seven of the casualties. The newspaper stated one of the incidents took place in the Mon state, and the remainder in Pegu division.⁴⁰

Casualties result from gathering food and jungle produce, collecting wood, traveling, agriculture, portering, and forced labor.⁴¹

Program Management and Coordination

There is no functioning mine action program in Myanmar.

Victim assistance

There is no national strategy or guidelines for victim assistance (VA) in Myanmar. The Ministry of Social Welfare, Relief and Resettlement is responsible for disability issues. Myanmar's fifth National Health Plan (2007–2011) includes activities that should benefit persons with disabilities, including mine/ERW survivors. No information is known about the plan's implementation process and monitoring.⁴²

Data collection and management

No official or systematic data collection of mine/ERW casualties has been established in Myanmar. The ruling authority collects some general health information through hospitals and health centers, but does not differentiate mines and ERW from other causes of traumatic injuries.⁴³

Several organizations working in mine/ERW-affected areas collect a limited amount of data on mine/ERW casualties where they operate but there is no common data collection standard or unified database for verification and elimination of duplicate reports. Under-reporting is likely, due to the limited scope of data collection and a lack of access to conflict-affected areas.⁴⁴ The systematic collection of casualty data also remained difficult due to the SPDC restrictions introduced in 2006 prohibiting the involvement of international NGOs in surveys not authorized within their original contracts.⁴⁵

Demining and Battle Area Clearance

No humanitarian mine clearance programs are known to exist, although some demining activities have been undertaken on an *ad hoc* basis in Myanmar. The FBR include a course on mine identification and emergency clearance procedures for their relief teams. The most recent training took place in November 2008. Mines encountered on their missions are generally not removed by FBR personnel, but by anti-junta militia. In cases where mines are removed by FBR personnel, they are turned over to anti-junta militias.⁴⁶ The FBR noted that they encountered mines less frequently in 2008 than in 2007 due to a decrease in activity by the Myanmar Army, which withdrew from many outposts in the north of Karen state.⁴⁷

Some sporadic military mine removal and village demining have been reported in previous years.⁴⁸ Landmine Monitor received photographs of Myanmar Army soldiers using probes to manually clear a path between two military camps in Hpapun township in January 2009.⁴⁹

⁴⁰ Landmine Monitor analysis of media reports published by the *New Light of Myanmar* between 1 January and 31 May 2009; and survey conducted by Landmine Monitor during field visit, February to March 2009.

⁴⁶ FBR, "Advanced Training Completed by Shan, Kachin, Karenni, and Karen Teams," 2 December 2008, www.freeburmarangers.org.

⁴⁷ Email from FBR, 2 May 2009.

⁴⁸ Some NSAGs and the Myanmar Army have previously reported conducting military demining. In some cases NSAGs remove mines laid by government forces and re-use them.

⁴⁹ Photographs provided by FBR, Bangkok, 25 February 2009.

Photographs by the KHRG show M14-type mines manufactured by Myanmar Defense Products Industries being removed by the KNLA in April and August 2008.⁵⁰ During 2008, the Karen National Union (KNU) received hand-held metal detectors from the NGO Gemeinsam gegen Landminen Austria (GGL-A), and a volunteer from GGL-A assisted in training KNU personnel in their use.⁵¹

The Committee for Internally Displaced Karen People (CIDKP) started a one-year demining project in May 2008, supported by GGL-A. CIDKP trained six demining teams of three deminers each and planned to deploy them for two months tackling demining tasks determined by CIDKP. GGL-A agreed to provide a total of €20,000 (US\$29,452) for the project, including the cost of metal detectors, but it suspended payments before completing disbursement pending receipt of progress reports from CIDKP. GGL also provided support for risk education (RE) conducted by CIDKP.⁵²

The CNF/A reported that it cleared and destroyed mines that it had planted in the border area between Myanmar and India, including 1,600–1,800 mines removed from three sites. The CNF/A provided details of the amount of stockpiled components (TNT, gelatin sticks, detonators, and bamboo casings) that it destroyed.⁵³

“Atrocity” demining⁵⁴

The UN Special Rapporteur described as “particularly worrying” the “reported practice of human minesweepers, whereby civilians are forced by the military to clear brush in suspected mined areas or to serve as porters for the military in areas where there is a mine hazard. According to reports, civilians have been requested to remove mines without training or protective equipment, or to repair fences in mined areas; serious casualties have been reported.”⁵⁵ In previous years, Landmine Monitor received credible reports of civilians being forced by the military to undertake these activities.⁵⁶

A Karen village woman told the KHRG in June 2008 how the Myanmar Army’s LIB 343 forced her and others to carry supplies to the Gk’Hee Gkyo military camp in Hpapun township despite their refusal because of the mine danger. On 9 June 2008, one porter was injured by a landmine and died the same day after the military insisted on taking him to the camp instead of a hospital.⁵⁷ Saw Bpo Heh, a 35-year-old resident of Bpaw Baw Hta village, died of landmine injuries after DKBA Battalions 907 and 999 entered his and nearby villages on 22 February 2008, and forced residents to serve as guides and porters along local trails.⁵⁸

The FBR reported in January 2008 that villagers near the road between Busakee army camp and Ler Mu Plaw camp (between Hpapun and Thandaung townships) had faced almost daily army demands for labor as minesweepers, road-clearers, and porters.⁵⁹ Also in January, a man who was captured and forced to porter for the Myanmar Army escaped and ran into the jungle only to step on a landmine. He was discovered and treated by KNU medics.⁶⁰

⁵⁰ KHRG, Photos B 123, 124, and 125, www.khrg.org.

⁵² Telephone interview with Rita Eyi, GGL-A, 3 July 2009.

⁵³ Email from Nicolas Florquin, Geneva Call, 23 June 2009.

⁵⁴ The term “atrocity” demining is used by Landmine Monitor to describe forced passage of civilians over confirmed or suspected mined areas or the forced use of civilians to clear mines without appropriate training or equipment. “Atrocity” demining is sometimes referred to in human rights reports as “human mine sweeping.”

Risk Education

Despite a large mine problem and significant mine/ERW casualties, mine/ERW RE is either non-existent or inadequate in areas with reported casualties. Limited activities are carried out by Karen state by the CIDKP, in Tenasserim division by the Karen Department of Health and Welfare (KDHW) and in Karenni state by the Karenni Social Welfare and Development Centre (KSWDC).⁶¹

There are no state-run RE activities, although “beware mines” signs have been placed by authorities in some parts of the country.⁶²

NGO activities in 2008⁶³

Organization	Type of activity	Geographic location	No. of beneficiaries
CIDKP	RE delivered through 6 teams	Karen state	9,658 (3,111 women, 3,390 men, and 3,157 children)
KDHW	RE delivered through 4 teams	Tenasserim division	2,298 (650 women, 548 men, and 1,100 children)
KSWDC	RE delivered through 3 teams	Karenni state	2,581 (767 women, 1,393 men, 421 children)

RE in Myanmar has been very limited throughout the last 10 years. Several international NGOs conducted needs assessments to explore the possibility of establishing a program, but have only conducted very limited activities. Several national NGOs have conducted limited activities, which increased in 2006.⁶⁴

Victim Assistance

The total number of mine/ERW survivors is unknown, but at least 2,019 survivors have been identified since 1999.⁶⁵ Adequate medical care was not available to survivors and persons with disabilities in 2008. The ruling authority reportedly directed less than 3% of the national budget annually to healthcare, resulting in limited services for the population generally.⁶⁶ The *New Light of Myanmar* carried several reports of assistance to new mine casualties in 2008, although the type of assistance was not mentioned.⁶⁷ Continuing regime restrictions impeded the ability of some international organizations to provide assistance and protection to populations, particularly within contested areas.⁶⁸

⁶¹ RE activities in Karen state by CIDKP, in Tenasserim division by the KDHW and in Karenni state by the KSWDC are supported with technical assistance by a Danish NGO. RE data by CIDKP, KDHW, and KSWDC provided to Landmine Monitor by a Danish NGO, 17 June 2009.

⁶² Photographic and verbal reports collected by Landmine Monitor, Yangon, 2–6 February 2009.

⁶³ Data on RE by CIDKP, KDHW, and KSWDC provided to Landmine Monitor by a Danish NGO, 17 June 2009.

⁶⁴ Ibid.

⁶⁵ This is based on 2,002 injured casualties between 1999 and 2008, plus 17 injured casualties in 2009 (see Casualties section). See previous editions of Landmine Monitor.

⁶⁷ Landmine Monitor analysis of 24 media reports published by the *New Light of Myanmar* between 1 January and 31 December 2008.

⁶⁸ ICRC, “Annual Report 2008,” Geneva, May 2009, p. 193, www.icrc.org; and *Landmine Monitor Report 2008*, p. 952.

No official information on military assistance to soldiers injured by mines/ERW was provided to Landmine Monitor for 2008. A media report that interviewed a mine-injured military veteran stated disabled veterans received a monthly stipend of MMK10,000 (about \$9.50). The article reported the housing allowance had been withdrawn for injured military veterans and since the end of 2007, disabled veterans (most of whom were reported to have been injured by landmines) were no longer allowed to live indefinitely in military quarters.⁶⁹

Physical rehabilitation, orthopedic surgery, and prosthetics were available to some mine/ERW survivors through rehabilitation centers in 2008, both within Myanmar and in Thailand near the border. The Ministry of Health was responsible for medical rehabilitation of persons with disabilities. It ran three physical rehabilitation centers independently and three centers with the Ministry of Defense.⁷⁰ The National Rehabilitation Hospital provided prosthetics free of charge. The Shwe Min Tha Foundation assisted persons with physical disabilities to access medical care by covering incidental costs, such as transportation to medical centers and food. However, the foundation was unable to support all those who requested assistance due to a lack of funding.⁷¹ The six government-operated rehabilitation centers provide 4,225 people with physical rehabilitation services.⁷²

After it suspended full operational support to the six rehabilitation centers run by the ruling authority in June 2007, the ICRC in 2008 supplied the centers with sufficient equipment to continue meeting clients' needs.⁷³ The ICRC Physical Rehabilitation Programme, with the Myanmar Red Cross Society, provided management training and financial and technical support to the Hpa-an Orthopaedic Rehabilitation Centre in 2008. Located in the most mine-affected area of the country, the center provided services for 1,194 clients in 2008.⁷⁴ In total, all seven rehabilitation centers provided 1,867 prostheses (1,291 to mine/ERW survivors) and 1,204 orthoses (eight to mine/ERW survivors).⁷⁵

Since 2002, Clear Path International (CPI) has provided prosthetics, physical therapy, and socio-economic services to mine/ERW survivors along the Thai-Myanmar border. Prosthetics and physical therapy were provided at four workshops in 2008—two based in Thailand and two in Myanmar. Of those in Myanmar, the Loi Kaw workshop in Karenni state was permanently staffed in 2008, providing approximately 100 prosthetics.⁷⁶ Help without Frontiers (Helfen ohne Grenzen, HoG) worked in 2008 with CPI and the Shan Health Committee to develop two prosthetic workshops in Shan state.⁷⁷ Two private companies also provided commercial prosthetic services.⁷⁸ CPI believes they assisted approximately 160 survivors in Myanmar in 2008.⁷⁹

The Back Pack Health Worker Teams provided primary and emergency medical care to people in rural areas and conflict-affected regions, including services to 22 mine/ERW casualties in 2008.⁸⁰ The FBR trained and supported 49 mobile teams that provide medical and other humanitarian assistance to IDPs in some conflict areas.⁸¹ The provision of healthcare to many populations in contested areas of Myanmar remained limited due to the high level of

danger to the workers themselves from armed conflict, the presence of mines/ERW, and risk of imprisonment.⁸²

There are no known psychosocial services available to mine/ERW survivors in Myanmar, although limited services were available in Thailand near the border with Myanmar.⁸³ The Ministry of Social Welfare, Relief and Resettlement facilitated socio-economic and rehabilitation services, including the running of the Vocational Training School for Adult Disabled. Many of the school attendees were mine/ERW survivors.⁸⁴ The Association for Aid and Relief Japan provided vocational training for 91 people in 2008, including 13 mine/ERW survivors.⁸⁵ CPI developed three farms to provide income for mine/ERW survivors. Two farms are located on the Myanmar-Thailand border, one near the Loi Kaw Wan IDP camp and another near the Loi Tai Leng IDP camp, both in Shan state. The third farm is near the Khung Jor refugee camp in Thailand. In 2008, each farm had approximately 15 beneficiaries.⁸⁶ HoG supported the development of five fishponds at Loi Kaw Wan in 2008.⁸⁷

In Thailand, medical care was provided to mine/ERW survivors from Myanmar at clinics in refugee camps and public district hospitals in the border provinces with Myanmar. The Mae Tao Clinic (MTC), Médecins Sans Frontières (Doctors without Borders), International Rescue Committee, Malteser International-Germany, and other aid organizations provided emergency medical referral to mine/ERW survivors in these border provinces.⁸⁸ In 2008, 219 persons with disabilities from central Myanmar and its border areas with Thailand traveled into Thailand to receive prostheses from the MTC Prosthetic Center. Eighty-six percent of those receiving prosthetics (188 people) were landmine survivors.⁸⁹ HoG and CPI provided financial support for the production of around 200 prostheses in 2008 to MTC, some surgery supplies, and training for technicians.⁹⁰ In 2008, six new prosthetic technicians, all mine survivors, graduated from the MTC Prosthetics Department training program. All returned to Myanmar and work in prosthetic centers run by independent health and welfare sections of ethnic communities.⁹¹ Handicap International also operated prosthetics workshops within refugee camps in Thailand for mine/ERW survivors from Myanmar.⁹² Since 2006, no new reports have been received by Landmine Monitor of mine/ERW survivors from Myanmar receiving medical care in Indian or Bangladeshi facilities.⁹³

In 2008, no active discrimination against persons with disabilities in employment, access to healthcare, or provision of other state-run services was reported. However, there was inadequate state funding for services to assist persons with disabilities. The majority of persons relied on their families to provide for their welfare. Discrimination against persons with disabilities was reported.⁹⁴

Myanmar had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol as of 1 July 2009.

NEPAL

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Antipersonnel mines, IEDs, ERW
Estimated area of contamination	3.25km ² of mined and battle/IED areas
Casualties in 2008	73 (2007: 104)
Estimated mine/ERW survivors	Unknown but at least 550
Demining in 2008	Clearance of 13,200m ² of mined areas
Risk education recipients in 2008	100,000
Support for mine action in 2008	\$1,051,395 (2007: \$1.75 million)

Ten-Year Summary

The Republic of Nepal has not acceded to the Mine Ban Treaty. Since 1999, some of Nepal's most senior officials have expressed support for a ban on antipersonnel mines and various leaders have regularly stated that Nepal is carefully studying accession to the Mine Ban Treaty. Nepal voted in support of every pro-ban UN General Assembly resolution from 1996 to 2006, then abstained the past two years. Both Maoist rebels and government forces used antipersonnel landmines and/or improvised explosive devices, including victim-activated devices, in the decade-long conflict that ended in 2006. Mine use was prohibited under the May 2006 cease-fire agreement and subsequent November 2006 Comprehensive Peace Agreement.

Since the end of its internal armed conflict and despite not being party to the Mine Ban Treaty, Nepal has made slow but steady progress towards clearance of mined areas with UN support.

Landmine Monitor identified a total of 756 casualties from victim-activated devices (205 killed and 551 injured) between 2003 and 2008. From 1999 to 2002, the Nepal Campaign to Ban Landmines reported 1,326 casualties (522 killed and 804 injured), but these were unconfirmed and include incidents involving command-detonated devices.

Since 2004, a large number of NGOs—with the Nepal Red Cross Society, the army, and the police—have been involved in delivering risk education (RE), coordinated by UNICEF. Community-based RE is delivered through thousands of volunteers, supported by village facilitators. In 2009, a program was established to introduce more systematic RE into schools.

The armed conflict left state services at a minimum in affected areas. The health sector remains severely lacking in government funding, trained medical staff, and material resources. Yet there have been improvements, particularly since the end of the conflict. With the support of NGOs, rehabilitation services have improved to international standards. The government and victim assistance stakeholders, with support from UNICEF and Handicap International, developed a National Victim Assistance Strategic Framework in August 2009.

Mine Ban Policy

Nepal has not acceded to the Mine Ban Treaty. The November 2006 Comprehensive Peace Agreement (CPA) committed the government and the Unified Communist Party of Nepal/Maoist (UCPN/M)¹ rebels to halt the use of landmines, and required the parties to assist each other to mark and clear mines and booby-traps within a certain time.²

¹ It was formerly known as the Communist Party of Nepal-Maoist (CPN/M). It changed its name in January 2009 when it absorbed another Nepalese communist political party.

² Comprehensive Peace Agreement between Government of Nepal and CPN/M, 21 November 2006, points 5.1.1(i), 5.1.2 and 5.1.4. Earlier, the May 2006 bilateral cease-fire between the government of Nepal and the CPN/M, and accompanying Code of Conduct, committed both sides to forego use of landmines.

After registering to participate, Nepal did not attend the Ninth Meeting of States Parties to the Mine Ban Treaty in November 2008 in Geneva. On 2 December 2008, Nepal abstained from voting on the annual UN General Assembly Resolution 63/42 calling for universalization and implementation of the Mine Ban Treaty. This was the second consecutive year that Nepal abstained, after voting in favor of all previous pro-ban resolutions since 1996.

A Ministry of Foreign Affairs official told a visiting ICBL delegation in December 2008 that the decisions not to participate in the Ninth Meeting of States Parties, and to abstain on the UNGA vote, reflected the current government thinking that Nepal should not associate itself with treaties of which it was not a member. He added that there was a lack of convergence of views on the question of accession among major stakeholders such as the Ministry of Home Affairs, Ministry of Defense, and the army.³

The ICBL mission to Kathmandu from 14–16 December 2008 met with the Army Commander-in-Chief, Minister of Peace and Reconstruction, Advisor to the Minister of Foreign Affairs, Foreign Secretary, Defense Secretary, leaders from major political parties, and others. Subash Chandra Nembang, the Chair and Speaker of the Constituent Assembly, stated that the time was right to act on this issue and promised to extend his full support.⁴ It appears, however, that the army wishes to retain the option to use landmines again to protect its defense posts in case of renewed insurgency.⁵

Nepal attended the Bangkok Workshop on Achieving a Mine-Free South-East Asia held 1–3 April 2009, the second in a series of regional meetings convened in the lead-up to the treaty's Second Review Conference, but did not make any statements. It did not attend the May 2009 intersessional Standing Committee meetings in Geneva.

It is likely that progress toward accession has been slowed by the stalemate on integration of the Maoist rebels into Nepal's army, as well as the resignation of the Maoist Prime Minister and change of government in May 2009.

On 10 August 2008, the Minister of Peace and Reconstruction, Ram Chandra Poudel, signed the August Declaration on Mine Action and the Ottawa Treaty, prepared by the Nepal Campaign to Ban Landmines (NCBL) which stated, "We will make efforts to create an environment conducive to making the Nepal government sign the Mine Ban Treaty and enforce it immediately on our respective behalf." The declaration set the short-term goal of accession prior to the Second Review Conference in November 2009.⁶ Also in August 2008, the NCBL received signatures from 13 out of 25 political parties in the Constituent Assembly to a "Letter of Commitment" to pursue accession to the Mine Ban Treaty.⁷

Nepal is not party to the Convention on Conventional Weapons and has not signed the Convention on Cluster Munitions.

Use, production, transfer, and stockpiling

No new use of antipersonnel mines by the Nepal Army has been reported since the 2006 cease-fire. Previously, the Nepal Army used antipersonnel mines as well as improvised explosive devices (IEDs) assembled in-country around military installations, police posts, and infrastructure. The Nepal Army has stated that it started using mines in 2002, and estimates it deployed around 14,000 antipersonnel mines (including 11,000 PMD-6 mines and 3,000 POMZ-2 and NMM 14 mines). It also estimates that it used about 25,000 command-detonated IEDs.⁸

⁴ ICBL meeting with Subash Chandra Nembang, Chair and Speaker, Constituent Assembly, Kathmandu, 16 December 2008. Notes by Landmine Monitor.

⁵ ICBL meeting with Gen. Rukmang Katwal, Chief of Staff, Nepal Army, Kathmandu, 14 December 2008. Notes by Landmine Monitor.

⁶ NCBL, "August Declaration on Mine Action and the Ottawa Treaty," 10 August 2008.

⁷ NCBL, "Letter of Commitment by Political Parties," signed during a National Seminar on Our Declaration for Envisioning Peaceful Mine-Free Nepal, Kathmandu, 10 August 2008.

⁸ See *Landmine Monitor Report 2007*, pp. 936–937. Landmine Monitor reported indicators of mine use by government forces as early as 1999.

In December 2008, General Rukmang Katwal, the army's Chief of Staff, told an ICBL delegation that Nepal had never used landmines on its borders, and could not conceive of a situation which might necessitate their use. He acknowledged that the few thousand mines in Nepal's stockpile could hardly afford any protection.⁹

A Nepal Army spokesperson said in 2007 that the army had a stockpile of about 3,000 antipersonnel and antivehicle mines, including POMZ-2 and PMD antipersonnel mines. Nepal imported its mines from China, India, and the former Soviet Union, mostly in the 1980s.¹⁰ Nepal is not known to have exported antipersonnel mines.

In 2003 and 2005, Nepali officials told Landmine Monitor that Nepal produced antipersonnel mines.¹¹ Since the 2006 cease-fire and CPA, army officials have insisted that there has never been any production of antipersonnel mines. In 2007, an army officer denied any antipersonnel mine production, while acknowledging that soldiers frequently made command-detonated IEDs at barracks using munitions such as mortar shells, rockets, bombs, and antivehicle mines.¹² In March 2008, another army official told Landmine Monitor that Nepal did not produce or use any victim-activated mines or IEDs.¹³ In December 2008, General Rukmang Katwal told the ICBL that Nepal had no capacity to produce landmines, nor did it ever have such capacity.¹⁴ No Nepali-produced antipersonnel mines have been found in minefields.

It does not appear that Nepal is currently producing antipersonnel mines, but the conflicting information about past production remains to be clarified. Landmine Monitor will continue to list Nepal as a producer until Nepal makes an official, formal statement that it does not produce antipersonnel mines and does not intend to do so in the future.

Non-state armed groups

Although the former rebel Communist Party of Nepal/Maoist (CPN/M) became a part of the interim government in April 2007, its People's Liberation Army (PLA) still exists and is being demobilized. In the past, the PLA was expert at the manufacture and use of a variety of IEDs, including victim-activated, time-delayed, and command-detonated types.¹⁵ There have been no reports of new use of antipersonnel mines, victim-activated IEDs, or booby-traps by the PLA since the May 2006 cease-fire.¹⁶

In December 2008, Shree Ram Dhakal (also known as Prasanta), Secretary of the CPN/M central office, told ICBL representatives said that the struggle is not over yet and nobody knows what may happen in the future. Under the terms of the CPA and the Monitoring of the Management of Arms and Armies agreement, the PLA was cantoned at seven sites and obligated to turn in all IEDs at designated storage locations a safe distance from the sites. Some observers believe some PLA cadres, and their arms, remain outside the UN camps. Shree Ram Dhakal said that all weapons and explosives were handed over to the UN, but that some might have been inadvertently left out.¹⁷

⁹ ICBL meeting with Gen. Rukmang Katwal, Nepal Army, Kathmandu, 14 December 2008. Notes by Landmine Monitor.

¹⁰ See *Landmine Monitor Report 2007*, p. 936.

¹¹ *Ibid.*; and *Landmine Monitor Report 2006*, p. 1,022. In 2003, Brig.-Gen. Kul Bahadur Khadka told a visiting ICBL delegation that Nepal produced antipersonnel mines. In August 2005, a former government official told Landmine Monitor that landmines were produced at the weapons factory at Sunchari in Makwanpur district south of Kathmandu.

¹² See *Landmine Monitor Report 2007*, p. 936. In April 2007, Brig.-Gen. Lok Bahadur Thapa, Head of the Engineers Directorate, told Landmine Monitor that Nepal does not have the capacity to produce factory-made landmines, and that the Sunchari factory only produces plastic grenades.

¹³ Interview with Maj. Prabin Khadka, Operations Officer, MAC, Engineers Directorate, Nepal Army, Kathmandu, 23 March 2008.

¹⁶ In December 2006, nine Maoists were reportedly injured while assembling IEDs inside the Maoist cantonment in Surkhet. The CPN/M has refused to disclose any details about the incident. "9 Maoists injured in cantonment in Surkhet," *Rajdhani* (newspaper), 18 December 2006.

¹⁷ ICBL meeting with Shree Ram Dhakal "Prasanta," Secretary, CPN/M, Kathmandu, 15 December 2008. Notes by Landmine Monitor.

Rebel armed groups still exist in Nepal, especially in the Terai region. There is no evidence that any of them have used or possessed antipersonnel mines. Many use command-detonated IEDs (see Casualties section below).

Scope of the Problem

Contamination

Nepal is affected by landmines, almost all antipersonnel, as well as by ERW. The decade of internal armed conflict that ended in November 2006 left Nepal contaminated by IEDs, used by both Nepal's army and police, and by the CPN/M. More recent violence involving autonomy-seeking groups in Nepal's southern Terai region is adding IED contamination, albeit not yet on a large scale.¹⁸

The Security Forces, which include both the Nepal Army and the Armed Police Force, laid 53 antipersonnel minefields, and a further 300 or so areas are protected with command-detonated devices (including IEDs),¹⁹ as defensive perimeters around military installations, police posts, and infrastructure.

As of July 2009, the Nepal Army had cleared 17 minefields and 90 IED fields.²⁰ That left 36 minefields covering an estimated 3.25km². On the basis of existing clearance capacity (two to three demining platoons), the UN Mine Action Team (UNMAT) projected that all mined areas could be cleared by mid-2011.²¹

In July 2008, the UN Mission in Nepal (UNMIN) concluded destruction of all Category 1 (unstable) IEDs at Maoist cantonment sites in accordance with the CPA. In excess of 7,250kg of explosive items were destroyed in nine locations.²² UNMAT continued destruction of Category 2 (safe to store) IEDs in 2009. As of July, 7,926 IEDs had been destroyed and a further 18,308 items remained to be destroyed.²³

A UN interagency mine action assessment conducted in late 2007 was still awaiting comment by the government as of December 2008.²⁴

Casualties

In 2008, the Nepali NGO Informal Service Sector Center (INSEC) recorded 73 new mine/ERW casualties (four killed and 69 injured) from victim-activated explosions in 38 incidents.²⁵ Boys accounted for the majority of casualties (33 casualties), followed by men (17), girls (13), and women (10). Most casualties were caused by tampering with explosive devices (60), followed by collecting wood and water (four). Children were 72% (43) of all the casualties that occurred while tampering with explosive devices. In addition, there was one demining accident in August 2008, which resulted in a deminer losing several fingers.²⁶

The number of casualties in 2008 decreased by 29% from the 104 casualties (13 killed and 91 injured) reported in 2007: the number of incidents decreased by 7% (from 42 in 2007).²⁷ Despite the overall decrease in incidents, there was an increase in incidents related to armed groups in the Terai region.

¹⁸ Telephone interview with Stephen Robinson, Program Manager, UNMAT, 28 July 2009. The UN provided mine action support through UNMIN until the end of 2008, when that role transitioned to UNMAT.

¹⁹ See *Landmine Monitor Report 2008*, p. 958.

²⁵ Unless specified otherwise, all information in this section is based on casualty data provided by email from Prashannata Wasti, Coordinator, INSEC, 23 June 2009.

²⁶ Interview with Stephen Robinson, UNMIN, Kathmandu, 19 December 2008.

²⁷ See *Landmine Monitor Report 2008*, p. 962.

The total number of casualties from victim-activated devices in Nepal is unknown, owing to the late onset of data collection. Landmine Monitor identified a total of 756 confirmed casualties from victim-activated devices (205 killed and 551 injured) between 2003 and 2008, using information provided by INSEC, UNICEF, and media reports. However, the data for 2003 and 2004 is only partial, gathered retrospectively by UNICEF from 2005 onwards. Casualties are certainly under-reported by INSEC, as from 2006 to 2008 only non-combatant casualties were included in their database. From 1999 to 2002, the NCBL reported 1,326 unconfirmed casualties (522 killed and 804 injured). However, as this data includes casualties from targeted attacks, this does not represent an accurate picture of the numbers killed and injured by victim-activated weapons.²⁸

Casualties continued to occur in 2009. By 23 June, 15 incidents caused 32 casualties, killing eight and injuring 24. Nineteen casualties were boys, six men, four women, and three girls.²⁹

In 2009, with UNICEF support, a separate database was established by INSEC for incidents caused by intentional (command) detonation of explosive devices. The database is based on secondary sources, such as historical INSEC data and media reports.³⁰ As of July 2009, the database contained 254 casualties (including 21 killed) for 2008,³¹ from 76 intentional explosions in 20 districts, including one incident that caused 41 casualties. Casualties from intentional explosions amounted to 78% of all casualties from explosions in Nepal in 2008.³²

There are no comprehensive statistics on people injured and killed in the conflict or on persons with disabilities. The National Federation of the Disabled planned to conduct a nationwide disability survey to address the lack of data once funding has been secured.³³

Risk profile

The greatest risk comes from IEDs.³⁴ The majority of casualties occurred in Terai and an increasing number were caused by the activation of IEDs placed by new armed groups.³⁵ Tampering and handling were the main causes of explosions. Children accounted for 63% of casualties in 2008.³⁶ In November 2008, the UN claimed that, “[a]s the situation is now more stable, the return of internally displaced people and the increased number of abandoned barracks surrounded by minefields could lead to an increase in casualties.”³⁷

Socio-economic impact

Despite the limited extent of contamination, the benefits of clearance could be considerable—opening up power delivery to communities that in many areas go unserved for most of the day, and permitting the construction of more cell phone towers, in addition to increasing land available for cultivation.³⁸

Program Management and Coordination

Mine action

Nepal’s cabinet decided in June 2007 to set up a National Mine Action Authority (NMAA), consisting of an interministerial Steering Committee with strategic policy responsibility and an implementing Technical Committee, both under the auspices of the Ministry of Peace and

³⁸ Interview with Stephen Robinson, UNMAT, in Bangkok, 3 April 2009.

Reconstruction (MOPR).³⁹ As of July 2009, however, the Steering Committee had met only once. Restructuring underway at the MOPR was expected to lead to the establishment of a mine action office to serve as a focal point for coordinating mine action.⁴⁰

In the meantime, a Mine Action Joint Working Group, an informal committee which meets every four to six weeks and is chaired by UNMAT, addresses all mine action issues, including mine/ERW risk education (RE) and victim assistance (VA). The Joint Working Group's 26 members included the MOPR, the army and police, UN agencies, Nepal Red Cross Society (NRCS), NCBL, various national and international NGOs, and the ICRC as an observer.⁴¹

The Nepal Army set up a Mine Action Center (NAMAC) in 2007 in the Army Engineers Directorate, but this coordinates only the work of army engineers.⁴²

Victim assistance

The NMAA's Steering Committee and Technical Committee are tasked with coordinating mine action, including VA, but as of July 2009 had not become operational and did not have terms of reference.⁴³ Moreover, neither committee included the Ministry of Women, Children and Social Welfare, the lead ministry for people with disabilities, nor the Ministry of Health and Population.⁴⁴ UN agencies continued to interact with the government on the need for an operational national mine action authority.⁴⁵

Data collection and management

NAMAC operates a database equipped with the latest version of the Information Management System for Mine Action (IMSMA) by the Geneva International Centre for Humanitarian Demining (GICHD).⁴⁶ The database was accidentally wiped out in 2008, and in 2009 work started repopulating it with clearance records.⁴⁷

RE activities are not entered into IMSMA and all organizations maintain their own records. As of July 2009, UNICEF was working on gathering these records, but the data was not available to Landmine Monitor.⁴⁸

The MOPR is officially responsible for collecting and managing mine action data, but since June 2006, INSEC has been the de facto source of casualty data for the mine action sector in Nepal. Working in partnership with 50 organizations, the INSEC surveillance system of mine/ERW/IED explosions monitors all 75 districts of Nepal. At the Joint Working Group in December 2008, the Nepal Police, Armed Police Force, and Nepal Army agreed to provide INSEC with data on casualties in their own ranks from 2008 onwards.⁴⁹

Data is collected by INSEC in a standardized form, with case definition, differentiation of device types and detonation mechanisms, incident location, and casualty information.⁵⁰ The INSEC database allows for ongoing prioritization of RE, VA, advocacy, and clearance programs in Nepal. Members of the Joint Working Group used the data from INSEC in planning and prioritizing of their work in 2008.⁵¹

⁵¹ Interview with Hugues Laurence, UNICEF, Kathmandu, 2 April 2009; and MASG, "MASG Newsletter, 1 October 2008–28 February 2009," Washington, DC, 28 February 2009, p. 20.

The definition for “casualties from victim-activated devices” was revised by the Joint Working Group in 2008 and was to be used by members, including INSEC, from 2009 onwards. The revised definition includes “casualties injured or killed... when they have activated an Explosive Device (ED) unknowingly, or without the intention to harm, hurt or terrorize.” EDs are defined as IEDs, including booby-traps, antipersonnel mines, other explosive munitions, and ERW. The definition was also widened from that previously used by INSEC to include military and security personnel, in addition to civilians.⁵²

UNICEF did not maintain a database for ERW casualties in 2008, although it continued to monitor media reports and support the development of the INSEC surveillance system.⁵³

Plans

Strategic mine action plans

Nepal had no comprehensive national mine action strategy as of December 2008.⁵⁴ The army has set a target of completing clearance of all minefields within five years.⁵⁵

In August 2009, the MOPR, Handicap International (HI), UNICEF, and VA stakeholders developed a first national VA strategic framework. On this occasion the participants decided to create a new VA Working Group under MOPR leadership. The new group was to be operational by November 2009.⁵⁶

Integration of mine action with reconstruction and development

There has been some effort by the army to coordinate demining with reconstruction needs.⁵⁷ The Nepal Army is said to prioritize tasks in accordance with the wishes of local people but no formal mechanism links mine clearance to national development.⁵⁸

⁵² Minutes of Mine Action Joint Working Group meeting, Kathmandu, 11 December 2008, provided by Hugues Laurence, UNICEF, 14 July 2009; and INSEC, “New Casualties Victim-Activated Explosions-2009,” update 16 June 2009, www.inseconline.org.

National ownership

Nepal has demonstrated commitment to mine action by initiating clearance of affected areas without international legal obligations to do so. The Nepal Army's work is supported by UNMAT, which represents the first country deployment by the UN's Inter-agency Standing Committee on Mine Action.

Mine clearance is conducted exclusively by the Nepal Army while IED clearance is conducted by the Nepal Army and the Armed Police Force (see Demining section below), but in October 2008, the government requested UN support in a letter which stated "this activity is likely to take a couple of years."⁵⁹

UN support to clearance was initially provided through the UN Mission in Nepal (UNMIN) and was originally due to terminate at the end of 2008. After the government's request for continuing mine action support in October 2008, responsibility transferred on 1 January 2009 to UNMAT, comprising the UN Mine Action Service (UNMAS) and UNICEF. ArmorGroup provided operational supervision and some capacity-building support under an UNMIN contract awarded through a process of international tender, which ended in July 2008. ArmorGroup support was replaced by three UN technical advisors who focused mainly on providing capacity development of Nepal Army demining teams.⁶⁰

National mine action legislation and standards/Standing operating procedures

Mine action is governed by a 2007 cabinet decree.⁶¹ Standing operating procedures for demining were drafted based on the International Mine Action Standards and training provided by ArmorGroup, and their further development was ongoing as of December 2008.⁶²

UNMAT developed national technical guidelines and safety standards for RE, and the draft was under discussion with the Joint Working Group as of July 2009.⁶³

Demining and Battle Area Clearance

The Nepal Army's 14th Brigade is the only demining operator in Nepal, with two 20-person platoons operating in 2008. Two other platoons have been trained but have yet to be equipped or deployed for operations. The army intended to deploy a third platoon in 2009. Nepal's Armed Police Force, which works independently of the Nepal Army, deployed one EOD team in 2008, and in 2009 had a further EOD section in each of the six brigade headquarters.⁶⁴

Identification of hazardous areas

The Nepal Army provided the UN with details of 53 minefields, including maps described as of a "good standard" for 44 of them. The army also identified some 300 security posts protected by command-detonated explosive devices.⁶⁵

The extent of residual ERW contamination remains unclear. A 2007–2008 assessment that visited 117 locations, including 37 sites of clashes between the army and insurgents, found a limited threat, mostly isolated items of UXO or remnants of old stockpiles of IEDs in communities.⁶⁶

⁶⁶ Ibid.

Mine and IED clearance in 2008

All clearance of mines and ERW in Nepal is by manual means. In 2008, the army cleared six minefields covering an area of about 13,200m², destroying 1,136 antipersonnel mines. In 2009, before the onset of the monsoon season in July, the Nepal Army had cleared a further 10 minefields covering 20,700m² and destroying 1,482 antipersonnel mines. The total amount of land released amounted to 1.1km² in 2008 and 0.6km² in the first seven months of 2009.⁶⁷

After clearance operations in Kopche Community Forest in Siraha district, media reports cited a Nepal Army officer as saying deminers had been able to clear 98 mines of the 202 that had been emplaced there and that the others had been destroyed by fire or swept away in landslides. Clearance certificates for the task were reportedly presented to local residents by the United Kingdom's ambassador to Nepal, Andrew Hall.⁶⁸

The Armed Police Force reported in 2009 that it had completed clearance of all 3,041 IEDs laid around its police posts, although this had not been verified.⁶⁹

Demining and battle area clearance from 2004–2009

Systematic clearance operations began in 2007, following the end of the armed conflict. The army reported clearing three minefields and 25 battle areas in 2007 although the UN had reports of only one minefield cleared in 2007; the area cleared has not been reported.⁷⁰

Risk Education

RE was implemented through two types of activity in 2008: emergency RE and community-based RE. In 2009, systematic RE was introduced into the school system.⁷¹ It is estimated that the total number of beneficiaries in 2008 was approximately 100,000.⁷² This is a significant increase from 2007, when the number of beneficiaries reported was 7,508.⁷³ Although UNICEF considers that RE is adequate in terms of messages and prioritization, coverage is inadequate due to lack of funding.⁷⁴

RE has been conducted by NGOs since 2003 and is now delivered through a network of organizations, too numerous to mention all by name. The major implementing organizations were the NRCS, army, police, and the Armed Police Force, NCBL, the NGO Himalayan Human Rights Monitors (HimRights), Save the Children, UNMIN, and the Ministry of Education, with UNICEF playing a coordinating role.⁷⁵ A UNICEF/GICHD needs assessment in 2005 resulted in a strategic framework which integrated RE within the social mobilization campaign.⁷⁶ Emergency RE was conducted from 2006 as a result of new explosive incidents.⁷⁷

Casualty data is used to inform RE and to select and prioritize districts for RE programs. A 2008 Knowledge, Attitude and Practices survey commissioned by UNICEF and conducted by the Center for Research on Environment Health and Population Activities (CREHPA) in six of the most mine-affected districts of Nepal found exposure to RE negligible in all districts, despite a nationwide RE campaign.⁷⁸ It found that people were unaware of where explosive

devices could be encountered and how to practice safe behavior. However, their actual exposure to ERW was moderate and communities had other priorities. The survey concluded that there was a need for a systematic RE campaign that favored electronic media and direct training in the community through existing networks, for example through the school system. It also recommended that a “climate” conducive for reporting be established as some people expressed fear of reporting contamination to the police.⁷⁹ A baseline study by Partnership Nepal in June 2008, found that at-risk groups were not aware of the dangers of IEDs.⁸⁰

A national emergency RE network of 409 governmental, NRCS, and NGO focal points had the capacity to deploy prevention activities in 68 affected districts in a timely manner.⁸¹ In 2008, UNICEF trained 250 RE focal points in 30 districts in emergency RE.⁸² They delivered RE following incidents, at the request of communities or where risk was identified. UNICEF monitored the delivery of RE. Some of the organizations also provided standard RE, in addition to emergency RE.⁸³ The Ministry of Education was involved in emergency RE in about 20 districts through 20 RE trainers.⁸⁴

A network of hundreds of village facilitators, paid by the government and UNICEF, works with thousands of volunteer community mobilizers⁸⁵ and they conduct RE alongside their other work in all UNICEF programs—health, nutrition, water and sanitation, education, and other protection issues.⁸⁶ UNICEF further developed the community network in 2008 by training 38 district level trainers and 149 village facilitators in 14 districts.⁸⁷ The network has a separate monitoring system, run by the UNICEF district officers, that covers all issues, not only RE.⁸⁸

In September 2008 four video clips were broadcast through six TV channels, and radio spots were aired through 35 national and local radio stations.⁸⁹

Victim Assistance

The total number of survivors is unknown, but is at least 550. HI criticized VA in Nepal in 2009, saying it was the weakest of the five pillars of mine action and that there was an “absence of a national strategy, no data on total numbers of victims and casualties, poor coordination, a lack [of] clear policies and procedures for emergency response, limited tertiary healthcare, and almost-absent psychosocial care.”⁹⁰ Services offered were often concentrated in urban centers. The majority of facilities are operated by NGOs.⁹¹ Government funding was provided to a small number of NGOs for support services to persons with disabilities, but the majority of those with a disability relied almost exclusively on family for assistance.⁹²

⁹² US Department of State, “2008 Country Reports on Human Rights Practices: Nepal,” Washington, DC, 25 February 2009.

Citizens are eligible to access basic healthcare free of charge at government facilities. However, in 2008, government clinics were reportedly poorly equipped and few in number. Some health clinics in rural areas were forced to close due to Maoist intimidation.⁹³ There was also a severe lack of trained primary healthcare staff.⁹⁴

Emergency medical care was available at eight well-equipped government hospitals, all located in larger cities, as well as at private and NGO-run medical centers. The majority of facilities were located in the Kathmandu valley, forcing most survivors to travel long distances to access them. Poor roads, irregular public transport and high travel fares (which increased by 60% in 2008) often made it impossible to access services.⁹⁵

Evacuation of severely injured casualties, particularly from poor, rural areas impacted by mines/ERW, remained difficult due to unclear emergency procedures and inability to pay costs. The ambulance system has been criticized for inadequately equipping vehicles with medical supplies and paramedics.⁹⁶ NRCS ambulances charged for emergency evacuation according to the distance traveled, while others required a “donation” of no set amount.⁹⁷ In 2008, HI provided training for INSEC district representatives on how to access emergency medical attention immediately after an incident.⁹⁸

Nepalese district and regional hospitals have been criticized as “poor in terms of infrastructure, equipment, manpower and management.”⁹⁹ In 2008, the construction of a trauma center at Bir Hospital in Kathmandu was completed. Although it was not yet operational as of February 2009, it had already been criticized for its inaccessibility due to the hazardous and overcrowded surrounding roads.¹⁰⁰

Physical rehabilitation services were provided through centers in five regions of Nepal and through mobile camps. The vast majority of physical rehabilitation services in Nepal are provided by international and national NGOs.¹⁰¹ As a result of the efforts of international NGOs, facilities improved and meet international standards.¹⁰² The government-run Aerahiti National Rehabilitation Centre in Kathmandu began providing services to people with spinal cord injuries in June 2008.¹⁰³ Managed by the army, it is the first government-run rehabilitation center in Nepal and provides services to both military personnel and civilians.¹⁰⁴

The Ministry of Women, Children and Social Welfare provides free education and medical care for persons with disabilities, and it encourages other government and NGO agencies to provide rehabilitation services and assistance in employment.¹⁰⁵

There were no counseling programs in Nepal to assist mine/ERW victims and their family members, but the NCBL provides some ad hoc counseling assistance.

Economic reintegration of mine/ERW survivors and families of victims remained marginal in 2008. Financial compensation, pensions, and training were available for security force casualties. Families of people killed during the conflict are eligible for a one-time payment;

those injured or killed after the peace accords are not eligible.¹⁰⁶ Post-conflict casualties can receive assistance if their injuries happened at or near military posts. The process to acquire the necessary documentation to access free services often takes months.¹⁰⁷

Nepalese law mandates access to employment, education, transportation, and other state services for persons with disabilities, but there are no laws prohibiting discrimination. In 2008, discrimination against persons with disabilities was reportedly common in healthcare, employment, education, and provision of other state services.¹⁰⁸ Nepal signed the UN Convention of the Rights of People with Disabilities and its Optional Protocol on 3 January 2008: it had not ratified either instrument as of 1 July 2009.

Victim assistance activities

Since 2005, HI has operated a physical rehabilitation project targeting persons with disabilities caused by the conflict. The project supported five centers and three satellite units managed by local partners in 2008. In total, the services provided physiotherapy to 5,013 people, including three mine/ERW survivors, and provided 2,044 orthopedic devices. HI also helped 516 of the poorest rehabilitation beneficiaries to access treatment through a Socio-Economic Fund. The cost of surgery for five survivors of victim-activated explosions was covered by the fund, in addition to the cost of emergency medical treatment for two other casualties of victim-activated explosions. HI operated seven mobile camps in 2008 in remote areas, bringing rehabilitation services to isolated communities and areas affected by the most recent conflict.¹⁰⁹ This was a decrease from the 16 mobile camps operated by HI in 2007.¹¹⁰

Although the need for physical rehabilitation in remote areas continues, the decrease in service provision was due to a lack of funding.¹¹¹ HI also supported community-based rehabilitation programs in 13 districts in 2008, which assisted 144 persons with disabilities to make significant improvements in their physical mobility, and 203 to improve their ability to perform daily activities.¹¹² From June 2008 to January 2009, HI also provided 2,160 persons with disabilities with information on health, education, and economic, social, and political involvement. The number of mine/ERW survivors was not specified.¹¹³

The ICRC continued to collaborate with Green Pasture Hospital in Pokhara and the NRCS in providing rehabilitation services to more than 1,098 people and produced 97 prostheses and 174 orthoses in 2008. Four mine/ERW survivors received prostheses and one received an orthosis.¹¹⁴ The center began providing artificial upper limbs for clients in 2008.¹¹⁵ In response to the increase in travel costs in 2008, the ICRC increased its reimbursement of transportation costs by over 70% compared to 2007. Outreach visits were also organized through the partnership.¹¹⁶ The Micro-Economic Initiative program, supported by the ICRC and implemented through the NRCS, provided financial assistance to survivors to start small businesses.¹¹⁷

The NGO Friends of the Disabled managed the Hospital and Rehabilitation Centre for Disabled Children, assisting under-privileged children with physical disabilities. The hospital's community-based rehabilitation program mobilized local resources to improve beneficiaries' quality of life in a large number of districts and facilitated mobile camps in six districts.¹¹⁸

The NCBL provided scholarships to 170 children who were direct survivors of conflict, including 50 survivors of explosions, and vocational training to 25 mine/ERW/IED survivors in 2008.¹¹⁹ The NCBL is also the ICBL's VA focal point, advocating for the rights of survivors with the government and raising awareness of VA.m

In 2008, HimRights covered the costs of emergency medical assistance to five new casualties of victim-activated explosions in four districts.¹²⁰

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates or resource mobilization strategies for fulfilling mine action needs (including RE and VA) in Nepal. The interministerial Steering Committee within the NMAA holds responsibility for setting strategic mine action policy.¹²¹ UNMIN and UNICEF coordinated UN assistance according to a strategic agreement between the two agencies for the period 2007–2008.¹²² In November 2007, a UN assessment was completed in response to Nepal's request for assistance in mine action, as of December 2008, the draft report was still awaiting comment by the government.¹²³

National support for mine action

Landmine Monitor is not aware of funding for mine action from the national budget of Nepal in 2008. No national funding was reported in 2007.

International cooperation and assistance

In 2008, three countries, Australia, Canada and the UK, as well as the European Commission (EC) reported providing \$1,051,395 (€713,972) to mine action in Nepal. Reported mine action funding in 2008 was roughly 40% less than the \$1,756,621 reported for 2007. There are no strategic plans or baseline cost estimates against which to judge the adequacy of 2008 funding levels in fulfilling Nepal's mine action needs.

2008 International Mine Action Funding to Nepal: Monetary¹²⁴

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Canada	UNDP	Mine clearance	\$437,492 (C\$466,360)
EC	UNICEF	Support for mine action	\$265,068 (€180,000)
Australia	UNICEF	Support for mine action	\$256,110 (A\$300,000)
UK	UNMAS	Capacity-building, mine clearance	\$92,725 (£50,000)
Total			\$1,051,395 (€713,972)

As of June 2009, the UN reported that no funding or pledges had been received for mine action projects within the 2009 Nepal Humanitarian Transition Appeal. The original request for mine action within the appeal was \$572,608, but as of June 2009 had been revised downward to \$236,334.¹²⁵ No reasons were specified for the change in required funding.

OMAN

Ten-Year Summary

The Sultanate of Oman has long said that it is supportive of the Mine Ban Treaty, and it has voted in favor of every pro-ban UN General Assembly resolution since 1996. An official stated in 2007 that accession was under active consideration. In 2001, Oman revealed for the first time that it had a limited stockpile of antipersonnel mines for training purposes, and in 2007 it disclosed that it consisted of less than 2,000 mines. Oman is believed to have a small residual mine/UXO problem, mostly in the Dhofar region in the south, but its precise extent remains unknown.

Mine Ban Policy

Oman has not acceded to the Mine Ban Treaty. Increased interest in treaty accession seen in 2007 did not appear to have intensified in 2008 or 2009.¹

On 2 December 2008, Oman voted in favor of UN General Assembly Resolution 63/42 calling for universalization and implementation of the Mine Ban Treaty. Oman has voted in favor of every annual pro-ban General Assembly resolution since 1996.

Oman attended as an observer the Ninth Meeting of States Parties in Geneva in November 2008, but made no statements. It did not attend the intersessional Standing Committee meetings in May 2009.

Oman has never produced or exported antipersonnel mines, but has imported and used them in the past.² An Omani official stated in November 2007 that Oman's stockpile consists of fewer than 2,000 antipersonnel mines and that Oman has not bought any new mines for more than 20 years.³ Omani officials have on several occasions stated that Oman now only possesses antipersonnel mines for training purposes.⁴

Oman is not party to the Convention on Conventional Weapons. As of 1 July 2009, it had not signed the Convention on Cluster Munitions.⁵

Scope of the Problem and Demining

Oman is believed to have a residual mine and UXO problem, mostly in the Dhofar region in the south, the result of an internal armed conflict in 1964–1975.⁶ The precise extent of the residual problem remains unknown, although it was described by a United States Army deminer as

¹ See *Landmine Monitor Report 2008*, p. 971. In November 2007, an official told the ICBL that the decision about accession was at cabinet level. An ICBL delegation visiting Oman in October 2007 was assured in meetings with officials from the Ministry of Foreign Affairs that Oman would seriously consider accession, and these officials expressed the hope that this would happen soon. In April 2007, an Omani military official told the ICBL that Oman already basically abides by the provisions of the Mine Ban Treaty and that "something will happen soon" regarding accession.

² ICBL meeting with Maj. Muslim Elbarami, Ministry of Defense, at the Dead Sea, 19 November 2007. On 25 February 2007, Hanwha Corporation in the Republic of Korea transferred 750 remote-controlled Claymore directional fragmentation charges to Oman for US\$200,000. These munitions are not considered mines under the Mine Ban Treaty, as long as they are not tripwire activated. Response to Landmine Monitor questionnaire by the Permanent Mission of the Republic of Korea to the UN in New York, 16 June 2008.

³ ICBL meeting with Maj. Muslim Elbarami, Ministry of Defense, at the Dead Sea, 19 November 2007.

⁴ ICBL meeting with Col. Abdelaziz Al Mahrun, Ministry of Defense, in Geneva, 23 April 2007; and response to Landmine Monitor questionnaire by the Ministry of Defense, 27 February 2001.

⁵ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 224.

PAKISTAN

Ten-Year Summary

The Islamic Republic of Pakistan's mine ban policy has changed little in the past decade: it has repeatedly stated that antipersonnel mines are a necessary part of its self-defense strategy. Pakistan has abstained from voting on every pro-ban UN General Assembly resolution since 1996. It made extensive use of antipersonnel mines from December 2001 to mid-2002, during an escalation of tensions with India. In December 2006, Pakistan stated its intention to mine some sections of its border with Afghanistan, but did not after widespread international criticism. The country remains one of the few mine producers, manufacturing both detectable hand-emplaced antipersonnel mines and remotely-delivered mines. Pakistan's ban on the export of antipersonnel mines has been in place since 1999. Non-state armed groups have used antipersonnel mines in the North-West Frontier Province, Federally Administered Tribal Areas, and Balochistan.

Pakistan is affected by both mines and explosive remnants of war (ERW) close to its border with Afghanistan, along its border with India, and possibly also in the Swat Valley as a result of combat between the army and members of non-state armed groups. The army retains the primary responsibility for demining.

Landmine Monitor recorded at least 1,969 casualties from mines, ERW, and victim-activated improvised explosive devices (IEDs) between 1999 and 2008 (728 killed, 1,146 injured, and 95 unknown). Mine/ERW risk education (RE) was conducted in Pakistan from 2000 to 2006 by a number of NGOs, mainly for at-risk communities and Afghan refugees. By 2008, however, no NGOs were active in RE. The army was reported to have conducted some RE activities, but no evidence was found of this. While Pakistan asserted that mine/ERW/IED survivors "are properly looked after,"¹ most survivors live in poor, conflict-affected regions with limited access to services. Pakistani law protects the equality of persons with disabilities and provides employment quotas but enforcement is lacking.

Mine Ban Policy

Pakistan has not acceded to the Mine Ban Treaty. In April 2009, a Ministry of Foreign Affairs official confirmed that Pakistan's views have not changed.² It has consistently maintained that: "Pakistan remains committed to pursue the objectives of a universal and non-discriminatory ban on anti-personnel mines in a manner which takes into account the legitimate defence requirements of States. Given our security compulsions and the need to guard our long borders, not protected by any natural obstacle, the use of landmines forms an important part of our self-defence strategy. As such, it is not possible for Pakistan to agree to the demands for the complete prohibition of anti-personnel landmines till such time that viable alternatives are available."³

Pakistan attended as an observer the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008, but did not make any statements. It has not attended any intersessional Standing Committee meetings since 2002.

On 2 December 2008, Pakistan abstained from voting on UN General Assembly Resolution 63/42 calling for universalization of the Mine Ban Treaty. It abstained on all previous annual UNGA resolutions in support of the treaty.

¹ CCW Amended Protocol II Article 13 Report (for the period 16 August 2006 to 15 August 2007), Form B.

² Interview with Muhammad Kamran Akhtar, Director, Disarmament Division, Ministry of Foreign Affairs, Islamabad, 23 April 2009.

³ Pakistan, Explanation of Vote on the draft UN General Assembly resolution, A/C.1/62/L.39, 17 October 2007. See also *Landmine Monitor Report 2008*, p. 973; *Landmine Monitor Report 2007*, pp. 948–949; and *Landmine Monitor Report 2006*, p. 1,039.

Pakistan is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines. Pakistan submitted its annual report required by Article 13 in September 2008. Pakistan became a party to CCW Protocol V on Explosive Remnants of War in February 2009.

As of 1 July 2009, Pakistan had not signed the Convention on Cluster Munitions.⁴

Pakistan NGOs Sustainable Peace and Development Organization (SPADO) and Community Appraisal and Motivation Programme (CAMP) distributed 500 copies of the Urdu translation of the Pakistan chapter of *Landmine Monitor Report 2008*. SPADO organized a poster competition held at the University of Peshawar on the national impact of landmines and cluster bombs.⁵

Use

The last confirmed use of antipersonnel mines by Pakistan took place between December 2001 and mid-2002, when it laid very large numbers of mines during an escalation of tensions with India.⁶ In December 2006, Pakistan stated its intention “to fence and mine some selective sections” of its border with Afghanistan to prevent cross-border militant activity, but did not do so after widespread international criticism.⁷

In addition, Pakistan maintains permanent minefields along certain portions of the Line of Control (LoC) in Kashmir. There were reports of new use of mines by Pakistani troops in Kashmir during the Kargil crisis in mid-1999.⁸

Interviews conducted by Landmine Monitor in 2009 in Balochistan, the Frontier Region of Kohat, North and South Waziristan, and Bajaur, Kurram, Mohmand, and Orakzai agencies revealed a general perception that Pakistani security forces use antipersonnel mines to protect military installations. But local populations could not offer specific details, and Landmine Monitor was not able to substantiate the allegations.⁹ According to a January 2009 news article, a person was killed when he stepped on an antipersonnel mine within the boundaries of a police station in Bannu Tehsil, North-West Frontier Province (NWFP).¹⁰

Production, transfer, and stockpiling

Pakistan is one of a small number of countries still producing antipersonnel mines.¹¹ Since January 1997, Pakistan Ordnance Factories has produced detectable versions of hand-emplaced blast mines in order to be compliant with CCW Amended Protocol II.¹² In 2007, Pakistan reported that it “has also planned incorporation of self-destruct and self-deactivation mechanism in its

⁴ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 225–226.

⁵ The posters were later displayed at a public exhibition. Emails from Raza Shah Khan, Executive Director, SPADO, Peshawar, 4 and 7 June 2009.

⁶ See *Landmine Monitor Report 2004*, pp. 1,087–1,088; and *Landmine Monitor Report 2003*, p. 661.

⁷ See *Landmine Monitor Report 2007*, pp. 949–951. In April 2009, a Ministry of Foreign Affairs official confirmed to Landmine Monitor that Pakistan decided to postpone consideration of laying mines on the Afghan border following international criticism, but also noted that those who criticized the contemplated action did not recommend any alternatives. Interview with Muhammad Kamran Akhtar, Ministry of Foreign Affairs, Islamabad, 23 April 2009.

⁸ See *Landmine Monitor Report 2004*, p. 1,088.

⁹ Landmine Monitor conducted interviews with community elders, staff of NGOs and humanitarian agencies, and journalists in Balochistan from 28–30 March 2009, and in the other locations from 15–20 March 2009. See also *Landmine Monitor Report 2008*, p. 974.

¹⁰ “Landmine Blast Kills Man,” *Associated Press of Pakistan*, 4 January 2009, www.app.com.pk.

¹¹ Pakistan Ordnance Factories, located in Wah cantonment, is a state-owned company established in 1951 that in the past produced six types of antipersonnel landmines, two low-metal blast mines (P2Mk1 and P4Mk2), two bounding fragmentation mines (P3Mk2 and P7Mk1), and two directional fragmentation Claymore-type mines (P5Mk1 and P5Mk2).

¹² Article 13 Report, Form C, 2 November 2005; and Sixth Annual Conference of States Parties to CCW Amended Protocol II, “Summary Record of the 1st Meeting, Geneva, 17 November 2004,” Geneva, CCW/AP II/CONF.6/SR.1, 13 May 2005, p. 14.

future production” in order to meet Amended Protocol II requirements.¹³ The protocol requires that all remotely-delivered mines have self-destruct and self-deactivation mechanisms. Pakistan reported in 2002 that it was developing a remotely-delivered antipersonnel mine system, but has provided no further details.¹⁴

Pakistan’s Statutory Regulatory Order No. 123 (1) of 25 February 1999 makes the export of antipersonnel mines illegal.¹⁵ The law penalizes importation of mines, but no data is available regarding whether people have been arrested or charged under this law. Pakistan states that it has not exported mines “since early 1992.”¹⁶ In the past, the country was a major exporter of landmines. Pakistani-made mines have been found in Afghanistan, Bangladesh, Eritrea, Ethiopia, Somalia, Sri Lanka, and elsewhere.

There is no official information available on the size of Pakistan’s antipersonnel mine stockpile. Landmine Monitor has estimated that Pakistan stockpiles at least six million antipersonnel mines, the fifth largest stockpile in the world.¹⁷ Pakistan has neither confirmed nor denied this estimate. In previous years, Pakistan reported that it destroyed “a large number of outdated mines every year.” However, no information about the quantity or types of mines destroyed has been made available for 2008.¹⁸ In 2007, Pakistan stated that it had “met the deadlines to improve the specifications on detectability of mines” to be compliant with Amended Protocol II.¹⁹

Non-state armed groups

Non-state armed groups (NSAGs) have sporadically used antipersonnel mines, antivehicle mines, and IEDs in attacks on Pakistani security forces and civil administration, and in sectarian, inter-tribal, and inter-family conflicts.²⁰ Use of mines has been recorded in some districts of the NWFP, in the Federally Administered Tribal Areas (FATA), including North and South Waziristan and the Frontier Regions of Bannu, Dera Ismail Khan, Kohat, and Tank, and in Balochistan province.

¹³ Article 13 Report (for the period 16 August 2006 to 15 August 2007), Form C. In its Article 13 report for the period 16 August 2007 to 15 September 2008, Pakistan used the short form, and Form C is marked “unchanged.”

¹⁴ See *Landmine Monitor Report 2002*, p. 724.

¹⁵ Article 13 Report, Form D, 10 November 2006 states “Pakistan has declared a complete ban on export of landmines, even to States Parties, with effect from March 1997.”

¹⁶ Interview with Muhammad Kamran Akhtar, Ministry of Foreign Affairs, Islamabad, 23 April 2009. See also *Landmine Monitor Report 2002*, p. 725.

¹⁷ In a December 1999 meeting between the ICBL and Brig. Feroz Khan, Director, Arms Control and Strategic Affairs, Ministry of Defense, in Geneva, Brig. Khan noted that since 1997 Pakistan had converted 2.5 million antipersonnel mines to detectable status. He said that at one time this represented about one-third of Pakistan’s total stockpile, but [in 1999] represented a higher proportion. He noted that the stockpile number is a state secret, and that the number is fluid and could increase in the future. Based on these comments, the ICBL estimated that Pakistan could maintain a stockpile of at least six million antipersonnel mines.

¹⁸ In its Article 13 Report (for the period 16 August 2007 to 15 September 2008), Pakistan used the short form, and Form B is marked “unchanged.” It is unclear if this means they continue to destroy large numbers of mines each year, as was stated in the previous Article 13 Report (for the period 16 August to 15 August 2007). The same was reported in Pakistan’s Article 13 reports submitted in November 2006 and November 2005.

¹⁹ Article 13 Report (for the period 16 August 2006 to 15 August 2007), Form C. The nine-year deadline for Pakistan to destroy or modify all stockpiled low-metal-content (non-detectable) antipersonnel mines was 3 December 2007. Pakistan provided no details about how or when it met the requirement.

²⁰ Pakistan has stated in its previous annual Article 13 reports that NSAGs “have several times used mines and improvised explosive devices against army personnel and civil administration. The Corps of Military Engineers continues to assist both military and civil authorities in defusing and clearing such devices.” In its Article 13 Report for the period 16 August 2007 to 15 September 2008, Pakistan used the short form, and indicated this is “unchanged.” See Article 13 Reports (for the period 16 August 2006 to 15 August 2007), 10 November 2006, and 2 November 2005

North-West Frontier Province

Increased armed conflict took place in Upper Dir, Lower Dir, and Swat districts of the NWFP in 2008 and 2009 between government troops and Taliban groups. During its offensive in the Swat Valley, Taliban groups were reported to have used antipersonnel landmines.²¹ According to Human Rights Watch, in mid-May 2009, the Taliban laid mines in eight locations in Mingora and in four places in nearby Sharifabad after they had seized those areas.²² The Pakistani army media officer in Mingora told the ICBL that the army has encountered victim-activated IEDs and factory-made antipersonnel and antivehicle mines in the Swat Valley, which it attributes to the Pakistani Taliban and “foreign elements.”²³

Federally Administered Tribal Areas

With increased fighting in several parts of FATA in 2008 and 2009, there have been reports of antipersonnel mine, antivehicle mine, and IED incidents in Bajaur and Mohmand agencies.²⁴ Prominent members of different agencies in FATA confirmed on the condition of anonymity that militants continued to use antipersonnel mines.²⁵ Despite an earlier ban on the sale of mines in FATA, the collapse of state authority in some areas meant that mines were available in local markets. Tribes and sub-clans living along the Durand Line in Waziristan are believed to have kept stockpiles of mines since the time of Afghan-Soviet conflict.²⁶

Balochistan

The Balochistan Liberation Army, Balochistan Republic Army, Balochistan Liberation United Front, and Taliban groups used antipersonnel mines, antivehicle mines, and/or IEDs in 2008 and 2009, mostly targeted at the Pakistani army and Frontier Corps, but civilians have also been killed and injured.²⁷ In August 2008, a man died after stepping on an antipersonnel mine in Dera Bugti district;²⁸ another man was injured in September 2008 after stepping on an antipersonnel mine in Nasirabad district.²⁹ In April 2009, three children were killed by an antipersonnel mine in Jaffarabad district (See Casualties section below).³⁰ In October 2008, it was reported that the Frontier Corps had seized antipersonnel mines, among other weapons, in Balochistan.³¹

Kashmir

Many political and armed organizations opposing the Indian government reside in Pakistani-administered Kashmir, but they do not carry out armed activities in Pakistan. In October 2007, the United Jihad Council issued a statement in which it pledged not to use antipersonnel mines.³²

Scope of the Problem

Contamination

Despite clear evidence to the contrary, Pakistan has repeatedly affirmed that it “faces no problem of un-cleared mines; hence no casualties were caused accidentally.”³³ It has also stated “mines have never caused humanitarian concerns in Pakistan, despite having fought three wars with India and... [a] military standoff during 2001–2002.”³⁴

However, evidence that Pakistan is affected by both mines and ERW includes mine/ERW casualties recorded during 2008 and 2009. Moreover, Pakistan’s Article 13 report published in 2007 reports that “in the area adjoining Pakistan-Afghanistan border, sometimes mines are encountered, but these are mines left by the former Soviet troops.”³⁵ It also states, “Existing perimeter marking signs have been painted and marked according to [Amended Protocol] AP-II standards,” acknowledging that some mined areas remain.³⁶

No estimate exists of the extent of contamination but growing conflict between the government and militants in 2009 has reportedly resulted in new use. Human Rights Watch cited residents of Mingora town in the Swat Valley as saying the Taliban had placed mines in the town as the army embarked on its offensive to drive them out of the area in May 2009.³⁷

Pakistan has declared that mines it laid on the Indo-Pakistan border during the 2001–2002 stand-off with India “have been completely cleared.”³⁸ It has also claimed that “minefields laid along the Line of Control (LoC) are properly fenced and clearly marked to impose requisite caution on civilians living in the surrounding areas.”³⁹ However, inhabitants of Pakistani-administered Kashmir report consistently that some areas along the LoC are still contaminated and have not been properly fenced by the militaries of either India or Pakistan.⁴⁰ Inhabitants of Garhi Sher Khan in Poonch district, for example, informed Landmine Monitor that villages on both sides of the LoC were contaminated by mines and ERW, and that rainfall caused mines to drift onto the Pakistani side of the border from higher areas on the Indian side.⁴¹

The government has acknowledged that a mine problem does exist from mines left by Soviet troops on the Pakistan-Afghan border.⁴² Contamination dates from the Soviet occupation of Afghanistan (1979–1989), when mines were scattered by Soviet and Afghan forces from helicopters, and the mujahideen used mines to protect their bases in the tribal areas.⁴³ In North and South Waziristan, local inhabitants told Landmine Monitor during field research in 2007, 2008, and 2009 that NSAGs, including the Taliban and tribal armed elements, continued to use former mujahideen bases, and that the area around these camps was contaminated with mines

emplaced by the NSAGs as well as by mines dating back to the Afghan-Soviet war. Inhabitants of the two tribal areas said mine incidents were still occurring, but did not provide specific casualty data.⁴⁴

Casualties

In 2008, there were at least 341 mine, ERW, and victim-activated IED casualties (145 killed and 196 injured) in Pakistan. Most of the casualties were civilian (190) and 151 were security forces. The overwhelming majority of the casualties were men (302), 13 were boys, and seven were women: for 19 casualties, age and gender were unknown. Antivehicle mines were the main cause of casualties (145, including 69 civilians), followed by antipersonnel mines (67, including 50 civilian casualties), other mines (44, including 39 civilians), and ERW (18, all but one civilian). For the remainder, the device causing the casualties was unknown.⁴⁵ Due to increased conflict the casualty rate in 2008 is an increase from the 271 recorded casualties in 2007, but remained lower than 2006 (488).⁴⁶

Casualties continued to occur in 2009 with at least 67 mine/ERW/victim-activated IED casualties (38 killed and 29 injured) as of 31 May. All were caused by mines, including five antipersonnel mine casualties. Fifty-one casualties were civilian (including four children) and 16 were military.⁴⁷

The total number of mine/ERW/victim-activated IED casualties in Pakistan is unknown. Landmine Monitor recorded at least 1,969 casualties between 1999 and 2008 (728 killed, 1,146 injured, and 95 unknown).⁴⁸ Between 1980 and 2002, the Pakistan Campaign to Ban Landmines identified 1,038 landmine/ERW casualties (377 killed, 566 injured, and 95 unknown).⁴⁹

Landmine Monitor visited several refugee camps in April 2008 and April 2009 and identified at least 60 survivors out of some 24,000–30,000 refugees in Raro, Amboor, and Manakpaiyan I, II, and III refugee camps. Most survivors were injured when crossing the LoC.⁵⁰ In 2007, a Response International (RI) household survey in Pakistani-administered Kashmir identified at least 234 survivors in Abbaspur and Hajira in Rawalakot district close to the LoC.⁵¹

In its Sixth Five Year Plan, the government estimated that persons with disabilities comprised approximately 2.5% of the total population.⁵²

Risk profile

In recent years, people have been at increased risk of mines, ERW, and victim-activated IEDs due to exacerbated conflict and mine use in tribal disputes. Although the army is sometimes targeted, civilians are most at risk, particularly while traveling.⁵³ In Kotli and Bhimber, RI found that people near the LoC in Kashmir are most at risk from antipersonnel mines, especially after periods of heavy rainfall when mines tend to drift. Most at risk are men and boys engaged in cutting wood, grazing animals, or farming.⁵⁴

⁴⁴ Landmine Monitor field research, North and South Waziristan, 2–5 April 2007, 16–22 March 2008, and 15–20 March 2009. Bermal, which is located half in Pakistan and half in Afghanistan, was bombarded by American forces, while Azam Warsak is 40–50 miles (64–80km) inside Pakistan. Shakai is on the boundary of North and South Waziristan. These camps were operational in the Afghan-Soviet war and are still operational under the command of local Taliban leaders.

Program Management and Coordination

Mine action

Pakistan has no formal civilian mine action program. The Ministry of Foreign Affairs disclosed plans in 2007 to establish a Training Center for Demining and Awareness to act as a mine action center for operations in Pakistan and overseas, and to provide RE in affected areas of Pakistan. However, a Ministry of Foreign Affairs official told Landmine Monitor in April 2009 that the ministry had made no progress with this initiative.⁵⁵

Victim assistance

Pakistan does not have programs or a strategic framework specifically addressing the needs of mine/ERW/IED survivors. The National Council for the Rehabilitation of Disabled Persons formulates disability policy and also provides “some job placement and loan facilities as well as some subsistence funding.”⁵⁶ The Ministry of Women’s Development, Social Welfare and Special Education and the National Institution of the Handicapped, within the Ministry of Health, coordinate and provide services.⁵⁷

The 2002 National Policy for Persons with Disabilities established objectives and strategies for the full integration of persons with disabilities by 2025.⁵⁸ In 2006, a five-year action plan was developed to implement the policy.⁵⁹ In 2008, the government announced the creation of a “National Task Force on welfare, education, training and rehabilitation of Persons with Disabilities,” chaired by the Secretary Ministry of Social Welfare and Special Education.⁶⁰ In May 2009, Landmine Monitor was unable to confirm specific outputs of the task force.

Data collection and management

There is no comprehensive casualty data collection mechanism in Pakistan. Hospital records do not differentiate between mine/ERW survivors and other amputees. Many incidents go unreported by the media, as they generally occur in remote, conflict-affected regions. Landmine Monitor obtains much of its casualty data from SPADO and CAMP, which monitor the media and obtain casualty information through their field operations. They developed a unified monitoring system in 2008, but a SPADO representative told Landmine Monitor that many casualties go unreported.⁶¹

Demining and Battle Area Clearance

Mine and battle area clearance is carried out by engineer units of the armed forces.⁶² The army was reported to have conducted demining operations in the area of Chamalang in Balochistan in 2009, clearing antivehicle mines and other unspecified mines.⁶³ In 2007, the army cleared 200 mines from the Chamalang coalfield in Loralai district after a dispute over its ownership

between the Marri and Luni tribes led to the laying of mines. The clearance operation was reportedly completed without any deminer casualties.⁶⁴

Pakistan's paramilitary Frontier Constabulary and army engineers are said to have also undertaken demining operations in FATA.⁶⁵ However, the FATA security apparatus does not have the technical capacity or equipment to undertake demining operations and are unable to provide security for mine clearance.⁶⁶

Risk Education

Pakistan has no strategic framework for mine/ERW RE, nor are any organizations providing RE for civilians in contaminated areas. As noted above, there was no evidence of any progress in plans to create a government Training Center for Demining and Awareness.⁶⁷ In its latest CCW Amended Protocol II Article 13 report, Pakistan stated that its RE situation was "unchanged" since it reported in 2007 that its army engineers were educating people in the "border belt regarding the hazards posed by mines."⁶⁸ However, in field research and interviews with aid workers, activists, and journalists, Landmine Monitor was unable to identify any measures put in place by local authorities in border areas to protect civilians from mines.⁶⁹

In 2008, RI conducted needs assessments in Kotli and Bhimber districts, which showed an "acute" need for RE.⁷⁰ But it was unable to secure funding, and thus did not provide any RE in 2008.⁷¹

RE started in Pakistan in 2000 with one NGO in Bajaur agency (FATA). The number of organizations and geographical coverage increased in 2001 and RE was delivered in Afghan refugee camps, as well as to local communities. In 2006, RE activities reduced considerably, and by 2007 RI was the only NGO implementing an RE program and it worked to leave a residual capacity and train community-based organizations.⁷²

Victim Assistance

The estimated number of survivors is unknown, but at least 1,146. There are no specific victim assistance (VA) programs in Pakistan and survivors receive the same services as other persons with disabilities.

In its latest CCW Amended Protocol II Article 13 report, Pakistan asserted that survivors "are properly looked after" with compensation, rehabilitation, and a disability allowance.⁷³ Since most survivors live in poor, conflict-affected regions, they have limited access to services. Landmine Monitor field research in March 2009 confirmed a continuing lack of the necessary emergency and continuing medical care services in the mine-affected areas of Balochistan, FATA, and Pakistani-administered Kashmir. Seriously injured survivors continued to be referred to hospitals in major cities. Healthcare in the conflict regions deteriorated further in 2008, as NGOs continued to pull out, due to the security threat.⁷⁴

⁷³ Article 13 Report (for the period 16 August 2006 to 15 August 2007), Form B.

⁷⁴ Landmine Monitor field research, North and South Waziristan and other areas of FATA, 15–20 March 2009.

Military hospitals in the conflict areas reportedly provided better medical care to mine/ERW/IED casualties than civilian hospitals. However, these hospitals were largely closed to civilians, even though some Kashmiri migrants injured by landmines while crossing the Kashmiri LoC were reportedly treated.⁷⁵

According to the ICRC, “political turmoil continued to hamper access to services in most regions where the ICRC provides assistance for physical rehabilitation services.”⁷⁶ It added that, “the network of centres providing physical rehabilitation services remained inadequate to meet existing needs.”⁷⁷

In 2008, the Pakistani government launched the Benazir Income Support Fund, a social security fund to assist poor and vulnerable people.⁷⁸ The fund will reportedly provide Rs1,000 (US\$14) a month for persons with disabilities and Rs2,000 (\$28) a month for those with severe disabilities.⁷⁹

Pakistani law protects the equality of persons with disabilities and provides an employment quota, reserving 2% of jobs for them in the public and private sectors. Employers that do not adhere to the quota are supposed to pay a fine to a disability assistance fund, but there was a “lack of adequate enforcement mechanisms.”⁸⁰

The National Council for the Rehabilitation of the Disabled provided job placement and financial assistance. It also ran the Pakistan Society for the Rehabilitation of the Disabled, which provided “rehabilitation, vocational training, and some medical support to persons with disabilities.”⁸¹

Pakistan signed the UN Convention on the Rights of Persons with Disabilities on 25 September 2008, but it had not yet ratified the convention or its Optional Protocol as of 1 July 2009.

Victim assistance activities

In 2008, the ICRC continued to provide support through training, mentoring, and funding for physical rehabilitation projects. Altogether, 5,277 patients attended the ICRC-funded centers and 758 prostheses (39% for mine survivors), 1,078 orthoses (8% for mine survivors), 118 wheelchairs, and 309 pairs of crutches were provided.⁸² The ICRC also provided 104 grants to persons with physical disabilities in the Muzaffarabad district, who were registered at the Muzaffarabad Physical Rehabilitation Center. The aim of this project was to reintegrate persons with disabilities “into mainstream society by improving their socio-economic conditions.”⁸³

In 2008, the Pakistan Institute of Prosthetic and Orthotic Sciences (PIPOS) signed a Memorandum of Understanding with the ICRC to provide free rehabilitation services to persons with disabilities, including landmine survivors, in FATA and the NWFP.⁸⁴ The ICRC provided formal prosthetic and orthotic training to three PIPOS staff in 2008.⁸⁵

CAMP operated a Disability Resource Center in Mansehra, offering referral and a national advocacy campaign in cooperation with the UK-based NGO Leonard Cheshire Disability. In 2008, it provided assistance to 110 people, including three survivors from Bajaur agency.⁸⁶ CAMP also started a Primary Trauma Care Course in collaboration with local authorities in FATA. The training aimed to provide basic trauma care skills to health workers in remote areas. As of December 2008, 100 health workers had participated in the course and seven District Headquarters Hospitals were assisted with mobile Primary Trauma Kits. The center is also authorized to issue disability certifications facilitating access to services available for persons with disabilities. It issued 62 such certificates during 2008.⁸⁷

Hayat Shaheed Teaching Hospital in Peshawar reported that it had provided 11 prostheses to mine survivors from different parts of FATA on a “no loss, no profit” basis. Financial support for these survivors was provided by the Ministry of Religion’s Zakat fund for humanitarian assistance.⁸⁸

In 2008, the Human Development Promotion Group, which has provided prosthetics to some 80 mine/ERW survivors since 2003, announced a new project to assist a further 15 survivors, with support from First Hands Foundation of the United States.⁸⁹ While RI provided assistance to survivors in the past,⁹⁰ it did not do so in 2008.

Other organizations providing services to survivors (and other persons with disabilities) were Helping Hand for Relief and Development,⁹¹ the Lady Reading Hospital,⁹² Sarhad Society for Rehabilitation of the Disabled, the Hayatabad Medical Complex, and the Habib Physiotherapy Complex, which also continued to run its physiotherapy degree program.⁹³

RUSSIA

Ten-Year Summary

The Russian Federation has not acceded to the Mine Ban Treaty. Russia has not attended a Mine Ban Treaty meeting since May 2003. It has consistently abstained in voting on the annual UN General Assembly resolution calling for universalization of the Mine Ban Treaty. In the past decade, Russia has used antipersonnel mines in Chechnya, Dagestan, Tajikistan, and on its border with Georgia. It is not believed to have used antipersonnel mines in the August 2008 conflict with Georgia over South Ossetia. Russia stated it stopped production of blast mines in 1997. It is not known to have exported any antipersonnel mines since 1994. In November 2004, Russia for the first time revealed that it had a stockpile of 26.5 million antipersonnel mines, stating that it had destroyed 19.5 million since 2000. It has apparently been destroying about one million mines per year since 2005. Russia ratified the Convention on Conventional Weapons Amended Protocol II on landmines on 2 March 2005 and Protocol V on Explosive Remnants of War on 21 July 2008.

Russia is heavily contaminated with mines and explosive remnants of war (ERW). The mine problem, especially in Chechnya, remains to be addressed effectively by the authorities. In July 2009, federal and regional leaders pledged to speed up demining of the republic.

Landmine Monitor identified 2,795 casualties in Russia from 1999 to 2008, of which 2,609 (616 killed and 1,993 injured) occurred in Chechnya and 186 (63 killed, 120 injured, and three unknown) in the rest of the country.

UNICEF, the ICRC, Danish Demining Group, and Voice of the Mountains were the most significant providers of risk education (RE) over the last ten years, which was largely focused on Chechnya. A lack of funds has reduced RE coverage in the last three years. Attempts to transfer responsibility for data collection and RE from UNICEF to a Chechen Mine Information Center have been stymied by a lack of local government funds.

Emergency and continuing medical care, rehabilitation, and reintegration services are available for persons with disabilities, including mine/ERW survivors, throughout Russia, but quality and coverage varies across regions. The healthcare system is reportedly understaffed and suffering from widespread corruption. Benefits for persons with disabilities improved somewhat in 2008, but remained inadequate. Despite legal prohibitions against discrimination, persons with disabilities faced widespread social exclusion.

Healthcare in Chechnya improved in 2007 and 2008, with increased government funding. However, considerable challenges remained, exacerbated by ongoing instability. Victim assistance (VA) in Chechnya improved from 2001 to 2004, with UNICEF support to prosthetics production, physical rehabilitation, and vocational training. However, due to lack of funds, UNICEF has progressively reduced its involvement in VA in Chechnya. There were thus few opportunities for psychosocial support or economic reintegration in 2008.

Mine action, particularly RE, VA, and advocacy in Chechnya faced a major setback with the murder of Zarema Sadulayeva, head of the NGO Let's Save the Generation, and her husband in August 2009.

Mine Ban Policy

Russia has not acceded to the Mine Ban Treaty. It has often cited the military utility of antipersonnel mines, the lack of viable alternatives, and the financial difficulties in destroying its large stockpile within four years as reasons for not joining.¹ However, Russia continues to express support for the

¹ At a January 2007 press conference, the chief of Russia's engineering troops, Col.-Gen. Nikolay Serdtsev, stated, "The Russian armed forces cannot allow themselves to give up the use of landmines, which for a long time will remain one of the most effective and inexpensive types of defensive weapon." "Russia needs landmines: army general," *Agence France-Presse*, 19 January 2007.

treaty's humanitarian objectives.² In November 2007, Russia said that "movement along the road towards peace without mine weapons should be realistic and consistent...."³ In November 2008, Russia repeated the need for progress to be "realistic and consistent."⁴ In June 2009, a Russian official told Landmine Monitor that Russia is committed to the objective of a mine-free world, but reiterated that any prohibition must take into account national security considerations.⁵ According to the official, Russia's accession to the Mine Ban Treaty is dependent on "solving a number of technical, financial and other tasks" related to implementation.

On 2 December 2008, Russia abstained from voting on UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty, as it has done on every annual pro-ban General Assembly resolution.

Russia did not attend the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008, or the May 2009 intersessional Standing Committee meetings. The last time Russia attended a Mine Ban Treaty meeting was in May 2003.

Russia is party to the Convention on Conventional Weapons (CCW) and its Amended Protocol II on landmines.⁶ It submitted a national annual report as required by Article 13 on 30 October 2008. Russia used Amended Protocol II's optional nine-year extension to defer (until 3 December 2007) its compliance with the protocol's technical requirements for self-destruct and self-deactivation mechanisms for remotely-delivered antipersonnel mines and detectability for antipersonnel mines. In November 2007, Russia said, "By the end of this year a set of measures to implement requirements of the Protocol...will be nearing its completion."⁷ In November 2008, Russia said it had "fine-tuned and adopted for execution a national system for technical standards of landmines, including [antipersonnel mines] APMs."⁸

Russia has provided few details about how it is complying with the protocol's technical requirements.⁹ In June 2009, a Russian official told Landmine Monitor that an array of measures have been undertaken including destruction and disposal of outdated landmines and deployment of new mine detection and clearance devices.¹⁰

Russia ratified CCW Protocol V on Explosive Remnants of War on 21 July 2008. As of 15 August it had not yet provided a national report as required by the protocol (due 20 July 2009).

Russia has not signed the Convention on Cluster Munitions.¹¹

Production, transfer, stockpiling, and destruction

Russia has produced at least 10 types of antipersonnel mines since 1992, including blast mines (PMN, PMN-2, PMN-4, and PFM-1S) and fragmentation mines (POMZ-2, OZM-72, MON-50, MON-90, MON-100, and MON-200). Russia has stated on several occasions that its production

² Russia stated in November 2006 that "a mine-free world remains our common goal. Nonetheless, we have noted on several occasions that our movement towards this goal has to be realistic and gradual, sustaining the necessary level of security and stability." Statement of Russia, Eighth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2006.

³ Statement of Russia, Ninth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2007.

⁴ Statement of Russia, Tenth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 12 November 2008.

⁵ Interview with Ministry of Foreign Affairs official, Moscow, June 2009.

⁶ Russia submitted a series of declarations with its ratification instrument that will guide its national implementation of Amended Protocol II. For details of the declarations, see *Landmine Monitor Report 2005*, pp. 854–855.

⁷ Statement of Russia, Ninth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2007.

⁸ Statement of Russia, Tenth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 12 November 2008.

⁹ In November 2008, Russia said, "Information on implementation of Protocol II by Russia has been submitted in a question-answer form to the Secretariat of our Conference." Statement of Russia, Tenth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 12 November 2008.

¹⁰ Interview with Ministry of Foreign Affairs official, Moscow, June 2009.

¹¹ For details on cluster munition policy and practice see HRW and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 230–235.

of blast mines stopped in 1997.¹² Russia has been conducting research on modifications to existing landmines, new landmines, and alternatives to landmines since at least 1997.¹³

Russia has had a moratorium on the export of antipersonnel mines that are not detectable or equipped with self-destruct devices since 1 December 1994. The moratorium formally expired in 2002, but Russian officials have stated, most recently in June 2009, that it is still being observed.¹⁴ Russia is not known to have made any state-approved transfers of any type of antipersonnel mine since 1994.

In November 2004, Russia for the first time released official information on the number of antipersonnel mines in its stockpiles, when Minister of Defense Sergei Ivanov cited a figure of 26.5 million. The minister forecast that approximately 23.5 million of these antipersonnel mines would be destroyed between 2005 and 2015. He said that in 2000 Russia stockpiled 46 million antipersonnel mines, but had since destroyed or disposed of about 19.5 million of them.¹⁵

It appears that in recent years, Russia has been destroying about one million stockpiled antipersonnel mines per year. Russia has provided varying numbers and time periods for the total number of stockpiled antipersonnel mines that it has destroyed. In November 2008, Russia stated that “about 10 million anti-personnel mines” had been destroyed in “recent years.”¹⁶ In November 2007, an official said “around 9 million anti-personnel mines” had been destroyed in “previous years.”¹⁷ In November 2006, a Russian official said, “more than 8 million” antipersonnel mines had been destroyed over “recent years.”¹⁸ In January 2005, a Russian official said more than seven million stockpiled antipersonnel mines had been destroyed.¹⁹

Russian officials have acknowledged that Russian military units in other members of the Commonwealth of Independent States maintain antipersonnel mine stockpiles, such as 18,200 in Tajikistan and an unknown number in Georgia (Abkhazia).²⁰

¹² See for example, Statement of Russia, Tenth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 12 November 2008; statement of Russia, Ninth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2007; and statement of Russia, Third Annual Conference of States Parties to CCW Amended Protocol II, 10 December 2001. In January 2005, Russia said it had not developed, produced, or supplied blast mines to its armed forces for more than nine years. Statement by Amb. Leonid Skotnikov, Plenary Meeting of the Conference on Disarmament, Geneva, 27 January 2005.

¹³ Maj.-Gen. Alexander Averchenko, “Traditional and New Tasks,” *Amreysky Sbornik*, No. 1, 1997. In 2004, Russia said it has spent or plans to spend RUB3.33 billion on research, development, and production of new engineer munitions, including alternatives to antipersonnel mines. Statement by Sergei Ivanov, Minister of Defense, parliamentary hearings on ratification of Amended Protocol II, 23 November 2004.

¹⁴ Interview with Ministry of Foreign Affairs official, Moscow, June 2009. In November 2006, Amb. Anatoly I. Antonov stated, “Starting from 1994 we have been observing the moratorium on the export of the most dangerous APMs.” Eighth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2006. In August 2006, Russia told the Conference on Disarmament, “We are interested in working out a universal international agreement on banning the transfer of the most dangerous antipersonnel mines.” Statement by Amb. Valery Loshchinin, Permanent Representative of the Russian Federation, Plenary Meeting of the Conference on Disarmament, Geneva, 10 August 2006.

¹⁵ Statement by Sergei Ivanov, parliamentary hearings on ratification of CCW Amended Protocol II, 23 November 2004.

¹⁶ Statement of Russia, Tenth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 12 November 2008. Perhaps contradicting this trend, an official asking not to be identified told *Landmine Monitor* in June 2009 that Russia had destroyed “more than 8 million” antipersonnel mines during “the last few years.” Interview with Ministry of Foreign Affairs official, Moscow, June 2009.

¹⁷ Statement of Russia, Ninth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2007.

¹⁸ Statement of Russia, Eighth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 12 November 2006.

¹⁹ Statement by Amb. Leonid Skotnikov, Plenary Meeting of the Conference on Disarmament, Geneva, 27 January 2005.

²⁰ Tajikistan has reported that bilateral negotiations concerning Russian stockpiles of antipersonnel mines in Tajikistan are ongoing. Tajikistan Article 7 Report, Form B, 3 February 2008. Russia has apparently destroyed the stockpile of antipersonnel mines it had in the disputed Transnistria region of Moldova. See *Landmine Monitor Report 2006*, p. 535.

Use

The government of Georgia accused Russia of using antipersonnel mines during the August 2008 conflict over South Ossetia.²¹ Investigations by Human Rights Watch (HRW) found that Russian forces fired cluster munitions into populated areas of Georgia causing civilian casualties, but found no evidence of antipersonnel mine use by either Russia or Georgia.²² In a 30 January 2009 letter to HRW, a Russian Ministry of Foreign Affairs official denied Russian use of either antipersonnel mines or cluster munitions in the conflict.²³

Over the past decade, Russia has used antipersonnel mines on a regular basis, primarily in Chechnya, but also at times in Dagestan, Tajikistan, and on the border with Georgia.²⁴

In June 2006, Russian officials confirmed to Landmine Monitor that Russian forces continued to use antipersonnel mines in Chechnya, both newly emplaced mines and existing defensive minefields, noting, "Antipersonnel mines are used to protect facilities of high importance." They indicated that forces of the Ministry of Defense, Ministry of Interior, and Border Guards used mines.²⁵ In discussions with Landmine Monitor since 2006, Russian officials have not stated that use of antipersonnel mines has stopped. Landmine Monitor will continue to cite Russia as an ongoing and active user of antipersonnel mines until an official denial is made and confirmed by the facts on the ground.

Russia has generally argued that its mine use has been necessary to stop flows of weapons, drugs, and terrorists, and maintained that it has been in full compliance with CCW Amended Protocol II.²⁶

The Russian domestic media regularly reports stories of bombings and attacks against state structures conducted by insurgent, separatist, or criminal groups in the Caucasus regions of Chechnya, Dagestan, Ingushetia, North Ossetia, Kabardino-Balkaria, and other locations. While many reports referred to "landmines," it appears that in most cases armed groups used command-detonated improvised explosive devices (IEDs), time-delay bombs, or antivehicle mines, according to available information in media reports.²⁷

Chechen insurgents are considered expert at the manufacture and use of explosives, and regularly claim credit on the internet for the use of command-detonated IEDs and suicide bombs.²⁸ In June 2009, Russian officials told Landmine Monitor that Russia needed international

²¹ For example, Georgia provided the ICBL and others with a document titled "Bombed and Mined Areas During Russian Occupation (from 7 August 2008)," dated 26 August 2008, that alleges Russian use of antipersonnel mines in at least eight locations from 7 August to 21 August 2008.

²² See, HRW, *A Dying Practice: Use of Cluster Munitions by Russia and Georgia in August 2008* (New York: HRW, April 2009); and HRW, *Up In Flames: Humanitarian Law Violations and Civilian Victims in the Conflict over South Ossetia* (New York: HRW, January 2009).

²³ "Despite Georgian aggression in South Ossetia, the Russian Federation did not employ the use of cassette [cluster] bombs or antipersonnel landmines." Letter to HRW from Andrei Kelin, Director, Fourth Department for CIS Countries, Ministry of Foreign Affairs, 30 January 2009.

²⁴ For a summary of past use, see *Landmine Monitor Report 2004*, pp. 1,186–1,187.

²⁵ Interview with Russian delegation, CCW Group of Governmental Experts, Geneva, 23 June 2006. Translation by Russian delegation and notes by HRW. They insisted that all use of antipersonnel mines "complies with Amended Protocol II," that "all necessary documentation for minefields is retained," and that all minefields "are fenced and the civilian population informed." Russia has regularly acknowledged using antipersonnel mines in Chechnya in the past.

²⁶ See, for example, Statement by Amb. Anatoly I. Antonov to the CCW Group of Governmental Experts, Geneva, 18 November 2003. The Ministry of Defense has developed guidelines on laying minefields in compliance with the protocol's requirements. These are taught at the military schools and at special training courses in the armed forces. Statement of Russia, Eighth Annual Conference of States Parties to CCW Amended Protocol II, Geneva, 6 November 2006.

²⁷ See, for example, "Militiamen got ambushed in Kabardino-Balkaria," *Lenta.ru Information Agency*, 11 June 2009, www.lenta.ru; "Terror act in the capital of North Ossetia," *Kavkazsky Uzel Information Agency*, 6 November 2008, www.eng.kavkaz-uzel.ru; "In Dagestan, armoured Khasavyurt SIZO vehicle blown up," *Kavkazsky Uzel Information Agency*, 1 May 2009, www.eng.kavkaz-uzel.ru; and "Explosion in Ingushetia was aimed to kill best sappers, militia says," *Kavkazsky Uzel Information Agency*, 7 March 2009, www.eng.kavkaz-uzel.ru.

²⁸ See for example, "Details of mining operation in Jokhar," *Kavkaz-Center News Agency*, 21 December 2008; "Sabotage action in Jokhar," *Kavkaz-Center News Agency*, 25 April 2009; "Sheikh Sayeed Abu Saad: Reminder for Muslims," *Kavkaz-Center News Agency*, 23 May 2009; "Pro-Russian collaborators blown up in Jokhar," *Kavkaz-Center News Agency*, 10 June 2008; and "Martyr attacks a base of puppet police in Nazran," *Kavkaz-Center News Agency*, 17 August 2009.

assistance to conduct a full-scale humanitarian mine clearance operation in Chechnya due to the “active use” of antipersonnel mines by “Chechen rebels.”²⁹

Landmine Monitor has not conclusively identified any new use of antipersonnel mines by armed groups in Russia since 2007.³⁰ Casualties from antipersonnel mines continue to occur, but the date of placement of the mine, or who did so, is not certain.

In May 2009, a militia member was killed by a tripwire mine in the Urus-Martan district forest.³¹ In March 2009, a civilian in Dargo, Vedeno district of Chechnya, was killed by a landmine that was believed to be recently placed.³² Also in March, a Russian soldier was killed by a mine while on patrol in the Sunzhensk district of Ingushetia.³³ On 30 November 2008, two Russian soldiers were killed by a landmine near the village of Elistanzhi. In December 2008, it was reported that the Russian military must methodically clear mines, laid frequently by militants, in order to travel on the Elistanzhi-Vedeno highway.³⁴

Scope of the Problem

Contamination

Russia is heavily contaminated with mines and ERW, much of it resulting from World War II as well as conflict in the north Caucasus since the early 1990s. In addition to Chechnya, mine/ERW incidents have been reported in Dagestan, Ingushetia, and North Ossetia. ERW remain an acute problem in Dagestan, specifically in Botlikh, Buynaksk, and Novolaksky districts.

Mines have been used quite extensively in the two major conflicts in Chechnya. Estimates of the number vary greatly, because there has been no effort to comprehensively survey or catalogue the impact or scope of the problem.³⁵ In 2008, Chechen officials estimated that 24.5km² of land was affected—approximately one third of the contaminated areas were forest and the remainder was farmland.

Casualties

Landmine Monitor identified 45 mine/ERW/victim-activated IED casualties (10 killed, 32 injured, and three unknown) in Russia in 2008. Of these, 18 (five killed and 13 injured) were in Chechnya. Twelve (five killed and seven injured) of these were recorded by UNICEF, the rest were identified by Landmine Monitor from media reports.³⁶ The other 27 casualties (five killed, 19 injured, and three unknown) were from other regions of Russia.³⁷

Of the casualties in Chechnya, 10 were men, six boys, and two of unknown gender. Five casualties were military, and the civil status of the remaining 13 was unknown. Four casualties were caused by antipersonnel mines, one by an antivehicle mine, two by ERW, and one by a victim-activated IED; ten casualties were caused by unknown devices. The most common activity at the time of the incident was playing/recreation (six casualties), travel (four), handling ERW (two), collecting wood, water, or food (one), and herding (one); the activities of four casualties were unknown. Ten casualties had not received RE; it was not known whether the other eight had.³⁸

³⁶ Casualty statistics provided by email from Eliza Murtazaeva, Project Officer, Child Protection, UNICEF, 28 July 2009; and Landmine Monitor media monitoring, January 2008–June 2009.

³⁷ Landmine Monitor media monitoring, January 2008–June 2009.

³⁸ Casualty statistics provided by email from Eliza Murtazaeva, UNICEF, 28 July 2009; and Landmine Monitor media monitoring, January 2008–June 2009.

Of the casualties in the rest of Russia: five were men; one was a woman; one was a girl; the gender of two children was unknown; and the gender and age of the remaining casualties was unknown. Most of the casualties were civilians (23), three were security forces, and the civil status of one casualty was unknown. Three casualties were caused by victim-activated IEDs, one by ERW, one by an unspecified mine, and the devices causing the remainder of casualties were unknown.³⁹ Fifteen casualties were caused by an unknown device on Loo Beach, Lazarevsk district, Sochi, which exploded when a girl unwrapped a package she had found.⁴⁰

The 45 casualties in 2008 represent a decline from 2007, when Landmine Monitor identified a total of 53 casualties (21 killed and 32 injured), 44 (19 killed and 25 injured) of which were in Chechnya and nine (two killed and seven injured) in the rest of Russia.⁴¹ However, due to probable under-reporting of casualties, this is not necessarily indicative of a trend.

The total number of mine/ERW/victim-activated IED casualties in Russia is unknown. Landmine Monitor identified 2,795 casualties (679 killed, 2,113 injured, and three unknown) in Russia from 1999 to 2008, of which 2,609 (616 killed and 1,993 injured) occurred in Chechnya and 186 (63 killed, 120 injured, and three unknown) in the rest of the country.⁴² UNICEF reported a total of 3,106 casualties in Chechnya (725 killed and 2,381 injured) from 1994 to 2008.⁴³ *Landmine Monitor Report 2005* reported a total of 5,321 casualties (857 killed and 4,464 injured) in Chechnya reported by the Chechen Center of Catastrophe Medicine between 2002 and 2005. However, it is likely that this total included many casualties of command-detonated devices.⁴⁴

Of the casualties reported by UNICEF in Chechnya from 1994 to 2008, the majority were men (1,894), followed by boys (636), women (442), and girls (134). Antipersonnel mines caused the most casualties (1,030), followed by ERW (913), antivehicle mines (234), and victim-activated IEDs (220); 709 were caused by unknown devices. Most casualties were bystanders/passers-by at the time of the incident (752), other activities included travel (685), handling or tampering with explosive devices (322), collecting wood, water, or food (303), agriculture (221), herding (197), playing/recreation (180), fishing or hunting (19), or scrap collection (13); the activities of 414 casualties were unknown. Only 52 casualties had received RE and 2,084 had not; it was unknown whether the remaining 970 had.⁴⁵

³⁹ Landmine Monitor media monitoring, January 2008–June 2009.

⁴⁰ “Explosion on Sochi beach kills two persons,” *Caucasian Knot*, 7 August 2008, www.eng.kavkaz-uzel.ru.

⁴¹ This includes the media reports of casualties reported in *Landmine Monitor Report 2008* and UNICEF casualty statistics for Chechnya. Note that in July 2009, UNICEF reported an additional casualty for 2008, unreported in *Landmine Monitor Report 2008*. See *Landmine Monitor Report 2008*, p. 992; and casualty statistics provided by email from Eliza Murtazaeva, UNICEF, 28 July 2009.

⁴² These figures were compiled from UNICEF figures for Chechnya from 1999 to 2008 (in the July 2009 version of the database, which sometimes differs from figures reported in previous Landmine Monitor reports due to verification and quality assurance of the data), plus additional reports in the media for Chechnya in 2006 and 2007 reported in *Landmine Monitor Reports 2007–2008* and media reports for the rest of the Russian Federation from 2002 to 2007, reported in *Landmine Monitor Reports 2003–2008*. The figures for 2005 reported in *Landmine Monitor Report 2006* were not reliable as they included many command-detonated devices; the statistics for 2005 from *Landmine Monitor Report 2007* are used here. For 2002, *Landmine Monitor Report 2003* reported five boys killed near Volgograd and *Landmine Monitor Report 2004* reported seven military personnel killed in Dagestan. Therefore, for this report Landmine Monitor has counted 12 killed for 2002. Figures for 1999–2001 in *Landmine Monitor Reports 2000–2003* are not reliable and probably contain many command-detonated devices. Therefore, they have been omitted from this total. Casualty statistics provided by email from Eliza Murtazaeva, UNICEF, 28 July 2009; *Landmine Monitor Report 2008*, p. 992; *Landmine Monitor Report 2007*, pp. 963, 969, 1,048; *Landmine Monitor Report 2006*, pp. 1,057–1,058, 1,142; *Landmine Monitor Report 2005*, p. 862; *Landmine Monitor Report 2004*, p. 1,104; *Landmine Monitor Report 2003*, p. 673; *Landmine Monitor Report 2002*, p. 738; *Landmine Monitor Report 2001*, pp. 906–907; and *Landmine Monitor Report 2000*, pp. 844–845.

⁴³ Casualty statistics provided by email from Eliza Murtazaeva, UNICEF, 28 July 2009.

⁴⁴ See *Landmine Monitor Report 2005*, p. 947.

⁴⁵ Casualty statistics provided by email from Eliza Murtazaeva, UNICEF, 28 July 2009.

Landmine Monitor identified 38 casualties (16 killed, 20 injured, and two unknown) in Russia in 2009, as of 16 June. Of these, 14 (three killed, nine injured, and two unknown) occurred in Chechnya; 24 (13 killed and 11 injured) occurred in other parts of Russia. UNICEF provided no confirmation of the casualties that occurred in Chechnya in 2009.⁴⁶

There were an estimated 15 million persons with disabilities in Russia⁴⁷ and 110,613 in Chechnya.⁴⁸

Risk profile

Chechnya continues to be the most at-risk region of Russia, though there has been a significant decrease in casualties, which has been attributed to RE efforts.⁴⁹ The reduction may also be due to an increased use of gas, removing the need to collect firewood for fuel from dangerous areas.⁵⁰ Within Chechnya, mountainous areas, forests, and areas where military confrontations took place are the most dangerous. Casualties are usually men aged 15–40 and incidents tend to be clustered in the spring and summer period. People engaged in seasonal labor, such as grazing livestock or gathering wood, hay, berries or wild garlic are particularly at risk.⁵¹

Program Management and Coordination

Mine action and risk education

There is no formal, civilian mine action program in Russia and no national mine action authority. A special committee to deal with mine and ERW problems has, though, been set up within Chechnya, comprising different ministries.⁵² In 2008, UNICEF continued to act as the focal point for coordination of mine action in the North Caucasus.⁵³ UNICEF conducts occasional, *ad hoc* coordination meetings, which are attended by Laman Az (Voice of the Mountains, VoM), Danish Demining Group (DDG), and the ICRC.⁵⁴

Victim assistance

There are no coordination structures or plans for VA in Russia in general, or Chechnya in particular. The Ministry of Health and Social Development is responsible for programs and benefits for persons with disabilities.⁵⁵ On 19 December 2008, President Dmitry Medvedev signed a decree establishing a Council for the Disabled, which will develop proposals for implementing government policy on persons with disabilities and drafting changes in Russian law to ensure equal rights and opportunities.⁵⁶

Data collection and management

There is no comprehensive and publicly available casualty data collection mechanism in Russia. UNICEF has collected information on civilian casualties in all administrative districts of Chechnya since 2001. It uses the Information Management System for Mine Action (IMSMA) through its local partner NGO, VoM, to store data on mine incidents.⁵⁷ The latest version had been due for installation in June 2007, but this date was postponed until mid-2008. As of mid-August 2009, however, no updated version had been installed.⁵⁸ Casualties in the rest of Russia are not systematically reported and the media remains the main source of information.

Until 2008, RE activity data was managed by VoM.⁵⁹ This data was shared at the coordination meetings to avoid duplication of effort. However, due to a lack of funds in 2009, VoM no longer collected RE data.⁶⁰ UNICEF originally planned to hand over data gathering and RE components to local authorities in 2008, but the Chechen authorities were not able to fund such programs.⁶¹

Plans

Strategic mine action plans

There is no known strategic mine action plan either for Russia as a whole, or for Chechnya in particular. Since 2008, however, Russia has stated that “planned” demining operations have been “ongoing” in Chechnya.⁶² Through the end of 2009, it was reportedly planned to clear some 1.2km² of mined areas in Chechnya.⁶³

National ownership

Commitment to mine action and victim assistance

Russia has previously demonstrated insufficient commitment to clearing mines and ERW from Chechnya. In 2009, however, there were signs that this might be changing. On 22 July 2009, the Minister of Emergency Situations, Sergey Shoygu, officially stated that “within 10 days” the ministry would set up “special groups” to demine agricultural land in Chechnya.⁶⁴ Following this statement, the president of Chechnya claimed that all mines and ERW would be cleared from the territory of the republic in “a short time.”⁶⁵

National mine action legislation and standards/Standing operating procedures

On 29 December 2008, the Russian government issued a decree on the use of federal vehicles during emergency demining operations.⁶⁶ On 10 June 2009, the parliament of Kaliningrad adopted a law governing clearance of mines and ERW left over from World War II.⁶⁷

EMERCOM has stated that all its operations are implemented in accordance with the International Mine Action Standards.⁶⁸

Demining and Battle Area Clearance

Mine clearance continues to be carried out by the federal Engineering Troops of the Ministry of Defense, demining brigades of the Ministry of Internal Affairs, and the Ministry of Emergency Situations (MES), through its specialized demining units, EMERCOM Demining, and the “Leader” Center for Special Tasks.⁶⁹

No comprehensive reporting of demining in Chechnya has been made public. For 2008, the Russian Ministry of Internal Affairs reported the destruction of 9,085 explosive devices in the Chechen republic,⁷⁰ while the Russian Engineering Forces from the North Caucasus Military District Armed Forces reported the destruction of some 96,000 explosive devices.⁷¹

In April to May 2009, MES deminers from “Leader” conducted demining operations on “Zarya” state agricultural land near Grozny. As a result some 500,000m² of agricultural land was cleared and approximately 170 ERW were destroyed.⁷²

Before Russian military forces withdrew from the buffer zone adjoining South Ossetia on 10 October 2008, Russian military forces reportedly conducted extensive clearance of unexploded submunitions. Civilians reported clearance by Russian troops in Disti, Kvevo Khviti, Meurneoba, Tirdznisi, Variani, Varianis, and Zemo Khviti.⁷³ They have not reported in detail on their clearance as of 1 July 2009, although statements to the CCW cited clearance by EMERCOM personnel of 3,000 ERW from 3 August to 16 September 2008.⁷⁴

Risk Education

In 2008, RE was only reported in Chechnya. UNICEF stated that, “Regardless of the fact that fortunately there is a significant decrease in casualty rate, there is still a need to continue informing people about the existing threat.” However, UNICEF also reported that a reduction of funds had resulted in a decrease in RE activity, and that there was a lack of government programs for RE.⁷⁵ UNICEF stated that RE efforts had “undoubtedly... contributed to the overall decrease of casualties among civilians, especially among the children in Chechnya.”⁷⁶

RE was implemented by DDG, VoM with UNICEF support, and the ICRC. Together, they reached 76,324 beneficiaries (21,864 adults and 54,460 children)—a similar number as in 2007 (72,000) but a significant decrease from 2006 (110,000).

Risk education activities in 2008⁷⁷

Organization	Type of activity	Geographical location	No. of beneficiaries
DDG	RE to schoolchildren, seasonal workers, people reconstructing their war-damaged homes and agricultural workers. Regional festival "Children against Mines." Establishment of 23 safe play areas.	Groznenskiy, Urus-martanovskiy, Shalinskiy, Nozhay-Yurtovskiy and Vedenskiy regions Safe play areas in: Kurchaloevskiy, Nozhay-Yurt, Vedenskiy, and Urus-Martanovskiy regions	44,324 people, 27,460 of whom were schoolchildren and 16,864 were adults (9,230 men and 7,634 women)
VoM	Direct RE presentations, leaflets, posters, and training school teachers.	Vedenskiy district, Urus-Martanovskiy, Shatoiskiy and Grozny	Some 25,000 people (approximately 20,000 children and 5,000 adults)
ICRC	Direct RE and support to RE activities: school teachers' and journalists' competition, media articles, youth groups, billboards, murals, safe play areas (32 rehabilitated out of 56 built). Microeconomic projects for safe economic activities for families vulnerable to weapon contamination.	Chechnya urban and rural areas	139 teachers, 20 journalists, and over 20,000 children

UNICEF monitored the work of DDG and VoM in 2008. In both cases it found increased community awareness after people had attended the NGOs' presentations.⁷⁸

A UNICEF needs assessment in 2000 found low levels of awareness about mines/ERW in Chechnya and limited local capacity for implementing RE programs. UNICEF initially sponsored RE programs focusing on Chechen internally displaced persons (IDPs) in Ingushetia.⁷⁹ Also in 2000, DDG started implementing RE within Chechnya itself, as did a variety of local NGOs.⁸⁰ Since then, DDG has reached out to a wide variety of target audiences, including both children and adults.⁸¹ In 2001 and 2002, UNICEF worked with the Chechen Ministry of Education to develop an RE school curriculum, distributing 304,000 RE textbooks and 5,000 teacher's guides. In 2002, the first 770 teachers were trained in RE by DDG and VoM.⁸² UNICEF revised and improved the curriculum in 2007. From 2004–2005, UNICEF partnered with the Chechen State Drama Theater to develop RE dramas and deployed teams

⁷⁷ Response to Landmine Monitor questionnaire by Alkhazov Anzor Sultanovich, DDG, 20 May 2009; emails from Eliza Murtazaeva, UNICEF, 4 and 7 August 2009; response to Landmine Monitor questionnaire by Eliza Murtazaeva, UNICEF, 28 July 2009; ICRC, "Russian Federation: ICRC activities from January to March 2008," 29 April 2008, www.icrc.org; ICRC, "Russian Federation: ICRC activities from April to June 2008," 24 July 2008, www.icrc.org; ICRC, "Russian Federation: ICRC activities from July to December 2008," 24 March 2009, www.icrc.org; and email from Krisztina Huszti Orban, Legal Attaché, Arms Unit, Legal Division, ICRC, 4 September 2009.

⁸² Response to Landmine Monitor questionnaire by Eliza Murtazaeva, UNICEF, 28 July 2009.

of instructors to provide interactive RE presentations in rural and mountainous areas. Since 2005, UNICEF has sponsored the creation of RE “focus groups” comprising local officials, medical personnel, education professionals, religious, and youth leaders to increase community ownership of RE provision at the community level.⁸³ Many of UNICEF’s activities, especially those at the community level have been implemented through its local partner VoM, which was the first local NGO to address the issue of mines/ERW in 2000.

The ICRC has partnered with the Chechen branch of the Russian Red Cross Society, the republic and districts Houses of Children’s Creativity, and local authorities in providing a variety of RE activities, often reaching out to teachers and journalists, as well as constructing safe play areas. Until 2003, in addition to Chechnya, the ICRC also provided RE for the Chechen IDPs in Ingushetia, both children and adults, for the Chechen IDPs and resident population of the Botlikh and Novolak regions in Dagestan, as well as for Chechen children that underwent rehabilitation in sanatoriums in North Ossetia and Kabardino-Balkaria.⁸⁴

Let’s Save the Generation, a local NGO, has also engaged in RE activities, such as distributing materials, producing mine awareness videos, drama in partnership with the Chechen State Drama Theater, and a televised game show.

Victim Assistance

There are an unknown number of mine/ERW survivors in Russia. However, there have been at least 2,386 mine/ERW injured casualties within Chechnya since 1994⁸⁵ and 129 in Russia outside Chechnya since 1999.⁸⁶

Emergency and continuing medical care, rehabilitation, and reintegration services are available for persons with disabilities, including mine/ERW survivors, throughout Russia, but quality and coverage varies across regions. The Russian military has extensive medical experience in dealing with blast injuries. Healthcare is provided free of charge, though according to media reporting, “hospitals are understaffed, poorly equipped and rife with corruption.”⁸⁷ A 2008 study on disability in Russia found many persons with disabilities had negative experience with the healthcare system, citing “long queues, large waiting times, red tape and even humiliation...by medical and social examination personnel.”⁸⁸

The ICRC supplied hospitals in North Ossetia, Ingushetia, and Chechnya with emergency supplies for the surgeries of 275 patients. It also provided *ad hoc* assistance to the Ingush Republican Hospital to help treat casualties of an explosion in Nazran in June 2008. The ICRC partnered with the Saint Petersburg Military Medical Academy, North-Ossetian State Medical Academy, and Chechen State University in an emergency surgery seminar in June 2008, which attracted participants from Chechnya, Ingushetia, North Ossetia, Dagestan, Kabardino-Balkaria, Armenia, and Azerbaijan.⁸⁹

A 2008 study found that “most individual rehabilitation programmes currently designed for disabled people are totally inadequate....”⁹⁰ In October 2008, a new policy on physical rehabilitation came into force, aimed at broadening and simplifying access, and improving the

⁹⁰ Saratov Center for Social Policy and Gender Studies, “Key findings of the survey on disability and disabled people in Russia,” 2008, p. 3, rehabsys.ru.

quality and efficiency of services.⁹¹ There are at least five major rehabilitation centers specifically equipped to address the needs of disabled Russian war veterans, including amputee mine/ERW survivors. War veterans are eligible for free treatment, including prosthetics, rehabilitation, and psychosocial support. However, service provision was not consistent in all regions.⁹² The ICRC provided an orthopedic training seminar to 33 doctors from 15 republican hospitals and polyclinics in 2008.⁹³

The European Union (EU) continued to support the Russian government in its “Rehabilitation System: Services for the Disabled” program at the federal level and in four pilot locations: Kostroma, Moscow, and Saratov regions and in St. Petersburg. The project aims to improve disability law, train rehabilitation specialists, and encourage the use of NGOs and companies in service provision.⁹⁴ In November 2008, the project sponsored a research conference in St. Petersburg on “Social support to disabled people in St. Petersburg,” which presented a variety of policy recommendations for improving accessibility for and social integration of persons with disabilities.⁹⁵ The project also supported the first ever survey on disability issues in Russia, released in 2008.⁹⁶

Opportunities for economic reintegration were limited and President Medvedev admitted in April 2009 that persons with disabilities were particularly vulnerable to the recent economic crisis.⁹⁷ While government benefits, including a disability pension, existed for persons with disabilities and for caregivers,⁹⁸ they were not adequate to meet needs.⁹⁹ Some regions, such as Moscow, had better benefits than others.¹⁰⁰ On April 7, 2008, the federal government issued amendments to the regulations on recognizing persons with disabilities.¹⁰¹ The amendments aimed to simplify legal procedures for receiving the status of a person with disabilities and subsequent care and support.¹⁰² In May 2008, the Russian government extended additional support to certain veterans with disabilities in 2008, offering a free car or lump sum of RUB100,000 (US\$4,040).¹⁰³

In 2008, the Ministry of Health and Social Development continued to support several local NGOs—the All-Russian Society of Disabled Persons, All-Russian Society of the Blind, All-Russian Society of the Deaf and Disabled War Veterans of Afghanistan—in the provision of assistance for the creation of new businesses, job opportunities and rehabilitation for persons

with disabilities.¹⁰⁴ The EU study found that local disability NGOs were viewed favorably by persons with disabilities and their families.¹⁰⁵

Employment quotas for persons with disabilities were mandated by law, but employment discrimination continued and there were no penalties for failing to comply with quotas. NGO advocacy reportedly succeeded in convincing some international companies to consider hiring persons with disabilities and local authorities in Moscow reportedly encouraged employment of persons with disabilities.¹⁰⁶

Russian laws prohibit discrimination against and mandate accessibility for persons with disabilities, but were inadequately enforced. Discrimination was reported in education, employment and services in 2008.¹⁰⁷ The EU study found that persons with disabilities lacked sufficient information on the legal framework for disability.¹⁰⁸

The EU-supported disability survey found broad acceptance among the general population for inclusion of persons with disabilities.¹⁰⁹ However, the United States Department of State stated that in Russia, “Persons with disabilities were generally excluded from the social and political life of their communities and isolated from mainstream society.”¹¹⁰ Institutions for persons with disabilities were allegedly “poor, with unqualified staff and overcrowding. . . .”¹¹¹ In May 2008, President Medvedev admitted that disability was “an issue we did not talk about at all for a long time.”¹¹²

Young persons with disabilities were often discouraged by authorities from attending school.¹¹³ UNICEF and Perspektiva, a local NGO, promoted inclusive education in 2008, raised funds for improving school accessibility, and held seminars with teachers on including children with special needs in the classroom.¹¹⁴ In March 2009, children and youth NGOs and community organizations wrote an appeal to the Republic of North Ossetia’s Ministry of Construction and Architectural Policy calling for laws mandating accessibility to businesses and public buildings.¹¹⁵

Russia signed the UN Convention on the Rights of Persons with Disabilities on 24 September 2008, but not its Optional Protocol. As of 1 August 2009, Russia had not ratified the convention.

Victim assistance in Chechnya

Healthcare in Chechnya received increased federal and local government funding, allowing the ICRC scale down its medical assistance.¹¹⁶ Health infrastructure improved in 2007 and 2008.¹¹⁷ Nonetheless, health needs in Chechnya were reportedly “extensive” and healthcare provision was hindered by ongoing instability.¹¹⁸ Many international humanitarian agencies had withdrawn by 2008.¹¹⁹ There were few opportunities for psychosocial support or economic reintegration. Many persons with disabilities in Chechnya were living in Temporary Accommodation Centers, but, according to Amnesty International, faced forced evictions, even in winter.¹²⁰

The ICRC made a donation of pharmaceuticals and medical supplies to six hospitals in Chechnya in 2008. It concluded its seven years of support to the Grozny Prosthetic-Orthopedic Center in 2008 and provided training to Chechen prosthetic/orthotic technicians. The ICRC also supported two courses organized by the Pirogov Medical Surgical Centre in Moscow and the Scientific Research Work Institute of Traumatology and Orthopedics in St. Petersburg for seven surgeons and four traumatologists from Chechnya.¹²¹

On 3 April 2008, VoM, in partnership with UNICEF, Handicap International (HI), and several government agencies, organized a marathon for persons with disabilities to raise awareness of the mine/ERW threat and disability issues.¹²² VoM and UNICEF continued to support a football team of mine and UXO survivors.¹²³ UNICEF also continued to support a network of 19 psychosocial school programs and rehabilitation centers for children traumatized by war in Chechnya.¹²⁴

From 2008–2009, the European Community Humanitarian Office (ECHO) supported HI in a livelihood project targeting persons with disabilities, including mine/ERW survivors, in Chechnya. The project benefited 110 households, all of which had at least one person with disabilities.¹²⁵

Due to ongoing insecurity, Médecins Sans Frontières (MSF) continued to implement a “remote control” program of medical assistance in Chechnya, managed and monitored from Moscow. In particular, they supported the trauma department and reconstructive surgery department for war-injured at Grozny’s Hospital 9, which have benefited mine/ERW survivors.¹²⁶

The World Health Organization provided support to two local NGOs, Let’s Save the Generation and Association of Chechen Women Doctors, to provide medical, rehabilitation, and psycho-social support to children and teenagers with disabilities.¹²⁷ Let’s Save the Generation’s work faced a major setback with the murder of their director Zarema Sadulayeva in August 2009.¹²⁸

In October 2008, the families of three Chechen mine casualties received compensation of €20,000–35,000 (\$36,815–51,541), following a European Court of Human Rights decision that the Russian government had failed to adequately protect them from the threat of mines.¹²⁹

Support for Mine Action

In April 2008, the MES signed an agreement with the Serbian Ministry of Trade to carry out demining operations in Serbia starting in 2008. Russia was to cover the full cost of the operations, estimated at around \$35 million.¹³⁰ In July 2008, the MES sent 60 demining personnel to Serbia to clear an airfield near Niš and the adjoining area: cluster submunition clearance at the airport began in August 2008.¹³¹ Clearance operations continued as of August 2009.¹³² Russia has not reported a value for its contributions to international mine action during 2008 or 2009.

In August 2009, Russia announced approximately \$6 million in bilateral funding to the government of Nicaragua to cover mine clearance operations until May 2010. Of the total contribution, approximately \$3 million is reportedly a combination of in-kind contributions of equipment and monetary contributions to purchase equipment, including mine detectors and road building machinery to improve accessibility to mine-affected areas: roughly \$3 million will cover the costs of clearing the remaining mined areas. Nicaragua planned to set aside a small portion of the contribution to fund a rapid response clearance team until the end of 2010.¹³³ In December 2008 the rapid response teams had ceased operations due to a funding shortage.¹³⁴

SAUDI ARABIA

Ten-Year Summary

The Kingdom of Saudi Arabia has participated in most Mine Ban Treaty meetings since December 2000 and has continuously claimed that it has never produced, exported, or used antipersonnel mines. In 2002, Saudi Arabia indicated for the first time that it stockpiles antipersonnel mines, which it confirmed again in 2008.

Saudi Arabia is not mine-affected, but may have a residual UXO problem, possibly including cluster munition remnants.

Mine Ban Policy

Saudi Arabia has not acceded to the Mine Ban Treaty. In July 2008, Saudi Arabia told Landmine Monitor that it “is still in the process of studying” the treaty.¹ Officials have said that while it supports the humanitarian objectives of the treaty, Saudi Arabia does not want to give up its option to use antipersonnel mines in the future.²

Saudi Arabia has regularly attended Mine Ban Treaty meetings. In November 2008, it sent a delegation from the Ministry of Defense and Aviation to attend the Ninth Meeting of States Parties in Geneva. It also attended the intersessional Standing Committee meetings in Geneva in May 2009.

On 2 December 2008, Saudi Arabia was, as in previous years, absent from voting on UN General Assembly Resolution 63/42 which called for universalization and full implementation of the Mine Ban Treaty.

Landmine Monitor has previously reported that Saudi Arabia has never produced, exported, or used antipersonnel mines but that it stockpiles a small number imported in the past.³ In July 2008, Saudi Arabia wrote to Landmine Monitor, “Recently the Kingdom has not produced nor exported any type of mines... The Kingdom possesses a stockpile of old anti-personnel mines however; these mines have never been used. There are no stockpiles of American-owned antipersonnel mines inside the Kingdom.” It went on to note that it has “a number of legislations and procedures... that regulate importing, producing and storing anti-personnel mines.”⁴

Saudi Arabia is party to the Convention on Conventional Weapons but has yet to join its Amended Protocol II on landmines or Protocol V on Explosive Remnants of War. As of 1 July 2009, Saudi Arabia had not signed the Convention on Cluster Munitions.⁵

Scope of the Problem

Saudi Arabia is not mine-affected, but some parts are believed to still be affected by UXO, possibly including cluster munition remnants from the 1991 Gulf War. The engineering corps of the Saudi army is reported to have a unit in every region of the kingdom to respond to requests for clearance.⁶ No information is available on any clearance activities over the last few years.

Support for Mine Action

Saudi Arabia reported contributing US\$1.5 million in 2008 to the UN Mine Action Coordination Centre Southern Lebanon. A contribution of \$500,000 was made in April 2008, followed by a \$1 million donation in October 2008.⁷ In 2007, the Saudi Red Crescent Society donated \$200,000 to the ICRC and the International Federation of Red Cross and Red Crescent Societies for persons with disabilities and mine survivor projects.⁸

SINGAPORE

Ten-Year Summary

The Republic of Singapore's position on the Mine Ban Treaty has not changed during the past decade. It continues to view antipersonnel mines as legitimate weapons necessary for self-defense, and it remains one of the few mine producers. Still, it has maintained a moratorium on the export of antipersonnel mines since February 1998, has voted in favor of every pro-ban UN General Assembly resolution since 1996, and has attended as an observer all but one of the annual meetings of Mine Ban Treaty States Parties.

Mine Ban Policy

Singapore has not acceded to the Mine Ban Treaty. In March and April 2009, Ministry of Foreign Affairs officials reiterated that while Singapore supports all initiatives to overcome the humanitarian consequences of landmine use, it reserves the right to use antipersonnel landmines for self-defense.¹

On 2 December 2008, Singapore voted in favor of UN General Assembly Resolution 63/42, calling for the universalization and full implementation of the Mine Ban Treaty, as it has in previous years. At the same time, it asserted, "Singapore firmly states that the legitimate security concerns and the right to self-defense of any State cannot be disregarded. A blanket ban on all types of anti-personnel landmines might therefore be counterproductive."²

An official told Landmine Monitor in 2009 that Singapore continues to attend Mine Ban Treaty-oriented meetings in order to keep abreast of international developments regarding mines and factor that into its policy considerations.³ In November 2008, Singapore sent an observer to the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva but did not make any statements. In April 2009, Singapore participated in the Bangkok Workshop on Achieving a Mine-Free South-East Asia, the second in a series of regional meetings convened in the lead-up to the treaty's Second Review Conference. Singapore did not attend the May 2009 intersessional Standing Committee meetings.

Singapore is not party to the Convention on Conventional Weapons and as of 1 July 2009 had not signed the Convention on Cluster Munitions.⁴

Use, stockpiling, production, and transfer

Singapore has said that its army only uses antipersonnel landmines for training, but that it must retain the option to use mines for self-defense.⁵

In March 2009, a Ministry of Foreign Affairs official restated that Singapore will not disclose any information regarding its stockpile of antipersonnel mines for defense and security reasons. The official stated that Singapore maintains stringent controls on its stockpile management system and that all mines are destroyed after their expiration date.⁶

¹ Telephone interview with and email from Sharon Seah, Assistant Director, International Organizations Directorate, Ministry of Foreign Affairs, 30 March 2009; and statement by Col. Tony Teo, Defense Attaché, Embassy of Singapore, Bangkok Workshop on Achieving a Mine-Free South-East Asia, 3 April 2009.

³ Email from Sharon Seah, Ministry of Foreign Affairs, 31 March 2009.

⁴ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 238–239.

⁵ Interview with Lt.-Col. Koh Chuan Leong, Head, General Staff Branch, Singapore Army, Geneva, 20 September 2006.

⁶ Telephone interview with and email from Sharon Seah, Ministry of Foreign Affairs, 30 March 2009.

Singapore has long acknowledged that it produces antipersonnel mines, but officials have declined to reveal if production lines are currently running.⁷

Singapore declared an indefinite moratorium on the export of all antipersonnel mines in February 1998.⁸ In April 2009, a defense official confirmed that the moratorium remains in place.⁹

⁷ Singapore is known to have produced two types of antipersonnel mines: a plastic blast mine (VS-50) and a bounding fragmentation mine (VS-69), both copies of Italian designs. Singapore Technologies Engineering (STE), through its subsidiary Singapore Technologies Kinetics, is the government-linked company that produces antipersonnel mines. Norway, New Zealand, and the Netherlands have ordered government investment funds to withdraw any investments in STE due to its involvement in landmine production. See *Landmine Monitor Report 2007*, p. 975, and *Landmine Monitor Report 2004*, p. 645.

⁸ Email from Sharon Seah, Ministry of Foreign Affairs, 31 March 2009.

⁹ Statement by Col. Tony Teo, Embassy of Singapore, Bangkok Workshop on Achieving a Mine-Free South-East Asia, 3 April 2009.

SOMALIA

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Antipersonnel and antivehicle mines, UXO, AXO
Estimated area of contamination	Unknown
Casualties in 2008	116 (2007: 74)
Estimated mine/ERW survivors	Unknown but at least 1,405
Demining in 2008	Spot clearance of ERW only
Risk education recipients in 2008	Unquantified
Support for mine action in 2008	\$0.8 million (2007: \$6.3 million)

Ten-Year Summary

There has been continuous conflict in Somalia, including use of antipersonnel mines by various factions, throughout most of the past decade. Since 2002, the UN Monitoring Group on Somalia has published a number of reports with allegations of the transfer of antipersonnel mines to various Somali parties from a number of countries, including Mine Ban Treaty States Parties Eritrea and Ethiopia. From 2002 to 2005, 17 Somali factions signed the NGO Geneva Call's Deed of Commitment banning antipersonnel mines.

Landmines and explosive remnants of war (ERW) affect Somalia as a result of internal and international conflicts which have taken place in the country since 1964. The Landmine Impact Survey identified 35 impacted communities in nine districts in the Puntland area and a further 90 impacted communities in Sanaag and Sool regions. The extent of the problem in southern Somalia is less well known. There is no centralized mine action program in Somalia. In 2008, clearance of ERW was coordinated through mine action centers in Baidoa in south central Somalia and Garowe in the northeast of the country.

Landmine Monitor has identified 2,354 mine/ERW casualties (832 killed, 1,405 injured, and 117 unknown) in Somalia (excluding Somaliland) between 1999 and 2008. Risk education during that period has been sporadic and largely *ad hoc*, especially in the south of the country.

There are no specific victim assistance policies or activities in Somalia. The health care situation continued to deteriorate in 2008 and there was little capacity to provide emergency surgery or trauma care outside of Mogadishu. Rehabilitation and healthcare facilities are difficult to access and there was very little psychosocial or economic support for mine/ERW survivors.

Background

The Transitional Federal Government (TFG) of the Somali Republic was created under a 2004 charter; since then it has been engaged in various levels of armed conflict.¹ Since early 2007, al-Shabaab (the Youth) and other armed groups have carried out attacks and at times engaged in intense fighting against government forces, Ethiopian troops, and the African Union peacekeeping mission to Somalia (AMISOM). In September 2007, a number of other

¹ In January 2004, leaders of many Somali groups signed an agreement to adopt a Transitional Federal Charter under the Intergovernmental Authority on Development-facilitated process in Nairobi, Kenya. The charter provides the legal framework for a five-year transitional period of government in Somalia. The charter, government, and parliament make up the Transitional Federal Institutions of Somalia.

opposition groups created a formal coalition, the Alliance for the Re-liberation of Somalia (ARS).² In February 2009, after signing a peace agreement with and incorporating the ARS into the government, the TFG became the Government of National Unity (GNU). As of June 2009, al-Shabaab and another group, Hezbul Islam, continued to fight against the GNU, including in Mogadishu.³

Mine Ban Policy

Somalia has not acceded to the Mine Ban Treaty. The Prime Minister attended as an observer the First Review Conference of the Mine Ban Treaty in Nairobi in November–December 2004 where he stated the TFG’s intention to outlaw antipersonnel mines.⁴ The government did not attend any Mine Ban Treaty meetings in 2008 or 2009.

Somalia was absent from the vote on UN General Assembly Resolution 63/42 in December 2008 calling for universalization of the Mine Ban Treaty. It voted in favor of a similar annual resolution for the first time in December 2007.

Somalia is not party to the Convention on Conventional Weapons. It signed the Convention on Cluster Munitions in December 2008, but had not yet ratified as of 1 July 2009.⁵

Several Somali factions have renounced use of antipersonnel landmines by signing the Deed of Commitment administered by Geneva Call. Most of these signatories are members of the Transitional Federal Institutions (government and parliament), but some may also continue to control independent militia forces and territory.⁶

In June 2009, Geneva Call and the Puntland Mine Action Center (PMAC), the institution responsible for mine action in the northern Somali region of Puntland (see Program Management and Coordination section below), held a workshop on implementation of the Deed of Commitment. Participants included the President of Puntland and representatives from the Inter-Ministerial Commission for Mine Action, the House of Representatives, the Puntland military, UN agencies, and mine action NGOs.⁷ The meeting reviewed progress in implementing the Deed of Commitment in Puntland and explored future actions to fulfill the obligations under the Mine Ban Treaty.⁸

Production and stockpiling

Somalia has never been known to manufacture landmines, but mines are thought to be widely available (see Transfer section below). Most factions involved in armed conflict in Somalia are believed to possess landmines.⁹ Demobilizing militias have turned in landmines: photographs of the Disarmament, Demobilization and Reintegration (DDR) program available on the AMISOM

⁸ Geneva Call, “Puntland authorities and stakeholders review progress in the implementation of Geneva Call’s Deed of Commitment banning anti-personnel mines,” 22 June 2009, www.reliefweb.int.

⁹ The former TFG Deputy Prime Minister told Landmine Monitor in 2005 that he believed militias in Mogadishu alone held at least 10,000 antipersonnel mines. Interview with Hussein Mohamed Aideed, Deputy Prime Minister, in Geneva, 15 June 2005. See also, *Landmine Monitor Report 2008*, pp. 1,003–1,004; *Landmine Monitor Report 2007*, p. 978; and *Landmine Monitor Report 2006*, p. 1,064.

website in July 2009 showed antivehicle mines and improvised explosive devices (IEDs).¹⁰ In June 2008, Ethiopian troops based in Luuq district reportedly seized a vehicle transporting antipersonnel mines, as well as antivehicle mines and a variety of other weapons.¹¹

The armed groups in Somalia that signed the Geneva Call Deed of Commitment have pledged to undertake stockpile destruction. In June 2009, Mohamed Omar Habeeb “Dheere” of the Jowhar Administration informed Geneva Call that it only possessed antivehicle mines.¹² Also in June 2009, United Somali Congress/Somali National Alliance (USC/SNA) chair Hussein Mohamed Farah Aideed informed Geneva Call that it had handed over its stockpiles to AMISOM in Mogadishu in early 2007, and AMISOM then destroyed them.¹³ The USC/SNA had previously stated it had 1,800 antipersonnel landmines in its stockpile.¹⁴

In August 2008, Geneva Call informed Landmine Monitor that the Somali National Front (SNF) had reportedly completed an inventory of its stockpile and had approached UNDP in Baidoa to request technical assistance for stockpile destruction.¹⁵ In June 2009, the SNF told Geneva Call that its stockpiles had been moved to Dolow in the Gedo region and that it needed technical and financial support for their destruction.¹⁶

On 24 July 2008, PMAC destroyed 48 stockpiled PMP-71 antipersonnel mines near Garowe on behalf of the Puntland authorities. Mines Advisory Group (MAG) provided technical assistance to PMAC.¹⁷ In April 2009, MAG and a Puntland police explosive ordnance disposal (EOD) team destroyed 78 Pakistani-made P4 antipersonnel mines in Bosasso.¹⁸ The Juba Valley Alliance and Rahanweyn Resistance Army previously stated to Geneva Call that they possessed antipersonnel mines, but did not reveal the types or numbers or any action taken to destroy them.¹⁹

Transfer

Since 2002, the UN Monitoring Group on Somalia has published a number of reports containing allegations of the transfer of antipersonnel and other mines from a number of countries to various Somali parties.²⁰ The most recent report was submitted on 10 December 2008.²¹ Neither that report, nor the two previous ones (24 April 2008 and 18 July 2007) make new allegations of transfers of antipersonnel mines from states into Somalia.²² In response to past claims by the UN

It is unclear if the stockpiled mines declared by the Juba Valley Alliance are antipersonnel or antivehicle. Email from Katherine Kramer, Geneva Call, 5 September 2008.

²⁰ See *Landmine Monitor Report 2007*, pp. 978–979; *Landmine Monitor Report 2006*, pp. 1,065–1,066; *Landmine Monitor Report 2005*, pp. 870–871; and *Landmine Monitor Report 2004*, p. 1,112. See also, “Report of the team of experts appointed pursuant to Security Council resolution 1407 (2002), paragraph 1, concerning Somalia,” S/2002/722, Annex 4.

²¹ “Report of the Monitoring Group on Somalia pursuant to Security Council resolution 1811 (2008),” S/2008/769, 10 December 2008.

²² The April 2008 report cites the transfer of antitank mines and components from Eritrea in 2008 in support of al-Shabaab. The July 2007 report provides new information about two alleged shipments of antipersonnel mines in July 2006 from Eritrea to Somalia that the Monitoring Group previously reported on. See *Landmine Monitor Report 2008* country reports on Somalia, Ethiopia, and Eritrea for the most recent Monitoring Group claims of mine and mine component transfers.

Monitoring Group, the Presidents of the Seventh and Eighth Meetings of States Parties wrote to the chair of the group for clarification and further information of relevant evidence presented in reports, including seeking further details on the specific types of mines allegedly transferred.²³ As of July 2009, no response to either request, or further progress in analyzing the Monitoring Group's allegations, had been reported.

In February 2009, it was reported that the Russian Navy had captured three boats of "Somali pirates" smuggling arms in the Indian Ocean, and a spokesperson cited landmines (type unspecified) among the weapons seized.²⁴

Landmines are evidently still being bought and sold at arms markets in Somalia.²⁵ In June 2009, *Reuters* reported the continued sale of landmines and other weapons at markets in Mogadishu. It said that one dealer claimed to sell landmines (type unspecified, but likely antivehicle) for approximately US\$100 apiece.²⁶

Use

Landmine Monitor has not identified any confirmed reports of new use of antipersonnel mines from May 2008 to May 2009 by government forces or any of the non-state armed groups (NSAGs) operating in Somalia. NSAGs continued to use IEDs in large numbers, with media sources often referring to command-detonated bombs and IEDs as "landmines." While all victim-activated mines and other explosive devices are prohibited by the Mine Ban Treaty, command-detonated mines and devices are not. Landmine Monitor analysis of media reports indicates that most, if not all, of the explosive attacks attributed to landmines were command-detonated devices.

For 2008, the Somali NGO Security Preparedness and Support Program (SPAS) reported at least 84 incidents (including seizures and recoveries, as well as attacks) involving "landmines," resulting in 237 casualties. None involved use of victim-activated antipersonnel mines, although there were nine incidents involving IEDs without reported remote-control capabilities.²⁷

In March 2009, GNU Interior Minister Sheikh Abdulkadir Ali Omar reportedly suffered minor injuries when an explosive device detonated in the Bakaraaha market, killing one of his bodyguards and injuring another.²⁸ Although the media reported the device as a "landmine," the type of explosive device could not be confirmed.

Scope of the Problem

Contamination

Landmines and explosive remnants of war—both abandoned explosive ordnance (AXO) and UXO—affect many parts of Somalia.²⁹ In a March 2007 evaluation (see Program evaluations section below), the Geneva International Centre for Humanitarian Demining (GICHD) concluded that ERW were "very widespread" and, in most of the country, "constitute a greater threat than do minefields."³⁰

²⁵ See *Landmine Monitor Report 2008*, pp. 1,003–1,005, for details. In April 2008, the Monitoring Group stated that mines (type unspecified) were purchased at Arjantin or other arms markets in 2007 and 2008, by al-Shabaab and representatives of Somali clans. The report also stated that at the Arjantin arms market or other arms markets, mines (type unspecified) were sold in 2008 by TFG military officers, the Somali National Security Agency and Mohamed Omar Habeeb "Dheere."

²⁸ "Somali minister wounded in landmine blast," *Daily Nation* (Nairobi), 26 March 2009, www.nation.co.ke.

²⁹ See *Landmine Monitor Report 2006*, p. 1,066.

³⁰ GICHD, "Somalia report: Mission to Somalia (Somaliland and Puntland)," Draft, 15 May 2007, p. 4. A Joint UN Assessment co-led by UNMAS and UNDP Somalia in June 2007 concluded that the perception of the mine problem in south central Somalia was greater than the reality. UN, "Report from the Inter-agency Mine Action Assessment Mission to Somalia (South Central)," June 2007, p. 2, www.mineaction.org.

Two phases of a Landmine Impact Survey (LIS) have been conducted in the regions of Puntland (in 2004–2005), and Sool and Sanaag (in 2007).³¹ In total, 125 communities were found to be impacted by 263 suspected hazardous areas (SHAs). Roads and pastures are most heavily contaminated in terms of land of socio-economic value.³² The communities in Sanaag and Sool under the jurisdiction of the Somaliland Mine Action Center are being resurveyed by the British NGO HALO Trust. HALO planned to complete the survey in September 2009.³³

No LIS has been undertaken for south central Somalia, but surveys undertaken in four districts in 2008 indicate a contamination level of 10% of all communities,³⁴ a lower rate than found elsewhere in Somalia. The office of the UN mine action team in Somalia reported that the survey did not include Mogadishu where fighting has been the most severe and it is believed the final results will show that contamination is scattered across south central Somalia. In Bay region, for example, 26 communities in Baidoa district were found to be contaminated, a number much higher than in the other surveyed areas.³⁵

Fighting between Ethiopian troops—who entered the country in 2007 in support of the TFG—and non-state armed groups added to the contamination in the south, and media reports have attested to the use of roadside bombs, IEDs, and mines, as well as to resultant casualties.³⁶ Danish Demining Group (DDG), a demining NGO operating in Somalia, has conducted surveys in Mogadishu which found that some parts of the city have a serious UXO problem.³⁷ According to David Bax, the UN Mine Action Service (UNMAS) Mine Action Programme Manager,³⁸ “communities in South Central Somalia are exposed to large quantities of Explosive Remnants of War...and the socio-economic impact on the local population is immeasurable.”³⁹ Fighting continued in central Somalia and Mogadishu as of June 2009, with heavy artillery bombardment of urban areas.⁴⁰

Casualties

Landmine Monitor identified 116 mine/ERW casualties (39 killed and 77 injured) in Somalia (excluding Somaliland) in 2008.

Of the total for Somalia, PMAC identified 58 mine/ERW casualties (17 killed and 41 injured) in the Puntland region in 2008. The majority of these casualties were boys (30), followed by adult men (17), girls (nine), and women (two). This data lacked details on device type, civil status, and/or activity at the time of the incident.⁴¹ According to UNMAS, the majority of casualties were caused by ERW.⁴²

The remaining 58 casualties (22 killed and 36 injured) were identified by Landmine Monitor using data from media, UN Department of Safety and Security (UNDSS), and SPAS reports covering the south and central regions of the country.⁴³ The South Central Mine Action Center

⁴² UN Mine Action Team, “UN Somalia Mine Action: Project Update & Achievements 2008,” 3 March 2009, p. 2.

⁴³ *Landmine Monitor* media monitoring for calendar year 2008.

(SCMAC), which covers the south central region of the country, identified six casualties (three killed and three injured) in the south and central regions of Somalia in 2008. No further details on these casualties were available⁴⁴ and there was no way to tell if the SCMAC figures overlapped with media, UNDSS, and SPAS figures. SCMAC figures were thus not included in *Landmine Monitor Report 2008* casualty figures. Likewise, the Somalia Red Crescent Society (SRCS) reported 58 injured mine casualties in 2008 (18 injured casualties reported at Howlwadag branch clinic and three at Isha branch clinic in Baidoa; 11 at Farjanno branch clinic in Kismayo; five at Lafole, four at Km-13; and two at T-da emergency branch clinics in Mogadishu; and one at Bal'ad branch clinic). However, it was not possible to determine whether these casualties overlapped with the Landmine Monitor figures above.⁴⁵

The 116 casualties identified in 2008 represents an increase compared with 2007, when Landmine Monitor identified 74 casualties (26 killed, 40 injured, and eight unknown). Given the lack of systematic data collection, this should not be necessarily considered indicative of a trend.

Landmine Monitor has identified 2,354 mine/ERW casualties (832 killed, 1,405 injured, and 117 unknown) in Somalia (excluding Somaliland) between 1999 and 2008. PMAC was able to provide cumulative data (lacking details of device type, civil status, or activity) for 207 of these mine/ERW casualties (71 killed and 136 injured) between 2005 and 2008.⁴⁶ SCMAC was able to provide cumulative data (lacking details of device type, civil status, gender, or activity) for 18 of these mine/ERW casualties (12 killed and six injured) between 2005 and 2008.⁴⁷ At the end of 2008, SCMAC's Information Management System for Mine Action (IMSMA) database had a total of 96 casualties (50 killed and 46 injured) with varying amounts of detail. The earliest incident recorded was in 1996 but some records are missing the dates of the incidents.⁴⁸

Casualties continued to be reported in 2009, with Landmine Monitor identifying 25 casualties (eight killed and 17 injured), as of 31 May. PMAC recorded 17 casualties (five killed and 12 injured) and SCMAC recorded four (two killed and two injured), as of 31 May.⁴⁹ An additional four casualties (one killed and three injured) were reported by UNMAS in an ERW incident at Baidoa market.⁵⁰ The ICRC identified 33 "cases of explosive ordnance related incidents from our two hospitals in Mogadishu" in January–May 2009, but did not have information about whether incidents involved victim-activated or command-detonated devices.⁵¹

Risk profile

In Puntland, most casualties are male adults engaged in herding or traveling.⁵² A knowledge, attitudes, and practices (KAP) survey found that men and older people had a better knowledge and understanding of the risk, and recommended targeting females and younger people with risk education messages.⁵³ In south central Somalia people are most at risk from ERW, including AXO, mainly in urban centers, in particular Mogadishu, Baidoa, and Dhusa Mareb.⁵⁴ Particular risk groups include children playing, adult men harvesting explosives, women street cleaners in Mogadishu, internally displaced persons (IDPs), and nomads.⁵⁵

Program Management and Coordination

Mine action

There is no centralized mine action program in Somalia. A number of UN agencies are involved in supporting mine action in Somalia, known collectively as the UN Mine Action Team. UNDP Somalia Mine Action (executed by the UN Office for Project Services, UNOPS), headquartered in Nairobi, provides assistance to authorities in Somalia through the UNDP multiyear Rule of Law and Security (ROLS) Programme.⁵⁶ Since 6 February 2009, UNMAS has been the lead agency for mine action in south central Somalia. After many years of UNDP facilitating UN activities it was recognized that under the prevailing security situation it would be unrealistic for it to continue implementing mine action activities in south central Somalia. Consequently, the Resident and Humanitarian Coordinator for Somalia formally requested that UNMAS take responsibility for mine action activities in south central Somalia. UNMAS, as a department of the UN Department of Peacekeeping Operations, is accustomed to implementing mine action programs in complex humanitarian emergencies.⁵⁷ UNICEF provides support for risk education.⁵⁸

Activities are coordinated through mine action centers in Baidoa in south central Somalia and Garowe in the northeast.⁵⁹

Northeast Somalia

PMAC, which was established by Presidential Decree No. 097/2003 in 2003, coordinates and facilitates mine action activities, including risk education (RE), in Puntland. PMAC is directly supported both financially and operationally by UNDP. An interministerial committee provides governmental oversight and supervision: it consists of the ministries of interior, planning, health, education, information, and justice.

South central Somalia

In 2008, the UN Mine Action Team in Somalia signed a Memorandum of Understanding with the TFG on mine action in collaboration with Ministry of Home Affairs and Internal Security, and the SCMAC was established in Baidoa. The Swedish Rescue Services Agency (SRSA) began conducting surveys, RE, and EOD in collaboration with UNDP Somalia Mine Action in the region. Surveys were conducted in 791 villages in Bakol, Bay, Gedo, and Hiran regions. Approximately one in 10 (a total of 79) villages were found to be contaminated. The mine and ERW-affected villages are in the districts of Baidoa, Bioley, Huddur, Qansah Dere, and Wajid.⁶⁰ RE is also coordinated by SCMAC.⁶¹

Risk education

Capacity development and support in managing RE was provided to SCMAC and PMAC by UNDP Somalia Mine Action through an in-kind SRSA technical advisor.⁶² In addition, Handicap International (HI) provided a four-day RE training course in May 2008 to PMAC staff, MAG, police EOD personnel, and the Puntland Ministry of Security.⁶³

⁶³ Interview with Xhevdet Gegollaj, Mine Risk Education Project Coordinator, HI, Hargeisa, 8 April 2009; and email from Xhevdet Gegollaj, HI, 30 March 2009.

Victim assistance

PMAC and SCMAC are mandated to coordinate victim assistance (VA) in their respective areas of operation. However, there are no specific VA policies, strategies, plans or functioning coordination mechanisms.⁶⁴

Data collection and management

The PMAC office in Garowe manages the mine action database using IMSMA while the office of the UN Mine Action Team in Baidoa manages the IMSMA database for south central Somalia.⁶⁵ RE data is entered into IMSMA, but it is not complete.⁶⁶

PMAC has collected information on mine/ERW casualties since 2005 through its regional liaison officers, resulting in what UNMAS called, “a relatively comprehensive understanding of the casualty trends....”⁶⁷ Casualty information collected by PMAC is entered into IMSMA.

The situation in south central Somalia is very different, with “only sporadic and unverified casualty data.”⁶⁸ The quality of information has improved since 2007, when the UN Mine Action Team and its partner, DDG, began to verify information in the Bakool, Bay, and Mogadishu regions. However, the “volatile security situation continues to restrict movement, at times preventing verification of casualties.”⁶⁹ Therefore, there is likely to be significant under-reporting of casualties in the south central region.

Basic data on mine/ERW/IED casualties was gathered in Mogadishu hospitals and in SRCS branch clinics, which are supported by the ICRC. However, the ICRC and SRCS data was reportedly very “rough.”⁷⁰ Patients are themselves often unable to determine the kind of device that injured them.⁷¹ UNDSS in Somalia⁷² and SPAS⁷³ also collected data on mine/ERW/IED incidents, along with other security information. They also were not always able to distinguish between victim-activated and command-detonated devices.⁷⁴

Plans

Strategic mine action plan

The UN has stated that its mine action program works to ensure that all mine action activities in Somalia are implemented according to the 2006–2010 UN Inter-Agency Strategy. The project is headquartered in Nairobi with staff rotating between there and the three regions of Somalia. As a consequence of the differing security, development, and capacity issues in Puntland and south central Somalia, the strategy for mine action in each region is distinct.⁷⁵

The short-term strategy (2009–2010) is to strengthen support and technical assistance for PMAC to develop its coordination capacities across all five pillars of mine action. New EOD teams will also be trained, equipped, and capable of conducting EOD under the supervision of technical advisors.⁷⁶ In the medium-term (2010–2012), technical assistance and capacity development support to PMAC will be scaled down. In the long-term it is planned that PMAC

Until the security situation in south central Somalia stabilizes and a more permissive operational environment emerges it is not possible to determine the level of activities that can be undertaken. As a result the mine action program operates with a high degree of flexibility.⁷⁸ The primary aim for 2009 was to support the SCMAC and clearance capacities. This includes developing capacities to undertake high-priority clearance, continually training EOD teams, and enhancing the capacities of existing *ad hoc* survey, RE, and emergency medical teams.⁷⁹ It was also planned, depending on the security situation, to provide assistance to AMISOM to enhance their EOD capacities; this initiative had begun by June (see Demining and battle area clearance in 2008 section below).⁸⁰

There are no national standards or a strategy for RE.⁸¹ UNDP Somalia Mine Action has developed their own RE plan which consists of three main activities: transfer of the UNDP national RE coordinator and some UNDP/SRSA facilitators to the SCMAC as RE implementation staff, implementing direct RE activities in all areas of south central Somalia, and ensuring the sustainability of RE activities by training local RE community focal points in all targeted areas.⁸² The transfer of RE teams to SCMAC had not taken place as of June 2009.⁸³

⁸³ Email from Noe Falk Nielsen, UNDP/SRSA, 26 June 2009.

Integration of mine action with reconstruction and development

A GICHD evaluation in 2007 (see Program evaluations section below) concluded that mine action contributes to other pillars of international support to Somalia. It stated that by clearing pastureland and traditional migration routes, mine clearance enhances livelihoods and reduces vulnerability for pastoralists. In this regard, all aspects of mine action could be viewed simply as public services, the effective delivery of which restores public confidence in the state and its organs.⁸⁴

National ownership

Commitment to mine action and victim assistance

In the absence of effective national governance, commitment to mine action in Somalia has been demonstrated through agreements between local officials, the UN, and Geneva Call. Despite several years of UN assistance to mine action in Puntland, PMAC is not yet ready to take full ownership of mine action in this region. In a letter to Geneva Call on 10 January 2007, however, the Vice President of Puntland Hassan Dahir Mohamud reiterated Puntland's commitment to banning landmines and reducing the risks from mines.⁸⁵

National management

In the absence of a functioning central government, the UN maintains *de facto* responsibility for coordinating, planning, managing, and monitoring mine action activities on behalf of the TFG and the Puntland and Somaliland authorities.⁸⁶

National mine action legislation

PMAC was established by presidential decree in 2003, which formally makes it responsible for mine action in Puntland.⁸⁷ Mine action legislation has not been passed in south central Somalia.

National mine action standards/Standing operating procedures

Police EOD teams follow standing operating procedures developed by MAG.⁸⁸

Program evaluations

From March–April 2007, GICHD conducted an evaluation of European Commission (EC)-funded mine action in Africa, including Somalia.⁸⁹ GICHD recommended that UNDP/UNOPS should assist PMAC in revising its mine action strategy and continue capacity development of core local capacities (while formulating an exit strategy). As already noted, some of these recommendations are now being acted upon by the UN (see Strategic mine action planning section above).

The evaluation also recommended that HALO consider initiating mine clearance in Puntland, focusing on the larger minefields in the border regions of northern Mudug.⁹⁰ HALO has indicated that it is considering a move into Puntland, once most of the high- and medium-priority SHAs in HALO's current area of operations in Somaliland are completed and the security situation allows for safe operations.⁹¹

Demining and Battle Area Clearance

Police teams undertake EOD activities in Puntland and south central Somalia under direct supervision by MAG. In Puntland, EOD operations are coordinated with UNDP, and in south central Somalia, activities are supervised by SRSA and coordinated with UNDP/UNMAS.⁹² SRSA staff provide in-kind support to UNDP Somalia Mine Action.⁹³

⁹³ Email from Tammy Orr, UNMAS, 26 June 2009.

No mine clearance has occurred in Somalia since the Puntland LIS was conducted in 2004–2005. The priorities have been training police EOD units, conducting EOD and, since 2007, seeking to establish a mine action program in south central Somalia.⁹⁴

In 2008, MAG trained six members of the Puntland police in basic EOD. The police EOD team is supported financially by UNDP Somalia Mine Action. MAG also trained nine members of the Puntland police and military (the Darawish) as EOD team medics. In June 2009, MAG planned to assess the six EOD police personnel to determine if they are qualified to become EOD Level 2 operators.⁹⁵

In May 2008, MAG, in collaboration with UNDP, started a Conventional Weapons Management and Destruction (CWMD) project in Puntland with funding from the United States Department of State. As part of the project MAG established a basic explosives and UXO warehouse and improved the Central Demolition Site in Garowe.⁹⁶

SRSA conducted a basic EOD course for Somali police officers in Baidoa, south central Somalia, in January–April 2008. Following the training, 17 men and four women graduated as EOD operators, trained to International Mine Action Standards Level 2. Three EOD teams, including the four women graduates, were then based in Baidoa.⁹⁷

Demining and battle area clearance in 2008

In 2008, in Puntland, the Puntland EOD police team disposed of “visible ammunition.” Under the MAG project, a total of 2,594 ERW were disposed of in 45 EOD tasks.⁹⁸

No mine clearance was possible either in south central Somalia due to the ongoing conflicts.⁹⁹ UXO spot clearance in and around Mogadishu, however, was reported as being carried out by AMISOM troops from Burundi and Uganda.¹⁰⁰ Also in 2008, DDG marked for safe disposal 264 ERW, completed 57 dangerous area reports in IMSMA format, updated ERW threat maps for Mogadishu, and facilitated the disposal of 56 items of UXO by AMISOM.¹⁰¹ DDG teams also found two landmines in a former military bunker in an IDP camp near Arbis in the Afgooye corridor outside Mogadishu. The mines were not active.¹⁰²

Clearance efforts in Puntland appeared to gather momentum in 2009. In January–June in Garowe, Puntland’s administrative capital, EOD teams conducted 240,000m² of visual battle area clearance and 1,000m² of subsurface clearance, destroying a total of 109 items of UXO.¹⁰³ The EOD teams also discovered 100kg of explosives from the 1980s that had been buried in the rubble of an abandoned ammunition storage area. The contents of the storage area were subsequently destroyed with the cooperation of the Puntland authorities. An estimated 1,000 people live very close to the area, which has now been cleared and verified as free of UXO.¹⁰⁴

Also in 2009, in Galkayo, a large town near the Ethiopian border in Puntland that has often been off limits because of security concerns, EOD teams found and destroyed 454 ERW from the main police station. The munitions destroyed included 370 new hand grenades.¹⁰⁵

In June 2009, through the UN Mine Action Team in Somalia, MAG began training peacekeeping forces deployed with AMISOM in Mogadishu in EOD techniques.¹⁰⁶

Risk Education

RE in 2008 consisted primarily of emergency RE through direct presentations in IDP camps, to at-risk communities and in schools, and through radio broadcasts.¹⁰⁷ Training of trainers was conducted for SCMAC staff, national NGOs, and teachers.

The UNDP/SRSA mine risk education officer trained 112 RE facilitators across south central Somalia between April and September 2008. Of these, 38 were selected to be deployed as SRSA RE facilitators.¹⁰⁸

The lack of information available constrained the development of an RE strategy.¹⁰⁹ In Puntland, a KAP survey in three districts conducted by HI found that more than half of those surveyed “used ERW” for selling and making money, and for digging wells, and one-quarter entered mined areas. It found that only a small proportion of those surveyed had received RE, and thus concluded there was a low level of knowledge.¹¹⁰

Security issues plagued RE plans throughout Somalia in 2008 and both national and international staff had restricted access, resulting in delays and reduced activities.¹¹¹

Specific RE materials have been developed for Somalia by the UNDP/SRSA mine risk education officer and field teams, using a participatory approach and taking into account the low literacy rates, targeting dangerous behavior, and reflecting the greater risks from ERW than mines.¹¹²

The UNDP/SRSA mine risk education officer monitored activities in the Baidoa area in August and September 2008 and concluded that RE was satisfactory, and was having a positive impact on risk behavior. The officer identified a need for more RE, using more creative approaches, with increased sustainability through the training of more community focal points. Severe security restrictions and the lack of standards restricted the monitoring of UNDP partner organizations.¹¹³

Very little RE has been conducted over the last 10 years in Somalia.¹¹⁴ In 2000, UNDP ran a mine awareness program in Somali refugee camps in Djibouti.¹¹⁵ In 2005, SOMMAC organized a seminar to raise awareness among journalists.¹¹⁶ In 2005, HI produced RE materials for Puntland and trained members of PMAC and the Puntland police EOD teams who then continued to deliver limited RE through to 2008. This activity resulted, for the first time, in communities reporting UXO to EOD teams. In January 2006, GICHD also provided training to PMAC staff.¹¹⁷ In 2007, HI launched an RE project in Puntland, and DDG delivered RE messages in IDP camps and Mogadishu.¹¹⁸

Activities in 2008¹¹⁹

Organization	Type of activity	Geographical area	No. of beneficiaries
UNDP/SRSA	Train the trainers and direct RE	South central Somalia – Baidoa area, Bay region	26,343
UNICEF	RE in child protection activities in IDP camps and vulnerable communities. Life skills-based education and child-to-child clubs program started end 2008	Throughout Somalia	Est. 30,000
SOMMAC	RE	Mogadishu	Not known
DDG	Emergency RE	Mogadishu and IDP camps	26,776
HI	Training of trainers, mass media, materials production and support to PMAC	Radio across whole of Puntland; training courses in Galkayo, Galdogob, Bossaso, and Burtinle; RE materials in Galkayo.	350,511
MAG	Limited one-off emergency RE in response to one major incident	Garowe, Puntland	80 teachers
Diaspora Action Group	Awareness activities	Near Hagar in Lower Juba (southern Somalia close to Kenyan border) at the end of October	Not known

Victim Assistance

The total number of survivors is unknown, but is estimated to be 1,405. There were no specific VA policies or activities in Somalia in 2008 and mine/ERW survivors faced the same challenges as other persons with disabilities. The health care situation in Somalia continued to deteriorate in 2008, with NGOs facing increasing security risks. There is little capacity for emergency surgery or trauma care outside of Mogadishu. Rehabilitation and healthcare facilities are difficult to access in remote areas. Médecins Sans Frontières (MSF) reported that “external assistance is dwindling in quality and quantity due to high insecurity and increased targeting of humanitarian workers.”¹²⁰

With intensified fighting in May and June 2009, Mogadishu hospitals were reportedly “overwhelmed”¹²¹ and “overcrowded.”¹²² Medical personnel in the city faced routine “threats and intimidation” by armed groups.¹²³ The Medina Hospital in Mogadishu reported in June 2009 that it was unable to feed its patients.¹²⁴

¹¹⁹ Email from Katherine Grant, UNICEF, 31 March 2009; interview with David Bax, UNMAS, Nairobi, 4 March 2009; World Health Organization, “Somali Health Cluster Bulletin,” November 2008, www.emro.who.int; and emails from Xhevdet Gegollaj, HI, 30 and 31 March 2009.

¹²⁴ “Hunger stalks Mogadishu hospitals,” *IRIN*, 22 June 2009.

The UNMAS/UNDP Mine Action Medical team, consisting of a trauma nurse seconded from SRSA and eight medics, can provide care for mine/ERW/IED casualties on an *ad hoc* basis when they are not in the field supporting the south central Somalia EOD operations. For instance, in early 2009, the team provided emergency care at the Bay Regional Hospital in Baidoa to four casualties of an ERW incident at Baidoa market.¹²⁵ The team also provided support to the Bay Regional Hospital, training staff in first-aid and traumatology and treating some 1,200 patients.¹²⁶

Following an ERW accident in Garowe in October 2008, MAG medic trainers provided first-aid to the casualties. Through liaising with the Swiss Foundation for Landmine Victims Aid, MAG helped arrange for one of the injured survivors to get further medical treatment in Ethiopia.¹²⁷

The ICRC supported the main referral hospitals for surgery in both Mogadishu (Keysaney Hospital, run by the Somali Red Crescent Society, SRCS) and Medina. The ICRC provided funding, supplies, training, and supervision. The Keysaney hospital treated 1,209 weapon-wounded in 2008, though none of these casualties were caused by mines.¹²⁸ A team from the Qatar Red Crescent Society worked alongside local staff at Keysaney hospital but had to be withdrawn for security reasons at the end of 2008. The ICRC also delivered medical supplies to other hospitals around the country and first-aid posts in the Bay, Galgudud, Lower Juba, and Middle Shabelle regions.¹²⁹

Through its Special Fund for the Disabled (SFD), the ICRC, along with the Norwegian Red Cross Society, provided support to three SRCS rehabilitation centers: in Galkayo (Puntland), Hargeisa, and Mogadishu.¹³⁰ The centers provide prosthetic and orthotic services and physiotherapy. The ICRC provided training and supported staff to do courses on prosthetics, orthotics, and physiotherapy in Addis Ababa and Somaliland. The Galkayo Center assisted 114 patients with prostheses and 79 with orthoses and provided 885 patients with physiotherapy. The Mogadishu Center assisted 188 patients with prostheses and 238 with orthoses and provided 969 patients with physiotherapy.¹³¹ The ICRC said that the “quality of services improved in 2008” at the Galkayo Center but accessibility remained a problem, due to security issues and lack of public transport. Production of prostheses and orthoses at the Mogadishu center decreased by 40% in 2008, compared with 2007.¹³²

MSF continued to be the primary provider of free medical services in central and southern Somalia. This included facilities equipped for emergency surgery and trauma care in Belet Weyne, Daynile, Dinsor, and South Galkayo. However, ongoing insecurity hampered MSF’s operations. In 2008, four MSF employees were killed, projects in Bosasso, Kismayo, and Mogadishu had to be closed, and all international staff were evacuated in April.¹³³ In June 2009, MSF announced its withdrawal from the Bakool region, where it had run a health center and

four health posts, for security reasons.¹³⁴ MSF said, however, that “none of our projects treat a substantial number of landmine victims in Somalia.”¹³⁵

There is very little psychosocial or economic support for mine/ERW survivors or persons with disabilities in Somalia.¹³⁶ Abilis Foundation provided small grants to local organizations of persons with disabilities for income generation, including the Disabled Women for Bread in Janaale, Technical Aid for Disabled Community Organization in Wanlewey, and Banadir Disabled Concern Organization in Mogadishu.¹³⁷

Both the Transitional Federal Charter (TFC) and the Puntland Charter prohibit discrimination. The TFC gives the state responsibility for the welfare of persons with disabilities and the Puntland Charter protects the rights of persons with disabilities. However, the US Department of State said, “In the absence of functioning governance institutions, the needs of most persons with disabilities were not addressed.”¹³⁸ There was reportedly significant discrimination against them.¹³⁹

Somalia had not signed the UN Convention on the Rights of Persons with Disabilities or its Optional Protocol as of 1 July 2009.

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates for meeting mine action needs (including RE and VA) in Somalia. The mine action program in Somalia is wholly funded from international sources with the exception of a monthly contribution to PMAC (see below) since January 2004.¹⁴⁰ UNDP coordinates mine action in cooperation with UNMAS, UNICEF, and other UN agencies, as well as national and international NGOs. PMAC coordinates mine action in the Puntland region.¹⁴¹

National support for mine action

The government of Puntland has reportedly contributed SOS1.5 million (\$1,095) to PMAC monthly—or SOS15 million (\$10,950) annually—since at least January 2004.¹⁴² The specific uses of the contributions have not been reported.

International cooperation and assistance

In 2008, two countries reported providing \$840,450 (€570,725) to mine action in Somalia.¹⁴³ There are no baseline estimates of mine/ERW contamination against which to measure the adequacy of funds in addressing mine clearance and RE needs. No international funds in 2008 addressed VA needs in Somalia, which remain extensive.

¹⁴¹ UN, “Country Profile: Somalia,” www.mineaction.org.

¹⁴² Email from Abdirisak Issa Hussein, PMAC, 27 July 2009.

¹⁴³ Comparison of funding in 2008 to funding 2007 is not provided because some funds reported by donors in 2007 as contributions to Somalia were evidently for mine action in Somaliland, which Landmine Monitor calculates separately. Funds reported for 2008 have been differentiated in greater detail. As a result, direct year-to-year comparisons may not be valid.

2008 International Mine Action Funding to Somalia: Monetary¹⁴⁴

Donor	Implementing Agencies/ Organizations	Project Details	Amount
US	MAG	EOD in Puntland, unspecified mine action	\$655,000
United Kingdom	UNMAS	Capacity-building, mine clearance, emergency response	\$185,450 (£100,000)
Total			\$840,450 (€570,725)

¹⁴⁴ USG Historical Chart containing data for FY 2008, from “To Walk the Earth in Safety 2009,” received by email from Timothy Groen, Office of Weapons Removal and Abatement, US Department of State, 18 June 2009; and email from Amy White, Deputy Program Manager, DfID, 17 March 2009.

SRI LANKA

2008 Key Data

Mine Ban Treaty status	Not a State Party
Contamination	Landmines, ERW, abandoned explosive ordnance
Estimated area of contamination	Unknown
Casualties in 2008	79 (2007: 50)
Estimated mine/ERW survivors	At least 1,158
Demining in 2008	Mined areas: 4.3 km ² Battle areas: 164.5km ²
Risk education recipients in 2008	At least 85,000
Support for mine action in 2008	International: \$8,173,696 (2007: \$7,586,350)

Ten-Year Summary

The Democratic Socialist Republic of Sri Lanka has not acceded to the Mine Ban Treaty. Both government forces and the Liberation Tigers of Tamil Eelam (LTTE) used antipersonnel mines extensively until the February 2002 cease-fire. Sri Lanka has voted in favor of every pro-ban UN General Assembly resolution. In October 2002, the government announced its willingness to accede to the Mine Ban Treaty contingent on reaching an agreement with the LTTE prohibiting the use of mines. In 2005, Sri Lanka submitted a voluntary Article 7 transparency report. The LTTE resumed using antipersonnel mines in 2006, and apparently laid large numbers of mines in 2008 and early 2009. There were allegations of government use of mines in 2007 and 2008, which Sri Lanka strongly denied.

Mine action has been shaped by the war with the LTTE. Soon after demining started in 1999 it was halted by fighting. When it resumed in 2002, the Sri Lankan Army played the main role, but the creation of the National Steering Committee for Mine Action that year also paved the way for a concerted demining effort, supported and coordinated by UNDP and involving foreign NGOs. The collapse of the cease-fire in 2006 and escalating fighting severely constrained the pace of humanitarian action. The LTTE's military defeat in May 2009 led to a new government focus on demining as a prerequisite for resettlement of people displaced by the conflict.

Landmine Monitor identified 1,272 casualties in Sri Lanka from 1999 to 2008 (117 killed, 421 injured, and 734 unknown). Risk education has been delivered through emergency provision in internally displaced persons' camps, the training of volunteers in children's clubs, community-based organizations, NGOs, and through schools.

Sri Lanka's health system has improved since 1999, including advancements in the provision of services to persons with disabilities in general and mine/explosive remnants of war (ERW) survivors specifically. Awareness and provision of physical rehabilitation services for survivors have increased, although in 2008 there was a lack of trained personnel and resources. The resumption of fighting in 2006 adversely affected the delivery of healthcare in the conflict areas, where the majority of mine/ERW incidents occur. The cost of services, military restrictions on travel, and lack of affordable transport remained primary barriers to survivors accessing services. Government involvement in victim assistance was reported to have decreased since 2006.

Background

In January 2008, the government of Sri Lanka terminated the 2002 Cease Fire Agreement with the LTTE.¹ On 20 May 2009, the government declared an end to the war with the LTTE after seizing all territory previously under LTTE control, bringing an end to two decades of armed conflict between the government and the LTTE, which sought a separate homeland for Tamils in the north and east of the country.

Mine Ban Policy

Sri Lanka has not acceded to the Mine Ban Treaty. Government representatives have previously stated that Sri Lanka's accession was dependent on progress in the peace process, and have linked accession to agreement by the LTTE to forswear use of the weapon.²

Sri Lanka voted in favor of the annual UN General Assembly Resolution calling for universalization of the Mine Ban Treaty, UNGA Resolution 63/42, on 2 December 2008, as it has for every annual pro-ban General Assembly resolution since 1996.

Sri Lanka provided a voluntary Article 7 report in 2005. It subsequently indicated it would provide an update, but has not yet done so.³ In December 2008, an official told the ICBL that due to the security situation and other priorities, Sri Lanka was not in a position to provide an update, but would endeavor to submit a report, including information on stockpiles, during 2009.⁴

Sri Lanka sent observers to the Ninth Meeting of States Parties in November 2008, but did not make any statements. It also participated in the Bangkok Workshop on Achieving a Mine-Free South-East Asia in April 2009—the second in a series of regional meetings leading up the Second Review Conference in November—where it made a presentation on mine clearance in the country.⁵ Sri Lanka did not attend the intersessional Standing Committee meetings in May 2009.

Sri Lanka is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines. It has never submitted an annual Article 13 transparency report.⁶ It is not party to Protocol V on Explosive Remnants of War.

Sri Lanka has not signed the Convention on Cluster Munitions.⁷

The Landmine Ban Advocacy Forum, a non-governmental network which previously advocated for an antipersonnel mine ban in Sri Lanka, has not been active since January 2008 due to lack of funding, as well as the lack of response from the government on the issue.⁸

¹ The Cease Fire Agreement came into effect on 22 February 2002. The government withdrew from the agreement on 2 January 2008, citing cease-fire violations by the LTTE and other factors. See Government of Sri Lanka, "Sri Lanka: Government abolishes the cease fire agreement from 16 January 2008," *ReliefWeb*, 4 January 2008, www.reliefweb.int.

² Statement of Sri Lanka, Seventh Meeting of States Parties, Geneva, 18 September 2006; see also *Landmine Monitor Report 2004*, p. 1,116; and *Landmine Monitor Report 2005*, p. 878.

³ At the Seventh Meeting of States Parties in 2006, Sri Lanka stated that it would soon provide an update to its report submitted in 2005. The 2005 report did not include information on stockpiled antipersonnel mines. Sri Lanka stated this would be reviewed for future reports. Statement of Sri Lanka, Seventh Meeting of States Parties, Geneva, 18 September 2006; see also *Landmine Monitor Report 2007*, p. 988; *Landmine Monitor Report 2006*, p. 1,071; and *Landmine Monitor Report 2005*, p. 878.

⁴ Interview with Sumede Ekanayake, Counsellor, Permanent Mission of Sri Lanka to the UN in Geneva, Geneva, 28 November 2008.

⁵ Presentation by Brig. Lasantha Wickramasuriya, Brigade Commander, Sri Lanka Army Engineers Corps, Bangkok Workshop on Achieving a Mine-Free South-East Asia, 2 April 2009.

⁶ In December 2008, an official told Landmine Monitor that the security situation and other priorities prevented Sri Lanka from providing a report. Interview with Sumede Ekanayake, Permanent Mission of Sri Lanka to the UN in Geneva, Geneva, 28 November 2008.

Use, production, transfer, and stockpiling

During the height of armed conflict in late 2008 and 2009, both sides accused the other of using antipersonnel mines.⁹ Landmine Monitor was not in a position to verify these accusations first-hand, as Sri Lanka restricted access by journalists and NGOs to the conflict zone.¹⁰

From the beginning of the cease-fire in February 2002 until mid-2006, Landmine Monitor received few allegations and no compelling reports of use of antipersonnel mines by the LTTE, other than command-detonated Claymore-type devices that are permitted under the Mine Ban Treaty. Since May 2006, the Sri Lanka Army (SLA) has repeatedly accused the LTTE of planting antipersonnel mines.¹¹

It appears that in 2008 and 2009, the LTTE laid large numbers of mines in defense of its military installations throughout the north. An SLA representative said that they came across many new mines, improvised explosive devices (IEDs) and booby-traps between late November 2008 and March 2009, including Rangan 99 antipersonnel mines with a motion sensor.¹² In April 2009, the SLA was still publicly accusing the LTTE of continuing to use antipersonnel mines.¹³ The war ended on 20 May 2009.

The SLA frequently reported recoveries of mines from the LTTE in 2008 and 2009.¹⁴ In a survey of SLA reports and some news articles between June 2008 and May 2009, Landmine Monitor noted the recovery of 2,264 antipersonnel mines, 22 antivehicle mines, 10 Claymore mines, and 14 IEDs; although this does not constitute a comprehensive accounting. According to one report citing “top defence sources,” during the fighting the military recovered more than 1.5 million antipersonnel landmines from the LTTE.¹⁵ It is unclear, but this figure may include mines seized from arms caches and manufacturing sites, as well as mines removed from the ground. Through July 2009, the SLA continued to find caches of antipersonnel mines and other weapons.¹⁶

It was reported that the SLA encountered at least two large LTTE factories producing exclusively antipersonnel and antivehicle landmines in Kilinochchi and Mullaitivu districts, as well as more than 10 makeshift antipersonnel mine production facilities. Sri Lankan national news telecasts showed video clips of these landmine manufacturing plants with huge stocks of raw materials used for making mines.¹⁷

For many years, the LTTE has been considered expert in making explosive weapons. It was known to produce several types of antipersonnel mines: Jony 95 (a small wooden box mine), Rangan 99 or Jony 99 (a copy of the P4 MK1 Pakistani mine), SN 96 (a Claymore-type mine), fragmentation antipersonnel mines from mortars, and variants of some of these antipersonnel

¹⁶ See, for example, Media Centre for National Security, “Army Task Force VIII recover massive stock of ammunition, mines etc from Mullaitivu area,” 18 July 2009, www.nationalsecurity.lk. Many articles on weapons seizures appear on this site (www.nationalsecurity.lk), administered by the Sri Lanka Ministry of Defence.

¹⁷ Landmine Monitor monitoring of national television media, Independent Television Network and Rupavahini, October 2008–May 2009; and see also, “Lanka troops recover more than 1.56 million landmines in North,” *The Hindu*, 12 June 2009.

mines, including some with antihandling features, as well as Amman 2000, MK1, and MK2 antivehicle mines.¹⁸

Landmine Monitor has not seen compelling evidence of use of antipersonnel mines by Sri Lankan forces in this reporting period (since May 2008). There were serious allegations of use of antipersonnel mines by Sri Lankan security forces in 2007 and early 2008; Sri Lanka has strongly denied all accusations.¹⁹

In April 2009, Brigadier Lasantha Wickramasuriya of the SLA acknowledged in a presentation at the Bangkok Workshop on Achieving a Mine-Free South-East Asia that the SLA had used antipersonnel mines in the past, but stressed that such use was only in the past and that the SLA was not currently laying mines.²⁰ He said the army had used non-detectable Chinese, Belgian, and Italian mines, as well as bounding and fragmentation mines of United States, Pakistani, and Portuguese manufacture.²¹ Landmine Monitor had previously reported that Sri Lanka had acquired antipersonnel mines from China, Italy (and/or Singapore), Pakistan, Portugal, and perhaps Belgium, the US, and others.²²

There is no evidence that the government of Sri Lanka has ever produced or exported antipersonnel mines. It is likely to still have a stockpile, but the size and composition are not known.

Scope of the Problem

Contamination

Sri Lanka is extensively contaminated by mines and ERW resulting from the armed conflict between the government and the LTTE as well as by abandoned explosive ordnance.

Both sides used landmines, including belts of Pakistani-made P4 mines laid by the SLA and nuisance minefields laid by the LTTE in years leading up to a 2002 cease-fire. The extent of mine contamination worsened after the cease-fire collapsed in 2006, when the government repeatedly charged the LTTE with further use of antipersonnel mines.²³ The government also faced allegations, which it denied, that security forces used mines in 2007 and 2008 (see Use, production, transfer, and stockpiling section above).

Renewed conflict is believed to have resulted in extensive new UXO contamination, particularly in the northern Vanni region, as a result of government use of air- and ground-delivered ordnance and LTTE artillery attacks, which reached a peak in 2009 as government

¹⁸ Presentation by Brig. Lasantha Wickramasuriya, Bangkok Workshop on Achieving a Mine-Free South-East Asia, 2 April 2009. Sri Lanka previously provided technical details of the Jony 95 and Jony 99 mines, which it identified as “produced and used” by the LTTE. Voluntary Article 7 Report, Form H, 13 June 2005. See also, *Landmine Monitor Report 2008*, p. 1,017. Maj. Mangala Balasuriya of the SLA Field Engineering Brigade stated that during the last stages of the war they encountered a modified antipersonnel landmine which used white phosphorus. Telephone interview with Maj. Mangala Balasuriya, Field Engineering Brigade, SLA, 25 June 2009.

¹⁹ See *Landmine Monitor Report 2008*, p. 1,016.

²⁰ Presentation on Humanitarian Demining by Brig. Lasantha Wickramasuriya, Bangkok Workshop on Achieving a Mine-Free South-East Asia, 2 April 2009. Notes by Landmine Monitor.

²¹ Ibid. The presentation included a section titled “Types of Mines Used by the Sri Lankan Army,” followed by photographs and titles: P4 MK1 (Pakistan antipersonnel mine); M72 (China antipersonnel mine); VS-50 (Italy AP mine); M16 A1 (US bounding antipersonnel mine, however the photograph shows what appears to be a P7 MK 1 Pakistan or PRB M966 Portugal bounding mine); PRB 415 (photograph shows what appears to be a NR 409 Belgian antipersonnel mine); PRB 413 (photograph shows what appears to be a Portugal M421 antipersonnel mine); M15 and ND MK 1 antivehicle mines; and M18 A1 Claymore mines.

²² In its voluntary Article 7 report, Sri Lanka noted the presence of these antipersonnel mines in minefields: P4 MK1, P4 MK2, P4 MK3, P5 MK1, Type 69 (Pakistan); PRB 413 (Portugal/Pakistan); PRB 409, M696 (Portugal); Type 66, Type 72 (China); and VS-50 (Italy/Singapore). Voluntary Article 7 Report, Forms C and H, 13 June 2005. Landmine Monitor previously identified the following antipersonnel mines as having been used by government troops in the past: P4 and P3 MK (manufactured by Pakistan); Type 72, Type 72A, and Type 69 (China); VS-50 (Italy or Singapore); NR409/PRB (Belgium); M409 and M696 (Portugal); and M18A1 Claymore (US). See *Landmine Monitor Report 2004*, p. 1,118; and *Landmine Monitor Report 2005*, p. 881.

²³ See *Landmine Monitor Report 2008*, p. 1,018; and interview with Maj. Pradeep Gamage, Officer-in-charge, North Jaffna HDU, SLA, Jaffna, 3 April 2007.

forces sought to capture the last LTTE positions.²⁴ A UN spokesperson alleged the government used cluster munitions in a bombardment in February 2009²⁵ but after further investigation retracted the statement.²⁶

The National Steering Committee for Mine Action (NSCMA) reported in April 2009 that Sri Lanka had 402km² of land contaminated by mines and UXO.²⁷ Even before the final intensive rounds of fighting, however, the government had acknowledged it did not have precise knowledge of the total extent of contamination.²⁸

Sri Lanka's last voluntary Article 7 report submitted in June 2005 identified approximately 12.6km² of land (308 mined areas in nine districts) known to be contaminated by antipersonnel mines and 141.2km² of suspected hazardous areas (2,341 SHAs in 10 regions)²⁹ but pointed out that this was a rough estimate and actual contamination might prove much less.³⁰ In addition, the government estimated some 99km² of land were affected by ERW. UNDP estimated that at the end of 2007 Sri Lanka had a total of 29km² of confirmed mine contamination and an additional 523 recorded SHAs.³¹ UNDP, which had recorded 863 affected villages on its Information Management System for Mine Action (IMSMA) database in 2005, had reduced that number to 394 by the end of 2008.³²

The northern Jaffna peninsula, a focal point of fighting before the cease-fire, is the most severely affected area. About half of all mines laid in Sri Lanka up to the 2002 cease-fire were estimated to be in the peninsula and to affect some 228 villages, excluding military-occupied High Security Zones (HSZ).³³ However, northern districts of Kilinochchi, Mullaittivu, Mannar, and Vavuniya, and eastern districts of Amparai, Batticaloa, and Trincomalee have also been affected by resumed conflict.

Sri Lanka has some 62km² of HSZ—areas near military emplacements, camps, barracks, or checkpoints—often protected by a defensive perimeter of mines. These zones are not accessible to demining agencies.³⁴ After the flare-up in fighting in August 2006, the SLA also put other clearance tasks off-limits to operators because of their proximity to SLA positions.³⁵

Casualties

Landmine Monitor identified at least 79 new mine/ERW casualties in Sri Lanka in 2008, including 11 killed and 68 injured. The casualties included 69 security force personnel, seven civilians including two deminers, and three of unknown civil status. UNDP recorded six civilian casualties, including one deminer: one person killed and five injured in four incidents. The rest of the casualties were identified through media reports.³⁶ These totals exclude casualties from command-detonated Claymore mine and IED attacks. Of all the casualties identified in 2008, 77 were males (73 men, three boys, and one of unknown age) and one girl. The age and gender

³⁵ Interview with Elmo Anandarajah, Mine Action Officer, UNDP, Jaffna, 2 April 2007.

³⁶ Data supplied by email from Birendra Katugampola, Project Assistant, UNDP, 13 July 2009; and Landmine Monitor media monitoring, January 2008–December 2008.

of one person was not reported. Antipersonnel mines caused 48 of the casualties, other mines caused 20, other ERW caused three, a victim-activated IED caused one, and the devices causing seven casualties were unknown.

This is a sharp increase compared to the 50 casualties identified by Landmine Monitor in 2007. Comparison with previous years since 2006 may be unreliable, however, due to the limited access to conflict areas and media focus on large-scale military attacks.³⁷

The total number of mine/ERW casualties recorded in IMSMA from 1985 to 2008 is 1,378 (220 killed and 1,158 injured);³⁸ 920 of these casualties (156 killed and 764 injured) occurred from 1999 to 2008.³⁹ UNDP reported an additional six mine/ERW casualties (two killed and four injured) from 2007 that were not printed in *Landmine Monitor Report 2008*, due to late verification of these casualties.⁴⁰ Landmine Monitor identified 1,272 casualties in Sri Lanka from 1999 to 2008 (117 killed, 421 injured, and 734 unknown).⁴¹

The annual mine/ERW casualty rate increased from 1999 to 2001, due to heightened conflict in the north. In 2002, the Ceasefire Agreement was signed and a decrease in casualties was observed. Yet the numbers remained high as a result of renewed civilian movement in the mine/ERW-affected areas and the lack of public awareness about mines and ERW. Clearance and risk education (RE) efforts were cited as reasons for a decrease in annual casualty figures from 2002 to 2005, but with the resumption of conflict in 2006 casualty figures rose again. From 2006 to May 2009 accurate casualty information has been difficult to access, probably resulting in under-reporting.⁴²

Casualties continued in 2009 with Landmine Monitor identifying five new mine/ERW casualties, all injured, as of May. Of these, UNDP reported three casualties, and the remainder were reported by the media.⁴³ The casualties included three civilians and two military personnel. All were injured by antipersonnel mines in five separate incidents, three of which occurred in the first 17 days of April.

Civilians continued to be injured and killed in remote-detonation Claymore mine or IED attacks in 2008. In the first two months of 2008, the UN Secretary-General reported two Claymore mine attacks killing at least 25 people and injuring at least 10, including 15 children killed and 10 injured. It was noted that the full scale of civilian casualties from Claymore mine attacks and other military offensives is unknown, due to restricted access to conflict areas.⁴⁴ Landmine Monitor identified 51 casualties from Claymore mine attacks in 2008 from media reports, including 36 killed and 15 injured. Forty-one of the casualties were civilians (29 killed and 12 injured) and 10 were military personnel (seven killed and three injured). The UN Department of Safety and Security in Sri Lanka recorded 1,619 casualties from Claymore mine/directional fragmentation devices from 2006 to 8 September 2008, including 250 casualties from 1 January to 8 September 2008.⁴⁵

Risk profile

People are at risk from both mines and UXO, and recent conflict has increased this risk. The northern Jaffna peninsula is the most severely affected area. People are most at risk in September when harvesting and planting begins. The most at-risk groups are men aged 18–45,

⁴⁵ See *Landmine Monitor Report 2008*, p. 1,025.

children, and those displaced by conflict, as there are a large number of internally displaced persons (IDPs), many of whom resettled in 2008 and needed RE.⁴⁶ Around 20% of recorded casualties are children.⁴⁷ High-risk activities include collecting scrap metal, honey, forest fruits, or firewood, and fishing or hunting.⁴⁸

Socio-economic impact

When heavy fighting was still continuing, the UN cited landmines as a threat holding back convoys trying to deliver emergency relief to communities displaced by war.⁴⁹ Since the end of the fighting, the crucial A9 road connecting the Jaffna peninsula to the rest of Sri Lanka has reopened. Yet mine and UXO contamination have continued to pose a major obstacle to resettlement of the more than 280,000 people estimated as of July 2009 to be internally displaced.⁵⁰ Resettlement of IDPs is regarded by authorities as a priority for political stabilization as well as socio-economic recovery from years of conflict and natural disasters, such as the 2004 tsunami. In Jaffna, mined areas and HSZs have imposed severe constraints on the amount of land available for cultivation.

Program Management and Coordination

Mine action

Mine action management as of July 2009 was in a state of transition as the government adjusted to new political and socio-economic priorities that emerged after the military defeat of the LTTE in May.

Since its creation in August 2002, the NSCMA has held responsibility for setting mine action policy and priorities, and for coordinating mine action, mine/ERW RE, and victim assistance (VA).⁵¹ With the escalation of hostilities in 2006, the Ministry of Defense (MoD) and SLA area commanders came to play an increasingly dominant role in deciding which areas were open to demining, approving the allocation of tasks and issuing authorization for the movement of staff, equipment, and supplies.⁵²

In July 2009, however, Basil Rajapaksa, a member of parliament and senior advisor to the President, revealed that responsibility for mine action had passed to the Presidential Task Force for Resettlement, Development and Security in the Northern Province, of which he is chairperson. Rajapaksa stated that the Task Force would make all decisions on clearance and that demining operators and donors should submit all proposals to the Task Force, not the MoD (although visas for expatriate staff would still require MoD approval). The Task Force would appoint a coordinating director to each operator to handle such issues as visas and security passes for demining personnel and equipment.⁵³

The NSCMA, as of July 2009, was in the process of transitioning to a National Mine Action Centre (NMAC) and moving from the Ministry of Nation Building and Estate Infrastructure and Development (MNBEID) to new premises close to the Rajapaksa-led Task Force. Draft terms of reference drawn up by an international consultant set out a governance structure for the NMAC and proposed functions and responsibilities relating to operations, quality assurance (QA), information management, and RE.⁵⁴

⁵³ MNBEID, "Special Meeting on Demining in Northern Province," Meeting minutes, Colombo, 10 July 2009.

⁵⁴ Emails from Niloufer De Silva, Senior Program Manager, UNDP, 26 June and 8 July 2009.

In 2007 and 2008, the UNDP Support to Mine Action Project, reporting to the NSCMA, was responsible for identifying priorities, coordinating operations through tasking, QA and quality control, and issuing of completion reports.⁵⁵ Under a three-year agreement with the government that ended in 2006 but was extended annually up to 2009, UNDP provided international technical advisors and managed a mine action database.

UNDP provided support through a project office in Colombo and District Mine Action Offices (DMAOs) in Jaffna and Vavuniya.⁵⁶ At the NSCMA's request, UNDP opened a mine action sub-office in the eastern city of Trincomalee in June 2007 to expedite mine action in the districts of Amparai, Batticaloa, and Trincomalee,⁵⁷ and another sub-office in Batticaloa in February 2008 to cover the districts of Amparai and Batticaloa.⁵⁸ The Batticaloa sub-office has functioned as the key DMAO for eastern Sri Lanka since August 2008 and the Trincomalee office had ceased operating as of January 2009.⁵⁹

UNDP mine action support suffered from high turnover of international staff. Its Colombo-based technical advisor (who acted as program manager) left in November 2006 and was not replaced. A technical advisor stationed in Jaffna also left in November 2006, and had not been replaced as of mid-2009.⁶⁰ An international technical advisor recruited in July 2007 resigned in November 2008 for personal reasons.⁶¹ UNDP selected another technical advisor but as a result of delays in government approval of his visa he took up another appointment.⁶² Task Force chairperson Rajapaksa said the government had approved recruitment by UNDP of only one international technical advisor and other appointments would be considered in future.⁶³

Risk education

The NSCMA is responsible for coordinating RE, with support from UNICEF. UNICEF RE staff presence in DMAOs ended at the end of 2007.⁶⁴ In May 2008, UNICEF hired an international consultant to revive its mine action program,⁶⁵ and he joined in December 2008.⁶⁶

Coordination meetings organized by UNICEF at district level to review activities continued to be disrupted by conflict and displacement of local populations in 2008. It was only possible to hold regular meetings in Jaffna.⁶⁷ A Technical Working Group (TWG) comprising major stakeholders also held only two meetings in 2008.⁶⁸

Victim assistance

There is no government coordination of VA in Sri Lanka.⁶⁹ To date, UNICEF has been the coordinator of VA activities in the country.⁷⁰

Data collection and management

Until May 2009, UNDP maintained the Sri Lanka Mined Area Database using the Information Management System for Mine Action (IMSMA) at its office in Colombo. UNDP's sub-office in Batticaloa also operates a read-only IMSMA terminal.⁷¹ In May 2009, management of the database was transferred to the MNBEID.⁷² UNDP will continue to support the collection of casualty data and the maintenance of this database.⁷³

A March 2009 review by Norwegian-supported mine action consultants, Scanteam, found the database "in some disarray" and observed that "reporting from the field is slow and of varying quality. Decisions on how to report on different phases of mine clearance have not been agreed upon. IMSMA data is not being used, as far as the evaluation team was able to verify, for priority-setting and tasking."⁷⁴ UNDP said the assertion was inaccurate and that data from the IMSMA database was being used for planning, tasking, and monitoring.⁷⁵

UNDP collected casualty data in 2008 through a network of RE operators, including UNICEF, and the NGOs Sarvodaya and Community Trust Fund. Information is gathered directly from community members, local government officers, the security forces, and clearance agencies. UNDP verifies community reports of casualties.⁷⁶

Casualty data collection was affected by stringent security restrictions particularly in the northern Kilinochchi and Mullaitivu districts. Informal reports indicate that the number of casualties could be much higher than those recorded in IMSMA.⁷⁷

There are no reliable national statistics for the number of people with disabilities in Sri Lanka. The Community-Based Rehabilitation program of the Ministry of Social Services and Social Welfare (MoSS) estimates that 7% of the population is disabled.⁷⁸ The World Health Organization, with other donors, provided financial and technical assistance to the Ministry of Healthcare and Nutrition to establish a national injury surveillance system, including mine/ERW casualties. The project was piloted in six hospitals, including the National Hospital of Sri Lanka, and there are plans to extend it to other district hospitals.⁷⁹

Detailed RE activity reports are entered into IMSMA.⁸⁰ However, by July 2009, entry of 2008 activities was not complete, and data on RE activities by partner organizations in Amparai and Batticaloa districts was not recorded.⁸¹ There is a well-developed system for monitoring RE, both internally by the operators and UNICEF, and externally by the DMAO QA teams.⁸²

Plans

Strategic mine action plan

Since 2004, Sri Lanka has repeatedly set itself the goal of becoming mine-free, but the deadline for completion of mine clearance slipped from 2006 to 2008 and in that year officials changed their position to say “all mined areas except HSZ will be cleared by the end of 2009.”⁸³ Those targets, however, became impractical in view of the disruption to demining resulting from the revival of hostilities in 2006, the extent of known contamination, reports of possible new use, and the refusal of the military to allow clearance of minefields in and near the HSZs.⁸⁴

⁸⁴ See *Landmine Monitor Report 2008*, pp. 1,016–1,018.

Integration of mine action with reconstruction and development

Sri Lanka's mine action strategy prioritizes clearance that supports the resettlement of displaced persons; reconstruction of infrastructure such as roads, bridges, powerlines, and drinking water supply; and community needs such as schools and hospitals.⁸⁵ After a visit by UN Secretary-General Ban Ki-moon in May 2009, Sri Lanka also called for international support for demining as "an essential prerequisite to expediting the early return of IDPs."⁸⁶ After taking the lead in mine action in Sri Lanka in July 2009, the Presidential Task Force for Resettlement, Development and Security in the Northern Province described demining as "the foremost operation in order to enable resettlement and other development initiatives."⁸⁷

After security forces regained control of large areas previously occupied by the LTTE in 2006, the government prioritized emergency demining of these areas to expedite its "Re-awakening of the East Programme" aimed at resettlement, reconstruction, and development to rebuild houses, schools, public buildings, roads, and bridges while creating employment and encouraging investment in these areas.⁸⁸ In November 2008, the government launched its "Reviving the North" ("Uthuru Wasanthaya") program which included Jaffna, Kilinochchi, Mannar, Mullaittivu, and Vavuniya districts.⁸⁹

National ownership*Commitment to mine action and victim assistance*

For several years, Sri Lanka has exercised full national control of mine action through the MNBEID, the NSCMA, and DMAOs. In 2009, the government appealed for international support for demining but made clear in discussions with international organizations that national authorities would dictate the scope and location of their activities. Officials compared performance of international demining NGOs unfavorably with those of national and Indian agencies, and suggested donors should channel funding through the government to agencies recommended by the MNBEID.⁹⁰

National management

As a transitional measure towards establishing a National Mine Action Center, UNDP committed to supporting six full-time government positions. Five staff members had been recruited as of July 2009: a Senior Programme Officer for Mine Action, an IMSMA Officer, a Mine Action Secretary for the MNBEID in Colombo, and two Mine Action Quality Control Officers for the DMAOs in Jaffna and in Vavuniya.⁹¹

National mine action legislation and standards/Standing operating procedures

Sri Lanka has not enacted any national mine action legislation. UNDP drafted national standards in 2003 that were approved by the MNBEID in 2005 and published on 4 April 2006. A UNDP technical advisor started updating Sri Lanka's National Mine Action Standards (NMAS) in September 2008 at the NSCMA's request to bring them more into line with the International Mine Action Standards but did not complete the task before he resigned in November 2008.⁹²

A communications strategy was developed, and existing RE standards were revised in March 2009 (and were awaiting NSCMA approval as of July 2009) with support from the Geneva International Centre for Humanitarian Demining.⁹³ There are no national standards for VA in Sri

Lanka. UNICEF and a number of NGOs have begun working with the Ministry of Healthcare and Nutrition to develop a national VA policy, to be integrated into the NMAS.⁹⁴

Program evaluations

A review of mine action programs receiving Norwegian support, conducted in February–March 2009 found the national mine action program “in some disarray.” The report observed that “the mine action program in Sri Lanka is not presently planned according to good practice standards and processes. The Ministry of Nation Building and the UNDP as its counterpart have little capacity and competence and the mine action database (IMSMA) is not updated and consequently not used for strategic planning.”⁹⁵ UNDP disputed the findings observing that the IMSMA database had been updated and synchronized and was used for planning and other purposes, including tasking and monitoring.⁹⁶

The review concluded that “the planning, prioritisation and tasking of national authorities leaves much to be desired and this has a real and negative impact on the efficiency and effectiveness of the mine action work. The information provided by national authorities, and based on information from the SLA, is insufficient and hampers the implementation.” It further stated that “UNDP does not have the capacity to support the national authorities and so much needed capacity development in the areas of SOP [standing operating procedure] development, QA/QC and database population and use is not taking place.”⁹⁷

UNICEF contracted the NGO Motivation Charitable Trust to carry out an evaluation of VA in Sri Lanka from August to September 2008. The focus was to assess VA work over the previous five years, verify the needs of victims, and identify future VA partners.⁹⁸ The final report noted that although assistance for survivors was “on the right track,” there was a lack of long-term planning, and assistance focused too heavily on the survivors themselves and not on those affected by mines in general.⁹⁹ Lack of coordination and holistic provision of services also reduced overall effectiveness.¹⁰⁰ Survivors identified economic support as their major need. The assessment determined that economic reintegration needed to be holistic and offer a variety of opportunities to be sustainable and to meet all the needs of survivors and their families.¹⁰¹

Demining and Battle Area Clearance

Eight organizations carried out demining in Sri Lanka in 2008. The SLA’s Humanitarian Demining Unit (HDU), trained by the US commercial company RONCO in humanitarian demining between 2003 and 2006, was the biggest operator. In addition, demining was conducted by the national NGO Milinda Moragoda Institute for People’s Empowerment (MMIPE), as well as two Indian NGOs, Horizon and Sarvatra, and four international NGOs: Danish Demining Group (DDG), HALO Trust, Mines Advisory Group (MAG), and the Swiss Foundation for Mine Action (FSD). Some operators worked jointly. NPA suspended operations early in 2008 and in December announced that it was withdrawing from Sri Lanka.¹⁰²

Sri Lankan and Indian media reports in July 2009 said the Indian Army was about to deploy a team of 500 deminers to assist clearance in the north.¹⁰³ It was unclear as of mid-2009 if the Indian Army was indeed preparing to deploy demining personnel or if these reports had

confused preparations by Indian demining NGOs working in Sri Lanka to increase staff, many of them ex-army.¹⁰⁴

Identification of hazardous areas

No comprehensive national survey of mine/ERW contamination has been conducted: some operators have conducted surveys within their area of operation.¹⁰⁵ In mid-2009, as pressure for clearance mounted following the end of the fighting, demining operators—with support from some donors—were keen to undertake survey of areas designated for resettlement of IDPs.¹⁰⁶ The Presidential Task Force ruled in July 2009 that “General Mine Action Assessment should be carried out jointly with Sri Lanka Army as Army has much information about minefields.”¹⁰⁷

Demining and battle area clearance in 2008

The government reported that demining released a total of more than 168km² in 2008, compared with 162km² in 2007.¹⁰⁸ However, nearly three-quarters of the 2008 total was accounted for by the SLA, which mostly conducted emergency battle area clearance (BAC)—often only surface visual checks. Total mined area clearance nearly doubled in 2008, according to official data, of which almost half was attributed to the SLA (see table below).¹⁰⁹ In eastern districts, operators cleared 1.14km² in 2008, down from 1.7km² the previous year.¹¹⁰

In the north and the east, from January 2008 through March 2009, DMAO staff assigned 88 new tasks to demining organizations, performed 482 QA visits, and supported local government authorities to release 267.6km² of land, mostly former battle areas, for IDP shelters, resettlement, and other socio-economic uses.¹¹¹

Escalating hostilities in the northern Vanni region brought demining in the area to a standstill at the end of 2007 both as a result of fighting and tougher security restrictions by the military on movements of personnel and equipment to ensure that demining assets did not fall into the hands of the LTTE.¹¹²

Demining continued on northernmost Jaffna peninsula in 2008 but at a much reduced rate because the military only approved new tasks for demining in November. These included survey of suspect land in Uduvil and Tellippallai in HSZ buffer areas that were released after successful court action by local residents.

Total	4,325,947	4,420	6	17,302	164,535,768	168,861,715

The SLA had operated in 2007 with four field engineer regiments comprising a total of 505 deminers¹¹⁴ but in 2008 it kept a skeleton team of 150 deminers on BAC while the remainder were engaged in military operations.¹¹⁵

NPA/HDU, working with the SOLIDAR consortium of NGOs in the Kilinochchi and Mullaitivu districts of the LTTE-controlled Vanni region, had scaled down its operating staff in 2007 from some 650 to about 450 persons. This was because of growing constraints on operations imposed by the security situation, and reflected concerns by the authorities that its vehicles and equipment might fall into the hands of the LTTE. In addition, escalating hostilities brought forced recruitment of some NPA/HDU staff by the LTTE. In early January 2008, NPA suspended operations initially until April but then until August 2008, in the process withdrawing its program manager in July and cutting back to a skeleton staff in Colombo and Kilinochchi. NPA had intended to keep vehicles and equipment in storage until conditions permitted a resumption of operations but in December 2008 announced it was closing the operation and finally shut down in mid-2009.¹¹⁶ “We have decided to pull out because the authorities have

¹¹³ Interview with Regunathan Umapathy, MNBEID, Colombo, 22 June 2009; and email from Regunathan Umapathy, 23 June 2009; MNBEID, “Progress Report on National Mine Action Program Year 2008,” 8 January 2009, pp. 2–10, and 14 May 2009, pp 3–6; and emails from Ramachandran Ajantha, IMSMA Assistant, DMAO, 27 March 2009, 3 April 2009, 8 April 2008, and 23 April 2008. UNDP’s clearance statistics are based on weekly clearance reports filed by demining operators, but are not all consistent with operators’ reports, due to the occasional time lag in reporting to the IMSMA database. No area reduction or cancellation was reported. No agency has conducted clearance operations in the Vanni region since 19 December 2007. See also *Landmine Monitor Report 2008*, p. 1,021. FSD reported that in 2008 it cleared 1,326,628m² of mined area, 3,185,542m² of battle area, 2,485 antipersonnel mines, 217 UXO (and 1,741 other dangerous objects). Email from Marc Bonnet, Program Manager, FSD, 28 July 2009.

¹¹⁴ Interview with Capt. Thushara Jaywardhena, SLA, Mathegoda, 28 March 2008.

¹¹⁵ Presentation by Maj. Mangala Balasuriya, HDU, Field Engineers Brigade, SLA, NSCMA Review of 1st Quarter 2009 Results, Colombo, 14 May 2009.

¹¹⁶ Telephone interview with Jane Filseth Andersen, Advisor, Mine Action Department, NPA, 2 July 2008; see *Landmine Monitor Report 2008*, p. 1,022; and NPA, “Norwegian People’s Aid phases out in Sri Lanka,” 9 December 2008, www.npaid.org.

made our work impossible,” NPA General Secretary Petter Eide was quoted by the media as saying.¹¹⁷ NPA handed over all its available assets to the MNBEID.¹¹⁸

HALO had worked in Jaffna with two international and 350 national staff in 2007.¹¹⁹ It continued demining in 2008 but by June 2008 had only five tasks remaining which it finished by the end of the year.¹²⁰ By the end of 2008 HALO had reduced its staff to 30.¹²¹ Early in 2009, HALO started to receive new tasks in Jaffna and by February had raised its staff to 144 deminers working with two excavators.¹²² In mid-2009, in addition to its operating base in Jaffna, HALO had opened an office in Colombo. In response to the government’s emphasis on clearance for resettlement of IDPs, HALO raised its staff to 300 deminers but as of July had yet to receive clearance tasks.¹²³

FSD worked in Mannar and Vavuniya districts in 2007 and later took up operations in Batticaloa and Trincomalee districts, but in 2008 it received no tasks in the north and focused largely on Batticaloa. FSD worked with four international staff, reduced later to three, and approximately 89 nationals, supported by four mini-flails. By the end of 2008, FSD’s engagement in the east was winding down but it had increased staff to 180 in 2009 and thought the number could rise to as many as 300 by the end of the year as the government opened up clearance tasks in the north.¹²⁴

DDG had a total of 430 staff in 2007, including 280 in Jaffna and the remainder in Trincomalee but, like HALO, had to reduce its staff in Jaffna in 2008 due to lack of tasking and funding. It increased its operation in Trincomalee, adding one armored back-hoe loader and 114 deminers.¹²⁵ By mid-2009, DDG had expanded to a total of 406 staff, including four expatriates, 266 deminers, 64 supervisory staff, 51 support staff, and 21 administrative staff in anticipation of receiving new tasks.¹²⁶

MAG worked in 2008 with two international and 55 national staff in three manual clearance teams, two of them supported by Bozena mini-flails, conducting demining and BAC in Batticaloa district. In 2009 it continued to undertake tasks in the district but operations there were winding down while MAG was expanding to take on tasks in Mannar and Vavuniya districts. By September 2009 it had opened an operational base in Mannar, increased staff to 190 and added four armored excavators.¹²⁷

MMIPE operated in Anuradhapura and Trincomalee districts in 2008 with 63 deminers and Horizon operated in the Mannar and Batticaloa districts with 64 deminers, including 24 Indian deminers and four excavators. Horizon increased its capacity to 85 deminers by October 2008 in Batticaloa. Sarvatra carried out manual demining and BAC in Mannar with 54 deminers.¹²⁸ Horizon reportedly added 50 more deminers from India in August 2009. Sarvatra added 32 more in August and was reportedly planning to send another 32.¹²⁹

Demining and BAC in Sri Lanka from 2002–2008¹³⁰

Year	Mine clearance (km ²)	BAC (km ²)
2008	4.33	164.54
2007	2.64	159.31
2006	1.66	5.26
2005	1.34	18.22
2004	1.71	2.53
2003	1.14	0.01
2002	0.07	0
Total	12.89	349.87

Risk Education¹³¹

RE has been delivered through: emergency provision in IDP camps; the training of volunteers in children's clubs; community-based organizations; NGOs; schools; and local government (a district-based RE unit in Trincomalee). It consisted primarily of education, training, and community liaison. RE programs used formal and non-formal education systems, supported by public information dissemination (materials and mass media). According to estimates, at least 85,000 people received RE in 2008. In 2008, coverage was lower than previous years due to a reduced program period, and because most partners were without contracts for almost six months due to bureaucratic delays. In 2008, six districts were covered through three community-based RE partners, 51 field officers, and 701 volunteers and children who are animators.

Approximately the same number of men and women received RE. Particular effort was made to reach men, as they make up the highest proportion of casualties. The greatest number of people was reached through house-to-house visits, which was considered to be the most effective method.

UNICEF reports that its RE program has been very successful in contributing to a significant reduction in both mine incidents and mine casualties. It also identifies the high number of reports on UXO coming from affected communities and other suspected dangerous areas as another strong indicator RE's positive impact.

Emergency RE was provided, despite the challenges faced due to the conflict in the north. Some NGO volunteers were themselves displaced due to the conflict, and some lost family members. Access to LTTE-controlled areas in the Vanni region was difficult. UNICEF's partnership in Vanni with the NGO White Pigeon came to an end. RE was conducted through Sooriyan Radio with the support of the NGO Internews to reach difficult-to-access populations in Vanni and IDPs.

School-based RE was provided in the north and east by including RE in teacher training at the National Colleges of Education (a total of 2,005 teachers have been trained since the program began) and to monitor their work through In-Service Advisors, a type of inspector and master trainer (a total of 200 have been trained). School principals in 2,400 schools also received RE orientation. Although the original plan was to include RE in the school curriculum, this did not happen, and it is up to the teacher to include the topic in class. School-based RE is reportedly

¹³⁰ Emails from Reganathan Umpathy, MNBEID, 23 June 2009; and Vartharajah Murugathas, National Information Management Associate, UNDP, 8, 12, and 14 June 2007, and 8 and 23 April 2008. No land release by survey was reported.

¹³¹ All references in this section are from UNICEF, "EC support to Mine Risk Education and Survivor Assistance through UNICEF in Sri Lanka," Final report, April 2009, pp.1–15.

weak and, although a monitoring mechanism was introduced, data on how many schools have conducted RE is not available. NGOs have also provided RE in schools on request.

Community liaison was conducted by MAG and by community workers working with mine-affected communities to ensure they were aware of clearance activities being conducted in or around their areas, to provide a good link between clearance organizations and communities, and to collect information from communities about UXO and mine-related issues. RE teams also often served as an important link between aid and relief agencies and the government.

RE is increasingly integrated into other child protection issues, such as out-of-school children, under-age marriage, and child abuse.

Risk education activities in 2008¹³²

Organization	Type of activity	Geographic area
Sarvodaya	RE through community network, community liaison	Amparai, Batticaloa, and Jaffna districts
Community Trust Fund	RE through community network, community liaison	Mannar, Trincomalee, and Vavuniya districts
Kachcheri Child Focus RE Unit	RE through community network	Trincomalee district
Ministry of Education	Inclusion of RE in teacher training	North and east
InterNews	RE through mass media (radio and print)	
UNICEF and partners	Landmine safety briefings for aid workers	
MAG	Community liaison	

In 2009, RE was continued prior to and immediately following resettlement of IDPs. Opening of new IDP sites in areas needing ERW clearance in Jaffna required emergency or rapid intervention RE for construction workers, aid workers, and IDPs.¹³³

UNICEF started RE activities in Jaffna in 1998 with a focus on schoolchildren until activities were suspended due to hostilities in April 2000. Only limited RE was possible until after the February 2002 cease-fire when UNICEF and NGOs greatly increased activities. RE then became closely linked to resettlement of IDPs and mine clearance, with RE operators conducting community liaison.¹³⁴

In late 2003, UNICEF established an RE training-of-trainers capacity¹³⁵ and conducted activities to reach out-of-school children. RE delivery increased each year to a peak of 686,274 people in 2005, but has diminished since then due to renewed conflict.¹³⁶ In 2006 and 2007, emergency RE was provided to thousands of newly displaced people and aid workers, despite the obstacles created by renewed conflict.¹³⁷

The NSCMA coordinates RE, based on reports provided by UNICEF and the district-based IMSMA databases maintained by UNDP.¹³⁸ RE has also been coordinated at a district level, where QA is also conducted, but this has been disrupted by renewed conflict in recent years.¹³⁹ National standards were produced in 2004.¹⁴⁰ Two evaluations, by UNICEF and the EC Humanitarian Aid Office, in 2004 were broadly positive and concluded that RE may have contributed to a decrease in incidents.¹⁴¹ In mid-2007 UNICEF restructured its country program to be based on a broad vision of holistic child protection. In 2007, bureaucratic delays within UNICEF were blamed for leaving NGOs “isolated.”¹⁴²

Victim Assistance

The total number of mine/ERW survivors in Sri Lanka is unknown, but is at least 1,158.¹⁴³ Although there have been some improvements in VA provision in recent years, many challenges remain. There is no countrywide or centrally coordinated government effort to assist mine/ERW survivors. Assistance provided by a number of government agencies and NGOs is often *ad hoc* and fragmented,¹⁴⁴ and constrained by limited resources in both capacity and technology. Mine survivors have reported being denied specialist medical care when they have been unable to afford the cost.¹⁴⁵

Renewed fighting from 2006 to mid-2009 resulted in a significant decrease in VA, and health services generally, in the conflict areas, where the majority of mine/ERW incidents occurred.¹⁴⁶ Government involvement in VA was also reported to have decreased over this period.¹⁴⁷ Attacks directly on and near hospitals in the north further reduced their capacity.

Military controls on civilian movement in the north, already tight, became even more stringent in 2008 with military operations Jaffna, Kilinochchi, Mannar, Mullaittivu, and Vavuniya districts, severely hampering transport of medical supplies into and around conflict areas and healthcare efforts.¹⁴⁸ There was a lack of surgeons and specialists in most district hospitals in the northeast, and a need to improve the basic skills of health professionals in treating war-related injuries.¹⁴⁹ Poor roads further limited access to services. Although distances are short on the Jaffna peninsula, irregular public transport and the high cost of transportation meant a trip of a few kilometers could be costly and time consuming.¹⁵⁰

Relief efforts were further hampered by the government reportedly refusing to extend dozens of international aid workers’ visas in June 2009, because they were considered sympathetic to the defeated LTTE.¹⁵¹

National health policy calls for free primary medical care for all citizens, but it does not cover the specialist care that survivors often need.¹⁵² The MoSS is responsible for providing services to people with disabilities, including community-based rehabilitation (CBR). In the mine/ERW-affected north and east, CBR was only provided in the eastern Ampara and Batticaloa districts. Financial assistance from the government is said to be available to persons with disabilities including a monthly payment, medical assistance, self-employment grants, and housing programs. With few MoSS staff being located in the north and east there was limited awareness of and access to such programs in these areas.¹⁵³ Survivors included in a UNICEF needs assessment in August–September 2008 reported that the level of financial support from the government was not enough to provide a decent standard of living.¹⁵⁴

Survivors in the UNICEF needs assessment identified physical rehabilitation as a “basic need”¹⁵⁵ but services are insufficient to meet the demand. The government provided financial support to NGOs that assisted persons with disabilities, including subsidizing prosthetic devices and making purchases from suppliers with disabilities.¹⁵⁶

There are eight physical rehabilitation centers in Sri Lanka producing artificial limbs and assistive/mobility devices. All were supported by NGOs and offer the majority of services for free. Four centers are in the north and east provinces: Jaffna Jaipur Center for the Disability Rehabilitation (JJCDR); Jaffna White Pigeon Technical Institute of Prosthetics; Valvuthayam Mannar Rehabilitation Center; and the HI Physical Rehabilitation Center (PRC) in Batticaloa. The UNICEF needs assessment found the White Pigeon and Valvuthayam Mannar centers did not provide quality services because they lacked qualified personnel and used inappropriate technology. A severe shortage of physiotherapists was also reported in the northeast.¹⁵⁷

Sri Lankan military war disabled received free physical rehabilitation, financial compensation, and benefits.¹⁵⁸ The Ranaviru Sevana Rehabilitation Centre is the main rehabilitation center of the SLA and provides a comprehensive range of services to injured and disabled soldiers. Services include the provision of artificial limbs and mobility devices, physical therapy, vocational training, and social reintegration support through rejoining a regiment. Of the center’s 312 staff, 80% have been physically disabled by the war.¹⁵⁹

The mine/ERW survivors interviewed in the UNICEF needs assessment identified loss of livelihood as having a major impact on their standard of living.¹⁶⁰ The MoSS operated eight vocational training facilities for persons with physical and mental disabilities and provided job training and placements for graduates. There were 74 NGO-run schools and training institutions for persons with disabilities registered in 2008.¹⁶¹ Courses offered were not market-driven, resulting in a mismatch between skills training and employment opportunities.¹⁶²

Psychological care and social support are very limited in Sri Lanka and there is little awareness among survivors of available services. Only 3% of mine survivors interviewed in the UNICEF needs assessment had received psychological care and most were unaware of such

services.¹⁶³ Psychosocial care was predominantly provided in the mine/ERW-affected areas, by NGOs Sarvodaya and JJCDR in Jaffna and White Pigeon in Killinochchi.¹⁶⁴

It is against the law to discriminate against persons with disabilities in Sri Lanka, but discrimination was reported in 2008, limiting the access of persons with disabilities to employment, education, and other state-run services. Negative attitudes were also reported.¹⁶⁵ Sri Lanka signed the UN Convention of the Rights of People with Disabilities, but not its Optional Protocol, on 30 March 2007. As of 1 July 2009, it had not yet ratified the convention.

Victim assistance activities

HI signed a memorandum of understanding with the Ministry of Health to gradually hand over its Physical Rehabilitation Center (PRC) to the Batticaloa Teaching Hospital by June 2011. In 2008, the PRC provided rehabilitation services and artificial limbs to more than 1,000 new clients, almost one-tenth of whom were mine/ERW survivors. It extended services in the north, including to Vavuniya, through mobile teams. A temporary emergency unit to treat those who fled the fighting and were injured was established with the support of HI in 2009. HI-supported services provided assistance to 97 mine/ERW survivors in 2008.¹⁶⁶

The JJCDR supplied prostheses, orthoses, tricycles, wheelchairs, crutches, and other mobility devices to 405 mine/ERW survivors in 2008. The JJCRD services also included provision of physical therapy sessions to 65 survivors. The JJCRD is the only physical rehabilitation service provider in the Jaffna peninsula and was unable to assist all those in need in 2008.¹⁶⁷ ICRC continued support to the program in 2008, including meeting the costs of transport of persons going to the center, when needed. The quality of services was reportedly improved through on-the-job training by an ICRC ortho-prosthetist and an ICRC physiotherapist.¹⁶⁸

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates or resource mobilization strategies for fulfilling mine action needs (including RE and VA) in Sri Lanka. The NSCMA, which oversees mine action policy, includes representatives from the donor community. The Donor Peace Support Group (DPSG) for Sri Lanka includes a sub-group on mine action that informs donors on progress in mine action and promotes collective policy strategies among donors.¹⁶⁹

National support for mine action

Sri Lanka did not report contributions to mine action from the national budget in 2007 or 2008.

International cooperation and assistance

In 2008, six countries and the European Commission reported providing US\$6,859,896 (€5,550,520) to mine action in Sri Lanka, 8% more than international support reported in 2007. Funding levels have decreased each year since 2004, when approximately \$23.6 million was contributed and in 2008 were the lowest since 2002.

2008 International Mine Action Funding to Sri Lanka: Monetary¹⁷⁰

Donor	Implementing Agencies/ Organizations	Project Details	Amount
Japan	MAG, FSD, DDG	Mine clearance	\$2,027,697 (¥209,040,960)
United States	Centers for Disease Control, USAID Leahy, and Department of State	Mine clearance, VA	\$2,004,000
EC	FSD, UNICEF	Integrated mine action, mine clearance, RE, VA	\$1,767,120 (€1,200,000)
Australia	MAG, International Organization for Migration	Mine clearance, survey	\$1,109,810 (AUD\$1,300,000)
Norway	MMIPE	Mine clearance	\$1,135,360 (NOK6,400,000)
UK	MAG	Mine clearance	\$92,725 (£50,000)
Switzerland	FSD	Mine clearance	\$36,984 (CHF40,000)
Total			\$8,173,696 (€4,658,357)

Starting in August 2009, India has provided technical assistance and personnel to support mine/UXO clearance in Sri Lankan territories previously occupied by the LTTE. As of July 2009, India reportedly planned to commit 500 personnel to its clearance efforts in Sri Lanka.¹⁷¹

SYRIA

Ten-Year Summary

The Syrian Arab Republic is affected by mines and explosive remnants of war (ERW), including cluster munition remnants, especially in the Golan Heights. Little progress has been made in clearance since 1999. The number of mine/ERW casualties in Syria is unknown but some 600 casualties have been recorded in the Golan Heights since 1967. Risk education in Syria remained inadequate and limited to Quneitra governorate. Disability is not a government priority, but since 1999, mine/ERW survivors in the Syrian-controlled Golan Heights have seen improved medical care and rights.

Mine Ban Policy

Syria has not acceded to the Mine Ban Treaty. Its position has not changed in recent years. While expressing concern for the plight of mine victims and support for risk education and other efforts to protect civilians, Syria still views antipersonnel mines as necessary weapons for national defense, and considers Israel's continued annexation/occupation of part of the Golan Heights as an important reason for not joining the treaty.¹

On 2 December 2008, Syria was one of 18 countries to abstain from voting on UN General Assembly Resolution 63/42, which called for universalization and full implementation of the Mine Ban Treaty. It has abstained from voting on similar resolutions in previous years.

Syria did not attend the Ninth Meeting of States Parties in Geneva in November 2008 or the intersessional Standing Committee meetings in Geneva in May 2009.

Syria has not usually been identified as a producer or exporter of antipersonnel mines. The size and origin of Syria's mine stockpile is not known. Syria is thought to have last used mines during the 1982 conflict with Israel in Lebanon.

Syria is not party to the Convention on Conventional Weapons. Syria has not signed the Convention on Cluster Munitions.²

Scope of the Problem

Contamination

Contamination by mines and ERW originates from Syrian involvement in Arab-Israeli wars since 1948. As a result of the 1973 war with Israel, large parts of the Golan Heights in Syria's southwestern Quneitra governorate are heavily mined. In addition to the presence of both antipersonnel and antivehicle mines, the Golan Heights is contaminated with UXO, including unexploded submunitions.³

The Golan Heights is divided into three areas consisting of a Syrian-controlled area, an Israeli-controlled area, and a buffer zone—the Area of Separation (AOS)—monitored by the UN Disengagement Observer Force (UNDOF).⁴ UNDOF considers all areas not cleared or

¹ Telephone interview with Milad Atieh, Director, Department of International Organizations and Conventions, Ministry of Foreign Affairs, 29 January 2008; and interview with Mohd Haj Khaleel, Department of International Organizations and Conventions, Ministry of Foreign Affairs, Damascus, 25 February 2007. See also, for example, Statement of Syria, Seminar on Military and Humanitarian Issues Surrounding the Mine Ban Treaty, Amman, 19–21 April 2004.

² For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 244.

³ See *Landmine Monitor Report 2008*, p. 1033.

⁴ UNDOF maintains an area of separation, which is some 80km long and varies in width between approximately 10km in the center to less than one km in the extreme south. The terrain is hilly and is dominated in the north by Mount Hermon. UNDOF, "Golan Heights – UNDOF – Background," www.un.org.

marked by the UN as potentially contaminated.⁵ UNDOF officials previously reported estimates of 500,000 landmines in the AOS. One unconfirmed estimate has suggested there are at least 76 minefields in the Golan Heights; it is believed this refers only to the AOS. In consultation with the Syrian authorities, UNDOF instituted a minefield security and maintenance program in the AOS to identify and mark all minefields.⁶ No information is available regarding minefields in the Syrian-controlled and Israeli-controlled areas of the Golan Heights.⁷

In UNDOF's area of operation, especially in the AOS, the UN continues to report that mines affect UNDOF personnel and local inhabitants. UNDOF has claimed that the long-term presence of the mines and the "deterioration of their detonation systems" have increased the threat.⁸

In other regions of Syria, the severity of the landmine threat is unclear. Mines are also planted along the Jordanian and Turkish borders with Syria, but it is not known if any of these mines have migrated into Syrian territory as a result of soil movement or climatic effects.⁹

Casualties¹⁰

In 2008, the Quneitra Health Directorate and local media reported at least 11 new landmine casualties¹¹ in seven incidents, including four people killed and seven injured. Eight casualties were civilian (five children and three men) and three were Syrian military.¹² Nine casualties were caused by antivehicle mines and two by antipersonnel mines. Nine casualties occurred in Quneitra governorate and two in the neighboring Daraa governorate. The civilian casualties were involved in shepherding (three), farming, and playing (two each); for two casualties the activity at the time of the incident was unknown.

The ICRC and Syrian Arab Red Crescent (SARC) were aware of at least seven casualties in five incidents in 2008, but it is not possible to determine if these were included in the Quneitra Health Directorate's figures.¹³ The 2008 casualty rate is similar to that of 2007 but it is possible that some incidents were not reported.¹⁴

The Quneitra Health Directorate and UNDOF did not report any new mine/ERW casualties between January and 11 March 2009.¹⁵

The cumulative number of mine/ERW casualties in Syria is unknown and estimates vary. Casualty data is not gathered nationwide, it is not shared, and the local population usually does not inform UNDOF of incidents.¹⁶

The SARC has recorded 600 casualties since 1967 (248 killed, 210 injured, and 142 unknown). At least 350 casualties occurred in the Syrian-controlled Golan Heights and 70 in the Israeli-controlled part.¹⁷ In June 2008, the General Association for Care and Rehabilitation of Landmine Survivors reported that there were 533 mine casualties, including 203 killed and

330 injured.¹⁸ UNDOF added that “some peacekeeper casualties occurred at the beginning of the UNDOF mission.”¹⁹

Between 1999 and December 2008, Landmine Monitor identified at least 66 mine/ERW casualties (17 killed, 41 injured, and eight unknown). Several Syrian casualties occurred abroad, mostly in neighboring Lebanon.²⁰ Casualty increases noted since 2005 are partly explained by a lack of marking, poorly maintained signs, increased population in areas of the Golan that were formerly closed, and economic necessity.²¹ The majority of casualties were children, shepherds, and farmers.

Program Management and Coordination

There is no formal mine action program in Syria. UNDOF carries out mine clearance for operational purposes in the AOS.²² Humanitarian mine clearance inside the AOS is Syria’s responsibility, but such activities have to be approved by UNDOF. According to UNDOF, “from time to time” the Syrian military conducts limited clearance operations.²³ In exceptional cases, UNDOF has also conducted clearance for humanitarian reasons where individual mines or grenades posed a severe danger to the civilian population. Clearance may otherwise be conducted in the Golan Heights under UNDOF supervision to support existing settlements, such as the building of health centers.²⁴

Since 2004, the Quneitra Mine Awareness Committee has coordinated mine/ERW risk education (RE) activities in the governorate.²⁵ In 2008, the Committee met three times; the directorates of social affairs, health, and education, as well as non-governmental representatives attended.²⁶

Demining and Battle Area Clearance

The explosive ordnance disposal (EOD) team of the Polish battalion assigned to UNDOF (POLBATT) checks, marks, and certifies patrol paths and terrain. In March through June 2008, the POLBATT EOD team destroyed five casings of TM-46 antivehicle mines, one M-15 mine casing, and a mortar projectile.²⁷

Mine clearance in Syria outside the AOS is the responsibility of the Syrian Armed Forces. Previously, clearance was said to have been conducted in support of civilian infrastructure and agriculture.²⁸

¹⁸ The time period which the data covers is not known. “A Syrian Severely Wounded by Landmines left by Israeli Occupation Troops in Quneitra,” *SANA* (Quneitra), 17 June 2008, www.sana.sy.

²⁸ See *Landmine Monitor Report 2007*, p. 1,003; and emails from Maj. Andy McQuilkin, Commander, Task Force Golan Heights, UNDOF, 30 March 2007; and from Lt.-Col. S. Kaiser, Chief Liaison and Protocol Officer, UNDOF, 16 August 2005.

Jordan started demining along its border with Syria in January 2008.²⁹ It was reported that Turkey completed demining in Nusaybin near its border with Syria in August 2008 in order to open a new border crossing between the two countries. As a result of the operations, 200,000m² were cleared, resulting in the destruction of 310 antipersonnel mines, 35 antivehicle mines, and one hand grenade.³⁰

Risk Education

In June 2008, a report of the UN Secretary-General noted that “mines continued to pose a threat to UNDOF personnel and local inhabitants” in the Golan Heights.³¹ UNDOF has raised the issue of the need for RE with UNICEF, as it believes that the majority of children have little or no awareness of the risk of mines/ERW.³² Risk-taking behaviors, such as moving mines to the roads so that UNDOF will clear them or throwing unexploded devices to the Israeli side of the Golan Heights, have been reported.³³

As in previous years, basic RE was conducted by SARC and the local authorities through public information dissemination, as part of the “Healthy Villages” program and in schools. In 2008, three new “safe gardens” were established with SARC support in Khan Arnaba, Beir Ajem, and Albaath. RE signs and posters were placed next to the gardens, in squares, and along minefields.³⁴ The ICRC provided technical and financial support, and in 2009 it planned to carry out an evaluation of ICRC-SARC activities to plan future activities.³⁵ UNDOF conducted some *ad hoc* awareness activities for the local population.³⁶

It is difficult to determine the impact of RE activities since 1999. However, given that casualty rates have not decreased, and there are no RE activities in some contaminated areas, it may be assessed that RE in Syria was inadequate.

Victim Assistance

The estimated number of survivors is unknown but at least 330. Although authorities have paid increased attention to disability, it was not a government priority. Most persons with disabilities did not have access to services and had few employment and educational opportunities. They also faced discrimination, ignorance, and isolation.³⁷

The government provided basic health and social services free of charge.³⁸ Health facilities were usually reached in “reasonable times.” Medical care remained better in the capital than elsewhere in Syria.³⁹ Prior to 2002–2003, services for mine mine/ERW survivors were only available in the capital.⁴⁰ Due to decentralization, casualties also receive free emergency and continuing medical care at the Mamdooh Abaza hospital in Khan Arnaba.⁴¹ The hospital treated

six survivors in 2008.⁴² UNDOF can evacuate casualties and provide first-aid in its area of operation.⁴³

Physical rehabilitation is provided by the Ministry of Health and the Ministry of Defense, as well as by private centers.⁴⁴ Persons with disabilities, including mine survivors, also received orthopedic devices and material support from SARC.⁴⁵ Ten SARC volunteers received first-aid and weapons contamination training from the ICRC in 2008.⁴⁶

Since 2005, Syria has introduced disability legislation, a 4% public sector employment quota, and disability benefits. Disability committees monitored implementation in each governorate,⁴⁷ but it remained inconsistent in 2008.⁴⁸

Support for Mine Action

The report of the UN Secretary-General on UNDOF for the period from 1 July 2008 to 31 December 2008 highlighted shortfalls in funding for UNDOF operations in general due to unpaid assessments totaling US\$23.7 million as of September 2008. As of 31 October 2008, an outstanding \$2.4 million was owed to states which contributed troops to UNDOF. The UN Secretary-General reported that unpaid commitments “impede[d] the ability of the Secretariat to support the operations of the Force and to reimburse Member States contributing troops to the Force.”⁴⁹ The report did not specify any delays of payments related to mine clearance during the period or impacts of shortfalls on mine clearance projects. On 12 December 2008, the UN Security Council unanimously extended the UNDOF mission until 30 June 2009, again drawing attention to unpaid funds for the force.⁵⁰

TONGA

Ten-Year Summary

The Kingdom of Tonga has not acceded to the Mine Ban Treaty. Tonga has voted in support of every annual pro-ban UN General Assembly resolution since 2000.

Mine Ban Policy

Tonga has not acceded to the Mine Ban Treaty. In May 2007, a Ministry of Foreign Affairs official indicated that it was not a lack of political will that held Tonga back from joining; rather, Tonga lacked the internal resources needed to complete the necessary accession procedures.¹

On 2 December 2008, Tonga voted in favor of UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty. Tonga joined the UN in 1999 and has voted in support of every annual pro-ban UN General Assembly resolution since 2000.

Tonga's first and only participation in a Mine Ban Treaty-related meeting was in May 2007, when a Ministry of Foreign Affairs official attended the regional Mine Ban Treaty workshop in Port Vila, Vanuatu.²

Tonga has stated that it has never produced, transferred, or stockpiled antipersonnel mines.³

Tonga is not party to the Convention on Conventional Weapons and has not signed the Convention on Cluster Munitions.

¹ Remarks of Tonga, Regional Workshop Towards a Mine-Free Pacific, Port Vila, Vanuatu, 3 May 2007. Notes by Landmine Monitor.

² Co-chairs' Summary, Regional Workshop Towards a Mine-Free Pacific, Port Vila, Vanuatu, 3–4 May 2007, www.apminebanconvention.org.

³ Fax from Falekava Kupu, on behalf of the Acting Chief Secretary and Secretary for the Cabinet, Prime Minister's Office, 14 August 2001.

TUVALU

Ten-Year Summary

Tuvalu has not yet acceded to the Mine Ban Treaty. It has indicated its support on several occasions, and has voted in favor of some annual pro-mine ban UN General Assembly resolutions, including in December 2008. Tuvalu has never attended a Mine Ban Treaty meeting.

Mine Ban Policy

Tuvalu has not yet acceded to the Mine Ban Treaty, although it has in the past indicated its intent to do so.¹ In January 2004, a Tuvalu government official indicated that the main obstacles to joining the treaty were “limited manpower, and financial resources to meet other pressing needs on our budget.”² In September 2008, Tuvalu’s first ambassador to the UN confirmed these constraints.³

On 2 December 2008, Tuvalu voted in favor of UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty. After becoming a member of the UN in September 2000, Tuvalu was absent from the votes on the annual pro-mine ban resolutions by the UN General Assembly in 2000–2003 and 2006–2007, but voted in support in 2004 and 2005.

Tuvalu has never attended a Mine Ban Treaty meeting.

Tuvalu has stated that it does not use, produce, import, or stockpile antipersonnel mines.⁴

Tuvalu has not signed the Convention on Cluster Munitions, and is not party to the Convention on Conventional Weapons.

¹ In April 2002, an official said that Tuvalu would accede “in the years to come as it is not a priority area.” In September 2003, another official stated, “We do not see any obstacles in our final acceding to the said Convention.” In 2004, the Prime Minister said that the Attorney General would draft an accession bill to go to parliament. See *Landmine Monitor Report 2006*, p. 1038.

³ Meeting with Ambassador Afelee F. Pita, Permanent Mission of Tuvalu to the UN, New York, 10 September 2008. Notes by the Cluster Munition Coalition.

⁴ Letter to Landmine Monitor from Bill P. Teo, Secretary to Government, 15 April 2002.

UNITED ARAB EMIRATES

Ten-Year Summary

The United Arab Emirates (UAE) has not acceded to the Mine Ban Treaty. On several occasions over the last few years it has expressed interest in accession to the treaty. It has voted in favor of every pro-ban UN General Assembly resolution since 1996. The UAE has funded mine/UXO clearance in southern Lebanon since 2001 via the “Operation Emirates Solidarity” project.

Mine Ban Policy

The UAE has not acceded to the Mine Ban Treaty. In November 2007, a UAE Ministry of Foreign Affairs official told the ICBL that the UAE planned to join the treaty in the near future.¹ In October 2008, the Minister of Foreign Affairs agreed to receive a delegation from the ICBL sometime in 2009.²

The UAE has voted in favor of every pro-ban UN General Assembly resolution since 1996, including UNGA Resolution 63/42 on 2 December 2008, calling for universalization and full implementation of the Mine Ban Treaty.

The UAE attended as an observer the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008, but did not make any statements. It did not attend the intersessional Standing Committee meetings in May 2009.³

The UAE has stated that it has not produced, used, or exported antipersonnel mines.⁴ While some officials have said that the UAE does not have a stockpile of antipersonnel mines, Landmine Monitor has received conflicting information from another governmental source.⁵

The UAE became party to the Convention on Conventional Weapons on 26 February 2009, including Protocol V on Explosive Remnants of War, but not Amended Protocol II on landmines.

As of 1 July 2009, the UAE had not signed the Convention on Cluster Munitions.⁶

¹ Interview with Abdallah al-Naqbi, Ministry of Foreign Affairs, at the Dead Sea, 22 November 2007. The UAE has in the past expressed its support for the Mine Ban Treaty in principle. The UN Mine Action Service (UNMAS) conducted an advocacy mission to the UAE in September 2004 and senior officials said there were no serious reservations about joining the treaty, but that it had not been a priority issue. Amb. Satnam Jit Singh, UNMAS consultant, “UNMAS Advocacy Visits,” 16 December 2004 (reporting on his trip to five countries); and email from Amb. Satnam Jit Singh, Diplomatic Advisor, ICBL, 7 October 2004. In 2000, the UAE stated that it supports “the international effort to ban antipersonnel landmines.” Letter to Landmine Monitor (HRW) from Ministry of Foreign Affairs, 5 October 2000. Translated by the UAE Embassy, Washington, DC.

² Letter from the Permanent Mission of the UAE to the UN in Geneva, 14 October 2008. The letter was a response to a request from the ICBL for a meeting with the Minister of Foreign Affairs. As of August 2009, the visit had not taken place. The UAE wrote in March that the minister’s schedule was still busy due to prior engagements. Letter from the Permanent Mission of the UAE to the UN in Geneva, 30 March 2009.

³ It has attended a number of Mine Ban Treaty meetings in the past including the Seventh and Eighth Meetings of States Parties in 2006 and 2007, and the intersessional Standing Committee meetings in May 2006 and April 2007.

⁴ Interview with Abdallah al-Naqbi, Ministry of Foreign Affairs, at the Dead Sea, 22 November 2007.

⁵ The Secretary of Defense stated in September 2004 there were no stockpiles. Email from Amb. Satnam Jit Singh, ICBL, 7 October 2004. This was also claimed in a presentation by Ali al-Hosni, UAE military officer, at the Workshop on the Risks of Landmines and Explosive Remnants of War (ERW), Sharjah, 8–9 December 2003, organized by the Arab Network for Research on Landmines & ERW. In 2006, an official requesting anonymity told the ICBL that there were some stockpiles of antipersonnel mines.

⁶ For details on cluster munition policy and practice see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 250–251.

UNITED STATES OF AMERICA

Ten-Year Summary

The United States of America has not acceded to the Mine Ban Treaty. The Clinton administration set the objective of joining in 2006. However, the Bush administration announced in 2004 that the US would not accede. US law has prohibited all antipersonnel mine exports since 23 October 1992 and in December 2007, the export moratorium was extended until 2014. The US has not used antipersonnel mines since 1991, nor produced them since 1997. In 2008, the Pentagon abandoned plans to produce a weapon that would have been prohibited by the Mine Ban Treaty. In 2002, the US cancelled a program to combine existing antipersonnel and antivehicle mines into a “mixed” system. US antipersonnel mines stockpiled in Italy, Norway, and Spain were removed to comply with the Mine Ban Treaty obligations of those countries.

Between 1999 and 2008, Landmine Monitor identified 207 mine/explosive remnants of war (ERW) casualties who were US nationals (80 killed and 127 injured) from media reports and official US Department of Defense casualty reports. Comprehensive victim assistance services, including rehabilitation services and disability pensions, are provided to soldiers injured while on active duty, although cumbersome bureaucratic procedures have delayed a declaration of status that would allow for discharge from the military or resulted in a delay in receiving disability payments.

The United States has contributed at least \$796.8 million in support of mine action between 1999 and 2008. Funds are directed to mine action via the US Department of State and the Patrick J. Leahy War Victims Fund, as well as to research and development via the US Department of Defense.

Mine Ban Policy

The US has not acceded to the Mine Ban Treaty. The US participated in the Ottawa Process that created the treaty, but the Clinton administration decided at the last moment against signing and instead set 2006 as the objective for the US to join. In February 2004, the Bush administration reversed course and announced that it did not ever intend to accede.

According to its policy announced in February 2004, the US can use any type of landmine (antipersonnel or antivehicle) that self-destructs and self-deactivates for the indefinite future and without any geographic restrictions.¹

The policy also allows the US to use non-self-destructing (sometimes called “dumb” or “persistent”) antipersonnel mines, but only in Korea and only until the end of 2010. The US can use non-self-destructing antivehicle mines without geographic restriction, but only with presidential authorization, and only until the end of 2010.²

On 2 December 2008, the US abstained from voting on UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty. It has abstained on each annual pro-ban treaty UNGA resolution since 1997.

In January 2009, Secretary of State-designate Hillary Clinton told the Senate Committee on Foreign Relations, “The incoming Administration has not taken a position on the landmines treaty. We are committed to working with our friends and allies around the world to reduce the

¹ The new policy also states, “Landmines still have a valid and essential role protecting United States forces in military operations. . . . No other weapon currently exists that provides all the capabilities provided by landmines.” US Department of State, “Fact Sheet: New United States Policy on Landmines: Reducing Humanitarian Risk and Saving Lives of United States Soldiers.” 27 February 2004.

² Ibid.

threat posed by landmines.”³ In February 2009, US NGOs called on the Obama Administration to initiate a thorough review of US policy and to join the Mine Ban Treaty.⁴

The US last attended a Mine Ban Treaty-related meeting in June 2005. Colombian leaders and ban supporters have urged the US to attend the Second Review Conference of the Mine Ban Treaty, which opens in Cartagena on 30 November 2009.⁵ According to US officials, the US is actively considering participating.⁶

The US is party to the Convention on Conventional Weapons and its Amended Protocol II on landmines. It submitted an annual national report on 12 November 2008, as required under Article 13. The US ratified Protocol V on Explosive Remnants of War on 21 January 2009, the day after President Obama took office.⁷

The US has not signed the Convention on Cluster Munitions.⁸

Production, transfer, stockpiling, and use

In May 2008, the Vice Chief of Staff of the US Army stated that the XM-7 Spider Networked Munition would be procured in a configuration that only allowed command-detonation.⁹ Previously, the Spider system contained a feature that permitted it to function in a victim-activated mode, making it incompatible with the Mine Ban Treaty.¹⁰ This would have constituted the first production of antipersonnel mines by the US since 1997. The US Campaign to Ban Landmines had for several years strongly objected to Pentagon plans to move forward with the victim-activation feature, and the US Congress had taken steps to block a decision on full-scale production of victim-activated Spider systems.¹¹ A total of US\$56.4 million has been allocated for procurement of 147 Spider systems in fiscal year (FY) 2010.¹²

In previous years, Landmine Monitor has reported on another landmine system being developed, the so-called Intelligent Munitions System (IMS). Pentagon budget documents once stated that the “IMS utilizes sensors linked to effects and is controlled over robust

⁹ Marina Malenic, “Vice Chief Tells Senator Army Will Not Procure Victim-Activated Spider,” *Inside the Army*, Washington, DC, 26 May 2008.

¹⁰ For more background information on Spider, see *Landmine Monitor Report 2007*, pp. 1,011–1,013.

¹¹ See *Landmine Monitor Report 2007*, pp. 1,011–1,012. Budget documents released in February 2007 indicated that a decade-long research and development effort, originally intended to develop alternatives to antipersonnel mines, was instead resulting in programs to produce two new landmine systems, Spider and IMS. The Pentagon requested \$1.66 billion for research and production of these new systems between fiscal years 2006 and 2013 (\$558 million for the Spider program and \$1.1 billion for the IMS). Before the May 2008 announcement, it appeared these munitions would have a variety of ways of being initiated, both command-detonation (that is, when a soldier decides when to explode the mine, sometimes called “man-in-the-loop”) and traditional victim-activation (also called target-activation). The Pentagon made the decision to begin low-rate initial production of Spider in June 2006 and the first Spider systems were to be delivered in September 2008.

¹² Department of the Army, “Procurement of Ammunition, Committee Staff Procurement Backup Book Fiscal Year (FY) 2010 Budget Estimates,” May 2009, p. 416.

communications in either an autonomous mode or via Man-in-the-Loop control.”¹³ The use of the terms “autonomous mode” and “unattended employment” appeared to be synonymous with victim-activation, and would make this system incompatible with the Mine Ban Treaty. The army had requested a total of \$1.1 billion for research activities and eventual production of 1,325 IMS units between fiscal years 2006 and 2013, including \$307 million for research and \$792 million for production.¹⁴

The IMS program appears to have drastically changed both in scale and scope according to budget documents released in May 2009. The name of IMS was changed to “IMS Scorpion” and the description of the weapon, unchanged in all previous years, now says that Scorpion is “an anti-vehicular weapons system that provides highly responsive terrain-shaping and protection capabilities to the unit commander” and “Trained operators remotely control ground-emplaced munitions via a portable control station out to distances of 1.5 kilometers.” Reference in all previous years to antipersonnel effects, both lethal and non-lethal, associated with the planned capabilities of IMS were no longer present in the description of Scorpion in May 2009. The anticipated cost of the producing system and number of systems to be built were also dramatically reduced to just 49 Scorpion weapons at a cost of \$19.5 million for FY 2010. This funding increment allows for the low rate of initial production of Scorpion, if the army makes the decision to proceed with it, which is now scheduled to be made in January 2010. No further funding for Scorpion was allocated in future fiscal years. Textron Systems of Wilmington, Massachusetts is the prime contractor for Scorpion.¹⁵

Stockpiling

The US stockpiles approximately 10.4 million antipersonnel mines and 7.5 million antivehicle mines, the third largest landmine stockpile in the world after China and Russia. As of 2002, the stockpile had 1.56 million non-self-destructing landmines, including 1.16 million M14 and M16 antipersonnel mines and about 403,000 Claymore mines.

The US military stockpiles the M14 and M16 antipersonnel mines for use in any future war in Korea. US Army documents indicate about half of those mines are stored in the continental US. The US military also keeps in South Korea a substantial number of self-destructing, scatterable antipersonnel mines.¹⁶

The policy announcement in February 2004 also stated, “Within two years, the United States will begin the destruction of those persistent landmines that are not needed for the protection of Korea.”¹⁷ It is not known if this has resulted in the destruction of any antipersonnel mines.

According to a November 2005 American Forces Press Service press release, the US sent 100,000 mines to Iraq to be used to initiate the explosive demolition of other captured weapons. The type of mine was not specified.¹⁸

On 26 December 2007, the comprehensive US moratorium on the export of antipersonnel mines was extended for six years until 2014.¹⁹ US law has prohibited all antipersonnel mine exports since 23 October 1992, through a series of multi-year extensions of the moratorium.

¹³ Office of the Secretary of the Army (Financial Management and Comptroller), “Descriptive Summaries of the Research, Development, Test and Evaluation Army Appropriation, Budget Activity 5,” February 2007, p. 797. The same budget justification materials also noted that IMS is “capable of unattended employment” in engaging its targets.

US Antipersonnel Mine Stockpile²⁰

Munition	Number of antipersonnel mines
Artillery Delivered Antipersonnel Mine (ADAM)	8,366,076
M14	696,800
M16	465,330
Claymore	403,096
Gator	281,822
Volcano (M87 only)	134,200
Ground Emplaced Mine Scattering System (GEMSS)	32,900
Pursuit Deterrent Munition (PDM)	15,100
Modular Pack Mine System (MOPMS)	8,824
Total	10,404,148

Landmine Monitor previously reported there was uncertainty if the US planned to transfer some or all of its antipersonnel mines stockpiled in South Korea to the South Koreans as part of the termination of the War Reserve Stocks for Allies, Korea (WRSA-K) program.²¹ In June 2009, the South Korean government told Landmine Monitor, “AP mines were not included in the list of items for sale or transfer in the WRSA-K negotiations, and therefore, no AP-mines were bought or obtained.”²²

However, it is not clear what has or will be done with the US antipersonnel mines from the WRSA-K. The law ending the program states that any items remaining in the WRSA-K at the time of termination “shall be removed, disposed of, or both by the Department of Defense.”²³ Moreover, as noted above, US policy is to stop the use of non-self-destructing antipersonnel mines in Korea by the end of 2010.

According to one report, however, South Korea may still safeguard the antipersonnel mines for 10 years, without actually taking ownership over them. At an annual meeting between the South Korean Minister of Defense and US Secretary of Defense in Washington, DC on 17 October 2008, a memorandum was signed that, in addition to the stocks South Korea is acquiring from the US, would have South Korea store 89,000 tons (89 million kg) of weapons and ammunition for the US until 2018, including non-self-destructing landmines.²⁴

²⁰ Information provided by the US Armed Services in Spring/Summer 2002, cited in US General Accounting Office, “GAO-02-1003: MILITARY OPERATIONS: Information on U.S. use of Land Mines in the Persian Gulf War,” September 2002, Appendix I, pp. 39–43.

²¹ See *Landmine Monitor Report 2007*, p. 1,014; and *Landmine Monitor Report 2008*, p. 877. Most of the US mines in South Korea were part of the more extensive WRSA-K. The WRSA-K were munitions stored in South Korea but kept under US title and control, then made available to US and South Korean forces in case of an emergency. On 30 December 2005, President George Bush signed Public Law 109-159, authorizing the sale of items in the WRSA-K to South Korea during a three-year period, after which the WRSA-K program was terminated. The law states that any items remaining in the WRSA-K at the time of termination “shall be removed, disposed of, or both by the Department of Defense.”

The last known use of antipersonnel mines by the US was in the first Gulf War in 1991.²⁵

Casualties

In 2008, three ERW casualties were identified on US territory; two men were injured when ordnance exploded at a metal recycling plant in Raleigh, North Carolina, on 12 February, and a man died on 18 February while restoring a Civil War-era cannonball he had found.²⁶ Two US national landmine casualties occurred on foreign territory: on 24 June, a male US soldier was killed by a landmine in Nangarhar, Afghanistan²⁷ and on 3 August another was killed in Kabul, Afghanistan.²⁸

Overseas casualties continued to be identified in 2009, with three men killed and two injured, as of 31 July. On 1 January, a male US soldier was killed by a landmine in Afghanistan.²⁹ On 24 March, one US soldier was killed and two others injured when an ERW exploded at Camp Hansen in Okinawa, Japan.³⁰ On 5 April, a male US soldier was killed by a landmine in Baghdad, Iraq.³¹

Numerous other landmine/ERW/improvised explosive device (IED) incidents involving US military personnel occurred outside of the US in 2008 and 2009. In 2008, 131 US soldiers were killed by IEDs in Iraq. In the first six months of 2009 there were 29 IED fatalities.³² Seventy-six US soldiers were killed by IEDs in Afghanistan in 2008, and 68 were killed in 2009 to 5 August.³³ However, since the US military uses the term “improvised explosive device” to describe nearly all explosive devices encountered by US forces in Iraq and Afghanistan, and makes no distinction between victim-activated and command-detonated IEDs, it is impossible to determine how many of these may have been caused by weapons banned under the Mine Ban Treaty.³⁴

Between 1999 and 2008, Landmine Monitor identified 207 mine/ERW casualties of US nationals (80 killed and 127 injured) from media reports and official Department of Defense casualty reports.³⁵ Of these, five (three killed and two injured, all from ERW in 2007 and 2008) occurred on US territory.

The total number of landmine/ERW/IED survivors in the US is not known. As of May 2008, 24% of the soldiers who had served in the Iraq and Afghanistan wars (181,000 soldiers) were collecting disability benefits.³⁶ Many of those disabilities were likely caused by IEDs. Traumatic brain injury (TBI) was found to be the leading injury and cause of long-term disability among US forces serving in Afghanistan and Iraq. IEDs were the most common cause of TBIs among

²⁵ The US apparently did not use mines in Yugoslavia (Kosovo) in 1999, and has not used them in the conflict in Afghanistan that began in October 2001, or in the conflict in Iraq that began in March 2003. It reserved the right to use antipersonnel mines during each of these conflicts, and deployed antipersonnel mines to the region, at least in the cases of Kosovo and Iraq. The US last used mines in 1991 in Iraq and Kuwait, scattering 117,634 of them mostly from airplanes.

battle injuries.³⁷ Between September 2001 and 12 January 2009, there were 935 major limb amputations and 351 minor amputations as a result of the conflicts in Iraq and Afghanistan.³⁸

Victim Assistance

The total number of mine/ERW survivors in the US is unknown, although there have been at least 127 injured casualties both within the US and overseas. Comprehensive rehabilitation services and disability pensions are provided to soldiers injured on active duty, although a narrowed definition of combat-related injuries and cumbersome bureaucratic procedures prevented or delayed some from accessing services and benefits in 2008.³⁹

The US Army Amputee Patient Care Program, established in December 2001, provides individualized medical care, physical rehabilitation, and psychological support for active-duty amputees.⁴⁰ On average, amputees spend from six to 18 months in rehabilitation before returning to active duty or civilian life.⁴¹ Social and economic reintegration support is provided by government and civil society organizations, although Survivor Corps found a lack of awareness of the challenges faced by veterans with disabilities in reintegrating into their local community.⁴²

The Department of Defense and the Department of Veterans Affairs (DVA) have disability compensation programs for injured service members: the amount of compensation a service member receives depends on the level of disability, years of service, and salary.⁴³

Procedures to access benefits were found to be bureaucratic and confusing, which sometimes prevented access. In February 2007, problems were identified in the military's disability evaluation system and in other administrative procedures related to care for injured soldiers.⁴⁴ As of January 2009, the Department of Defense and the DVA were still working to expand the Disability Evaluation System in order to address concerns.⁴⁵

In 2008, the Department of Defense narrowed the scope of its definition for "combat related," restricting it to those injured in armed conflict and eliminating injuries incurred during training or other hazardous service.⁴⁶ The Disabled American Veterans organization called the move "one of the most shameful we've seen so far."⁴⁷

US law protects the rights of injured soldiers, persons with disabilities, and regulates care.⁴⁸ The Americans with Disabilities Act prohibits discrimination based on a person's disability.⁴⁹ On 30 July 2009, the US signed the UN Convention on the Rights of Persons with Disabilities but not its Optional Protocol.

Support for Mine Action

US Mine Action Funding Fiscal Years 2007–2010 (\$ million)⁵⁰

	FY 2007 (actual)	FY 2008 (actual)	FY 2009 (estimate)	FY 2010 (request)
Department of State (NADR)	51.04	66.94	71.0	70.64
Department of Defense (OHDACA)	5.00	5.12	5.2	5.2
International Trust Fund for Demining and Mine Victims Assistance (ITF)	8.65	12.89	12.5	7.5
Department of Defense Research and Development	14.4	13.63	14.29	14.69
Global War on Terror Supplemental Funding (for NADR and ITF)	7.0	0	0	0
Total	86.09	98.58	102.99	98.03
Minus Research and Development	69.83	84.95	88.7	83.34

Starting in FY 2009, three previously separate accounts for Nonproliferation, Anti-terrorism, Demining, and Related Programs (NADR), Humanitarian Demining (NADR-HD), International Trust Fund (NADR-ITF), and Small Arms/Light Weapons (NADR-SALW), have been combined into a single account for Conventional Weapons Destruction (NADR-CWD). The CWD program is funded through three separate NADR sub-accounts. As of May 2009, the FY 2010 request for globally-managed funds for NADR-HD was \$14.8 million; the FY 2010 request for globally-managed funds for NADR-SALW was \$48.9 million; and the FY 2010 request for the NADR-ITF was \$7.5 million.⁵¹

D-8; And Global War on Terror Supplemental Funding data from US Department of State, Bureau of Resource Management, "FY 2009 Congressional Budget Justification for Foreign Operations (Revised)," 29 February 2008, p. 83.

⁵¹ US Department of State, Bureau of Resource Management, "FY 2010 Congressional Budget Justification for Foreign Operations," 22 May 2009, p. 143.

Mine action funding by country, FY 2008

According to figures reported by the US Department of State in “To Walk the Earth in Safety 2009,” the US government spent \$83.4 million in FY 2008 on humanitarian mine action programs in 32 countries and areas, in addition to \$1.1 million to the Organization of American States for regional funding in the western hemisphere and \$21.2 million on global or multilateral funding.⁵² This is a change of less than 1% compared to reported funding in the previous fiscal year. The two largest recipients of US funding in 2008 remained Afghanistan and Iraq, receiving \$17.2 million and \$16 million respectively. While Benin, Burundi, Chad, Mauritania, Senegal, Thailand, and Tunisia received assistance in FY 2007, they did not receive assistance in FY 2008. Armenia, El Salvador, Ethiopia, Jordan, Liberia, Montenegro, Peru, the Philippines, and Somalia were new recipients in FY 2008.

Victim assistance funding

The Patrick J. Leahy War Victims Fund, managed by the US Agency for International Development, has been in operation in post-conflict and conflict-affected developing countries since 1989. The fund was established to provide a dedicated source of financial and technical assistance for civilian victims of war including survivors of mine and UXO incidents.⁵³ In FY 2008, the fund contributed an estimated total of \$13.85 million, including \$4.8 million to programs in Lebanon, Liberia, the Philippines, Sri Lanka, and Vietnam, as well as \$9.1 million to numerous regional and international initiatives spanning multiple countries. The estimated budget for the fund in FY 2007 was \$10 million. To date, the fund has provided more than \$166 million to more than 40 countries.⁵⁴

Leahy Victim Fund, Allocations for FY 2008⁵⁵

Lebanon	\$1,500,000
Liberia	\$500,000
Philippines	\$800,000
Sri Lanka	\$500,000
Vietnam	\$1,500,000
Multi-country	\$9,050,000
Total	\$13,850,000

Funding for victim assistance is also provided through the ITF. In calendar year 2008, \$1,566,220 of Department of State mine action funds were spent on victim assistance through the ITF: \$1,146,657 was allocated for victim assistance in calendar year 2007.⁵⁶

⁵² USG Historical Chart containing data for FY 2008, from “To Walk the Earth in Safety 2009,” Washington, DC, July 2009, pp. 43–47. US funding amounts and recipients may differ from FY 2008 budget items presented in “To Walk the Earth in Safety 2009,” according to later information provided to Landmine Monitor by the US Department of State. For details see recipient country reports in this edition of Landmine Monitor.

UZBEKISTAN

Ten-Year Summary

The Republic of Uzbekistan has shown no interest in the Mine Ban Treaty. Uzbek officials have stated that mines are necessary to prevent the flow of narcotics, arms, and insurgent groups across its borders. Uzbekistan used antipersonnel mines on its borders with Afghanistan, Kyrgyzstan, and Tajikistan between 1998 and 2001. Both Kyrgyzstan and Tajikistan contend that Uzbekistan also has laid mines inside their borders. Uzbekistan, it is believed, is still affected by mines it laid along its border with Afghanistan, but following clearance operations in earlier years, contamination has been reduced on its borders with Kyrgyzstan and Tajikistan. The extent of residual contamination is not known.

Information about mine and explosive remnants of war (ERW) casualties is incomplete, but at least 67 casualties have been recorded since 1999. No formal mine/ERW risk education activities have been reported in Uzbekistan, but some *ad hoc* activities took place between 2001 and 2004. It is not believed that specific victim assistance services were provided between 1999 and 2009.

Mine Ban Policy

Uzbekistan has not acceded to the Mine Ban Treaty. Uzbekistan has stated that mines are necessary for national security to prevent the flow of narcotics, arms, and insurgent groups across its borders.¹

In December 2008, Uzbekistan abstained from voting on UN General Assembly Resolution 63/42 calling for the universalization and full implementation of the Mine Ban Treaty. It abstained on similar resolutions in previous years. Uzbekistan has not attended as an observer any of the annual meetings of States Parties to the Mine Ban Treaty, or any meetings of the intersessional Standing Committees.

Uzbekistan has stated that it does not produce antipersonnel mines.² It is not known to have exported the weapon. It inherited a stockpile of antipersonnel mines from the Soviet Union. The size, composition, and condition of the stockpile are not known. One Ministry of Defense official indicated the stock consisted of OZM-72, POMZ, and PMN antipersonnel mines, while another said it contains all types of mines which were made in the Soviet Union. The mines are held by both the Ministry of Defense and the Committee on State Border Protection.³

Uzbekistan has used antipersonnel mines in the past, including on its borders with Afghanistan in 1998, Kyrgyzstan in 1999, and Tajikistan in 2000.

Uzbekistan is party to the Convention on Conventional Weapons and its original Protocol II on landmines, but has not joined to Amended Protocol II or to Protocol V on Explosive Remnants of War. It has not signed the Convention on Cluster Munitions.⁴

¹ See *Landmine Monitor Report 2008*, p. 1,047.

² Letter from Amb. Shavkat Khamrakulov, Embassy of Uzbekistan to the United States, 31 July 2001. Other officials have also made this claim.

³ Interviews with a Ministry of Defense engineering officer, May 2004; and a Ministry of Defense official, February 2003.

⁴ For further details on its cluster munitions policy, see Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, p. 261.

Scope of the Problem

Contamination

Uzbek forces emplaced mines along its international borders at various times: on its borders with Afghanistan in 1998, with Kyrgyzstan in 1999, and with Tajikistan in 2000; Soviet troops also laid mines on the Uzbek-Afghan border. Different sources have estimated that between 50,000 and 350,000 antipersonnel mines were laid on the three borders.⁵

Survey on the Tajik side of the border over several years had identified a total of 57 suspected hazardous areas (size unknown) as of December 2008.⁶ However, according to information received by Tajikistan from the Embassy of Uzbekistan in Tajikistan, Uzbekistan had cleared 95% of minefields along the Tajik border by the end of 2007. Demining operations were said to have been conducted by Uzbek army deminers in cooperation with Tajik border troops.⁷

In 2005, media reports cited Kyrgyz officials in Batken province as saying Kyrgyz border guards had checked previously mined areas of the border around the settlements of Ak-Turpak, Chonkara, and Otukchu, which had been cleared by Uzbek deminers, and confirmed that they were free of contamination.⁸

According to the most recent information available (2005), Uzbekistan has no plans to clear mines laid on its 150km border with Afghanistan.⁹

In July 2008, an explosion at an army ammunition storage area in Kagan town in Bukhara region killed at least three people and injured 21.¹⁰ There were unconfirmed reports of further casualties.¹¹ The extent of any residual contamination is not known.

Casualties

There are no official records of mine/ERW casualties in Uzbekistan; the government does not confirm reports and media reporting of incidents is rare.¹² Landmine Monitor did not identify any new mine/ERW casualties from 2008 through April 2009. It was not reported if there were any ERW casualties as a result of contamination from explosions at the Kagan ammunition storage area in July 2008.¹³

The last casualties identified by Landmine Monitor occurred in 2004 (four killed).¹⁴ Between 1999 and the end of 2004, at least 67 mine casualties occurred (at least 47 killed), but the number is probably higher due to a lack of reporting.¹⁵ For example, in 2001 a border guard was reported as saying that civilian mine casualties occurred daily.¹⁶

Uzbek landmines were reported to have caused Tajik casualties in Sugd region on the Tajik-Uzbek border, with one Tajik source estimating that 69 Tajiks had been killed between 2000 and 2006.¹⁷

Program Management and Coordination

There is no formal mine action program in Uzbekistan. All clearance is apparently conducted by the army. The extent of any clearance in 2008 or 2009 through April was not known.

Assistance to mine/ERW survivors appears to be addressed by existing services with no need for a separate victim assistance program. The Ministry of Labor and Social Security is responsible for coordinating rehabilitation and reintegration services for mine/ERW survivors and persons with disabilities. The Ministry of Public Health coordinates access to healthcare for persons with disabilities.¹⁸

Risk Education

In 2008–2009, no formal risk education (RE) activities took place in Uzbekistan. No RE was carried out after the Kagan ammunition storage area explosion though residents were evacuated.¹⁹

Some *ad hoc* RE activities took place between 2001 and 2004. An association of Afghan war veterans conducted RE for children and border guards; they reportedly made residents in the Jizzakh province border region sign statements that they would avoid mined areas in 2001 and 2002.²⁰ The National Society of Red Crescent in Uzbekistan provided RE training for employees in 2004.²¹ No RE has been recorded since.

Victim Assistance

The estimated number of survivors is unknown but at least 20. Uzbekistan provides subsidized healthcare and physical rehabilitation, but widespread informal payments for services make medical care unaffordable for many, including persons with disabilities.²²

Since 2003, benefits to persons with disabilities were adjusted to US\$7 per month. However, in combination with societal discrimination, this reportedly resulted in poverty for many.²³ In August 2008, a two-year cooperation project between the Ministry of Labor and Social Security and UN agencies started, aimed at developing a disability action plan and increasing social integration and employment opportunities for persons with disabilities.²⁴

In June 2008, the 1991 law “On the Social Protection of Disabled Persons in the Republic of Uzbekistan” was amended to include fines for facilities which are physically inaccessible to persons with disabilities. However, no penalties were reported, and many public places remained inaccessible.²⁵ On 27 February 2009, Uzbekistan signed the UN Convention on the Rights of Persons with Disabilities but not its Optional Protocol.

VIETNAM

2008 Key Data

Mine Ban Treaty status	Not a state party
Contamination	Antipersonnel and antivehicle mines, ERW, including submunitions
Estimated area of contamination	Unknown, impact survey estimated 15,897km ² of contamination in six central provinces
Casualties in 2008	90 (2007: 110)
Estimated mine/ERW survivors	Unknown but estimated 100,000
Demining in 2008	Not reported
Risk education recipients in 2008	Unknown
Support for mine action in 2008	International: \$7,637,404 (2007: \$3,948,658)

Ten-Year Summary

The Socialist Republic of Vietnam continues to view antipersonnel mines as legitimate weapons necessary for self-defense. Vietnam has abstained every year from supporting the annual UN General Assembly resolution calling for universalization of the Mine Ban Treaty. It has shown an increasing willingness to engage on the treaty since 2007. Vietnam has claimed it has not produced antipersonnel mines since the treaty came into effect, and that it has a policy not to export landmines.

Vietnam remains one of the world's most affected countries, predominantly by UXO, including cluster munition remnants, although there is also a mine problem. Vietnam's military has conducted most of the clearance since the end of the war with the United States in 1975. However, in the last decade, international organizations have been allowed to take on a small but slowly growing role in central Vietnam. The creation of a bomb and mine action coordination center in 2009 marked a new effort to mobilize resources and give added impetus to clearance.

Landmine Monitor recorded 1,545 mine/explosive remnants of war (ERW) casualties (589 killed and 956 injured) in Vietnam from 1999 to 2008.

Community and school-based risk education has been conducted through NGOs for over 10 years in six high-risk provinces. An evaluation of the UNICEF program in 2008 concluded, however, that it will take time to ensure a sustainable level of behavioral change.

The efforts of both the government and NGOs have led to an improvement in medical and rehabilitation services for mine/ERW survivors in Vietnam over the past decade. There has been an improvement in the quality and quantity of emergency and continuing medical care, provision of artificial limbs, and vocational training and micro-credit programs. Persons with disabilities have been included in the drafting of national laws and policies in relation to education, employment, and rights of persons with disabilities.¹

¹ Response to Landmine Monitor questionnaire by Nguyen Thi Linh Giang, Executive Assistant, LSN Viet Nam, 20 March 2009; response to Landmine Monitor questionnaire by Nguyen Thang Loi, Administration and Finance Supervisor, VNAH, 19 June 2009; and US Department of State, "2008 Country Reports on Human Rights Practices: Vietnam," Washington, DC, 25 February 2009.

Mine Ban Policy

Vietnam has not acceded to the Mine Ban Treaty. On 2 December 2008, Vietnam abstained from voting on UN General Assembly Resolution 63/42 calling for universalization and full implementation of the Mine Ban Treaty. It has abstained on all previous annual pro-ban treaty General Assembly resolutions. Vietnam has cited national security concerns, and especially border security, as reasons for not joining the Mine Ban Treaty.²

Since 2007, Vietnam has more frequently attended meetings of the Mine Ban Treaty. Vietnam made its first statement during an intersessional meeting in June 2008, where it stated:

“We therefore have joined the world community to welcome the various bans, moratoria and other restrictions already declared by States on anti-personnel landmines as well as the growing consensus against the indiscriminate use of anti-personnel landmines against civilians....We support the humanitarian aspects of the Ottawa Convention of Anti-personnel Landmines but we could not sign it yet as it regrettably does not duly take into account the legitimate security concerns of many countries including Vietnam.”³

Vietnam attended as an observer the Ninth Meeting of States Parties to the Mine Ban Treaty in Geneva in November 2008, but made no statements. It also participated in the Bangkok Workshop on Achieving a Mine-Free South-East Asia from 1–3 April 2009, the second in a series of regional meetings convened in the lead-up to the treaty’s Second Review Conference. It did not attend the intersessional Standing Committee meetings in Geneva in May 2009.

Vietnam signed but has not ratified the Convention on Conventional Weapons. Vietnam has not signed the Convention on Cluster Munitions.⁴

Production, stockpiling, and transfer

Vietnam has not revealed any new information in the past year regarding its production or stockpiling of antipersonnel mines. Vietnam has produced antipersonnel mines in the past.⁵ In 2008, officials said that Vietnam has not produced mines since the Mine Ban Treaty came into force, but also emphasized that Vietnam reserves the right to use and produce mines in the future.⁶ Until Vietnam issues an official public statement that it does not and will not in the future produce antipersonnel mines, Landmine Monitor will continue to list Vietnam as one of the few remaining global manufacturers.

In May 2008, an army official informed a Canadian government delegation that Vietnam’s stockpile of antipersonnel mines will expire in a few years. He stated that Vietnam has gradually started to destroy the mines “lot by lot.”⁷ The Ministry of National Defense told the ICBL in 2006 that the stockpile consists only of mines recovered from cleared minefields.⁸ In 2003, an official confirmed the existence of a stockpile of antipersonnel mines, saying, “Vietnam does not keep large stores of landmines, but we have enough to protect our country against invasion.”⁹

² See *Landmine Monitor Report 2008*, p. 1,050.

³ Statement of Vietnam, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008; and see *Landmine Monitor Report 2008*, pp. 1,050–1,051.

⁴ For details on cluster munition policy and practice see, Human Rights Watch and Landmine Action, *Banning Cluster Munitions: Government Policy and Practice*, Mines Action Canada, May 2009, pp. 261–262.

⁵ In the past, Vietnam produced copies of Chinese, Soviet, and US mines. The only mine Vietnam has reportedly produced since the 1990s is the “apple mine,” which is a recycled version of the BLU-24 (cluster) submunition dropped by the US during the Vietnam War. See *Landmine Monitor Report 2006*, p. 1,115; and *Landmine Monitor Report 1999*, p. 513.

⁶ See *Landmine Monitor Report 2008*, p. 1,051. In 2005 and 2006, officials from the Ministry of National Defense and Ministry of Foreign Affairs told visiting delegations that Vietnam no longer produces antipersonnel mines. See *Landmine Monitor Report 2007*, p. 1,023.

⁷ See *Landmine Monitor Report 2008*, p. 1,051.

⁸ See *Landmine Monitor Report 2007*, p. 1,024.

⁹ Interview with Lt.-Gen. Vu Tan, Ministry of National Defense, Hanoi, 13 May 2003. In 2000, a BOMICEN official indicated that the Ministry of National Defense was in the process of destroying “tens of thousands” of unsafe pre-1975 mines. See *Landmine Monitor Report 2000*, p. 542.

Vietnam told States Parties in June 2008 that, “we strictly observe our policy not to export” antipersonnel mines.¹⁰ The Ministry of Foreign Affairs previously wrote Landmine Monitor stating, “Vietnam has never exported and will never export mines.”¹¹

Scope of the Problem

Contamination

Vietnam is heavily contaminated by ERW, mainly UXO, including widespread and extensive contamination by cluster munition remnants, which date back to the war with the US in the 1960s and first half of the 1970s. Vietnam also has a lesser problem of mines, mostly left by conflicts in the 1970s with neighboring Cambodia and China.

Almost all Vietnam’s provinces and cities are affected by ERW to some extent. The US dropped 413,130 tons (4.1 million kg) of submunitions on Vietnam between 1965 and 1973, striking 55 of its 64 provinces and cities including Haiphong, Hanoi, Ho Chi Minh City, and Hue.¹²

The most affected provinces are Ha Tinh, Quang Binh, and Quang Tri in central Vietnam on either side of the former Demilitarized Zone that divided the north and south during the war. In 2009, Vietnamese officials estimated that some 66,000km² (20%) of the country is still affected by ERW,¹³ which is almost identical to official estimates in 2006.¹⁴ Officials reported in 2006 that clearance operations had tackled only 9–12% of the area affected by mines and UXO, and about one-quarter of the contaminating ordnance.¹⁵ An impact survey conducted in 2004–2008 estimated that almost 16,000km² of land was likely to be contaminated across the six central provinces.

Many items of UXO are also found along the border with the Lao People’s Democratic Republic, where the Ho Chi Minh trail was a target of intensive US bombing during the war.¹⁶ Much UXO contamination is still on the surface, but considerable quantities are found below the surface at depths of up to five meters and, in cases of heavy ordnance, at depths of up to 20m.¹⁷ Despite extensive surface clearance operations since the war, contamination at depths of 30cm or more remain “hardly investigated” and pose a significant threat.¹⁸

Casualties

In 2008, Landmine Monitor identified at least 90 new mine/ERW casualties (36 killed and 54 injured).¹⁹ All the casualties were civilians: 52 men, 27 boys, six girls, and four women. One casualty was a female of unknown age. For 44 casualties, the device causing the incident was not recorded: submunitions caused 13 casualties, mines five, and other ERW 28. The majority of casualties were involved in scrap metal collection (24), agricultural activities (18), and

¹⁰ Statement of Vietnam, Standing Committee on the General Status and Operation of the Convention, Geneva, 2 June 2008.

¹¹ Letter from Nguyen Manh Hung, Ministry of Foreign Affairs, 8 March 2001. An internal policy document provided to Landmine Monitor by the Ministry of Foreign Affairs, “The Question of Antipersonnel Mines,” 2 March 2000, also stated that Vietnam has not and will never export antipersonnel mines. Despite the denial of past export, it appears Vietnam provided antipersonnel mines to Cambodia, perhaps until the early 1990s.

¹⁹ Unless otherwise noted, Landmine Monitor analysis of data provided by: emails from Tran Hong Chi, Project Coordinator, CPI, 12 March 2009 and 1 July 2009; email from Phan Van Hung, Project Officer-Information/Database/GIS, Project RENEW, 12 August 2008; and Landmine Monitor media analysis from January to December 2008.

playing, handling, or tampering with the explosive device (17). Incidents were reported in seven provinces, with most occurring in Quang Tri (42), Quang Nam (17), and Quang Binh (10).

The 90 casualties recorded in 2008 is a decrease compared to the 110 new mine/ERW casualties (48 killed and 62 injured) recorded in 2007 and 96 casualties (39 killed and 57 injured) in 2006.²⁰ Due to limited data collection in Vietnam, comparison of annual recorded casualty data may not indicate a trend, nor represent the full scope of the problem.

Casualties continued to occur in 2009, with at least 18 new casualties (eight killed and 10 injured) as of 30 June. All the casualties were civilians: 11 men, two boys, one woman, and one child of unknown gender. Nine casualties were caused by submunitions, another four by other ERW, and the devices causing five incidents were unknown. Most casualties occurred during the collection of scrap metal (eight), “burning” (three), and agricultural activities (two).

The cumulative number of mine/ERW casualties in Vietnam is unknown. Landmine Monitor analysis recorded 1,545 mine/ERW casualties (589 killed and 956 injured) from 1999 to 2008. Project RENEW, an NGO, has identified 6,941 mine/ERW casualties (2,587 killed, 4,349 injured, and five unknown) in Quang Tri province between 1975 and 2008.²¹ From 1975 to the end of 2007, the Ministry of Labor, Invalids and Social Affairs (MoLISA) recorded 104,701 mine/ERW casualties (38,849 killed and 65,852 injured).²² According to the Ministry of Public Security, there have been more than 138,000 mine/ERW casualties (38,000 killed and 100,000 injured) in Vietnam since 1975.²³ People with war-related disabilities reportedly account for 26% of persons with disabilities.²⁴

Risk profile

UXO poses a greater threat to the civilian population than do mines, particularly BLU-26 and BLU-36 submunitions and M79 rifle grenades, which have together been responsible for most of the casualties since 1975.²⁵ The greatest risk is in the provinces of Quang Binh, Quang Tri, and Thua Thien-Hue.²⁶ Incidents are caused by livelihood activities, collecting scrap metal, and playing/tampering. They mostly occur during the flood season and summer.²⁷

According to a 2008 UNICEF evaluation of its support to mine action, three groups need to be targeted: the “unaware” (including children aged six to 10), the “reckless” (children aged 11 to 16 and adults, including scrap metal dealers and collectors), and the general public, whose knowledge maybe fair to good, but many of whom are misinformed.²⁸

Socio-economic impact

Contamination imposes a heavy financial cost at a time of rapid economic modernization; it limits cultivation of affected agricultural areas and requires costly clearance operations for major infrastructure and industrial development projects.²⁹

²⁹ Email from Col. Nguyen Trong Dac, Ministry of National Defense, 6 August 2006.

The Vietnam UXO/Landmine Impact Assessment and Rapid Technical Survey also observes that “perhaps the most significant socio-economic impact of landmines and UXO is that their presence creates a burden of fear and concern among people living in contaminated communities and impedes full participation in a wide range of productive economic activities.”³⁰

Program Management and Coordination

Mine action

Under a 2006 Prime Ministerial Decision, the Ministry of National Defense oversees mine action at the national level and clearance is undertaken by the Army Engineering Corps of the People’s Army of Vietnam (PAVN).³¹ The Technology Center for Bomb and Mine Disposal (BOMICEN), part of the Ministry of National Defense, has acted as a central coordinating body for clearance activities.³²

Provincial authorities coordinate mine action below the national level. NGOs engaging in mine action must sign a memorandum of understanding with the Department of Foreign Affairs of the province in which they work. Mine action priorities are set by the provincial government. District People’s Committees, which select the sub-districts or other areas that should be targeted.³³

The Vietnam Bomb and Mine Clearance Action Center (VBMAC) opened in February 2009 in line with a government decision announced a year earlier with a mandate to implement and accelerate clearance and to mobilize foreign funding for mine action. VBMAC said it was “the wish of the government to do everything possible to double national clearance capacity.” Although VBMAC’s director, Nguyen Trong Canh, is also BOMICEN’s director and he expected to recruit many of its personnel from BOMICEN, VBMAC is a civilian organization under MoLISA. In addition to clearance, VBMAC intends to engage in risk education and victim assistance and seeks to integrate UXO/mine action into broader development plans.³⁴

As of mid-2009, it remained unclear to what extent VBMAC would act as coordinator of the UXO/mine action sector. VBMAC said BOMICEN remained the lead agency in Vietnam’s mine action, and said it had been set up as “an implementing unit, not a policy-making unit.” However, VBMAC said it would actively participate and “coordinate” with the Ministry of National Defense in preparing a national mine action plan and would try to develop national standards.³⁵ VBMAC also negotiated an agreement with Norwegian People’s Aid (NPA) for support in developing a database unit to manage data from the UXO/Landmine Impact Survey and use it as a tool for tasking clearance operations by different agencies.³⁶

Risk education

VBMAC is also responsible for the coordination of risk education (RE).³⁷ However, in 2008 UNICEF was the *de facto* RE coordinator, and VBMAC will need more technical, financial and legal support to take on this coordination role.³⁸ UNICEF’s role is to support its counterparts and implementing partners, facilitate coordination of RE activities through the Landmine Working Group (LWG), provide financial and technical support for national implementing partners’ RE projects, and advocate for the Mine Ban Treaty.³⁹ The LWG met quarterly, rotating between the

central provinces and Hanoi. Most NGOs and government coordination agents participate.⁴⁰ VBMAC participated for the first time in a Landmine Working Group meeting in April 2009.⁴¹

Victim assistance

Formal coordination mechanisms did not exist in Vietnam for victim assistance (VA) in 2008. There was no VA framework and no agency had the clear mandate for coordination. However, the LWG quarterly meetings with NGO operators include collaboration on VA projects.⁴² VBMAC is also tasked with implementing government policies related to survivors and mine/ERW-affected communities.

MoLISA is responsible for disability issues and chairs the National Coordinating Council on Disability, which comprises 14 ministries and the Disabled People's Organization (DPO). The National Action Plan for Supporting People with Disabilities (2006–2010) was revised in consultation with groups of persons with disabilities, and was implemented in 30 of 64 provinces in Vietnam in 2008. This reportedly contributed to improved care and protection of persons with disabilities in the provinces where it was implemented.⁴³ Persons with disabilities were reportedly consulted in the development and review of national programs, such as the national poverty reduction program, vocational laws, and various education policies.⁴⁴

The Disability Forum is a network of disability groups and international NGOs, which addresses a range of issues, including rehabilitation and health services, employment, disability prevention, public awareness, barrier-free access to public places, as well as inclusive and vocational education.⁴⁵ The forum acts as a coordination body for NGO activities.⁴⁶

Data collection and management

There is no comprehensive national data collection system in place in Vietnam. As such, under-reporting is certain. The 2008 and 2009 casualty data analyzed by Landmine Monitor was collected and supplied by Clear Path International (CPI). CPI has collected casualty data through news media and reports from local authorities in 14 provinces since 2001. However, CPI only records and reports on casualties for whom it has provided services.⁴⁷ A number of other organizations collect data, including MoLISA, which is responsible for collection of data on persons with disabilities. Project RENEW collects data on Quang Tri province. The LWG has regularly discussed the need for increased information sharing and coordination work, including regarding collection and verification of casualty data.⁴⁸

Plans

Strategic mine action plans

Vietnam has no strategic plan for mine action. VBMAC has indicated it will work with the Ministry of National Defense to prepare one (see Program management and coordination section above). VBMAC expected to have some 600 staff in 2010 or “maybe later,” including 20 to 25 clearance teams. These would also undertake RE and, unlike BOMICEN’s clearance units, would focus more on integrating clearance with development priorities.⁴⁹ VBMAC also planned to open regional offices in the north, center, and south, but had no timetable for doing so.⁵⁰

There is no national strategic plan for RE.⁵¹ UNICEF has a five-year plan from 2005–2010 in six provinces which aims that, “The population over 6 years of age in affected areas is aware of UXO/mine risks and empowered to take preventative measures through effective education and training including mass media, community-based mine risk education, school-based mine risk education; and the marking of risk areas.”⁵²

Integration of mine action with reconstruction and development

BOMICEN operations have supported key national infrastructure projects, for example the expansion of Highway 1 between Hanoi and Ho Chi Minh City, but do not form an integral part of any national economic development strategy. Clearance by international organizations is tasked by provincial and district authorities according to local priorities.

National ownership

Commitment to mine action and victim assistance

The government approaches UXO and mine contamination as a major impediment to economic development. VBMAC reported that in 2008, the government spent VND800 billion (US\$48 million) on UXO/mine action.⁵³ The government is, however, concerned that clearance is

⁴⁹ Interview with Nguyen Trong Canh, VBMAC, Hanoi, 10 April 2009.

proceeding too slowly and in April 2009 it set up VBMAC in a bid to attract international resources to enable it to accelerate clearance.⁵⁴

National management

The Ministry of National Defense has had responsibility for UXO and mine clearance, and it has conducted most clearance operations through BOMICEN. International NGOs undertake clearance under agreements with provincial authorities (see Program management and coordination section above).

National mine action standards/Standing operating procedures

BOMICEN operates according to standing operating procedures developed by the Ministry of National Defense. VBMAC plans to develop national standards and had discussions with Golden West Humanitarian Foundation in March 2009 about conducting a review of mine action standards in accordance with the International Mine Action Standards.⁵⁵ A workshop to develop national standards for RE was facilitated by the Geneva International Centre for Humanitarian Demining (GICHD) in December 2007.⁵⁶ Draft national standards dated 15 December 2008 were being reviewed by MoLISA as of July 2009.⁵⁷

Demining and Battle Area Clearance

BOMICEN and PAVN have undertaken most of the UXO and mine clearance in Vietnam, operating with some 600–700 clearance personnel and reportedly clearing about 200km² a year,⁵⁸ but details of their operations are not made public. VBMAC planned to initiate operations in 2009 by deploying 10 teams with 20 members each in two districts of Quang Tri province.⁵⁹

International and local NGOs also engaged in mine and UXO clearance in 2008: Mines Advisory Group (MAG), Solidarity Service International (SODI), and PeaceTrees Vietnam (PTVN). NPA opened an office in Vietnam in November 2007 and in May 2008 started clearance operations in Cam Lo district, Quang Tri province, in cooperation with Project RENEW.⁶⁰

Identification of hazardous areas

In July 2009, Vietnam released the final report of a UXO/Landmine Impact Survey conducted by BOMICEN with technical support from the Vietnam Veterans of America Foundation (VVAFF) in two phases between 2004 and 2008. The survey covered all 1,361 communes of six central provinces considered most heavily contaminated: Ha Tinh, Nghe An, Quang Binh, Quang Ngai, Quang Tri, and Thua Thien-Hue.⁶¹

The survey reported a total of 3,214 battle and mined areas covering 15,897km², more than one-third of the six provinces' total land area of 45,115km², and affecting up to eight million people. Worst affected was Quang Tri province, with 739 bombed and mined areas affecting 3,866km² or 83% of its total land.⁶² Rapid technical response teams verified and cleared a total of 13.5km², less than 0.1% of the total area, removing 24,018 items of UXO.⁶³

⁶¹ BOMICEN/VVAFF, "Vietnam UXO/Landmine Impact Survey," Hanoi, July 2009, p. 3; and *Landmine Monitor Report 2008*, p. 1,053.

⁶² BOMICEN/VVAFF, "Vietnam UXO/Landmine Impact Survey," July 2009, p. 43.

⁶³ Rapid Technical Response teams surveyed 13.5km² to a depth of five meters, conducting clearance to a depth of one meter on 11.5km² and to a depth of five meters on 2km². BOMICEN/VVAFF, "UXO/Landmine Impact Survey," July 2009, p. 7.

In the first phase, completed in May 2005, teams surveyed Ha Tinh, Quang Binh, and Quang Tri and confirmed 1,308km² of land as contaminated and a further 3,057km² as suspect.⁶⁴ The survey's second phase, between November 2006 and June 2007, covered the remaining 214 communes of the first three provinces, and all 619 communes of two additional provinces, Nghe An and Thua Thien-Hue.⁶⁵ BOMICEN reported that teams verified 7.85km² of land to a depth of five meters and destroyed nearly 17,000 items of UXO found to a depth of one meter. Another 40 detector signals indicating items buried at a depth of more than one meter were marked and reported to provincial military authorities.⁶⁶ In 2008, VVAF and BOMICEN extended the survey to Quang Ngai and deployed 11 two-person survey teams to survey 180 communes as well as six 20-person rapid technical response teams. Fieldwork took place between May and July. VVAF reported clearance to a depth of five meters over an area of 2.12km², with some 7,000 items of UXO destroyed.⁶⁷

MAG community liaison teams conducted needs assessments in the provinces of Nghe An, Quang Nam, and Quang Ngai in 2008, and Ha Tinh and Thua Thien-Hue in 2009, providing baseline data about UXO-related issues with a view to deciding the most appropriate province for expanding the program.⁶⁸ NPA also conducted a needs assessment of Thua Thien-Hue due for completion in August 2009.⁶⁹

Mine and battle area clearance

MAG, the biggest international demining operator in Vietnam, had four international and 177 national staff as of May 2009. It operated in two central provinces, Quang Tri and Quang Binh with seven mine action teams which spend 90% of their time on roving tasks and only 10% on static clearance. In 2009, MAG expected to reduce its presence in Quang Tri from five to three teams with a view to expanding into Quang Nam province, subject to the availability of funds. Post-clearance assessments conducted on all MAG sites found 61% in use as planned, 35% still under development, and 4% under unplanned use.⁷⁰

NPA, working in partnership with Project RENEW, provides technical support and management for a roving explosive ordnance disposal (EOD) team in Quang Tri. In 2008, it conducted 224 tasks and cleared a total of 977 items of UXO, of which 254 were submunitions and seven were mines.⁷¹

PTVN, which has operated in Quang Tri province since 2005, added a second EOD team in 2008 bringing the number of technicians to 20. It also operated two RE teams with a total of 20 staff. In 2008, the EOD teams undertook 241 roving tasks, clearing a total of 53,298m² and destroying 14,577 items of UXO.⁷²

SODI, with a total staff of about 170 people, operated in two provinces, Quang Tri and Thua Thien-Hue, deploying an area clearance team and mobile team in each province. SODI reported higher productivity as a result of area clearance teams switching from a 100% metal-free methodology to battle area clearance and deploying new detectors, including large-loop detectors. It also added a second roving unit within one of its mobile teams, improving speed of response and the range of operations. The area clearance teams cleared 1.66km² in 2008, up

from 1.48 km² in 2007, and destroyed 6,501 items of UXO, while the mobile teams cleared an area of 0.12km² and destroyed 13,548 items of UXO, up from 8,510 in 2007.⁷³

VVAF provided technical support to BOMICEN for two clearance projects. The first, implemented in October–December 2008 in Quang Tri province, involved three 20-person clearance teams and resulted in surface clearance of 99,486m² and clearance to a depth of five meters over 214,472m², removing six landmines and 254 items of UXO, including one 500-pound (227kg) bomb. The second project, implemented in June–August 2009 in Nghe An province, also involved three 20-person teams which cleared 202,000m² and 17 items of UXO, including five bombs.⁷⁴

Risk Education

RE was conducted by six NGOs in 2008, working in partnership with other organizations, and UNICEF working in partnership with the Research Centre for Ethnic Minorities' Education (under the Ministry of Education and Training), the Departments of Education and Training in three provinces, Youth Unions, and Project RENEW.⁷⁵ Total beneficiary numbers for the whole country are not available, but in Quang Tri and Thua Thien-Hue around 150,000 people were reached.⁷⁶

RE was delivered through community-based and school-based RE in six high-risk provinces: Quang Binh, Quang Tri, Thua Thien-Hue, Nghe An, Ha Tinh and Thanh Hoa, and through the mass media. Despite the need for RE in other provinces in the central and south-central region of Vietnam, NGOs have not been successful in raising funds for further expansion to these areas.⁷⁷

A 2008 UNICEF evaluation identified challenges to RE, including the lack of an updated nationwide UXO/mine casualty database and an effective coordination mechanism.⁷⁸

Limited needs assessments are conducted at the local level.⁷⁹ A knowledge, attitude, and practice (KAP) survey was conducted as part of the UNICEF evaluation in July 2008. It found that there was a high level of understanding among children, but that children were also found to be scrap metal collectors. It also found that while adults had a higher knowledge and understanding of risks, a greater number had not reached a stage of adopting safer behavior.⁸⁰ Catholic Relief Services (CRS) conducts baseline studies on UXO/mine contamination, casualties, and KAPs of at-risk groups each time it commences RE in a new district.⁸¹

Two studies pointed to the challenge RE faced in addressing scrap metal collection. A Project RENEW/NPA study found that RE “interventions are ineffective in terms of modifying the behaviour of collectors” as in most cases people are aware of the risks but do it out of economic necessity. It suggested that RE activities be revised to determine whether a more effective message could be sent, such as focusing on schoolchildren, and working with women to discourage their husbands and sons from taking risks.⁸² The UNICEF evaluation also concluded that RE must go beyond the dissemination of information, for example by looking for incentives for safe behavior, and looking at safe practices in scrap metal collection.⁸³ In 2008, the Golden

West Humanitarian Foundation launched a project to reduce the risk of scrap metal collection by setting up 28 Safe Holding Areas in Quang Tri province.⁸⁴

A UNICEF project in 2008 increased attention to building the capacity of the education sector and youth unions to provide RE in the school curriculum and using a child-to-child methodology to facilitate RE and other extracurricular activities. Teacher training was implemented in 18 schools in each province.⁸⁵ However, KAP study findings show that results from schools not involved in mainstreaming RE into the school curriculum were indistinguishable from those in schools where it was used,⁸⁶ and recommended that a monitoring system be put in place.⁸⁷ Other NGOs, including Counterpart International and CRS, were also involved in school-based RE.⁸⁸

The UNICEF evaluation also recommended that financial support for district mobile communication teams be discontinued, as it was “not a cost effective, efficient or appropriate vehicle for disseminating messages to the public.”⁸⁹

CRS disseminated telephone hotline numbers from MAG, SODI, and Project RENEW in Quang Tri, resulting in several requests for clearance of ERW.⁹⁰ MAG established its community liaison capacity in late 2007 in Quang Binh and Quang Tri, and gained a roughly 25% increase in productivity as a result of the improved quality of information obtained and trusted reporting structures developed with stakeholders. A cooperative agreement with CRS was signed in 2008 to participate and assist in existing school- and community-based RE programs.⁹¹

Although RE programs have a strong focus on capacity-building, the UNICEF evaluation recommended that it establish an explicit development strategy for its counterpart and implementing partners, demonstrating a clear transition by 2012 of the mine action project to government institutions.⁹² CRS works with local partners at every stage of project planning and implementation and conducts capacity-building, to enable them to take over the project with minimum support from international organizations.⁹³ SODI’s program is nationally managed with one expatriate program manager for monitoring operations and giving managerial advice.⁹⁴

Eighteen TV and radio programs were broadcast in the ethnic minority language for the Bru Van Kieu group in Quang Tri.⁹⁵

No external monitoring takes place routinely.⁹⁶ CRS staff, local partners, and community members conduct periodic monitoring of its activities.⁹⁷ SODI activities are monitored occasionally by SODI headquarters staff or donor representatives during their program evaluations.⁹⁸

UNICEF’s mid-term evaluation in 2008 concluded that, “while it is difficult to determine causality of association between UNICEF’s MRE program and its project aim of reducing the incidence and severity of injuries caused by UXO/landmines in Vietnam, UNICEF can claim due credit for contributing towards a decline in mortality and morbidity rates linked to UXO/mines in recent years. ... The most significant improvements were in the areas of increased awareness and knowledge of children and adults on UXO/mines, more effective counterpart

SODI headquarters conducted an evaluation of its work in 2008, monitoring one RE performance in a village. They concluded that there needed to be greater interaction and more audience participation.¹⁰¹

RE has been conducted in Vietnam for over 10 years, by up to six international organizations working with Vietnamese partners, including the Ministry of Education and Training, Women's Union, Youth Union, the Committee for the Care and Protection of Children, and the Committee on Population, Family and Children. RE has mainly focused on six provinces, with most activities taking place in the three provinces of Quang Binh, Quang Tri, and Thua Thien-Hue. Many contaminated areas have been underserved. It has mainly been community-based, with a particular focus on school-based RE, with the training of teachers and the development of a curriculum-based classroom teaching program, and has also been delivered through mass media. RE has also been delivered alongside clearance activities.¹⁰² The number of beneficiaries increased each year until 2007, when it decreased slightly.¹⁰³

In 1998, PTVN established the Danaan Parry Landmines Education Center in Quang Tri, which served as a training and resource center.¹⁰⁴ UNICEF took on a major role in RE in 2004, and in 2006 appointed a full-time RE officer.¹⁰⁵ From 2004, UNICEF implemented an injury prevention program in 15 provinces using mass media and a manual for use in homes, communities, and schools.¹⁰⁶ In 2004, a program targeting scrap metal collectors was conducted, including income generation projects.¹⁰⁷

Needs assessments and evaluations conducted in 2003 and 2004 showed that the majority of people were aware of the danger from mines and UXO, but most did not report or mark dangerous objects. They also concluded that RE did contribute to a reduction in casualties.¹⁰⁸

Victim Assistance

The total number of survivors is unknown, but is estimated to be 100,000.¹⁰⁹ Healthcare and rehabilitation services were generally adequate in Vietnam in 2008. Yet services are unevenly distributed across regions and costs for transport and medical care itself remain a barrier for many persons with disabilities. The services can be difficult to access, particularly for populations living in rural and mountainous areas. The majority of mine/ERW incidents occur far from provincial centers, where the healthcare services are concentrated. National health insurance was only provided to a fraction of persons with disabilities.¹¹⁰

The Ministry of Health is responsible for the majority of medical care. Rehabilitation services are provided by the Ministry of Health in coordination with MoLISA, and with the support of the ICRC Special Fund for the Disabled (SFD). More than 300,000 persons with disabilities in Vietnam are reported to have received rehabilitation services, including provision of prosthetics, orthotics, and wheelchairs over the past decade.¹¹¹

¹¹¹ Embassy of the Socialist Republic of Vietnam in the US, "National report of Vietnam under the universal periodic review of UN human rights council," 24 April 2009, www.vietnamembassy-usa.org.

Psychological and social support programs and economic reintegration activities were constrained by limited resources in 2008. NGOs and the government-sponsored rehabilitation program, which included approximately 100 vocational training centers for persons with disabilities, were the primary service providers.¹¹² UNICEF reported in 2008 that 85% of all adolescents with disabilities did not finish primary school, and half of children with a disability are illiterate.¹¹³ However, the Vietnamese government reported, “The number of children with disabilities enrolled in secondary and tertiary education increases each year.”¹¹⁴ Moreover, an NGO working in Quang Binh province reported that the training, employment, and community participation of mine/ERW survivors has built a positive image of survivors’ capabilities in the general community.¹¹⁵

The government has established a network of agencies and organizations operating at all levels throughout the country to protect the rights and interests of persons with disabilities, including MoLISA, the Viet Nam Association for the Support of Disabled Persons and Orphans, and the National Coordinating Committee on Disability.¹¹⁶ The National Coordinating Committee on Disabilities worked with local and international organizations to provide services in 2008, including social support, and advocacy for improved physical access to public buildings and transport, and employment opportunities.¹¹⁷

The Ministry of Foreign Affairs reported that the national constitution and other laws “all affirm disabled persons are citizens, society’s members, having full rights and obligations of a citizen, enjoying together with other citizens social achievements.”¹¹⁸ Vietnam has legislation protecting the rights and encouraging employment of persons with disabilities. The law requires businesses to meet a 2–3% quota of their workforce for persons with disabilities. However the government reportedly enforces these provisions unevenly.¹¹⁹ Barriers reportedly remain in education, employment, and participation in social activities.¹²⁰

The government signed the UN Convention on the Rights of Persons with Disabilities on 22 October 2007, but as of 1 July 2009 had not ratified the convention nor signed its Optional Protocol. The government reported in April 2009 that it was drafting a “Law on the Handicapped” and had progressed towards ratifying the convention.¹²¹

Victim assistance activities

A major challenge for the VA sector in Vietnam is resource mobilization. One NGO reported it could not expand its program to provide support for survivors and their families due to a lack of funding.¹²²

¹²² Response to Landmine Monitor questionnaire by Dang Quang Toan, Mine Victim Assistance Program Officer, Project RENEW, 20 March 2009.

MoLISA and the Ministry of Health with the ICRC SFD provided rehabilitation services through 10 centers in 2008. The SFD subsidized the provision of assistive devices and rehabilitation care to 3,054 amputees, 59% of whom were war victims.¹²³ The SFD continued to provide technical support and capacity-building, including a training course for 17 orthotic and prosthetic technicians through the Vietnamese Training Centre for Orthopaedic Technologists.¹²⁴ In collaboration with the Vietnamese Red Cross Society, the SFD distributed 204 wheelchairs for persons with disabilities living in remote and impoverished regions.¹²⁵

Vietnam Assistance for the Handicapped (VNAH) provided technical support to five regional rehabilitation and prosthetics centers, vocational training, and advocacy on laws and policies for persons with disabilities in 2008. It also worked with one state-owned and three private wheelchair manufacturers, and a network of local government and civil society organizations to distribute the devices. VNAH provided 2,500 prosthetics in 2008, physical rehabilitation to 450 persons with disabilities, and vocational training to 230.¹²⁶

Since Project RENEW began operations in 2002 in Quang Tri province, it has assisted 1,178 mine/ERW survivors and their families through microcredit projects and assistive devices. In Huang Hoa district, Quang Tri province, the Prosthetic and Orthopedic Mobile Outreach Program provided physical rehabilitation to 171 persons with disabilities, including mine/ERW survivors in 2008. The majority of those assisted were fitted with an artificial limb. Project RENEW reported the 25 mine/ERW survivors who attended their vocational training course all reported a significant increase in income after participating in the program.¹²⁷ Fifty survivors and their families were assisted in 2008 through the micro-credit project. Cooperation between Humpty Dumpty Institute and Project RENEW continued in 2008 to work towards establishing a mushroom farming project.¹²⁸

Clear Path International provided a wide range of services to 1,664 persons with disabilities in 2008, including 1,144 mine/ERW survivors and their families. Of the mine/ERW survivors assisted, 72 were new casualties in 2008. Services included emergency and on-going medical care, family counseling for recent victims, prosthetics provision and rehabilitation, and small grants, including educational scholarships and sponsorship of sport events for persons with disabilities.¹²⁹

Landmine Survivor Network Viet Nam (LSN Viet Nam) coordinated a diverse peer support program in Quang Binh province, assisting 382 mine/ERW survivors in 2008. Activities included providing loans to 145 survivors and vocational training to 144. In addition, LSN Vietnam provided assistance to more than 400 persons with disabilities through 20 self-help groups in 66 communes. LSN Viet Nam is working towards national registration as an NGO.¹³⁰

PTVN provided medical assistance and economic reintegration to mine/ERW survivors in Quang Tri province in 2008.

Support for Mine Action

Landmine Monitor is not aware of any long-term comprehensive cost estimates for meeting mine action needs (including RE and VA) in Vietnam. In June 2005, BOMICEN stated that without exact statistics on contamination and casualties, an accurate estimate of general funds required for clearance and VA was not possible.¹³¹

¹³¹ Interview with Lt. Col. Nguyen Trong Canh, BOMICEN, Hanoi, 27 June 2005.

National support for mine action

Vietnam has never reported the amount of funds that it has spent on mine action with the exception of 2002 when the Ministry of National Defense stated that the government had invested “hundreds of billions of dong [tens of millions of US dollars] for mine detection and clearance” each year.¹³²

International cooperation and assistance

In 2008, five countries reported providing \$7,637,404 (€5,186,340) to mine action in Vietnam. Reported mine action funding in 2008 was approximately 93% more than reported in 2007.

2008 International Mine Action Funding to Vietnam: Monetary¹³³

Donor	Implementing Agencies/ Organizations	Project Details	Amount
US	BOMICEN, Veterans for America, MAG, NPA, Vietnam Veterans Memorial Foundation, Golden West Humanitarian Foundation, Survivor Corps, CRS, PTVN, Humpty Dumpty Institute	Via the Centers for Disease Control, USAID Leahy and Department of State	\$4,149,000
Japan	VBMAC	Mine/UXO clearance	\$1,566,695
Germany	SODI	Mine clearance	\$1,160,824 (€788,282)
United Kingdom	MAG	Mine clearance	\$741,800 (£400,000)
Norway	UNDP, NPA	Cluster munition workshop, mine action training	\$19,085 (NOK107,580)
Total			\$7,637,404 (€5,186,340)

In addition to the funding listed above, in March 2009, Iceland announced providing €22,000 (\$32,397) to raise public awareness of unexploded ordnance in Thua Thien-Hue province.¹³⁴ Also in March 2009, Solidarity Service International (Germany) pledged €435,250 (\$640,949) for clearance in Quang Tri province.¹³⁵ SODI mine clearance projects in Vietnam are funded by the German Federal Ministry for Economic Cooperation and Development and private donations.¹³⁶

OTHER AREAS

ABKHAZIA

Ten-Year Summary

Abkhazia has not taken any unilateral steps to ban antipersonnel mines. In 2001 and 2002, Abkhazian authorities acknowledged that Abkhazian soldiers were still using antipersonnel mines. Georgian forces also used antipersonnel mines in the Upper Kodor Gorge in 2006. Until 2003, there were also allegations that private armed groups from Georgia entered Abkhazia and laid antipersonnel mines.

Demining in Abkhazia has been ongoing since December 1997. As a result of new contamination linked to the August 2008 conflict in Georgia, HALO Trust, the sole clearance operator in Abkhazia, hoped to be able to complete demining operations by the end of 2010, a delay of two years from its earlier plans.

Landmine Monitor has identified at least 136 casualties from mines, explosive remnants of war (ERW), and improvised explosive devices (IEDs), including 33 killed, 92 injured, and 11 unknown, between 1999 and 2008. HALO recorded 119 casualties (31 killed, 77 injured, and 11 unknown) for the same time period. HALO has recorded some 701 mine/ERW casualties between 1992 and 2008, including 153 people killed, 438 injured, and 110 unknown, including peacekeepers, but data may be incomplete. HALO was the main provider of mine/ERW risk education, even though it decreased its operations in conjunction with decreased contamination. No specific framework for victim assistance exists in Abkhazia and services, despite slow improvements, were still inadequate.

Mine Ban Policy

Abkhazia is a breakaway region of Georgia and is only recognized by Russia and Nicaragua.¹ After the disintegration of the Soviet Union, the 1992–1993 conflict between Abkhazia and Georgia was characterized by significant use of mines by both sides. A cease-fire agreement was reached in May 1994.

Due to its status, Abkhazia cannot accede to the Mine Ban Treaty. It has not taken any unilateral steps to ban antipersonnel mines. Officials have expressed sympathy with humanitarian concerns surrounding landmines, but made clear that they consider antipersonnel mines militarily essential. In August 2009, the Deputy Foreign Minister of Abkhazia, Maxim Gunjia, told Landmine Monitor, “Our general policy towards landmines is still viewed through [the] perspective of our relations with Georgia. We still consider [that there is a] threat from their territory.”² A Ministry of Foreign Affairs official previously told Landmine Monitor that Abkhazia could prohibit antipersonnel mines only after Georgia acceded to the Mine Ban Treaty and signed a peace treaty with Abkhazia.³

Use, stockpiling and retention, and production

Abkhazian forces were last confirmed to have used antipersonnel mines in 2002.⁴ According to 2008 news reports, Georgia accused Abkhazian forces, or Russian forces operating from Abkhazia, of laying mines on the border during and after the armed conflict in August 2008

¹ The Republic of Abkhazia is a member of the Unrepresented Nations and Peoples Organization.

² Email from Maxim Gunjia, Deputy Foreign Minister of Abkhazia, 24 August 2009.

³ See *Landmine Monitor Report 2007*, p. 1037.

⁴ The Abkhazian Minister of Defense told Landmine Monitor that Abkhazia used antipersonnel mines in northern Kodori Gorge in 2002. See *Landmine Monitor Report 2004*, p. 1,180. Abkhazia maintains specialized units to lay minefields on order. See *Landmine Monitor Report 2005*, p. 933.

between Georgia and Russia over South Ossetia.⁵ In September 2008, Georgian field engineers reportedly demined areas after Abkhazian military forces withdrew from Ganmukhur village, Zugdidi district.⁶ Landmine Monitor has not been able to independently confirm these allegations of use of antipersonnel mines by Abkhazian forces in 2008.

There were also reports of Georgian use of antipersonnel mines. During the conflict in August 2008, Abkhazian and Russian forces moved into the Upper Kodor (Kodori in Georgian) Gorge and retook it from Georgian forces. Media reports state that Abkhazian troops encountered minefields during their operations.⁷ Abkhazian and Russian forces in Abkhazia were also reported to be victims of newly laid antivehicle and Claymore mines.⁸ According to HALO Trust, demining personnel encountered minefields laid since 2006, when the area was under control of Georgian forces.⁹

Landmine Monitor has not been able to independently confirm allegations of use of antipersonnel mines by Georgia in the Upper Kodor Gorge in 2008. In communications with Landmine Monitor, the Deputy Foreign Minister of Abkhazia, Maxim Gunjia, did not allege Georgian use of antipersonnel mines. However, he did claim that Georgian LAR-160 rocket launchers had fired cluster munitions containing more than 10,000 M095 submunitions (also known as M85-type submunitions) in the Kodor Valley, affecting an area of eight hectares (80,000m²). He also said that Georgia mined bridges with antivehicle mines.¹⁰

Abkhazia is not known to have ever produced or exported antipersonnel mines, but its military forces maintain a stockpile.¹¹ Abkhazia has not revealed the size and composition of its stockpile. Russian engineering units stationed in Abkhazia may also stockpile antipersonnel mines.

Scope of the Problem

Contamination

Abkhazia was contaminated with mines and ERW during the 1992–1993 conflict between the breakaway republic and Georgia proper. Both Georgian and Abkhazian forces used landmines extensively during the conflict. Mines were also used in varying degrees between the May 1994 cease-fire and the late 1990s by individuals and small groups, primarily in relation to criminal activities.¹² The main road leading to the upper Kodor Gorge is mined from both sides and HALO has been maintaining mine warning signs around that area. In addition, new mines

⁹ Emails from HALO, 7 August 2009 and 9 July 2009; and email from Matthew Hovell, Caucasus and Balkans Desk Officer, HALO, 19 August 2009. For further details see the report on Georgia in this edition of Landmine Monitor.

¹⁰ Email from Maxim Gunjia, Deputy Foreign Minister, 24 August 2009. This is the first time Landmine Monitor has received an allegation that Georgia used cluster munitions in the Kodor Gorge, though its use of cluster munitions elsewhere in August 2008 has been well documented. The Deputy Foreign Minister provided photographs of submunitions and containers, but Landmine Monitor has not been able to independently investigate and confirm the information.

¹¹ Interview with Col. Garry Kupalba, Deputy Minister of Defense, Sukhum, 12 April 2007.

¹² HALO, “Caucasus & Balkans, Georgia, The Problem,” www.halotrust.org.

appear to have been laid in the upper Kodor Gorge in 2006, when the area was under the control of Georgian forces.¹³ As of April 2009, 42 mined areas covering 0.9km² had been identified by HALO as requiring clearance.¹⁴

Casualties

Landmine Monitor identified at least 20 mine/ERW casualties in six incidents (three killed and 17 injured) in Abkhazia in 2008; at least 14 were civilians.¹⁵ HALO recorded three casualties in 2008 in one ERW incident (one man killed and two girls injured).¹⁶ The additional 17 casualties were identified through Landmine Monitor media monitoring and included 11 civilians involved in incidents with unspecified types of mines (three men, five adults, one child, and two unknown) and six Russian security forces involved in an antivehicle mine incident.¹⁷ All casualties occurred in Gal district.

The casualty rate in 2008 suggests a significant increase from the 14 casualties (three killed and 11 injured) identified by Landmine Monitor in 2007. However, this should not necessarily be considered indicative of a trend, as data remains incomplete.

Casualties continued to occur in 2009; Landmine Monitor identified four casualties (one killed and three injured) as of 31 May 2009. On 5 March 2009, a male construction worker was killed by an ERW in Sukhum district. Three men (two military and one civilian) were injured on 29 March 2009 by an IED in Ochamchira district.¹⁸

Landmine Monitor has identified at least 136 mine/ERW/IED casualties (33 killed, 92 injured, and 11 unknown) between 1999 and 2008.¹⁹ HALO recorded 119 casualties (31 killed, 77 injured, and 11 unknown) for the same time period.²⁰ HALO has recorded 701 mine/ERW casualties between 1992 and 2008, including 153 people killed, 438 injured, and 110 unknown, including peacekeepers, but data might be incomplete.²¹

Program Management and Coordination

There is no mine action authority in Abkhazia. Mine action data collection, planning, and operational coordination continue to be provided by the Abkhaz Mine Action Centre (AMAC), established by HALO in 1999.²²

There is no specific framework for victim assistance in Abkhazia and risk education was mainly conducted by HALO.²³ Mine/ERW survivors are included in the broader services for persons with disabilities. The Ministry of Health and Social Welfare continued to be responsible for the needs of persons with disabilities.²⁴

Data collection and management

HALO uses its own database to store mine action information and provide maps and other data to concerned organizations, including the UN Human Rights Office and the UN Observer Mission in Georgia.²⁵

There is no comprehensive casualty data management system in Abkhazia.²⁶ HALO maintains a casualties database, which is shared with Abkhazia's Ministry of Health and Social Welfare and with the disability NGO Association of Invalid Support (Association Inva-Sodeistvie, AIS).²⁷ AIS is represented in all districts in Abkhazia and also continued to maintain a database of more than 4,000 persons with disabilities assisted since 1998.²⁸ In 2008, HALO began expanding data collection to previously under-reported areas, with support from their branch office in Gal district.²⁹

The NGO Geneva Call, in partnership with local civil society organizations, began a survey on socio-economic needs of mine survivors in the South Caucasus, including Abkhazia, in June 2008. The survey was interrupted in August 2008, due to the Russia-Georgia conflict. However, by October 2008, all interviews, including with 69 people from Abkhazia, were complete. As of June 2009 the survey results were not available.³⁰

Plans

Strategic mine action plans

HALO produces its own workplan each year.³¹ For 2009, it planned to clear 42 mined areas covering an estimated 0.9km².³² Since the conflict in August 2008 HALO has also worked in the upper Kodor Gorge. The primary objective was to remove the threat posed to the remaining civilian population by ERW. The second objective was to identify the mined areas and start demining.³³ HALO estimated it would be able to clear the newly identified minefields in the upper Kodor Gorge up to the end of 2010, pending completion of survey work in this area.³⁴

HALO expects that mines and UXO will occasionally be found in Abkhazia even after its demining operations have finished. As of 2009, in the lower part of Abkhazia, HALO was still destroying up to 30 items of UXO a month through call-outs.³⁵ For this purpose, HALO plans to establish a small local explosive ordnance disposal (EOD) capacity for a number of years after it leaves Abkhazia to deal with occasional call-outs.³⁶

Demining and Battle Area Clearance

Demining in Abkhazia continues to be carried out primarily by HALO using manual deminers and mechanical assets.³⁷ As of 2009, it had four manual teams, six survey teams, one "Large Loop" demining team, one mechanical team, and one EOD team.³⁸ Internal quality assurance and quality control continue to be carried out in accordance with HALO's global standing operating procedures.

³⁷ HALO, "Abkhazia, Georgia Summary of Activities, The Halo Trust 1997–2009," April 2009.

³⁸ Email from Matthew Hovell, HALO, 9 July 2009.

In 2008, HALO cleared 1.39km² of mined areas, with the destruction of 266 antipersonnel mines and 109 antivehicle mines, and 15,299 ERW. A further 35,000km² of suspected hazardous area was released. Of this total, HALO's EOD teams deployed in the Upper Kodor Gorge destroyed more than 14,000 items of ERW between August 2008 and April 2009.³⁹

HALO began demining in Abkhazia in December 1997. As of April 2009, 250 minefields had been cleared by manual and mechanical clearance teams with the destruction of more than 35,000 mines and items of UXO.⁴⁰ In addition, HALO has been conducting a survey of residual contamination since 2005. Up to the end of 2008, 109 (89%) of village administrations had officially recorded that they were satisfied that no further clearance was required in their areas of responsibility.⁴¹

Demining in 2004–2008

Year	Mine clearance and area reduction (km ²)
2008	1.39
2007	2.67
2006	2.01
2005	2.56
2004	2.31*

* This figure differs slightly from that reported in *Landmine Monitor Report 2005*.

Risk Education

In 2008, HALO's mine/ERW risk education (RE) teams continued to conduct post-clearance follow-up and community liaison.⁴² RE was also conducted at the request of the UN Observer Mission in Georgia and the ICRC, and focused on the upper Kodor Gorge.⁴³

AMAC and HALO ran an RE program from 1999 to 2006 with the support of the ICRC, reaching 183,163 people. It was targeted at schoolchildren and people engaged in livelihood activities. In 2004, it began to include internally displaced persons and refugees from Georgia. There was a strong link with clearance activities, and casualty data was collected. RE materials were produced in Russian, Abkhazian, and Georgian, and messages were broadcast on television. A 2002 needs assessment identified adult men as most at-risk, and found that people were aware of the danger from mines and UXO but they did not know how to minimize the risk. In 2006, the HALO/AMAC formal RE program ended and the roles of HALO's RE teams were modified to focus on post-clearance follow up and community liaison.

Victim Assistance

The number of mine/ERW survivors in Abkhazia is at least 438.⁴⁴ The health sector in Abkhazia improved slightly in 2008 and 2009.⁴⁵ Individuals who, in the past had to travel to Sochi in Russia for such services, now receive them closer to home.⁴⁶

The Republican Hospital in Sukhum is the referral hospital and has a centralized network of healthcare services under the Ministry of Health and Social Welfare.⁴⁷ In 2008, patient services increased in all hospitals in Abkhazia, due to general structural renovations and new equipment. Local personnel continued to lack up-to-date skills, however, and funding was still insufficient.⁴⁸

There are rehabilitation centers at the Republican Hospital in Sukhum and the Agudzera Hospital in Gulripsh district.⁴⁹ Physical rehabilitation and prosthetics are also provided by the Gagra Orthopedic Center, managed by the Ministry of Health and Social Welfare with ICRC support.⁵⁰ In 2008, 369 individuals benefited from services provided at the Gagra Center; of these, 78 received prostheses and 100 received orthoses.⁵¹

In 2008 and the first half of 2009, AIS continued to assist persons with disabilities, including 30 mine/ERW survivors, through the provision of mobility devices, psychological support, and socio-economic services including free access to education for children with disabilities and legal aid.⁵² AIS distributed 30 wheelchairs with support from the Ministry of Health and Social Welfare and private donations in 2008.⁵³ The ministry also provided AIS with US\$15,000 to purchase mobility devices for persons with disabilities; 20% were for mine survivors.⁵⁴

While disability legislation was drafted in May 2007, as of May 2009, no information was available on its status.⁵⁵

Support for Mine Action

Landmine Monitor is not aware of any comprehensive long-term cost estimates or resource mobilization strategies to fulfill mine action needs (including RE and victim assistance) in Abkhazia. The resource mobilization strategy for mine action is limited to strategic planning by HALO through AMAC. The Ministry of Health and Social Welfare is responsible for the healthcare and social care of persons with disabilities.

International cooperation and assistance

The United States reported contributing \$700,000 (€475,350) to mine action in Abkhazia in 2008, to HALO for mine clearance.⁵⁶ Following the conflict in 2008, a further \$3.7 million was donated by the US Department of State for emergency clearance; of this \$1.2 million was allocated to Abkhazia and the rest to Georgia.⁵⁷

FALKLAND ISLANDS/MALVINAS

Scope of the Problem

The 1982 armed conflict between Argentina and the United Kingdom resulted in many thousands of antipersonnel and antivehicle mines being laid on the Falkland Islands/Malvinas, most by Argentina. There is also UXO, including a number of areas that contain cluster munition remnants resulting from the use of BL-755 cluster bombs by the UK against Argentine positions. The precise extent of UXO contamination is not known. The UK has also noted the presence of booby-traps on the Falkland Islands/Malvinas.¹

The UK has reported that 117 mined areas remain, covering a total area of some 13km²—a significant reduction from previous estimates of 20km²—which contain “just over” 20,000 mines.² Moreover, this reduced estimate includes four suspected hazardous areas amounting to almost 5.8km², which “probably have no mines but there are still suspicions.”³ The mined areas are mainly beaches and peat bogs. Three minefields are said to be within one mile (1.6km) of the capital, Port Stanley. When depositing its initial Article 7 report in August 1999, the UK included minefield maps for the Falkland Islands/Malvinas.⁴

Minefields are said to be surrounded by a three-strand fence and marked with danger signs at regular intervals around the perimeter, in addition to the NATO standard mine warning triangles. No human casualties from mines or UXO have been reported in the Falkland Islands/Malvinas since 1984, although there have been a number of “infringements of minefields” recorded, including a few children and several tourists, with some people arriving in the mined areas after disembarking from boats.⁵ A number of cattle have been killed in minefields.⁶ Presumably, minefields are not fenced where the edge of the minefield touches the coast. The UK has reported that six military personnel were injured in 1982 and a further two were injured in 1983. Most military accidents took place while clearing/lifting the minefields in the immediate aftermath of the 1982 conflict or in the process of trying to establish the extent of the minefield perimeters, particularly where no detailed records existed.⁷

KOSOVO

2008 Key Data

Contamination	Antipersonnel and antivehicle mines, submunitions, other UXO
Estimated area of contamination	55 known dangerous areas and 65 suspected areas (1 January 2009)
Casualties in 2008	Six (2007: 14)
Estimated mine/ERW survivors	Unknown but at least 439
Demining in 2008	0.94km ² of mine and battle area clearance
Risk education recipients in 2008	35,700

Ten-Year Summary

Kosovo declared independence from Serbia on 17 February 2008, but it is not yet a UN member state and is thus not eligible to adhere to international treaties such as the Mine Ban Treaty.

Throughout the armed conflict that ended in June 1999, both the Kosovo Liberation Army and the Federal Republic of Yugoslavia armed forces used antipersonnel landmines. During March–June 1999, NATO forces dropped more than 1,200 cluster bombs on Kosovo. Mines were used sporadically after June 1999, mainly by unknown actors in attacks against the remaining Serbian minority in Kosovo, with the last reported use of antipersonnel mines in 2002. Local authorities and international troops continued to recover antipersonnel mines from caches or seize them from individuals.

Following the cease-fire between the Federal Republic of Yugoslavia and NATO, the UN coordinated a major demining operation by international NGOs and commercial companies from June 1999 to December 2001. Despite claims that almost all mines and explosive remnants of war (ERW) had been removed, significant clearance operations continue.

Landmine Monitor analysis of data from the authorities and additional reports of deminer and peacekeeping casualties identified 553 mine/ERW casualties (111 killed, 439 injured, and three unknown) in Kosovo between 1999 and 2008. Risk education was provided with no interruption by a large number of international and national organizations in Kosovo between 1998 and 2008, but activities decreased in 2007–2008.

Assistance for persons with disabilities, including mine/ERW survivors remains inadequate. While progress has been made in strengthening the health sector after the 1999 conflict, its infrastructure is limited and services insufficient.

Background

Kosovo declared independence from Serbia on 17 February 2008.¹ When Kosovo's constitution came into effect on 15 June 2008, 43 UN members recognized Kosovo as an independent state.² By July 2009, more than 60 states recognized Kosovo.³

¹ In 1999, conflict between the armed forces of the then-FRY and the KLA led to the NATO bombing campaign against the FRY in Kosovo. In June 1999, Kosovo came under the administration of the UN Interim Administration Mission in Kosovo (UNMIK), which was granted authority by UN Security Council Resolution 1244. Beginning in October 2005, the UN facilitated negotiations on Kosovo's future status. The negotiations discontinued in June 2007, when no agreement could be reached.

² "Kosovo's New Constitution Comes Into Force," *Dow Jones International*, 15 June 2008.

³ Ministry of Foreign Affairs of the Republic of Kosovo, "Countries that have recognized the Republic of Kosovo," www.ks-gov.net.

Serbian President Boris Tadić called the declaration of independence illegal and stated that, “Serbia considers Kosovo as its southern territory.”⁴ Russia, a permanent member of the UN Security Council holding a veto, considers Kosovo’s declaration of independence illegal, based on existing UN Security Council resolutions.⁵ Russia’s position impacts Kosovo’s ability to become a UN member state and thus be eligible to adhere to international treaties such as the Mine Ban Treaty.

Kosovo’s new constitution calls on the European Union (EU) to take over the oversight role from the UN Interim Administration Mission in Kosovo (UNMIK). On 13 June 2008, UN Secretary-General Ban Ki-moon proposed a plan to downscale UNMIK’s activities and to allow the EU’s mission in Kosovo to operate under the UN’s umbrella.⁶ UNMIK, however, formally continues to exercise its authority according to Resolution 1244 until the Security Council decides otherwise.⁷

Mine Ban Policy

Use and stockpiling

Kosovo saw an increase in violence after the declaration of independence, but there have been no confirmed cases of new use of antipersonnel mines.⁸ Weapons possession is a criminal offense for all Kosovo residents except those holding UNMIK authorization, with penal sanctions for violations.⁹ In February 2009, a man was reportedly arrested in Štrpce by the Kosovo Police Service for possessing an antipersonnel mine.¹⁰

Scope of the Problem

Contamination

Kosovo became contaminated by landmines and ERW, primarily UXO, during the conflict between the then-Federal Republic of Yugoslavia (FRY) and the Kosovo Liberation Army (KLA) in the late 1990s which led to NATO bombing of the FRY and Serbia in 1999.¹¹ However, explosive ordnance disposal (EOD) teams continue to encounter items of UXO dating back to World War II.¹² Contamination includes cluster munition remnants.

The UN coordinated a major demining operation by international NGOs and commercial companies from June 1999 to December 2001 and reported that “the problems associated with landmines, cluster munitions and other items of unexploded ordnance in Kosovo have been virtually eliminated.”¹³ However, further investigation since then has revealed considerably more contamination.

⁴ “Serbia rejects Kosovo’s new constitution – Tadic,” *RIA Novosti* (Belgrade), 15 June 2008, en.rian.ru.

⁵ “Russia assures Serbia of its support; Medvedev signals firmness on Kosovo,” *International Herald Tribune*, 26 February 2008; and “Security Council holds emergency talks on Kosovo,” *UN News Center*, 17 February 2007, www.un.org.

⁶ “Tension as charter takes effect in Kosovo; Ongoing dispute over authority could hinder new country,” *International Herald Tribune*, 16 June 2008. Serbia and Russia both insist that the EU mission is illegal, as the Security Council has not approved it.

⁷ “Kosovo: UN peacekeeping chief heads to region for fact-finding tour,” *UNMIKonline*, 2 May 2008, www.unmikonline.org.

⁸ The last reported use of antipersonnel mines occurred in 2002 and of antivehicle mines in 2003. See *Landmine Monitor Report 2003*, p. 748; and *Landmine Monitor Report 2005*, p. 955. In previous years, mines were used in attacks against the remaining Serbian minority in Kosovo, and against Serbian military and police forces on Kosovo’s border with southern Serbia.

⁹ See *Landmine Monitor Report 2002*, p. 822.

¹⁰ “KPS thwart would-be Albanian bomber,” *B92*, 17 February 2009, www.b92.net.

¹¹ See *Landmine Monitor Report 2006*, p. 1,146.

¹² UNMIK, “OKPCC EOD Management Section Annual Report 2008,” Priština, 12 January 2009, p. 4.

¹³ “UNMIK Mine Action Programme Annual Report – 2001,” MACC, p.1.

The Office of the Kosovo Protection Corps Coordinator (OKPCC) has no estimate of the extent of residual mine and UXO contamination but in May 2009 it reported 120 known and suspected dangerous areas, compared with the total of 58 reported two years earlier, although this was lower than the 130 reported in 2008.¹⁴ The May 2009 estimate included 55 known dangerous areas and 65 suspected areas that require technical survey and possible clearance.¹⁵ The 55 known dangerous areas consisted of nine minefields and 46 areas contaminated with unexploded submunitions. The 65 suspected areas include 55 mined areas and 10 areas contaminated by cluster munition remnants.¹⁶

A community liaison survey completed by the HALO Trust in August 2007 identified 126 additional mine or UXO clearance tasks.¹⁷ The OKPCC discounted 42 of these in 2008 and another 10 as of May 2009 after resurvey found they had no mine or UXO threat.¹⁸ HALO, however, said its clearance operations in 2008 and 2009 found contamination in areas OKPCC had discounted.¹⁹

Casualties

In 2008, the OKPCC EOD Management Section and the Institute of Public Health (IPH) reported six ERW casualties (two killed and four injured) in three incidents.²⁰ All casualties were civilian men. On 1 April 2008, one man was killed and three others injured by a submunition while collecting scrap metal in the village of Harilac, near Priština's airport. On 25 May 2008, one man was killed by a submunition that was mixed into scrap metal while on duty in a private factory in Raskovë, north of Priština. On 16 December 2008, a man was injured by a grenade while working for a construction company in Priština. No antipersonnel mine casualties have been reported in Kosovo since 2004.²¹

The 2008 casualty rate is a decrease compared to 2007 (14 casualties, all injured) and the lowest recorded since the end of the conflict in 1999.²² A change in the casualty profile and age group can be noticed: while in 2008 men collecting scrap metal were involved in all incidents, in 2007 the biggest casualty group was children tampering with devices.²³

Casualties continued to be recorded in 2009, with at least seven ERW casualties (one killed and six injured), in three incidents, as of 30 June 2009.²⁴ On 5 March 2009, two boys aged 16 and 17 years were injured while playing with ERW in their house in Gračanica. On 14 April 2009, three men were injured by ERW while reconstructing a wall in their house in Kopirnica. In June 2009, a 29-year-old man was killed and his brother injured in their house in Kisinica by a submunition collected for its metal.

The total number of mine/ERW survivors in Kosovo remains unknown. Landmine Monitor has identified 553 mine/ERW casualties (111 killed, 439 injured, and three unknown) between 1999 and 2008. These figures were based on Landmine Monitor analysis of records from 2001

to 2007 provided by OKPCC detailing 91 casualties (16 killed and 75 injured),²⁵ an OKPCC summary report for 1999 to 2009,²⁶ and reports on four deminer casualties (one killed and three injured; three in 2001 and one in 2007) and four American and British peacekeeping casualties (one killed and three injured) in 2001 identified by Landmine Monitor.²⁷ The vast majority of casualties (438) were recorded between 1999 and 2000 (86 killed and 352 injured), but raw data for this period was not available.²⁸ From 2001 to 2008, a significant decrease in mine/ERW incidents was recorded, but data may be incomplete.²⁹

Risk profile

OKPCC/IPH data shows that the most at-risk groups are boys and men deliberately tampering with devices. In 2008 an increase in scrap metal collection activities was recorded.

Socio-economic impact

The Geneva International Centre for Humanitarian Demining (GICHD), following up on a 2006 review of existing data, stated in early 2007 that “even if the true extent of contamination is more extensive than previously understood, its impact remains modest.”³⁰ According to the OKPCC, both contamination records and the pattern of recent incidents continue to indicate that ERW, such as hand grenades and submunitions, pose the main humanitarian threat, while the threat from antipersonnel mines is limited.³¹ No human mine incident has been recorded since 2004.³²

Program Management and Coordination

Mine action

The OKPCC EOD Management Section, formerly under the control of UNMIK, was transferred to the government of Kosovo in May 2009.³³ The EOD Management Section was expected to become the National Mine Action Authority under a government ministry, but as of July 2009 the government had not chosen a ministry.³⁴

The EOD Management Section continues to serve as a mine action center, responsible for coordinating all demining and survey, as well as quality assurance, risk education (RE), public information, and victim assistance (VA). It coordinated the clearance operations of the Kosovo Protection Corps (KPC) EOD teams and demining NGOs in 2008, and reported inspecting clearance sites on a daily basis.³⁵

²⁵ “Query on mine/UXO incidents 2002–2007,” provided by email from Bajram Krasniqi, OKPCC, UNMIK, 16 April 2008.

²⁶ “List of Mine/UXO Civilian Victims in Kosovo 1999–2009,” provided by email from Bajram Krasniqi, OKPCC, UNMIK, 1 July 2009. This summary report has 551 casualties (113 killed and 438 injured), however, Landmine Monitor double-checked this data and cross-referenced it with the OKPCC individual records for 2001–2008 and the peacekeeping and deminer casualties to come to its own figure.

³⁵ UNMIK, “OKPCC EOD Management Section Annual Report 2008,” Priština, 12 January 2009, pp. 1, 2.

Risk education

The OKPCC EOD Management Section was mandated by UNMIK to coordinate RE activities.³⁶ Coordination meetings were held regularly in 2008.³⁷

Victim assistance

There is no VA strategy or plan in Kosovo. According to UNMIK's "Multi Year Strategic Plan for the Kosovo Mine Action Program 2008–2010" (MYSP), the Ministry of Labor and Social Welfare (MoLSW) is responsible for rehabilitation, reintegration, and support of mine/ERW survivors. The EOD Management Section is responsible for annual planning, reporting, and stakeholder management, while local organizations are to implement VA and rehabilitation activities.³⁸ There are no VA objectives or activities listed in the MYSP, or in the 2008 OKPCC EOD Management Section Work Plan.³⁹

In 2008, some VA issues were discussed at the OKPCC EOD Management Section's RE meetings.⁴⁰ However, the key organizations that provide direct support to mine/ERW survivors or persons with disabilities did not attend RE meetings and it remains unclear which organizations, if any, were invited to participate.⁴¹ The OKPCC reported that VA activities are coordinated with the MoLSW and the IPH.⁴²

The Office of the Prime Minister is responsible for coordinating and promoting the rights of persons with disabilities through the Human Rights Coordinator. The MoLSW and the Ministry of Health, including its IPH, are the main public institutions with responsibilities for services to persons with disabilities, including mine/ERW survivors and other people injured during conflict.⁴³ However, a United States Department of State report issued in 2008 noted that ensuring the rights of persons with disabilities was not a priority for the government.⁴⁴

The National Council on Disabled People is an advisory body to the government. In 2008, its priority was drafting a national platform on persons with disability but this was not achieved.⁴⁵

Data collection and management

The EOD Management Section maintains a mine action database using the Information Management System for Mine Action (IMSMA); the database contains completion reports of the KPC EOD teams and demining NGOs.⁴⁶

The UNMIK MYSP indicated that the Ministry of Health will be responsible for data collection through the IPH and the OKPCC, and will investigate mine/ERW incidents causing casualties in cooperation with police.⁴⁷

Since December 2001, the IPH has collected, maintained, and shared mine/ERW casualty data with the support of the EOD Management Section.⁴⁸ Data is collected by the police and the KPC EOD teams; it is verified by the OKPCC and the IPH and recorded into IMSMA

forms.⁴⁹ Data is stored both in the IPH database and in the IMSMA database housed with the OKPCC.⁵⁰ Data is shared with the Ministry of Health, the MoLSW, and the Red Cross of Kosovo (RCK), and information is available on request to any other organization.⁵¹ The IPH does not share information on recent casualties who may require prostheses with the National Ortho-Prosthetic Center (NOPC), which is on the same premises, or with other VA service providers or organizations for persons with disabilities.⁵² Because of decreasing casualty rates, no change in the current data collection mechanism is foreseen.⁵³

In 2008, the OKPCC reported the need for complete casualty data and a mine/ERW survivor needs assessment distinguishing between injured war veterans and civilians.⁵⁴ The necessary information to start a needs assessment is stored at the IPH. However, no progress was reported as of July 2009.⁵⁵

The disability NGO HandiKos maintains a database of persons with disabilities, which is shared with other service providers including the NOPC.⁵⁶ A census planned for November 2008 was rescheduled to April 2010.⁵⁷ The Coalition of Organizations of People with Disability of Kosovo reported that the government will include questions on disability.⁵⁸

Plans

Strategic mine action plans

The MYSP for 2008–2010 prepared by UNMIK provides a framework for all mine action, setting out seven main goals. These include: establishing a national mine action coordinating mechanism; completing the identification, marking, and recording of suspected risk areas; developing demining and EOD capacity; and maintaining high levels of awareness among at-risk populations. To achieve these targets, the MYSP calls for the OKPCC to draw up annual integrated workplans for the new mine action coordination authority that will form the basis of a resource mobilization strategy.⁵⁹ The workplans are also supposed to set measurable targets to provide a basis—previously lacking—for assessing progress.⁶⁰

The OKPCC's 2008 workplan, however, identified three general goals: (1) oversight, coordination and management of UXO and mine clearance; (2) development of the KPC EOD capacity; and (3) management of NGOs and international donor funding. Although the plan identified activities, it did not set measurable objectives or targets.⁶¹

Demining priorities under the 2008 workplan were to clear as many of the remaining dangerous areas as possible that have been confirmed to contain UXO, cluster munition remnants, or mines.⁶² However, OKPCC reported that “as quickly as the existing dangerous areas were surveyed and cleared, NGOs and members of the public were continuing to report new suspected areas.”⁶³ A total of three community clearance requests were received in 2008, of which two were completed in 2008 and one was included in plans for 2009.⁶⁴

RE is included in the MYSP with one strategic goal: “maintain high levels of mine and EOD awareness in at-risk populations.” This goal was to be achieved through five operational objectives: developing RE targeted at the primary at-risk groups and their behavior (youths aged between 14 and 23 playing or tampering); developing an annual RE plan with the Ministry of Education, Science and Technology; improving and maintaining coordination; engaging local media in RE dissemination; and increasing EOD teams' RE capacity through training and materials. Planned activities included: developing a system for RE priority-setting and quality assurance by the end of 2008, and ensuring that RE activities in the annual workplans are adapted to changes in geographic and at-risk groups.⁶⁵

A National Disability Action Plan was developed by the Office of the Prime Minister in cooperation with disabled peoples' organizations in 2008. The plan aims to strengthen existing services and create new ones for persons with disabilities in the health, education, social protection, employment, and information sectors. Implementation is scheduled to begin in September 2009.⁶⁶

National ownership

Kosovo embarked on the process of taking control of mine action from the UNMIK EOD Management Section in May 2009 (see Program management and coordination section above).⁶⁷ Since June 2006, the EOD Management Section has been staffed entirely by Kosovars.⁶⁸ The

EOD Management Section has stated that Kosovo's mine action program does not require external advisors.⁶⁹

The UNMIK MYSP acknowledges that there is a need to address the needs of survivors.⁷⁰ In practice, however, there is no specific budget for VA within the OKPCC, and little progress has been noticed in government service provision.⁷¹ The KPC EOD team is staffed entirely by Kosovars, but there has been little progress in transferring responsibility for VA from UNMIK to a national mine action coordination authority. There is no specific legislation for mine/ERW survivors in Kosovo, but there is legislation protecting the rights of persons with disabilities.⁷² Survivors can obtain some financial benefits through the MoLSW.⁷³

National mine action legislation and standards/Standing operating procedures

The MYSP identifies the preparation of mine action legislation as a strategic goal and calls for government agencies and Kosovo Protection Force (KFOR) Engineers to cooperate in drafting laws on handling explosives and risk reduction.⁷⁴ Action on legislation was held up pending the government's decision on which ministry would assume responsibility for mine action, expected before the end of 2009.⁷⁵ The KPC has continued to use standing operating procedures (SOPs) based on UN national technical and safety guidelines and the International Mine Action Standards.⁷⁶

Demining and Battle Area Clearance

Four operators engaged in demining in Kosovo in 2008: the KPC, KFOR, Mines Awareness Trust (MAT), and HALO.⁷⁷ HALO resumed clearance operations in May 2008 when the OKPCC renewed its accreditation for clearance which had expired in December 2006.⁷⁸

The EOD Management Section continued to cooperate closely with KFOR, which conducted improvised explosive device destruction and the two bodies exchanged technical information and advice.⁷⁹

Demining

The KPC continued to operate with seven EOD teams in 2008 as in 2006 and 2007.⁸⁰ Staff increases in 2007 gave the KPC flexibility to operate teams as a single unit for large tasks or as two units of nine members for small tasks or EOD response.⁸¹

The EOD Management Section had planned to disengage MAT by the end of 2007, leaving only national capacity for future clearance.⁸² In March 2008, however, the EOD Management Section stated that it was seeking funds to continue contracting MAT⁸³ and it continued operating in 2008 with funding from the UN Mine Action Service. MAT was tasked to conduct

⁸³ Interview with Ahmet Sallova, OKPCC, UNMIK, Priština, 12 March 2008.

mine clearance around the mountainous Koshare region as well as spot clearance of any other suspicious items reported in that area.⁸⁴

HALO, which was re-accredited for clearance on 26 May 2008 after an 18-month gap in demining operations, deployed two teams the same day onto tasks which had been identified in its 2006–2007 survey.⁸⁵

The Mine Detection Dog Centre for South East Europe (MDDC) from Konjic, Bosnia and Herzegovina, provided support to the KPC EOD Management Team working with MAT in mine clearance, battle area clearance (BAC), technical survey, and area reduction.⁸⁶ Kosovo's affected areas are considered suitable for dogs and MDDC teams are said to have proved effective in accelerating survey.⁸⁷

Identification of hazardous areas

Of the 126 tasks HALO identified in its 2006–2007 survey, 10 had been cleared in accordance with International Mine Action Standards (IMAS) principles: HALO (four tasks), KPC (four), and MAT (two). HALO was working on four others as of July 2009. OKPCC had listed another 59 as “pending” and in need of further action but it had not entered them on IMSMA. It had discredited the remaining 53 after sampling conducted by MAT.⁸⁸

HALO, however, advocates application of guidelines and principles laid down in IMAS 8.22, which states that sampling is unsuitable for technical survey of low density minefields.⁸⁹ HALO also reported in July that subsequent clearance on 13 of the discredited sites conducted in 2008–2009 by HALO, KPC, or MAT had discovered a total of more than 400 mines or unexploded submunitions.⁹⁰

The KPC Quality Assurance (QA) Inspectors mark suspected hazardous areas throughout the year. They also mark the remaining dangerous areas prior to the onset of snowfall.⁹¹

Mine and battle area clearance

Clearance operations in 2008 focused mainly on UXO, particularly cluster munition remnants, which constitute the biggest remaining threat. During 2008, the KPC, KFOR, HALO, and MAT cleared and handed back to the public almost 1km² of land, destroying a total of 2,793 explosive items.⁹² For reasons that remain unknown, the OKPCC EOD Management Section does not distinguish in reporting between mine clearance and BAC.

Mine and Battle Area Clearance in 2008⁹³

Demining operators	Mine and battle area clearance (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed	Unexploded submunitions destroyed	Other UXO destroyed
KPC	545,833	208*	1	99	237
MAT	89,108	92	0	28	14
HALO	249,694	35	0	201	2
MDDC**	59,180	2	0	0	10
KFOR	0	68	19	99	1,678
Total	943,815	405	20	427	1,941

* Includes 158 antipersonnel mines found and destroyed during clearance of a Yugoslav army ammunition compound in Llukare.

** MDDC was working with MAT on tasks assigned to MAT but has reported slightly different results to those reported by UNMIK.

Quality assurance/Quality control

The OKPCC EOD Management Section's QA Inspectors provided external quality assurance of clearance teams, making daily visits to KPC and NGO task sites.⁹⁴ The QA Inspectors also ensured the mine clearance teams conducted the appropriate internal quality control checks according to SOPs approved by the OKPCC EOD Management Section.⁹⁵

KPC, HALO, and MAT submitted completion reports for all tasks completed during 2008. Some tasks where continued clearance was required in 2009 were suspended. Investigations for all reported incidents involving members of the public injured by items of UXO and mines were conducted by either the QA Inspectors or by OKPCC EOD Management Section's Public Information Assistants.⁹⁶

Progress since 1999

Kosovo declared independence from Serbia on 17 February 2008. Serbia, as a State Party to the Mine Ban Treaty, is required to destroy all antipersonnel mines in areas under its jurisdiction or control as soon as possible, but not later than 1 March 2014. After Kosovo declared independence, OKPCC officials said it planned to accede separately to the treaty.⁹⁷ If Kosovo becomes a State Party to the Mine Ban Treaty, it will have a different mine clearance deadline.

Lack of data on contaminated areas and the OKPCC's decision not to distinguish between mine clearance and BAC have made it difficult to assess the progress of demining operations. A total of 45km² have been cleared since 1999 (see table below). HALO has estimated Kosovo will need 15 years to complete clearance at current rates.⁹⁸

Mine and Battle Area Clearance from 1999–2008

Year	Clearance (km ²)
2008	0.94
2007	1.08
2006	2.75
2005	4.32
2004	2.73
2003	0.80
2002	0.20
1999–2001	32.2
Total	45.02

Risk Education

In 2008, RE was implemented by several international and national organizations—some working with the Ministry of Education, Science and Technology—through public dissemination, community liaison (CL), and activities targeting children. RE activities continued to decrease in 2008, reaching 35,700 beneficiaries (43,000 in 2007 and 50,800 in 2006).⁹⁹ The decrease was due to several factors, including the reduced number of incidents and reduced staff working on RE.¹⁰⁰ These figures do not include indirect beneficiaries reached through media,¹⁰¹ however, and coverage remained higher than in 2005 (22,631 beneficiaries).¹⁰² There was no specific RE policy or communication change in 2008. RE continued to be based on previous messages/materials and remained mainly focused on schoolchildren. Because of increased casualties due to scrap metal collection activities, some efforts were reportedly undertaken to better adapt RE to at-risk groups in 2008.¹⁰³

Risk education was also provided through local media; 120 ERW/mine awareness messages were published in three main newspapers in 2008. Messages included pictures and information on what people should do and who they should report to.¹⁰⁴

MAT and KPC EOD teams have CL teams. Before, during, and after the clearance teams are deployed to a village, the communities within the surrounding areas are given information about clearance operations and general mine awareness messages. HALO does not have a CL team but clearance team leaders similarly inform local communities before and during clearance. Communities are advised to seek KFOR help whenever inhabitants come across suspicious objects.¹⁰⁵ The KPC EOD teams received RE refresher training before being deployed at the beginning of the year.¹⁰⁶

Risk education has been provided without interruption by many international and national organizations in Kosovo between 1998 and 2008.¹⁰⁷ According to Landmine Monitor data, some 315,924 people received risk education from 2002 to 2008.¹⁰⁸ The population in Kosovo is said to have been saturated with RE activities since 1999.¹⁰⁹

The 2007 GICHD assessment concluded that until clearance and destruction of munitions held by the population is achieved, RE efforts should be continued.¹¹⁰

Activities in 2008¹¹¹

Organization	Type of organization	Type of activity	No. of beneficiaries
RCK with Ministry of Education, Science and Technology	NGO and government	RE to schoolchildren through community networks	15,677
KFOR	Government	"Education against Landmine Danger" program to schoolchildren; children taught to recognize mines/ ERW and marks of mine danger	8,550
KPC	Government	CL and direct RE presentations in schools	1,050
QPEA—Centre for Promotion of Education in cooperation with the Serbian NGO "Future" from Gracanica, Kosovo	NGO	"Mine Risk Education in the Frame of the Psychosocial Seminars for Teachers"	20 primary schools, 2,400 teachers and children
HALO	NGO	CL and RE	150
MAT	NGO	CL and RE	125
OKPCC EOD Management Section	Government	Direct RE presentations and training of trainers, RE training to KFOR, materials production and distribution for schools, RE safety briefings to Organization for Security and Cooperation in Europe staff and other agencies	7,748

Victim Assistance

The total number of survivors is unknown, but is believed to be at least 439. There was no marked improvement in VA implementation in 2008. Government service provision remained weak.¹¹² NGOs continued to be the main service providers for persons with disabilities, but too few were effectively addressing survivors' needs.¹¹³ The European Commission (EC) noted that the monitoring capacities among authorities and civil society in regard to the promotion and enforcement of human rights—particularly education, health and employment rights—are very limited.¹¹⁴

Free primary healthcare is available at government institutions for mine/ERW survivors.¹¹⁵ While many health facilities have been repaired since the end of armed conflict in 1999,¹¹⁶ the health sector remains poor, with under-developed infrastructure, equipment, and hospital capacity.¹¹⁷ The Emergency Centre of Priština University Clinical Centre is the only medical facility with the capacity to deal with major trauma cases.¹¹⁸

Mine/ERW survivors are entitled to receive free orthopedic appliances through the Ministry of Health,¹¹⁹ but physical rehabilitation facilities continue to be insufficient.¹²⁰ The government-funded NOPC is the only facility in Kosovo that produces and fits lower limb prostheses. As a result, many patients access services in neighboring countries. Frequent interruption in the supply of materials, due to funding shortages, resulted in service delays.¹²¹ In 2008, the NOPC received material from the Ministry of Health.¹²² Kosovo has approximately 150 trained physiotherapists, of whom about 25 graduated in 2008.¹²³

In 2008, limited psychological services were available, but some community mental health centers under the Ministry of Health were not in operation.¹²⁴ There is a lack of socio-economic reintegration programs and, among Kosovo's unemployed population, persons with disabilities remain among the most disadvantaged groups.¹²⁵ There is no legislation providing financial assistance to mine/ERW survivors injured after June 1999, but mine/ERW survivors, and families of persons that have been killed by mines/ERW, can receive financial support from the MoLSW; if the disability is more than 81%, the caregiver of the survivor can also receive financial assistance.¹²⁶ A reduction of electricity bills is granted by the Ministry of Energy and Mining to survivors.¹²⁷ Overall, pensions remained inadequate and discrepancies between war veterans' benefits (six times higher) and civilian war victims were not addressed.¹²⁸ Special education remains limited,¹²⁹ and children with disabilities are often excluded from educational opportunities.¹³⁰

Kosovo has legislation prohibiting discrimination against persons with disabilities,¹³¹ but HandiKos reported that existing provisions are not adequately implemented.¹³² The "Law on Material Support for Families of Children with Permanent Disabilities" entered into force in

June 2008, but was not implemented.¹³³ Legislation on the provision of social services contracted through the MoLSW was approved in April 2005, but it is unknown if it was implemented.¹³⁴

Victim assistance activities

It is unknown how many mine/ERW survivors received assistance in 2008, or over the last 10 years, as often they were not differentiated from war-injured or other persons with disabilities.

In 2008, 133 people received prostheses at the NOPC (133 in 2007 and 122 in 2006). An additional 88 prostheses were “in process of production/fitting.” It is unknown how many beneficiaries were mine/ERW survivors, as the NOPC does not differentiate patients by cause of disability.¹³⁵

Jesuit Refugee Services (JRS) continued to provide medical and logistical support, referral to the NOPC, materials, school transport fees, and psychosocial assistance to its network of some 68 mine/ERW survivors (65 in 2007). In July 2008, 30 young mine/ERW survivors attended the annual JRS summer camp in FYR Macedonia.¹³⁶

The International Trust Fund for Demining and Mine Victims Assistance (ITF) reported that one patient from Kosovo received rehabilitation services at the IRRS in 2008.¹³⁷ An unknown number of survivors from Kosovo attended a rehabilitation workshop for mine/ERW survivors from Southeastern Europe, organized by the Croatian NGO Bembo in Kranjska Gora, Slovenia, in March 2008.¹³⁸

Handicap International (HI) provided support to disability organizations through advocacy and capacity-building, to ensure that disability issues are mainstreamed into local policies.¹³⁹ The three-year diploma course in physiotherapy developed and handed over by HI in 2004 was operating as planned, under the responsibility of the Ministry of Health and Priština University in 2008.¹⁴⁰

The largest disability NGO in Kosovo, HandiKos, continued its advocacy and community-based rehabilitation activities.¹⁴¹

Support for Mine Action

Landmine Monitor is not aware of a comprehensive long-term cost estimate for fulfilling mine action needs (including RE and VA) in Kosovo. In the absence of a national mine action authority, the OKPCC retains responsibility for mine action planning and programming.

National support for mine action

Kosovo’s government contributed to mine action by funding seven KPC EOD teams in 2007; it did not provide a value for the contribution. In May 2008, the OKPCC reported that the government would continue its funding in 2008 but gave no further details.¹⁴²

International cooperation and assistance

In 2008, four countries reported providing \$1,227,477 (€833,544) to mine action in Kosovo, more than double the amount reported in 2007. Funding at 2008 levels, in spite of the large increase compared to 2007, does not appear sufficient to meet mine action needs in Kosovo.

In 2008, the ITF allocated \$251,010 (almost 1%) of its funds to Kosovo.¹⁴³ Funds were allocated to demining, RE, and VA.¹⁴⁴ In 2007, the ITF allocated \$273,590 (1.2%) of its funds to mine action in Kosovo.¹⁴⁵

NAGORNO-KARABAKH

2008 Key Data

Contamination	Antipersonnel and antivehicle mines, submunitions, other UXO
Estimated area of contamination	13.7km ² of mined areas, and 85km ² of areas with cluster munition remnants
Casualties in 2008	14 (2007: four)
Estimated mine/ERW survivors	Unknown but at least 256
Demining in 2008	5.79km ² of mined areas 28.84km ² of battle areas
Risk education recipients in 2008	12,717
Support for mine action in 2008	\$1,498,549 (2007: \$1.35 million)

Ten-Year Summary

Authorities in Nagorno-Karabakh have not taken any unilateral steps to ban antipersonnel mines. Leaders have stated their support for an eventual ban.

With the help of HALO Trust, Nagorno-Karabakh has made steady progress in clearing mine and battle areas, including cluster munition remnants. Since HALO restarted its clearance program in 2000 and through the end of 2008, more than 29km² of mined areas and 133km² of battle areas were cleared.

From 1999 to 2008, HALO recorded 214 mine and explosive remnants of war (ERW) casualties (41 killed and 173 injured) in Nagorno-Karabakh. Since 1995, at least 329 mine/ERW casualties have been recorded. Risk education was conducted from 1999 to 2008, focused particularly on children and adults engaged in agricultural activities. Risk education decreased in 2008. Persons with disabilities, including mine/ERW survivors, can receive one-time financial compensation, free medical treatment, and pensions, but assistance remains insufficient.

Mine Ban Policy

Nagorno-Karabakh is not recognized by any UN member state. Prior to the dissolution of the Soviet Union, the Parliament of the Nagorno-Karabakh Autonomous Province voted in 1988 to secede from the Azerbaijan Soviet Socialist Republic (SSR) and join the Armenian SSR, which resulted in armed conflict from 1988 to 1994. The region declared independence as the Nagorno-Karabakh Republic in 1991.

Nagorno-Karabakh's political and military leaders have previously stated their support for an eventual ban on antipersonnel mines, but have indicated that, even if eligible to do so, Nagorno-Karabakh would not join the Mine Ban Treaty until the conflict with Azerbaijan is resolved and all states in the region support a ban on antipersonnel mines.¹

Nagorno-Karabakh has stated that it has never produced or exported mines, and has not purchased new mines since 1995. Its antipersonnel mine stockpile consists of mines left over from the Soviet Union (OZM-72, PMN-2, and POMZ-3 mines).

¹ Meetings between the Nagorno-Karabakh Committee of ICBL, Naira Melkounian, Minister of Foreign Affairs, and Masis Mailian, Deputy Minister of Foreign Affairs, Stepanakert, 1–2 February 2002; and interview with Irina Beglaryan, Head of Political Department, Ministry of Foreign Affairs, Stepanakert, 3 February 2006.

Scope of the Problem

Contamination

Nagorno-Karabakh is affected by landmines and ERW, mainly UXO, from the 1988–1994 conflict between Armenia and Azerbaijan. Contamination includes mined areas covering some 13.7km² (around one-fifth containing antipersonnel mines) and cluster munition remnants over up to 85km², more than double the previous estimate of up to 40km². Contamination from unexploded submunitions is found especially in the Askeran and Martakert regions.²

Casualties

HALO reported 14 mine/ERW casualties (two killed and 12 injured) in 10 incidents in Nagorno-Karabakh in 2008.³ Most casualties were adults (11), and three were children. Only partial information was provided on gender; there were at least four men. Antivehicle mines caused four incidents, antipersonnel mines three, and ERW three. Information on activities and location was not provided. The 2008 casualty rate is an increase compared to 2007 (five, all injured), but similar to 2006 (14 casualties, two killed and 12 injured) and 2005 (15 casualties, three killed and 12 injured). The 2008 casualty rate is still lower than in 2004 (44 casualties, 11 killed and 33 injured).

Casualties continued to be reported in 2009, with seven mine casualties (one killed and six injured) in three incidents to 8 July 2009.⁴ All casualties were adults and were caused by antivehicle mines.

The total number of mine/ERW casualties in Nagorno-Karabakh is unknown. HALO has information on 329 mine/ERW casualties (73 killed and 256 injured) in 251 incidents between 1995 and July 2009.⁵ The Ministry of Social Welfare recorded 360 casualties between 1994 and 2005, with at least 101 injured from 2000 to 2005.⁶

From 1999 to 2008, HALO recorded 214 mine/ERW casualties (41 killed and 173 injured) in 160 incidents.⁷ The majority of casualties were adults (155); there were 59 child casualties. Most incidents were caused by landmines (103)—antivehicle mines caused 56 incidents and antipersonnel mines 47—and ERW caused 57 incidents. Since 2004, a decrease in casualty rates has been reported.

The number of persons with disabilities in Nagorno-Karabakh is unknown. However, out of a population of approximately 140,000 people, 10,207 persons with disabilities receive pensions.⁸

Risk profile

HALO has reported that the main at-risk groups are children engaging in risk-taking behavior, and adults engaging in agricultural activities. The main threat is posed by ERW.⁹

² Email from Matthew Hovell, Caucasus and Balkans Desk Officer, HALO, 8 July 2009; and see *Landmine Monitor Report 2008*, p. 1,087.

³ All information in this paragraph is from HALO, "Mines and UXO Accidents in Nagorno Karabakh corrected as at 1 July 2009," provided by email from Matthew Hovell, 8 July 2009. Please note that HALO provided device data linked to incidents, not to casualties. Also HALO revised its 2007 mine/ERW casualty data upwards to five (all injured). Previously, it reported four casualties (all injured) in 2007.

⁴ HALO, "Mines and UXO Accidents in Nagorno Karabakh corrected as at 1 July 2009," provided by email from Matthew Hovell, HALO, 8 July 2009.

⁵ Ibid.

⁶ See *Landmine Monitor Report 2006*, p. 1,163.

⁷ HALO, "Mines and UXO Accidents in Nagorno Karabakh corrected as at 1 July 2009," provided by email from Matthew Hovell, HALO, 8 July 2009.

⁸ Naira Hayrumyan, "Overcoming Aid Syndrome: Karabakhis do not want charity and wait for concrete programs," *ArmeniaNow*, 13 June 2008.

⁹ Email from Matthew Hovell, HALO, 8 July 2009. HALO added a further clarification that while children are most likely to be injured by UXO, tractor drivers are usually injured by antipersonnel mines. In general, however, antipersonnel mines are less of a threat due to HALO's clearance of minefields near populated areas. Email from Valon Kumnova, Desk Officer, Horn of Africa, HALO, 3 August 2009.

Program Management and Coordination

Mine action

A Mine Action Coordination Committee is primarily responsible for liaison between the *de facto* government and HALO, but meets only when needed.¹⁰ HALO set up a mine action center in Nagorno-Karabakh in 2000, which is staffed by HALO personnel.

Victim assistance

There is no specific victim assistance (VA) framework and mine/ERW survivors receive the same services as other persons with disabilities in Nagorno-Karabakh. The Ministry of Social Welfare is responsible for the development and implementation of disability policies. Its tasks included ensuring medical assistance for persons with disabilities and the provision of prosthetic devices, employment, and psychosocial rehabilitation. In April 2008, the Center of Medical and Social Expertise, under the Ministry of Social Welfare, was set up to determine the different categories of disability, rehabilitation needs, and other disability-related issues.¹¹

Data collection and management

Since 1995, HALO has collected casualty data in Nagorno-Karabakh. In 2009, HALO reported that full details on “most casualties” were recorded in its database,¹² but gaps remained in information provided to Landmine Monitor, including activity at the time of the incidents and locations.¹³ However, it appeared that casualty information has been verified and casualties previously unreported were inserted in the HALO database in 2009.¹⁴ HALO risk education (RE) teams collect incident details, visit survivors in hospital, and enter the information into the database. The Ministry of Defense does not provide information on military casualties.¹⁵

In late 2007, the NGO Geneva Call provided representatives of civil society organizations from the South Caucasus, including Nagorno-Karabakh, with training in conducting socio-economic needs assessment surveys for landmine survivors and other persons with disabilities. In the second half of 2008, Geneva Call, together with local partner organizations, undertook a survey on the socio-economic needs of mine/ERW survivors in conflict areas, including Nagorno-Karabakh. The survey was limited to the areas directly affected by the armed conflict, covering at least 10% of the registered landmine survivors. As of August 2009, the results of this survey had not yet been published.¹⁶

Plans

Strategic mine action plans

In July 2009, HALO estimated that, if current funding levels were sustained, between six and seven years’ work remained to clear Nagorno-Karabakh of contamination.¹⁷ HALO planned to continue to address contamination “based on priority” with about one-quarter of its resources devoted to battle area clearance (BAC) and three-quarters to mine clearance. HALO aims to clear all antivehicle minefields by the end of 2010 and to start its “Declared Minefield Free” process, region by region, in 2011.¹⁸

¹⁶ Email from Anne-Kathrin Glatz, Program Officer, Geneva Call, 4 August 2009.

¹⁷ Email from Matthew Hovell, HALO, 8 July 2009. Previously, in April 2008, HALO had estimated that it would take around five years and \$15 million to finish clearance. See *Landmine Monitor Report 2008*, p. 1,087.

¹⁸ Email from Matthew Hovell, HALO, 8 July 2009.

Integration of mine action with reconstruction and development

In 2008, HALO carried out a number of demining tasks to support reconstruction and development. A new gas pipe was installed in Martakert region, providing gas to four villages and Martakert town itself (the third largest town in Nagorno-Karabakh), benefiting some 5,000 people who previously had used bottled gas and wood burning stoves. The route the pipe had to take went through a mined area, which HALO cleared resulting in the destruction of two antivehicle mines and four items of UXO. Also in Martakert region, HALO cleared an area which was to be developed as a tourism/recreation area as it was suspected to have an antivehicle mine threat, and has conducted survey in support of a proposed new water pipe. Finally, HALO conducted survey and clearance in preparation for the construction of a gas pipe in Hadrut region. As of July 2009, construction of the pipe was underway.¹⁹

Local ownership

HALO has found the local authorities to be committed to mine action and have cooperated with HALO on all aspects of its work. For example, the Nagorno-Karabakh Rescue Services coordinate with HALO on explosive ordnance disposal (EOD) call-outs and other exchanges of information, and HALO's |RE program is fully supported by the Ministry of Education.²⁰

Demining and Battle Area Clearance

Demining in Nagorno-Karabakh continues to be carried out primarily by HALO, using six teams for manual demining, four for BAC, one for general survey, one for EOD, one for mechanical demining, and one for RE. In 2008, HALO cleared almost 5.79km² of mined areas and—a record for the program—more than 28.84km² of battle areas (see tables below). There were three donor visits to the program in 2008 as well as visits from HALO headquarters staff.²¹ Nagorno-Karabakh Rescue Services (formerly called the Department of Emergency Situations) has continued to conduct limited EOD, responding to 68 call-outs in 2008.

Mined area clearance in 2008

Area cleared (m ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed
5,785,712	943	68

Battle area clearance in 2008

Area cleared (m ²)	Cluster munition remnants destroyed	Other UXO destroyed
28,842,900	1,071	673

Progress since 2000

Since HALO restarted its clearance program in 2000 and through the end of 2008, more than 29km² of mined areas and 133km² of battle areas were cleared.

Risk Education

In 2008, 12,717 persons, including schoolchildren, tractor drivers and shepherds, received RE in Nagorno-Karabakh.²² This is a decrease compared to 2007 (24,055).²³ An increase in casualties was recorded in 2008, but overall, since RE activities began, mine/ERW incidents have decreased.²⁴ RE is still believed to be necessary until clearance activities are completed.²⁵

¹⁹ Ibid.

²⁰ Ibid.

²¹ Ibid.

²² Ibid.

²³ The number of RE recipients decreased because all the larger villages and towns were targeted in 2007; in 2008, RE was concentrated in rural areas. Email from Valon Kumnova, HALO, 3 August 2009.

²⁴ For more information, see the Casualties section.

²⁵ Email from Matthew Hovell, HALO, 8 July 2009.

Demining from 1999–2008

Year	Mine clearance (km ²)	Battle area clearance (km ²)	Area cancelled/reduced by survey (km ²)
2008	5.79	28.84	0.00
2007	5.43	17.67	0.45
2006	5.99	14.13	2.01
2005	5.59	12.82	2.43
2004	3.64	14.28	1.71

In 2008, HALO, working with the Nagorno-Karabakh Rescue Services and the Ministry of Education, was the only RE provider. A total of 7,489 adults and 5,228 children were reached, covering all regions of Nagorno-Karabakh and 102 schools. Awareness messages were delivered through interactive briefings, role-plays, games and audio-visual presentations. Messages were approved by the Ministry of Education and RE has been officially introduced into the school curriculum. Materials used included coloring books for children and posters and leaflets for both children and adults. HALO also organized RE training for 200 teachers in Stepanakert in March 2009.²⁶

From 1994 to December 2002, RE was provided mainly to children by the ICRC, in cooperation with the Ministry of Education and the Civil Defense. From 2003 to 2005, the ICRC implemented a “Safe Play Areas for Children” program in close cooperation with the Azerbaijan Red Crescent Society.²⁷ HALO started RE in March 2003 and worked in cooperation with the Nagorno-Karabakh Rescue Services and the Ministry of Education. From 2005 to 2008, 56,751 people were reached according to Landmine Monitor data. RE was coordinated through a Mine Awareness Working group from 1999 to 2002. There is said to be widespread public knowledge of the specific characteristics and risks of submunition contamination in Nagorno-Karabakh.

Victim Assistance

The total number of survivors is estimated to be at least 256.²⁸ Nagorno-Karabakh’s healthcare system has been adversely affected by the conflict.²⁹ In 2008, some efforts were made to strengthen existing health infrastructure, including allocating funds for the reconstruction of the Republic Hospital in Stepanakert and other medical facilities.³⁰ However, the healthcare system still lacks resources, equipment, ambulances, and medicines.³¹ Most patients are sent to Armenia for treatment.³²

³² Anahit Danielyan, “Private clinic may open in Stepanakert,” *KarabakhOpen*, 23 February 2008, www.karabakh-open.com.

The Stepanakert Polyclinic, which is the only full-care outpatient medical center in Nagorno-Karabakh, received medical supplies and equipment from the Armenia Fund in 2008.³³ In 2008, two surgeons from the Republic Hospital received training in Poland and Russia.³⁴ The Ministry of Health acknowledged, however, that many doctors did not receive any training in the last 10 to 15 years.³⁵

Mine/ERW survivors receive free or discounted treatment at both civilian and military hospitals. Officially, most persons with disabilities are entitled to free medical care and free medicine if they present a disability certificate. In reality they often have to pay unofficial costs to receive services. In 2008, one mine survivor reported he was not able to get a disability certificate from authorities,³⁶ while other people (who were reportedly not disabled) were listed among persons with disabilities through bribes and received benefits.³⁷ The government stated that the process of granting disability certificates would be reviewed.³⁸

The Prosthetic and Orthopedic Center (operated by the Ministry of Social Welfare) and the Republican Rehabilitation Center (operated by the Ministry of Health), both located in Stepanakert, provide prosthetics, rehabilitation, and psychosocial support services.³⁹ The Prosthetic and Orthopedic Center has the capacity to provide home care to 150 patients per year who cannot leave their houses. It plans to open a department specialized in the rehabilitation of children.⁴⁰ Between 1999 and 2008, the center assisted 675 outpatients through 24,859 visits, 380 inpatients through 14,300 visits, and 460 patients with house calls through 6,647 visits.⁴¹

Psychological support is available at the Center for Psychological Rehabilitation, in the Republic Children's Hospital, at the Stepanakert rehabilitation centers, and at regional hospitals in Hadrut, Martakert, and Martuni.⁴² The government announced it will reimburse 2008 private and public university tuition fees for persons having a "first" or "second degree" of disability.⁴³ Eight "first degree" persons with disabilities received special cars from the government to improve their mobility and the possibility for them to work as drivers.⁴⁴ It is expected that all "first degree" disabled war veterans will be provided with a special car.⁴⁵ In 2008, the government announced its intention to finance other income-generating activities,⁴⁶ but it is unknown if they were implemented.

In 2008, the ICRC assisted 70 health centers and provided material assistance to vulnerable persons.⁴⁷ Various veterans' groups are active in assisting persons with disabilities, including mine/ERW survivors.

Nagorno-Karabakh has laws to protect persons with disabilities, and provides monthly pensions corresponding to the level of disability.⁴⁸ All new mine/ERW casualties or their families receive a one-time disbursement of financial compensation. In May 2007, pensions, including those for civilian war disabled and veterans with disabilities, were increased by up to 25%, in accordance with the rising cost of living. In January 2008, monthly benefits for children with disabilities were also increased.⁴⁹

Support for Mine Action

International cooperation and assistance

In 2008, the Netherlands (US\$817,293/€555,000) and the United Kingdom (\$681,256/£367,353) reported contributing a total of \$1,498,549 (€1,017,621) to HALO for mine action in Nagorno-Karabakh.⁵⁰ Reported mine action funding in 2008 was approximately 11% more than reported in 2007. Funding has fluctuated between roughly \$500,000 and \$1.5 million per year since 2005.

⁴⁸ See *Landmine Monitor Report 2006*, p. 1,164; and Naira Hayrumyan, "Overcoming Aid Syndrome: Karabakhis do not want charity and wait for concrete programs," *ArmeniaNow*, 13 June 2008, www.armenianow.com.

PALESTINE

2008 Key Data

Contamination	Antipersonnel and antivehicle mines, IEDs, other UXO
Casualties in 2008	16 (2007: 94)
Estimated mine/ERW survivors	Unknown but at least 654
Demining in 2008	Unquantified
Risk education recipients in 2008	150,000

Ten-Year Summary

The Palestinian National Authority (PA) participated as an observer at the First Meeting of States Parties to the Mine Ban Treaty in May 1999, calling for a “Middle East free of mines.” In April 2000, the PA stated its strong support for, and desire to join, the Mine Ban Treaty. It did not participate in another international landmine-related meeting until May 2009, and has not made any recent public statements regarding its mine ban policy. Hamas is alleged to have used mine-like explosive booby-traps in Gaza during the fighting in December 2008–January 2009. There were earlier allegations of armed Palestinian groups using mines and improvised explosive devices (IED).

Operation Cast Lead, Israel’s attack on Gaza in December 2008 to January 2009, has added to the explosive remnants of war (ERW) problem in the Occupied Palestinian Territories (OPT). There has been little clearance of mines and ERW over the past few years, although the UN Mine Action Team in Gaza has been trying to address contamination resulting from the latest conflict.

Between 1999 and 2008, Landmine Monitor identified at least 794 casualties from mines, ERW, and victim-activated IEDs in the OPT (127 killed, 654 injured, and 13 unknown). From 1999 to 2008, mine/ERW risk education activities have been provided in the West Bank and Gaza mainly through school-based activities and public information dissemination. After Operation Cast Lead, specific emergency risk education activities were carried out. There have been no specific mine/ERW victim assistance activities in the OPT. Access to health services continued to deteriorate, particularly in Gaza, in 2008–2009. Disability legislation remains inadequate and the quality of services poor.

Mine Ban Policy

Governance of the Occupied Palestinian Territories, including Gaza and parts of the West Bank, is assigned to the Palestinian National Authority. Two Palestinian factions, Hamas in Gaza and Fatah in the West Bank, both claim to be the legitimate governing authority of the OPT. Neither faction has made any recent public statements on its policy toward banning antipersonnel mines. The PA-Fatah sent a representative to the May 2009 intersessional Standing Committee meetings in Geneva, its first participation in Mine Ban Treaty-related meetings since the First Meeting of States Parties in Mozambique in May 1999.

Use, transfer, and stockpiling

In December 2008, Israel launched 23 days of intense military operations in Gaza.¹ According to one *New York Times* report, Hamas fighters used victim-activated explosive booby-traps against Israeli forces.² Use of such booby-traps is prohibited by the Mine Ban Treaty. Landmine Monitor did not find any other serious allegations of use of antipersonnel mines or mine-like devices by any Palestinian entity during this reporting period (since May 2008).³

In May 2009, Egyptian authorities seized 48 antipersonnel mines, among other weapons, allegedly destined for Palestinian groups in Gaza.⁴ In February 2009, Hamas displayed antivehicle mines in its possession after the end of the conflict, but the source of the weapons is unknown.⁵

Scope of the Problem

Contamination

The OPT are contaminated with mines and ERW, although the precise extent of contamination is not known. There are believed to be at least 15 confirmed minefields, all located in the West Bank on the border with Jordan. It has been suspected that mines have also been laid by Israeli forces on the border between Egypt and Gaza and in various areas across the Gaza Strip.⁶

Further hazards exist as a result of the attacks by the Israeli Defense Forces (IDF) from 27 December 2008 to 18 January 2009 during Operation Cast Lead, when the Gaza Strip was bombed by sea, air, and land. Before and during the 23 days of operations, Hamas and other Palestinian militant groups fired rockets from Gaza into southern Israel, and engaged the IDF in ground combat.⁷ The existence of UXO in the Gaza Strip hinders reconstruction. Israeli forces reportedly used antivehicle mines to demolish buildings in Gaza, but there is no evidence that antipersonnel mines were laid by either side. The main threat is from a wide variety of UXO.⁸

In April 2009, the UN Mine Action Service's (UNMAS) Mine Action Team (UNMAT) in Gaza initiated assessments to identify the locations of ordnance; these were still underway as of 1 July 2009. Based on preliminary results, however, it appears that urban centers were the most heavily damaged by explosive ordnance. The core remaining UXO threat lies within the ruins of collapsed and damaged buildings.⁹ As of early June 2009, of the 215 buildings assessed, just under half were categorized as having a high or medium risk of UXO contamination, thereby necessitating explosive ordnance disposal (EOD) follow-up.¹⁰

¹ Landmine Monitor found no evidence of Israeli use of antipersonnel mines during its military operations in Gaza. See report on Israel in this edition of Landmine Monitor.

² The article also said Israel captured a Hamas map which showed planned mine and booby-trap emplacements. Steven Erlanger, "A Gaza War Full of Traps and Trickery," *New York Times*, 10 January 2009, www.nytimes.com.

³ Palestinian militias are considered expert in the production and use of command-detonated IEDs. The Mine Ban Treaty prohibits use of victim-activated IEDs and booby-traps, which function as antipersonnel mines, but not command-detonated IEDs. Media and other reports are not always clear whether devices involved in explosive incidents in the OPT are victim-activated or command-detonated, and reports often use a number of terms interchangeably, citing the use of bombs, landmines, booby-traps, and IEDs.

Casualties

In 2008, Landmine Monitor identified at least 16 new mine/ERW casualties, including eight killed and eight injured in 14 incidents.¹¹ The majority of casualties were men (10) and boys aged 13 to 16 (four); the age and gender of the remaining two is unknown. The most common activities at the time of the incident were herding (five) and tampering with explosive devices (four). ERW caused the majority of casualties (seven), and mines five (four were caused by unknown devices). Ten casualties were identified in the West Bank and six in Gaza.

The 2008 casualty rate is a significant decrease compared to 2007 (94) and 2006 (34),¹² but this is due to a lack of available data.

Casualties continued to occur in 2009, but sources provided conflicting information. Landmine Monitor was able to confirm 21 mine/ERW casualties (six killed and 15 injured) in six incidents, as of 31 May 2009.¹³ All but three of these casualties were recorded in Gaza after Operation Cast Lead ended on 18 January 2009. Eight casualties were children. The majority of casualties were caused by ERW (18), while mines caused three casualties.

Data from the Ministry of Health reported 30 ERW casualties, including seven killed and 23 injured, in Gaza between January and April 2009.¹⁴ UNICEF reported at least 35 casualties (11 killed and 24 injured) in Gaza between 18 January and 2 June 2009. As of early July 2009, casualty data was in the process of being checked, and no more details were available.¹⁵

The total number of Palestinian casualties from mines, ERW, and victim-activated IEDs is not known, and data varies depending on the source. Between 1999 and 2008, Landmine Monitor identified at least 794 casualties (127 killed, 654 injured, and 13 unknown).¹⁶ Defense for Children International Palestine Section (DCI/PS) recorded more than 2,500 mine/ERW casualties occurring between 1967 and 1998.¹⁷

Risk profile

According to Landmine Monitor analysis of 2008 casualty data, the majority of recorded casualties were children and men tampering/playing with explosive devices and conducting livelihood activities. Both an Israeli official and a Palestinian official reported that scrap metal collection has increased in the OPT.¹⁸ In 2009, following Operation Cast Lead in Gaza, those involved in rubble removal, farmers, and residents of contaminated areas are believed to be most at risk,¹⁹ as well as humanitarian aid workers.²⁰

Program Management and Coordination

The interministerial Palestinian Mine Action Committee (PNMAC) was established in 2002 and has been chaired by the PA Ministry of the Interior since 2006. It meets irregularly because of the lack of resources to implement activities and was reported to be suspended in August 2008.²¹ There is no information regarding PNMAT activity within Gaza. The Ministry of Interior within Gaza has a Director of Mine Action, but UNMAT has not been able to establish contact.²² UNMAT Gaza has not been involved in any activities in the West Bank, or with the PA.²³

It is unclear who has the final mandate to coordinate and monitor risk education (RE) and victim assistance (VA) activities.²⁴ PNMAT does not have a formal mandate,²⁵ and in 2008 its coordination role remained limited.²⁶ In 2009, following Operation Cast Lead, UNICEF took a *de facto* coordination role for RE.²⁷ The first RE coordination meeting was held in Gaza on 27 April 2009.²⁸ One of the main recommendations of a 2005 UNDP assessment was the development of a comprehensive mine action strategy, including victim assistance and data collection.²⁹ However, the recommendation has not been implemented, and in 2008 victim assistance was not on PNMAT's agenda.³⁰

There is no specific VA strategic framework in place in the OPT, and mine/ERW survivors receive the same services as other persons with disabilities.³¹ The Ministry of Health and the Ministry of Social Affairs are responsible for disability issues.³²

Data collection and management

There is no comprehensive data collection mechanism in the OPT, and it is not clear who has the final responsibility to collect casualty information.³³ Data is collected by the Ministry of Health, the Ministry of Interior, the Palestinian Red Crescent Society (PRCS), the Palestinian Police, and some international and local organizations.³⁴

In 2005, the PRCS designed a casualty database.³⁵ In June 2009, it reported that the database was still running, but casualty details were not made available to Landmine Monitor.³⁶ In 2009, Mines Advisory Group (MAG) reported that casualty data collection in Gaza "has been difficult and *ad hoc*" and that it was undertaking visits to hospitals in Gaza to collect information.³⁷ UNICEF reported that it was attempting to harmonize data from different actors in Gaza.³⁸

Plans and national ownership

Mine action is not a priority for the PA and is not mentioned in its Reform and Development Plan.³⁹ On 23 January 2009, UNMAS entered Gaza to conduct a technical assessment mission and begin establishing a mine action project in response to contamination resulting from Operation Cast Lead. Two offices were set up, one in Gaza and the other in Jerusalem.⁴⁰

Demining and Battle area Clearance

Palestinian police EOD teams are the only Palestinian body engaged in clearance operations in the OPT. The extent of any clearance has not been reported. The IDF has also cleared mines and UXO on an emergency basis in some parts of the OPT. Cooperation between Palestinian EOD teams and the IDF has generally been limited.⁴¹

Through 15 May 2009, UNMAT in Gaza had surveyed and cleared all known contaminated schools in Gaza (38 UNICEF-supported government schools and four UN Relief and Works Agency for Palestine Refugees in the Near East schools). UNMAT identified 197 items of UXO (56 containing white phosphorous and 141 containing high explosives).⁴²

MAG has been the key implementing partner for UNMAT,⁴³ while Norwegian People's Aid (NPA) also operated briefly in Gaza between March and May 2009.⁴⁴ Five MAG EOD teams removed and rendered safe UXO across the Gaza Strip, and conducted assessments in support of the operations of humanitarian and development organizations.⁴⁵ As of June 2009, MAG had not yet carried out demolitions in Gaza as it was still identifying a demolitions site and arranging for explosives and other equipment to be imported.⁴⁶

Risk Education

In 2008, mine/ERW RE, combined with activities raising awareness of the danger of small arms and light weapons (SALW), was provided by the Ministry of Education and Higher Education (MoEHE) with UNICEF support in both the West Bank and Gaza.⁴⁷ At the beginning of 2009, following Operation Cast Lead in Gaza, emergency RE was provided by an increased number of operators. As Gaza is densely populated, the ERW threat was considered "acute."⁴⁸

In 2008, RE/SALW awareness messages reached approximately 150,000 people, including 100,000 children and 50,000 adults. This is a decrease compared to 2007 (when 256,677 were reached), but it remains higher than in 2006 (when 81,892 were reached). In total, 538 teachers, Scout leaders, and counselors were trained in RE, as well as 56 trainers from the MoEHE. RE sessions were given in 132 schools, messages were broadcast on school radio, and posters designed by children were displayed. Awareness sessions were also given to parents at 124 events/exhibitions. These activities were conducted in high-risk areas in the West Bank (Hebron, Jenin, Nablus, Qalqilia Tubas, and Tulkarem) and the Gaza Strip (Gaza Middle Area, Khan Younis, Northern Gaza, Rafah, Gaza Middle Area, and Gaza City) due to their proximity to military bases/training zones, settlements, or minefields.⁴⁹

⁴⁸ ICRC, "Gaza: unexploded munitions a threat to civilians and humanitarian work," 21 January 2009, www.icrc.org.

⁴⁹ Email from Asmahan Wadi Nasser, UNICEF, 12 May 2008.

In 2009, additional operators provided emergency RE. UNICEF continued to provide financial and technical support.⁵⁰ World Vision distributed emergency supply kits that contained an RE brochure.⁵¹ Save the Children distributed family hygiene kits with a child-friendly flier.⁵² UNMAT/MAG conducted UXO/Safety Awareness Briefings for humanitarian workers.⁵³ The Palestinian Center for Democracy and Conflict Resolution (PCDCR) provided awareness messages through TV and radio, and conducted community and school-based activities.⁵⁴ The MoEHE continued to provide school-based RE covering an additional 72 schools in affected areas.⁵⁵ The IDF issued a warning on the ERW threat to Gazan residents, which was relayed in Palestinian and other Arabic language media.⁵⁶ As of April 2009, gaps that remained to be addressed included the limited capacity to conduct community liaison activities and to provide awareness of threats posed by UXO during rubble removal.⁵⁷

The ICRC held safety presentations for PRCS field teams and firefighters, as well as a basic mine action training course for 27 PRCS volunteers. The ICRC and PRCS designed and distributed 10,000 leaflets with RE messages.⁵⁸

Despite variable security situations, mobility restrictions, and the absence of a formal RE framework, awareness messages have been delivered without interruptions from 1999 to 2008 by different operators. Technical and financial support has been provided by UNICEF and the ICRC.⁵⁹ In 2005, a UNDP mission concluded that given the situation in the OPT, remarkable achievements had been attained in raising awareness about mines among children, but that there was a great need to address the ERW threat.⁶⁰

Victim Assistance

The estimated number of survivors is unknown but at least 654. Access to health services in the OPT, particularly Gaza, continued to worsen in 2008 due to health personnel strikes, mobility restrictions, and power cuts.⁶¹ The situation further deteriorated in 2009 due to Operation Cast Lead. At the end of the conflict, ICRC doctors reported that surgeons, burn doctors, and rehabilitation specialists were needed, and that the medical facilities in Gaza were not adequate to respond to healthcare needs.⁶² The PA also reported that the health system was not able to cope with demand.⁶³

Handicap International (HI) estimates the number of persons with disabilities has now increased to 15% of the population, due to ongoing conflict.⁶⁴ While there are several physical rehabilitation centers and programs to address the needs of persons with disabilities,⁶⁵ the quality

of services was a problem, and the main providers have remained NGOs.⁶⁶ PA health insurance services were poor, and Palestinians injured by Israeli forces were not entitled to insurance or compensation in Israel.⁶⁷

In 2008, the ICRC supported the Artificial Limb and Polio Center (ALPC) in Gaza City by donating material, components, physiotherapy equipment, and wheelchairs. They also renovated the center and provided training. The ICRC also supported the Al Shifa Hospital in Gaza in provision of post-surgical rehabilitation and in March 2008 organized a war surgery seminar.⁶⁸

The PRCS continued to provide a wide range of center and community-based services.⁶⁹ It provided emergency medical services and ensured the transport of injured and sick, with ICRC financial support.⁷⁰ HI continued to support local organizations providing services for persons with disabilities through rehabilitation outreach teams; it also supported the ALPC during Operation Cast Lead.⁷¹

In 2009, the Slovenian government earmarked €146,000 (US\$215,000) for rehabilitation of children in Gaza through the International Trust Fund for Demining and Mine Victims Assistance (ITF),⁷² to undertake medical evaluation and provide assistance to 25 mine/ERW survivors in Gaza.⁷³

There is legislation to protect the rights of persons with disabilities, but it is not rights-based and remains largely unimplemented. Discrimination against persons with disabilities has been reported.⁷⁴

Support for Mine Action

International support for mine action

Canada reported contributing C\$4,000,000 (\$3,752,400) in 2008 to UNDP for UXO clearance in Gaza.⁷⁵ The UN reported receiving \$137,676 from the Netherlands, \$582,401 from the European Commission, and \$623,524 from the United Kingdom. The Swedish International Development Agency provided an in-kind contribution of 3 staff (one medic and two EOD technicians).⁷⁶ No international mine/ERW action funding was reported for the OPT in 2007.

SOMALILAND

2008 Key Data

Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	Unknown
Casualties in 2008	37 (2007: 97)
Estimated mine/ERW survivors	Unknown but estimated 489
Demining in 2008	Mine clearance: 656,000m ² Battle area clearance: 45,000m ²
Risk education recipients in 2008	More than 500,000
Support for mine action in 2008	International: \$4.4 million (2007: \$1.9 million)

Ten-Year Summary

In 1999, the House of Representatives passed and the President of the Republic of Somaliland endorsed a resolution calling for a unilateral ban on landmines. In 2002, Somaliland destroyed 7,517 stockpiled antipersonnel mines. In 2004, the President proclaimed that Somaliland was already in “unilateral compliance” with the Mine Ban Treaty. Legislation banning antipersonnel mines and requiring mine clearance and stockpile destruction was passed and took effect in March 2009.

Somaliland is affected by mines and explosive remnants of war (ERW) as a result of a series of armed conflicts since 1964. The first mine clearance operations began in 1991 in and around the capital, Hargeisa. Impact surveys in 2003 and 2007 found all seven regions in Somaliland fully or partly under the control of the government in Hargeisa to be impacted by mines and ERW. There is some disagreement over the survey findings, and more recent surveys have shown the problem of ERW to be at least equally serious. In 2008, following an agreement between the HALO Trust and the Somaliland Mine Action Center (SMAC) and UNDP, HALO began to resurvey the complete territory of Somaliland. Information management continues to be a weak point of the mine action program. International NGOs have conducted mine and ERW clearance, and police explosive ordnance disposal (EOD) personnel have also conducted “spot” clearance tasks. UNDP began assisting Somaliland with mine action in 1997, and continues to support SMAC.

Landmine Monitor identified 814 casualties (207 killed, 500 injured, and 107 unknown) between 2000 and 2008. Quality data was not available for 1999. Risk education (RE) efforts have become more targeted and expansive since 2006. Handicap International remains the largest provider of RE (reaching more than 490,000 people in 2008). The police EOD teams, HALO, and Danish Demining Group provide RE in coordination with their activities.

There were no specific victim assistance policies or activities. Healthcare is poor, while psychosocial support and economic reintegration services are limited. The ICRC and NGOs provided some rehabilitation services. Constitutional provisions prohibiting discrimination against persons with disabilities were largely unimplemented.

Mine Ban Policy

Somaliland proclaimed independence from Somalia in 1991 after the fall of the government of Siad Barre. Somaliland is not recognized by the international community as an independent state, and thus it is not in a position to accede to the Mine Ban Treaty. Somaliland authorities have frequently expressed their commitment to a mine ban since 1997.¹

On 24 March 2009, the Antipersonnel Mine Ban Act took effect. It mirrors the Mine Ban Treaty, including obligations for mine clearance within 10 years, stockpile destruction within four years, and victim assistance (VA). The Act provides for penal sanctions for persons found violating the prohibitions in the legislation, including extraterritorial violations of the prohibitions by its citizens.²

The law bans use, possession, development, production, acquisition, and transfer of antipersonnel mines by any civilian or government official. It requires citizens who possess mines to arrange for their immediate collection for destruction by the authorities.³

SMAC, under the direction of the Office of the Vice-President, is responsible for coordinating implementation of the Act. The Act requires the Office of the Vice-President to submit annual transparency reports to the Legislative Assembly on implementation of the Act.⁴

The ban bill was first introduced in the Legislative Assembly in 2007, but consensus was not achieved and it was taken off the table before a vote.⁵ In 2008, the bill was reintroduced with active campaigning by civil society.⁶ The House of Representatives approved the bill on 17 January 2009, and the House of Elders (Guurti) followed suit on 3 March 2009. The bill became law 21 days later.

Production, transfer, stockpiling, and use

There are no indications that Somaliland has produced, exported, or acquired new landmines since proclaiming independence. There have been no confirmed instances of new use of antipersonnel mines.⁷

Officials have acknowledged the existence of a stockpile of antipersonnel mines, but have not provided information on numbers or types. The Antipersonnel Mine Ban Act requires the destruction of all stockpiled antipersonnel mines held by the government of Somaliland within four years.⁸

Somaliland has, in the past, periodically sent stockpiled antipersonnel and antivehicle mines, among other weapons and ammunition, to demining organizations operating in Somaliland for destruction.⁹

¹ On 1 March 1999, the House of Representatives passed a non-binding resolution calling for a total ban on landmines. In November 2004, the Vice-President of Somaliland spoke of “our already declared unilateral compliance” with the Mine Ban Treaty. See *Landmine Monitor Report 2005*, p. 976.

² “Antipersonnel Mine Ban Act 2007,” English translation, Articles 5, 6, 7, and 10. Penalties for individuals or groups are one to three years imprisonment or a fine of SOS1–2 million. For a corporate body, NGO, or government official the penalty is a fine between SOS5–10 million.

⁴ *Ibid.*, Article 15.

⁵ Emails from Dr. Ahmed Esa, Director, Institute for Practical Research and Training (IPRT), 19 July 2008 and 8 August 2008.

⁶ The bill was drafted by the House of Representatives Subcommittee on Internal Affairs, Security and Defense with the assistance of the IPRT, SMAC, and Geneva Call.

⁷ In late 2003 and early 2004 there were allegations of use of antipersonnel mines by the forces of both Somaliland and Puntland in their conflict over the town of Las Anod in the disputed Sool region. Both sides denied using mines, and no compelling evidence was found. See *Landmine Monitor Report 2004*, pp. 1,228–1,229.

⁸ “Antipersonnel Mine Ban Act 2007,” Article 10.

⁹ See *Landmine Monitor Report 2007*, pp. 1,079–1,080. Most notably, in 2002, DDG destroyed 7,517 stockpiled mines received from the Ministry of Defense.

Scope of the Problem

Contamination

Somaliland is affected by mines and ERW as a result of the 1964 and 1977–1978 border wars with Ethiopia, and civil wars in 1988–1991 and 1994–1995.¹⁰ Hargeisa, the capital, was heavily mined around military bases, refugee camps, private homes, and the airport. Large perimeter antivehicle mine belts surrounded former military camps elsewhere in the country, and there are suspected hazardous areas (SHAs) near the borders with Ethiopia, and mined roads. The war between Ethiopia and Somalia also left behind large amounts of UXO.¹¹

Two Landmine Impact Surveys (LIS) serve as the basis for measuring the extent of the problem in Somaliland. The first survey in 2002–2003 covered Awdal, Galbeed, Saaxil, Togdheer, and Woqooyi regions and identified 772 SHAs affecting 357 communities, while the LIS in 2006–2007 in Sanaag and Sool identified a further 210 SHAs impacting 90 communities.¹² In August 2008, UNDP estimated that up to 450 SHAs remained to be cleared.¹³

Views differ, however, on the scale and impact of the residual problem. SMAC considers Somaliland still to be “heavily mined.”¹⁴ In contrast, the results of demining by HALO and Danish Demining Group (DDG) since the first LIS was completed indicate that the mine problem is much less severe than the LIS suggested.¹⁵ During an evaluation of DDG’s mine action program in March 2008, the Geneva International Centre for Humanitarian Demining (GICHD) thought the larger problem for communities in Somaliland was the presence of small arms.¹⁶ In 2008, HALO, in collaboration with SMAC, began resurveying all remaining SHAs identified by the LIS. HALO expected the survey to be completed in September 2009.¹⁷

In 2008, Somaliland reported suicide bomb attacks on its territory, including car bomb attacks on the Presidential Palace, the UNDP compound, the Ethiopian consulate office in Hargeisa, and the intelligence headquarters in Bossaso, Puntland. Police EOD teams were the first to respond to each attack. It concluded that in two of the attacks explosives had probably been extracted from antivehicle mines and connected with fuzes and made into an improvised explosive device.¹⁸

Casualties

SMAC recorded 19 mine/ERW incidents resulting in 37 casualties (nine killed and 28 injured) in 2008 in the regions covered by SMAC Regional Liaison Officers (Awdal, Hargeisa, Sahil, Sanaag, Sool, and Togdheer). Most casualties were male (26), 11 were female, 17 were adults, and 20 were children. The majority of incidents (14) were caused by ERW, three by antipersonnel mines, and two by antivehicle mines.¹⁹ SMAC also reported that “Three de-mining accidents occurred with HALO de-miners in 2008 with minor injuries.” It was not clear whether these were included in SMAC’s casualty figures.²⁰

¹⁸ Somaliland Police EOD Project, “EOD Annual Report 2008,” Hargeisa, 2009, p. 11. HALO provided ambulances and trained medics with trauma bags to assist the casualties in Hargeisa. Email from Valon Kumnova, Desk Officer, Horn of Africa, HALO, 24 August 2009.

¹⁹ UN Mine Action Team, “UN Somalia Mine Action: Project Update & Achievements 2008,” 3 March 2009, p. 1; and SMAC, “Somaliland Mine Action Annual Report 2008,” Hargeisa, March 2009, pp. 5–6.

²⁰ SMAC, “Somaliland Mine Action Annual Report 2008,” Hargeisa, March 2009, p. 6.

The 37 casualties recorded in 2008 are less than the 97 casualties (26 killed and 71 injured) identified by Landmine Monitor²¹ or the 72 casualties (16 killed and 56 injured) recorded by SMAC in 2007.²² Given possible under-reporting, this should not necessarily be considered indicative of a trend.

Landmine Monitor identified 814 casualties (207 killed, 500 injured, and 107 unknown) between 2000 and 2008. No reliable data was available for 1999.²³

Casualties continued to occur in 2009, with SMAC identifying 22 casualties (four killed and 18 injured), as of 31 May.²⁴ According to the UN Mine Action Service (UNMAS), the majority of these were caused by ERW (12), four by antipersonnel mines, and five by unknown devices. Boys were the largest group of casualties (eight), followed by girls (seven), men (five), and women (one).²⁵

Risk profile

People are at risk from mine and other ERW contamination, particularly around Hargeisa.²⁶ Nomads and shepherds are at particular risk, and children form the highest casualty group.²⁷

Socio-economic impact

A 2007 GICHD evaluation of European Commission-funded mine action in Africa found that mine action contributes to other forms of international support for relief and development in Somalia, and concluded that by clearing pastureland and traditional migration routes, mine clearance enhances livelihoods and reduces vulnerability for pastoralists.²⁸ While pastureland was the most reported socio-economic blockage in the LIS in 2003, with nomads and herders as the most affected population at the time, more recently the high number of incidents involving women and children indicates a wider vulnerability to mines than just nomads and herders.²⁹ Livelihood expert Laura Hammonds believes it is difficult to determine the impact of mine action on poverty reduction, and a study for DDG concluded that a livelihoods analysis with better-off groups could help to determine whether there has been an increase in income over recent years and whether the increase is related to the use of land cleared.³⁰

Program Management and Coordination

Mine action

Mine action is organized under the office of the Vice-President, who heads the interministerial Mine Action Steering Committee. SMAC is Somaliland's coordination body, and continues to be supported by UNDP Somalia from Nairobi. Bimonthly mine action coordination meetings involving international NGOs are organized by SMAC, as is an RE working group supported by

UNDP.³¹ The National Demining Agency (NDA), part of the Ministry of Defense, is mandated to coordinate demining, RE, clearance, and survey, but is not operational.³²

SMAC organizes bi-monthly mine action coordination meetings, attended by HALO, DDG, Handicap International (HI), the police EOD teams, and the Mine Victim Association, a local NGO.³³ An RE/VA officer was appointed in January 2009 and as of March 2009, was waiting for VA training to begin assisting with VA services.³⁴ Along with the SMAC RE program coordinator, the RE/VA officer was responsible for chairing a biweekly RE working group meeting.³⁵

Data collection

One of the biggest challenges facing the mine action program is information management. Landmine Monitor has reported continual problems with the data in the Information Management System for Mine Action (IMSMA) database since 2002 when the mine action program began and IMSMA was installed.³⁶ The problems result from a number of factors, including inadequate technical expertise at SMAC and the use of “incompatible” forms in previous surveys. This has caused a major lack of confidence in the accuracy of the data.³⁷ In 2008, SMAC reported several persistent problems with the database beginning with the lack of training for its staff. Most of the skills acquired by the database staff are said to have been self-taught. SMAC continues to use an old version of IMSMA.³⁸

In July 2007, UNDP recruited a consultant to clean up the database but he was unable to do so during the term of the consultancy.³⁹ According to UNDP, an action plan to check and review all entries in the database was adopted and began with the deployment of an international database expert from the Swedish Rescue Service Agency in September 2008 but the consultancy was cut short at the end of October when suicide car bombs went off in Hargeisa.⁴⁰ The IMSMA officer returned to Hargeisa in March 2009 and conducted training for SMAC’s IMSMA section, and developed data input/analysis, reporting, and monitoring mechanisms for SMAC to use.⁴¹ Due to restrictions on international UN staff, it is not possible for the IMSMA officer to be based in Somaliland permanently.⁴²

Even if it had properly trained staff, the database suffers from some longstanding technical problems. The two LIS conducted in Somaliland are in separate databases and in different computers. SMAC has also reported that some towns and villages included in the LIS that covered Sanaag and Sool regions have no names or have coordinates that put them in the middle of the Gulf of Aden,⁴³ although the maps produced for the LIS Final Report do not indicate such problems.⁴⁴

⁴² *Ibid.*

⁴³ SMAC, “Somaliland Mine Action Annual Report 2008,” Hargeisa, March 2009, p. 8.

⁴⁴ Email from Tammy Orr, UNMAS, 1 July 2009. See the final survey reports at www.sac-na.org.

UNMAS reported that casualty information in Somaliland has been “systematically compiled since 2005” through the SMAC Regional Liaison Officers, “resulting in a relatively comprehensive understanding of the casualty trends in Somaliland.”⁴⁵ SMAC reported that data collection methods improved, with incident reports now including location coordinates, casualty information, and location photos.⁴⁶ Starting in January 2009, HALO collated casualty data from various regions in Somaliland, which was provided to SMAC at bi-monthly meetings.⁴⁷ Nonetheless, under-reporting of casualties is likely.⁴⁸

RE data is entered into IMSMA by SMAC but this needed further verification. HALO and DDG still maintain their own databases due to the inaccuracies of SMAC IMSMA data.⁴⁹

SMAC reported that no progress was made on establishing a VA database in 2008.⁵⁰

Plans

Strategic mine action plan

Somaliland developed a strategic plan in 2002, which was revised following the results of the first phase of the LIS. In 2006, the plan was again updated and extended to 2010.⁵¹ The short-term strategy sought continued UN support to strengthen the capacities of SMAC and the police EOD teams and by the end of 2009 it was planned that Somaliland would take on greater financial responsibility. The strategy also called for UNDP to support the construction of an EOD Police Command and Training Centre, and expand SMAC’s survey capacity.⁵²

⁴⁹ Interviews with Karina Lyng, DDG, Hargeisa, 8 April 2009; and Tammy Orr, UNMAS, Nairobi, 29 June 2009.

⁵⁰ Email from Dr. Ahmed Ali Mah, SMAC, 18 March 2009.

⁵¹ See *Landmine Monitor Report 2008*, p. 1,102.

⁵² UN, “2009 Portfolio for Mine Action,” New York, November 2008, p. 298; and Somaliland Police EOD Project, “EOD Annual Report 2008,” Hargeisa, 2009, p. 12.

The medium-term strategy (2010–2012) is to ensure that SMAC can operate independently, with a resource mobilization plan developed and implemented. All residual medium-priority areas identified by the LIS will have been dealt with, and the establishment of a national mine action authority will be pursued. It is planned that a VA, advocacy, and stockpile destruction strategy will be developed and implemented. In the long-term (beyond 2012), SMAC will be in a position to coordinate and undertake all mine action activities without the need for international supervision.⁵³

There was no national strategic plan for RE in 2008.⁵⁴ There is no strategy, plan, or policy framework for VA.⁵⁵

Integration of mine action with reconstruction and development

The Somalia Reconstruction and Development Programme 2008–2012 and the UN Transition Plan 2008–2009 form the framework for development in Somalia, including Somaliland, with particular emphasis on the achievement of the Millennium Development Goals.⁵⁶ Neither of these documents refers to the mine/ERW problem or to mine action.

Local ownership

Commitment to mine action and victim assistance

Somaliland has shown commitment to mine action through the creation of national structures, with the support of UNDP, and the adoption of national legislation. The government contributed US\$15,000 to SMAC's operations in 2006.⁵⁷ No funding by Somaliland was reported in 2007 or 2008.⁵⁸

National management

The Somaliland mine action program is executed and supervised by UNDP Somalia, which is based in Nairobi, Kenya. In its 2007 evaluation of the Somalia mine action program, GICHD concluded that on paper, Somaliland had a good institutional structure for mine action, but lacked adequate technical support from UNDP. Although previous UNDP personnel arranged training, equipment, facilities, and funding for SMAC personnel, and advice on policy matters, they did not provide ongoing support to help SMAC personnel apply their training. Additional problems included unclear job descriptions and travel/logistic problems for the UNDP staff. As a result, SMAC did not perform effectively.⁵⁹ Since 2006, support from UNDP has included subcontracting for technical services from Mine Advisory Group (MAG), Mechem, Swedish Rescue Services Agency (SRSA), and the International Mine Action Training Center (IMATC) in Nairobi. Technical training has been provided to upgrade the skills of the police EOD teams.⁶⁰

National mine action legislation

Presidential Decree No. 016/2004, which regulates mine action in Somaliland, states that all mine action organizations and government entities must comply with its provisions.⁶¹ Legislation in support of the Mine Ban Treaty, passed in April 2009, requires the destruction of all antipersonnel mines in mined areas under the jurisdiction or control of Somaliland as soon as possible but not later than ten years after the law's entry into force.⁶² This provision mirrors the text of Article 5 of the Mine Ban Treaty. A new policy on mine action was being discussed

in parliament in early 2009,⁶³ but the outcome and precise content of the policy were not known as of July 2009.

National mine action standards/Standing operating procedures

SMAC has developed standing operating procedures for mine action operations in Somaliland with the support of UNDP.⁶⁴ There are no RE standards, although the organizations involved in RE activities state that they follow international standards.⁶⁵

Program evaluations

In April 2008, GICHD conducted an evaluation of DDG's mine action program, commissioned by the Swedish International Development Cooperation Agency (SIDA).⁶⁶ The evaluation concluded that DDG's decision to close its mine clearance and EOD activities in Somaliland was justified, as mines and ERW in most of the communities where they had worked had become an insignificant factor. DDG had concluded, and GICHD agreed, that the capacities of HALO and the Somaliland police EOD teams were sufficient to address the remaining mine and ERW problem.⁶⁷

Demining and Battle Area Clearance

HALO is the only organization engaged in demining in Somaliland. The five police EOD teams, comprising a total of 24 personnel including paramedics, drivers, and supervisory staff, are part of the operations unit of the Somaliland Police Commission, which is under the Ministry of the Interior. SMAC provides task dossiers to the police EOD teams.⁶⁸ UNDP has focused on developing the capacity of the police EOD teams to address the residual ERW problem.

Sool and Sanaag remain disputed regions in Somalia, making access problematic for the UN and international NGOs. Somaliland's police EOD capacity does not include an EOD team dedicated to those regions, thus any EOD activities there are done by teams from other regions on a case-by-case basis.⁶⁹ HALO has accessed some of these areas to conduct surveys and continues to assist with mine clearance assets and EOD call-outs when the security situation permits.⁷⁰ In 2008, UNDP funded the construction of a police EOD compound at the Police Department for Criminal Investigation in Hargeisa consisting of office, classroom, and storage space.⁷¹

Until HALO completes the resurvey that began in 2008 it is unknown how much more time and resources may be needed to clear all the remaining SHAs.

Demining and battle area clearance in 2008

In 2008, HALO conducted three battle area clearance (BAC) tasks covering much smaller areas than in 2007 and cleared 33 SHAs (see table below) covering 666,795m². HALO's demining of mined areas included 356,649m² in manual clearance and 265,146m² in mechanical clearance.⁷² HALO deminers suffered three accidents in 2008, sustaining minor injuries.⁷³

Demining in Somaliland in 2007 and 2008

Year	Mined area cleared (km ²)	Antipersonnel mines destroyed	Antivehicle mines destroyed
2008	0.66	207	55
2007	0.32	463	58
Total	0.98	670	113

In January–July 2008, SMAC tasked the five police EOD teams based in Borama, Burao, Erigavo, and Hargeisa with clearing 243 hazardous areas covering an estimated 2.4km². The teams found a total of 236 ERW.

Battle Area Clearance in Somaliland in 2007 and 2008

Year	BAC (km ²)	UXO destroyed	AXO destroyed
2008	2.45	871	1,106
2007	3.76	819	4,369
Total	6.21	1,690	5,475

SMAC quality assurance teams visited HALO clearance sites 139 times, and visited 42 sites where EOD teams were conducting spot clearance (see below). SMAC also conducted quality assurance on 55 completed tasks by HALO. All completed areas were subsequently released to the local communities.⁷⁴

EOD clearance in 2008

UNDP has supported EOD capacity-building with the Somaliland police since 2001. Operations consist of tasking by SMAC based on the UXO danger areas in the database and responses to requests from local villagers called “community callouts.” The teams responded to requests, mostly by telephone, from 551 communities and recovered a total of 4,309 UXO. Among the recovered items were 602 items of UXO handed over to the police EOD teams by the Governor of Sool region.⁷⁵

EOD tasking was put on hold in July 2008 as the resurvey being conducted by HALO indicated that a majority of the SHAs identified by the LIS were being cancelled, while some new SHAs were being found. However, work continued through EOD call-outs. In order to avoid wasting time and resources on areas that were not contaminated or no longer contaminated, or where contamination had been previously over-estimated, it was planned to resume EOD tasking only after the new HALO contamination data was processed.⁷⁶

In May 2008, DDG resumed its Village by Village EOD Clearance project as part of its new Community Safety and Enhancement project that assists communities in the management of small arms. By the end of December it had conducted 145 community visits in Galbeed, Saaxil, Sanaag, Sool, and Togdheer regions and destroyed a total of eight mines and 281 ERW.⁷⁷

Progress since 2003

From 2003–2008 mine clearance averaged approximately 0.55km² per year. BAC has decreased each year since 2003 when 50km² were cleared, to 2008 when less than 1km² was cleared (see table below).

⁷⁴ UN Mine Action Team, “UN Somalia Mine Action: Project Update & Achievements 2008,” 3 March 2009.

⁷⁷ Response to Landmine Monitor questionnaire by Karina Lynge, DDG, 15 March 2009.

Demining in 2003–2008

Year	Mine clearance (km ²)	BAC (km ²)
2008	0.656	2.448
2007	0.320	3.760
2006	0.280	14.080
2005	0.300	18.300
2004	0.080	22.230
2003	1.680	50.550
Total	3.316	111.368

Somaliland Police EOD Results in 2002–2008

Year	Villages visited	Items collected/destroyed
2008	794	4,545
2007	271	19,650
2006	79	3,659
2005	98	2,195
2004	57	2,839
2003	103	10,276
2002	70	4,976
Totals	1,472	48,140

Since 2002, the Somaliland police EOD teams have cleared more than 48,000 items of UXO from 1,472 sites (see table below).⁷⁸

Risk Education

In 2008, RE in Somaliland was conducted both by NGOs and the police, through training of community focal points, direct RE presentations, mass media, and community liaison alongside EOD operations. More than half a million people received RE in 2008, including those reached through the mass media.

SMAC tasked the police EOD with RE assignments in coordination with their clearance work. For the first half of 2008, such tasks were prioritized using data from the LIS. For the latter half, they focused on call-outs, rather than LIS priorities, as they awaited information from HALO's survey. HI focused on communities classified as medium risk in the LIS. HALO and DDG RE activities were coordinated with their clearance efforts.⁷⁹ These activities were theoretically coordinated with SMAC, but according to GICHD these agencies "are all essentially self-tasking, although all operators ensure endorsement of their tasks by the SMAC."⁸⁰

At the end of 2008, SMAC conducted an assessment of HI's RE activities and recommended that HI try to reach beyond community leaders and training of trainers and work more at the community level.⁸¹

Since 1999, RE activities have been conducted by a number of NGOs, local government agencies, and commercial demining companies. Early efforts were *ad hoc* and limited, with UNICEF and HI the main players. Since 2004, DDG and HALO have also emerged as major contributors to RE, alongside their clearance operations.⁸² Police EOD teams, which began in 2002, have expanded their RE activities considerably since 2006.⁸³ RE activities have continuously increased since 2005.⁸⁴ Since 2007, RE in Somaliland has become more systematic, with efforts to target high and medium risk areas identified by the LIS.⁸⁵

RE activities in 2008⁸⁶

Organization	Type of activity	Geographic location	No. of beneficiaries
HI	Training of 355 community focal points, RE materials development and distribution, radio broadcasts	Unknown	493,029 (including those reached by mass media)
Police EOD teams	RE messages alongside EOD, and through radio and TV	Areas around Borama, Burao, Hargeisa, and Erigavo	56,000 people in 794 communities
HALO	Direct RE presentations and community liaison	Awdal, Galbeed, Sahil, and Togdheer	7,173
DDG	Direct RE with EOD in villages and an internally displaced persons (IDP) settlement	Galbeed, Saaxil, Sanaag, Sool, Togdheer, and regions; Hargeisa's Daani IDP settlement	2,447

HI's activities have included RE activities in refugee camps in Djibouti and Ethiopia for people from Somaliland in 2002, and a Knowledge, Attitudes and Practices (KAP) survey conducted in Awdal, Galbeed, and Togdheer.⁸⁷ In 2006, HI conducted a second KAP survey and found that knowledge of mines and safe behavior continued to be limited and in some cases had even decreased.⁸⁸ After a 10-month hiatus due to lack of funding, HI restarted its RE program in June 2007, again focused on young herders.⁸⁹

Victim Assistance

The total number of survivors is unknown, but is estimated to be 489. SMAC admitted in 2009 that, "Landmine accident survivors receive [a] minimum of assistance."⁹⁰ Survivors suffer from a lack of adequate government support and resources. The LIS showed that only 17% of recent survivors received emergency care and none received physical rehabilitation.⁹¹

Health facilities in Somaliland are reportedly "so ill-equipped and poorly staffed" that they are often unable to properly care for patients.⁹² Regional hospitals do not have surgeons and are unable to provide adequate emergency or continuing care. The Ministry of Health and Labour's Hargeisa Group Hospital and Borama Regional Hospital, and the Edna Adan Maternity and Teaching Hospital were the only hospitals capable of treating trauma from mine/ERW

⁸⁶ Email from Xhevdet Gegollaj, HI, 30 March 2009; interview with Xhevdet Gegollaj, HI, Hargeisa, 8 April 2009; Somaliland Police EOD Project, "EOD Annual Report 2008," Hargeisa, 2009, pp. 3, 10–11; and SMAC, "Somaliland Mine Action Annual Report 2008," Hargeisa, March 2009, p. 5. Note that the SMAC Annual Report states the project reached 58,290 people in 545 villages. The Somaliland Police EOD Project Annual Report says 56,357 in two places (pp. 3, 10, 11) but also says 57,350 (p. 10). Telephone interview with Oumer Qasali, Somaliland Police EOD Commander, 29 March 2009; email from Stanislav Damjanovic, HALO, 12 March 2009; and email from Karina Lyng, DDG, 12 March 2009

incidents.⁹³ However, the Edna Adan Hospital reported it had not treated any mine casualties during the past five years.⁹⁴ Transportation and medical evacuation to hospitals are inadequate.⁹⁵

HALO and DDG are capable of providing first-aid to civilian mine/ERW casualties until they can be evacuated to a proper hospital or medical center.⁹⁶ HALO can provide first-aid to stabilize a casualty until evacuation to a proper hospital or medical center is possible.⁹⁷ The Somaliland police EOD teams were trained in basic first-aid and initial treatment of casualties.⁹⁸ In October 2008, they were given training in “victim rescue and evacuation drills” by EOD technical advisors contributed by the Swiss government, and assisted by the SRSA.⁹⁹ The police EOD teams reported that their supply of medicines was “running short.”¹⁰⁰

Rehabilitation services are available at the Norwegian Red Cross/Somali Red Crescent Society (SRCS) and Disability Action Network (DAN) rehabilitation centers in Hargeisa, but were not easily accessible to survivors living in remote areas. The SRCS center assisted 366 patients with 262 prostheses and 201 orthoses and provided 2,254 patients with physiotherapy.¹⁰¹ While psychosocial support is available at some maternal and child health centers in Somaliland, there are few such resources accessible to most mine/ERW survivors.¹⁰² There were few efforts supporting the economic reintegration of survivors. Disabled former military personnel receive a pension from the government.¹⁰³

The Somaliland constitution prohibits discrimination and commits the government to assist persons with disabilities who have no one to care for them, but these provisions remained largely unimplemented.¹⁰⁴ The Somaliland Ministry of Family and Social Development was working towards non-discrimination legislation that includes disability provisions. As of April 2009, it was still awaiting approval.¹⁰⁵ HI assisted with translation support.¹⁰⁶

Victim assistance activities

Through its Special Fund for the Disabled (SFD), the ICRC, along with the Norwegian Red Cross, continued to support the SRCS Rehabilitation Center in Hargeisa. The SFD provides technical support and training, while the Norwegian Red Cross funds materials and salaries. The center also has an outreach team that provides free prosthetic and orthotic services to people living in rural areas. In 2008, the SFD provided training in clinical methods for lower-limb orthoses, special prosthetic cases and physiotherapy for lower-limb amputees. The ICRC said, “The quality of services is satisfactory, but access is a problem owing to the scarcity and high price of public transport.”¹⁰⁷ Moreover, the security situation was a “major constraint” and was cited as a primary reason for the center’s 22% drop in prostheses and orthoses production in comparison with 2007.¹⁰⁸

¹⁰⁸ Ibid.

DAN continued to run its Hargeisa Rehabilitation Center, and reported that 15 mine survivors came to the center for walking aids, orthopedic shoes, wheelchairs, tricycles, and physiotherapy services. Statistics from the regional units supported by DAN are not yet available.¹⁰⁹ DAN was awarded the 2008 STARS Impact Award for Health, which recognizes excellence in health provision to disadvantaged children.¹¹⁰ DAN continues to provide rehabilitation services on a cost-sharing basis, with HI support, and user-pay service fees.¹¹¹

The General Assistance and Volunteer Organization (GAVO) has focused on awareness and psychosocial support provision in Berbera and Burao.¹¹² While mental health provision remains a huge gap, GAVO has recently established mental health centers in Berbera and Hargeisa.¹¹³

The Abilis Foundation provided several small grants to local disabled people's organizations in 2008 and 2009, supporting income generation, skills training, and advocacy efforts of the Somaliland National Disability Forum, Sahil Handicap Organization, Voice of Somaliland Minority Women Organization, Somaliland Women and Children with Disabilities, and Alkownin Women Voluntary Organization. In particular, they supported the Somaliland Advocacy Mine Victim Association in providing "employment generation and rights awareness for mine victims empowerment." No further details were available.¹¹⁴

Support for Mine Action

Landmine Monitor is not aware of any long-term comprehensive cost estimates for meeting mine action needs (including RE and VA) in Somaliland. The Mine Action Steering Committee is nominally the mine action authority for Somaliland. Details of resource requirements for Somaliland's 2006–2010 mine action strategic plan were not available as of June 2009. No funding by Somaliland was reported in 2008, nor in 2007.

International cooperation and assistance

In 2008, three countries reported providing \$4,392,941 (€2,983,119) to mine action in Somaliland.¹¹⁵ No reported funds in 2008 were addressed to VA activities, which remain inadequate.

In addition to the above, HALO reported \$655,000 in funding from the United States during 2008.¹¹⁶ The US did not report funding to Somaliland in 2008.

¹⁰⁹ Email from Ali Jama, Managing Director, DAN, 31 March 2009.

TAIWAN

2008 Key Data

Contamination	Antipersonnel and antivehicle mines, ERW
Estimated area of contamination	2.9km ² of mined areas (March 2009, for Kinmen and Matsu)
Estimated mine/ERW survivors	Unknown but at least 574
Demining in 2008	Not reported, but estimated by Landmine Monitor to be 0.6km ² of mined areas

Ten-Year Summary

Officials have expressed Taiwan's support for a comprehensive ban on antipersonnel mines repeatedly since 1999. In 2001, a Ministry of National Defense spokesperson stated that Taiwan no longer uses antipersonnel mines. In 2002, Taiwan sent 42,175 stockpiled antipersonnel mines to Germany for destruction. In 2006, Taiwan enacted legislation that bans production and trade of antipersonnel mines, but not stockpiling and use; it requires clearance of mined areas within seven years and provides for compensation for future victims.

Taiwan is affected by mines and, to a lesser extent, by explosive remnants of war (ERW). It took its first tentative steps towards demining in 1999, bringing in a foreign clearance operator. In 2006, it scaled up its response, setting up a unit of army engineers to undertake humanitarian demining while continuing to bring in foreign organizations for specific tasks.

Landmine Monitor identified three mine/ERW casualties (two killed and one injured) in Taiwan between 1999 and 2008. Only very limited risk education has been provided by the Division of Army Engineers since 2007. Taiwanese mine survivors and persons with disabilities receive free medical care in one of the best healthcare systems in the region. Taiwanese law protects persons with disabilities' rights, access to services and employment opportunities.

Mine Ban Policy

Due to its international status, Taiwan cannot accede to the Mine Ban Treaty. The Legislative Yuan (the national legislature) passed the Antipersonnel Landmines Regulations Act on 26 May 2006 and it came into effect on 14 June 2006. The legislation falls short of a comprehensive ban on antipersonnel mines. It prohibits production and trade of antipersonnel landmines, sets a deadline for clearance of existing minefields, and provides for compensation for future victims. However, it permits stockpiling, as well as the use of antipersonnel mines "when it is imperative during war."¹

The government inaugurated in 2008 has not taken any further action to unilaterally ban antipersonnel mines.

Production, transfer, use, and stockpiling

Production and transfer of antipersonnel mines are prohibited under the 2006 Antipersonnel Landmines Regulations Act. Taiwan has stated that it stopped production of antipersonnel mines in 1982.² It is not known to have ever exported mines.

¹ Global Legal Information Network, Legislative Yuan, glin.ly.gov.tw. For more information on the development of the legislation and its provisions, see *Landmine Monitor Report 2006*, pp. 1,189–1,190.

² Letter from Gen. Kwan-Dan Lai, Military Combat and Planning Staff Office, Ministry of National Defense, 2 March 2004.

In 2001, a Ministry of National Defense spokesperson stated that Taiwan no longer uses antipersonnel mines, although in 2004 the ministry acknowledged that some of the minefields on the offshore islands have been maintained due to the military threat from China.³ Taiwan has committed to the removal of these minefields in seven years as required by the 2006 Antipersonnel Landmines Regulations Act.

Taiwan has never provided details on the size or composition of its stockpile of antipersonnel mines.⁴

Scope of the Problem

Contamination

Taiwan is affected by mines and, to a lesser extent, by ERW. Taiwan laid landmines during the 1950s on its two largest offshore islands, Kinmen and Matsu (Lian Jiang county), as well as on a number of smaller uninhabited islands, because of their proximity to China. The islands also have some UXO left from conflicts dating back to World War II or even before, some of it too old to identify, as well as from military training.⁵

The Ministry of National Defense stated in March 2004 that some of the minefields on Dong Yin, Kinmen, and Matsu islands would be “gradually” cleared once alternative weapons became available.⁶ In May 2006, a senior Ministry of National Defense official told Landmine Monitor there were “more than 200” minefields on the offshore islands.⁷

Kinmen county (a group of islands) is the most heavily mined region. The county government has reported that 80% of Kinmen’s coastlines are mined and that the army had emplaced large numbers of both antipersonnel and antivehicle mines on surrounding islands, including Dadan, Erdan, and Lieyu (Little Kinmen).⁸

Official estimates of contamination on Kinmen Island have varied widely. In June 2008, the Ministry of National Defense announced that it had identified 154 minefields covering approximately 3.4km² in Kinmen county and 154 minefields covering approximately 0.4km² in Matsu.⁹ In March 2009, following mine clearance operations, the army claimed that Kinmen had 131 recorded minefields covering 2.6km², containing an estimated 50,000 or more mines. The army said Matsu had 128 recorded minefields, covering 0.3km², and containing an estimated 20,000 or more mines.¹⁰ In 2005, a Ministry of National Defense official claimed that all mine-affected areas were marked, fenced, and inspected weekly,¹¹ but this has been disputed by local residents.¹²

On 29 October 2008, a forest fire on the island of Silu (part of the Matsu group of islands) triggered several mine explosions, but no casualties occurred.¹³

³ Ibid.

⁴ See *Landmine Monitor Report 2004*, p. 1,238, for known details on Taiwan’s production, stockpiling, and destruction of antipersonnel mines. In 2002, Taiwan sent 42,175 stockpiled antipersonnel mines to Germany for destruction.

Casualties

In 2008 and 2009, as of March, neither media nor official sources reported any new mine/ERW casualties in Taiwan.¹⁴ The last reported casualties, and the only ones identified by Landmine Monitor since 1999, occurred in 2005 when two Zimbabwean deminers were killed and one was injured.¹⁵ Taiwan does not have a mine/ERW casualty data collection mechanism but at least 574 mine survivors made successful compensation claims to the Ministry of National Defense between 1999 and 2008.¹⁶

As of 2008, about one million persons with disabilities had been identified in Taiwan, 5,050 of whom lived in the mine-affected county of Kinmen, and 361 in Matsu.¹⁷

Program Management and Coordination

Mine action

Until 2006, Taiwan had no formal mine action program and the Ministry of National Defense had responsibility for demining policy.¹⁸ A ministry official stated in 2005 that the military did not have the capacity to handle Taiwan's mine problems and that it contracted foreign organizations for demining.¹⁹

Regulations published by the Ministry of National Defense in January 2008 state that the ministry itself is the national mine action authority responsible for setting policy while the army is responsible for implementing it. The government reportedly considered setting up a national mine action center in 2006 but, after analyzing the scope of the mine problem in Taiwan, the Ministry of National Defense rejected the plan.²⁰

Plans

Strategic mine action plan

The army has not published a demining plan but in 2006 said it would complete clearance of all mined areas within five years, two years earlier than required by legislation.²¹ Under the Regulations on Eradication of Antipersonnel Landmines in Minefields issued under the 2006 Act and published in 2008, the Ministry of National Defense must give top demining priority to land needed for development, followed by regions that are not militarily sensitive. The last areas to be demined will be "military surveillance regions" where the ministry considers Taiwan needs alternative forms of defense.²²

On Kinmen Island, the Kinmen county government is responsible for coordinating local demining priorities. In January 2006, at the request of the Ministry of National Defense, the county government gave the Kinmen Defense Command a list of 35 minefields that it identified as priority for clearance.²³ The county government submitted another letter identifying clearance priorities to the Kinmen Defense Command on 30 April 2007. The county government convenes

coordination meetings with concerned parties when it considers them necessary, and contacts the Kinmen Defense Command on changes to clearance priorities.²⁴

In May 2008, the Ministry of National Defense told Landmine Monitor that from 2007 to 2009, the ministry had allocated NTD509.4 million (US\$16.1 million) for foreign organizations to demine 12 minefields on Kinmen and 14 minefields on Matsu, and NTD373.87 million (\$11.9 million) for army demining, including costs of covering technical service, insurance, and purchase of demining equipment. From 2010 to 2013, the ministry plans to allocate NTD340 million (\$10.8 million) to contract foreign agencies and support the army's demining program to clean up the rest of the minefields in Kinmen and Matsu.²⁵ In March 2009, the ministry confirmed the amount allocated for demining by the Army Demining Division (ADD) and foreign organizations in 2007–2009 but said it planned to allocate about NTD1.8 billion (\$57 million) to demine both Kinmen and Matsu from 2010 to 2013.²⁶

Local ownership

Commitment to mine action

Taiwan's military has committed to completing mine clearance by 2011 and is required to report annually to parliament on demining progress.

Mine action legislation

Taiwan's Antipersonnel Landmines Regulations Act, which came into effect on 14 June 2006, requires the Ministry of National Defense to disclose the location of all minefields and to complete clearance of all mines within seven years.²⁷ The ministry must submit annual reports to the legislature on the progress of demining; if demining is not completed within seven years, it may apply to the legislature for an extension. The law requires the government to compensate military personnel or civilians injured due to "negligence" during demining operations.²⁸

Under the Regulations on Eradication of Antipersonnel Landmines in Minefields, issued under the 2006 Act, the Ministry of National Defense is responsible for setting policy, approving programs and annual plans, and for monitoring the safety and environmental impact of demining. The army is responsible for preparing mine action plans, arranging funding, calling for tenders, and coordinating, implementing, and reviewing operations.²⁹

Mine action standards/Standing operating procedures

Taiwan has not adopted national mine action standards. Lieutenant-General Yang Tien-Hsiao, Commander of the Kinmen Defense Command, has said that army demining meets the latest version of the International Mine Action Standards (IMAS), and that the army would follow standing operating procedures for UXO clearance.³⁰ The regulations require mines to be destroyed in situ unless they pose a threat to the public or the environment, in which case mines should be transported to a location agreed by the army and local government. Movement and destruction of landmines have to be announced publicly seven days in advance.³¹

The Army Demining Division on Kinmen Island released the third edition of its Manual for Humanitarian Demining Techniques in May 2008. The manual, which was developed for internal use, was revised to take account of the ADD's field experience. It contains its standing operating procedures for demining, which are said to be based on IMAS, complemented by

comments of foreign advisors from Mechem, Explomo Technical Service Pte. Ltd. of Singapore, and the Cambodian Mine Action Center.³²

Demining and Battle Area Clearance

Until the ADD's creation in mid-2006, only sporadic demining had occurred on Kinmen, conducted by Specialist Gurkha Services (1998–1999) and MineTech International in 2004–2005.³³

As of March 2009, the ADD had 120 staff, recruited from the army's Corps of Engineers and its Military Academy, including deminers, team leaders, and administrative officers. The ADD works on Kinmen Island, Lieyu (Little Kinmen), Dadan, and Erdan undertaking manual and mechanical demining, using mine-protected vehicles to dig to a depth of about three meters and to filter soil. The army said operations are externally quality-assured but did not identify by whom.³⁴

Explomo Technical Services Pte. Ltd. replaced MineTech under contract to Kinmen Water Company in July 2006 and as of May 2008 still had some 80 deminers on Kinmen. Explomo also acted as technical advisors to ADD under a contract with the Ministry of National Defense valid until the end of 2009.³⁵

Korean Mine Action Group (KMAG), a commercial company, was contracted in 2007 to undertake demining on Matsu, which has more challenging terrain. It started demining on Beigan Island³⁶ in October 2007 and completed clearance there in July 2009.³⁷

Demining in 2008

On Kinmen, from May 2008 to March 2009, the ADD cleared 13 minefields covering 144,004m², with the destruction of 3,063 antipersonnel mines, 1,910 antivehicle mines, and 877 items of UXO.³⁸

Explomo cleared six minefields on Kinmen in 2008 covering 446,084m², removing 3,697 antipersonnel mines, 277 antivehicle mines, and 269 items of UXO.³⁹ In 2009, to 3 August, Explomo cleared another six minefields on Kinmen covering 208,136m², removing 6,524 antipersonnel mines, 688 antivehicle mines, and 614 items of UXO.⁴⁰

KMAG cleared 13 minefields on Matsu's Beigan Island in the first phase of demining operations between October 2007 and January 2008;⁴¹ it cleared another 12 minefields in the second stage between October 2008 and January 2009.⁴² The next demining operation began in April 2009 and concluded in July, completing clearance of all the mines in Beigan.⁴³

Risk Education

In 2007–2009, the Division of Army Engineers organized public events through the Kinmen county government and the Lienchiang county government (Matsu), and used local media to inform communities about its clearance activities and the risk of mines. The military also continued to improve fencing and marking of Kinmen minefields.⁴⁴

In 2008 and through March 2009, the Eden Social Welfare Foundation organized a workshop for 50 students at National Chengchi University and delivered five presentations for 80 junior high school students, 20 university students, and 70 church members to raise awareness about landmines and UXO.⁴⁵

The only other risk education activities were reported in 2007, when the Ministry of National Defense stated that troops stationed on the offshore islands are informed about risk education. It also stated that the military mails relevant information to local governments and requires them to inform local residents. The military also reinforced surveillance and marking of minefields.⁴⁶

Victim Assistance

The total number of survivors is not known but is at least 574.⁴⁷ Taiwanese mine survivors and persons with disabilities received free medical care in one of the best healthcare systems in the region.⁴⁸ Yet there have been concerns that the system is inadequately funded and staffed.⁴⁹

From 1999 until 30 November 2007, civilian mine survivors could apply for financial compensation under the Regulations on Compensation for Damage to the Public from Military Activities.⁵⁰ At the end of 2008, 574 applications had been approved, although Chen Fu-Hai, legislator from Kinmen county, urged the Ministry of National Defense to accelerate approval processes.⁵¹ Until 2008, 59 civilian mine survivors in Kinmen and 49 in Matsu had received financial compensation, totaling NTD129,950,000 (\$4,119,415).⁵²

Mine survivors or their families can also receive compensation under the Antipersonnel Landmines Regulations Act of 2006. The Ministry of National Defense published the procedures to apply for compensation under this act on 16 August 2007. Survivors can receive between NTD50,000 (\$1,585) and NTD1 million (\$31,700), depending on the level of disability. The deceased's legal heir can receive NTD150 million (\$4.8 million). Those who have already been compensated for the same cause by another scheme are not eligible. A review committee of local officials, scholars, and other people invited by the Ministry of National Defense was to be set up

to examine the applications.⁵³ Within certain restrictions, persons with disabilities are eligible for a labor insurance disability pension or lump-sum payment in Taiwan.⁵⁴

In February 2008, Kinmen county was selected as one of the three most accessible counties for persons with disabilities.⁵⁵ The county grants persons with disabilities a monthly allowance of between NTD2,000 (\$63) and NTD3,500 (\$111), depending on the level of disability.⁵⁶ In 2009, in order to enable persons with disabilities and economically disadvantaged families to receive necessary medical care on Taiwan island, the Kinmen County Assembly passed the “Measures of Airfare Compensation for Minority Groups in Kinmen County” to subsidize the costs of transportation.⁵⁷

In Matsu, persons with disabilities with proper identification can receive a monthly allowance of between NTD3,500 (\$111) and NTD4,000 (\$127), as well as grants for assistive technologies and a preferential price for transportation.⁵⁸ The Lienchiang County Association for Persons with Disabilities was founded in 2005, and is the first and only NGO for persons with disabilities in Matsu.⁵⁹

With the entry into force of the UN Convention on the Rights of Persons with Disabilities on 3 May 2008, the Eden Social Welfare Foundation and the League of Welfare Organizations for the Disabled Taiwan organized the “Proud to be Myself, Citizen Rights of Persons with Disabilities International Conference” on 8 and 9 December 2008. The two organizations announced during the conference a Declaration on the Rights of Persons with Disabilities of Taiwan, proposed by persons with disabilities. President Ma Ying-Jeou promised to put the declaration into action.⁶⁰

The Eden Social Welfare Foundation also provides assistive technologies to persons with disabilities around the world. It has donated 10,713 wheelchairs valued more than NTD85 million (\$2.69 million). In 2008, Eden donated 815 wheelchairs valued at NTD2,526,500 (\$74,815) to China, the Philippines, Sri Lanka, and Vietnam. It also donated 150 crutches and 10 white canes valued at NTD79,200 (\$2,511) to the Philippines.⁶¹

The Taiwanese constitution and the (Physically and Mentally) Disabled Citizens Protection Act protect access to services and the rights of persons with disabilities. The latter was amended in 2007 to specify the rights and interests of persons with disabilities in healthcare, education, employment, economic security, and support and protection services.⁶² Private businesses with more than 100 employees must have persons with disabilities make up at least 1% of its workforce. As of July 2009, at least 3% of the workforce of all public entities (including offices, schools, and enterprises) with 34 or more employees must be persons with disabilities. All new public buildings must be accessible.⁶³

Due to its international status, Taiwan cannot adhere to the UN Convention on the Rights of Persons with Disabilities.

Support for Mine Action

Landmine Monitor is not aware of any comprehensive cost estimates for fulfilling mine action needs in Taiwan. Partial cost estimates and multi-year allocations of funds have been reported in the past, but no new estimates have been provided based on mine clearance completed during recent years.⁶⁴ In October 2008, media sources reported a cost estimate of roughly NTD5.8 billion (\$183.9 million) for mine action operators to complete demining on Kinmen, based on comments by the head of Taiwan's military demining unit.⁶⁵

In December 2007, the Ministry of National Defense reported allocations for demining by international operators of NTD168 million (\$5.1 million) for 2007, NTD184.62 million for 2008 (\$5.9 million), and NTD122.28 million (\$3.9 million) for 2009. In addition, the ministry said allocations for demining by the ADD were NTD46.65 million (\$1.4 million) for 2007, NTD269.2 million (\$8.5 million) for 2008, and NTD 120.5 million (\$3.8 million) for 2009.⁶⁶ National allocations for 2008 would thus total NTD453.82 million (\$14.4 million). Actual disbursements for 2008 had not been confirmed as of June 2009. In May 2008, however, the Ministry of National Defense reported to Landmine Monitor that from 2007 to 2009, the ministry had allocated NTD509.4 million (\$16.1 million) for demining by international operators on Kinmen and Matsu, and NTD373.87 million (\$11.9 million) for army demining.⁶⁷

⁶⁴ For instance, as of May 2006, the Ministry of National Defense reported a proposed a budget of NTD4.2 billion (\$129 million at the 2006 exchange rate) to clear all minefields remaining after 2009. Letter from Lt. Gen. Cheng Shih-Yu, Ministry of National Defense, 1 May 2006.

WESTERN SAHARA

Ten-Year Summary

Both the Polisario Front and Moroccan forces used antipersonnel mines until the 1991 UN-monitored cease-fire. In 1999, a Polisario representative stated that it would join the Mine Ban Treaty if eligible to do so. In November 2005, Polisario proclaimed a ban on antipersonnel mines by signing the Geneva Call Deed of Commitment. Polisario has been destroying its stockpile of antipersonnel mines since 2006.

Western Sahara is contaminated with mines and explosive remnants of war (ERW). A 2008 survey by Landmine Action identified considerable contamination, particularly from unexploded submunitions and mines. Landmine Action initiated battle area clearance operations in 2008.

Between 1999 and 2008, Landmine Monitor identified 151 mine/ERW casualties in Western Sahara (44 people killed, 102 injured, and five unknown) with most casualties reported in 2006–2008. Casualty data collection improved over the past decade, but was incomplete and the number of casualties was probably under-reported. Intensive risk education was carried out from 1998–2000. After this, efforts were limited and mostly carried out by volunteers in programs that lacked the funding necessary for adequate dissemination of risk messages.

Victim assistance efforts have been limited throughout the past decade. Emergency transport remained inadequate and many mine/ERW survivors died before reaching assistance. Medical facilities in refugee camps lacked adequately trained staff and resources. Rehabilitation and prosthetics improved in 2008, with the start of an ICRC-supported program. Despite some assistance, there was an acute lack of economic opportunities for survivors and psychological support in refugee camps.

Mine Ban Policy

The sovereignty of Western Sahara remains the subject of a dispute between the government of Morocco and the Polisario Front (the Popular Front for the Liberation of Saguia el Hamra and Río de Oro). Polisario's Saharawi Arab Democratic Republic (SADR) is a member of the African Union, but is not universally recognized. It has no official representation in the UN, which prevents formal accession to the Mine Ban Treaty. Polisario officials have, since 1999, stated that they would adhere to the Mine Ban Treaty if permitted to do so.

On 3 November 2005, Polisario Minister of Defense, Mohamed Lamine Buhali, committed Polisario unilaterally to a ban on antipersonnel mines through the Deed of Commitment administered by the NGO Geneva Call. The Deed pledges Polisario to a ban on use, production, transfer and stockpiling of antipersonnel mines, and to cooperation in mine action.

Use, production, transfer, and stockpiling

Both Polisario and the Royal Moroccan Armed Forces used mines extensively until the 1991 UN-monitored cease-fire. In the past decade, Morocco and Polisario have periodically traded accusations of new mine use, but both have denied it.¹ In October 2008, Moroccan officials told a visiting ICBL delegation that Polisario rebels are still laying mines, but no concrete evidence has been presented.² In May 2009, however, Morocco told Landmine Monitor that it did not have any information about Polisario mine use in 2007 or 2008.³

¹ See, for example, *Landmine Monitor Report 2003*, p. 651; *Landmine Monitor Report 2002*, p. 717; and *Landmine Monitor Report 2001*, pp. 1,059–1,060.

² ICBL, "Mission Report: Morocco, 26–29 October 2008."

³ Permanent Mission of Morocco to the UN in Geneva, "Response to Questions from the Canadian NGO Mines Action Canada," 18 May 2009.

Polisario is not known to have produced or exported antipersonnel mines. Polisario officials claim they acquired antipersonnel mines in the past by lifting them from Moroccan minefields, especially those around the berms (defensive earthen walls about three meters high).⁴ Based on mines destroyed in 2006, 2007, and 2008, Polisario stocks have included antipersonnel mines of Belgian, Chinese, German, Israeli, Italian, Portuguese, Romanian, Soviet, United Kingdom, and Yugoslav manufacture.⁵

Polisario has not revealed the total number of antipersonnel mines it possesses. In 2002, Polisario told Landmine Monitor that it no longer had a stockpile of antipersonnel mines, except for 1,606 disarmed mines on display in a military museum.⁶ In January 2006, however, Polisario's Chief Engineer told Landmine Monitor that its stockpile consisted of more than 10,000 antipersonnel and antivehicle mines.⁷

Polisario has undertaken three public destructions of stockpiled antipersonnel mines, pursuant to the Deed of Commitment. It destroyed a combined total of 8,637 antipersonnel mines in February 2006 (3,316 mines), February 2007 (3,321 mines), and May 2008 (2,000 mines).⁸ Landmine Monitor had previously reported that the 2006 and 2007 destruction events included 284 antivehicle mines. Geneva Call, which requested clarification from Polisario, was told that the destroyed mines were MK1 antipersonnel mines, not K1 antivehicle mines. Polisario also said that mines recorded as FMP1 were actually Portuguese-made M969 mines.⁹

Scope of the Problem

Contamination

Western Sahara is contaminated with mines and ERW, especially cluster munition remnants and other UXO, although the precise extent of contamination is not known. More than 2,000km of berms were built during conflict in the 1980s, and remained after the 1991 cease-fire between Morocco and Polisario. Moroccan troops emplaced antipersonnel and antivehicle mines in and around the berms. Landmine Action has claimed that Western Sahara is "one of the most heavily mined territories in the world."¹⁰

Landmine Action deployed to Western Sahara in 2006 and trained local operators to conduct a survey of dangerous areas and items. The survey, which concluded at the end of 2008, identified 154 cluster munition strike sites, 40 mined areas, one ammunition storage area, and 486 individual items requiring spot clearance.¹¹ It found that contamination is concentrated around water holes, traditional settlement sites, and transport routes and determined that unexploded submunitions pose the greatest threat to people and animals.¹² Landmine Action believes that further survey is required in the 5km buffer zone leading to the berms.¹³

⁴ They may have acquired mines from other sources as well. Some of the stockpiled mines Polisario has destroyed are not known to have been in Morocco's arsenal, such as those of Belgian, Portuguese and Yugoslav origin.

¹³ Ibid.

Casualties

Casualty data is hard to obtain. From reports received, Landmine Monitor identified 26 casualties (nine killed, 16 injured, and one unknown) in Western Sahara in 2008, resulting from 16 mine/ERW/cluster munition incidents. Casualties included 12 adults (11 men, one of unknown gender), four children (three boys and one girl) and 10 casualties of unknown age (at least three of whom were male, the gender of the rest was unknown). Antivehicle mines caused 10 casualties, antipersonnel mines four, submunitions four, and unknown devices eight. Seven casualties occurred in Polisario-controlled Western Sahara (one killed and six injured) and 19 casualties occurred in Moroccan-controlled Western Sahara (eight killed, 10 injured, and one unknown). The most common activities at the time of the incident were travel (seven), herding/tending livestock (six), and playing (three). The activities of the other casualties at the time of the incident were not known¹⁴

Morocco reported 11 mine/ERW casualties (three killed and eight injured) in an annex to its voluntary Article 7 report for calendar year 2008, in mine-affected provinces of Moroccan-controlled Western Sahara.¹⁵ Mauritania's National Humanitarian Demining Program for Development (Programme National de Déminage Humanitaire pour le Développement, PNDHD) reported that two men from Mauritania, both nomadic herders, became casualties in a mine incident in Western Sahara in 2008. It was not noted if they were killed or injured.¹⁶ It is not clear if these casualties overlap with those identified by Landmine Monitor in 2008.

The 26 casualties identified in 2008 represent a decrease from the 36 mine/ERW casualties in 18 incidents identified in Western Sahara in 2007 (12 killed and 24 injured). However, reporting for 2008 is not thought to be comprehensive. In 2007, seven casualties also occurred in Polisario-controlled Western Sahara (three killed and four injured) and 29 in were reported in Moroccan-controlled Western Sahara (nine killed and 20 injured).

Casualties continued to occur in 2009, with 22 reported as of 10 August. One person was killed and 21 injured in nine mine/ERW incidents, include one citizen of Mauritania. Eight casualties occurred in Polisario-controlled Western Sahara (all were injured) and 14 were reported in Moroccan-controlled Western Sahara (one killed and 13 injured). Six casualties were caused by antipersonnel mines, 11 by antivehicle mines, four by unknown mine types, and one by ERW.¹⁷ This number includes five people injured while crossing a mined area of the berm during a protest, some 70km from the Saharawi refugee camps.¹⁸

In 2009, PNDHD reported two Mauritanian casualties, both nomadic men in two separate incidents in Moroccan-controlled Western Sahara. One incident was caused by an antipersonnel mine and the other by an antivehicle mine. Both casualties died while being transported to Mauritania for emergency medical assistance.¹⁹ There was insufficient detail to ascertain if these casualties were included in other reporting for Western Sahara.

Between 1999 and 2008, Landmine Monitor identified 151 mine/ERW casualties in Western Sahara (44 people killed, 102 injured, and five unknown). The majority, 86 casualties, were reported in the period from 2006–2008. This was most likely due to improved casualty data collection in recent years. The total probably under-represents the actual number of casualties during the period.²⁰The

²⁰ See *Landmine Monitor Report 2008*, p. 1,122 (36 casualties in 2007); *Landmine Monitor Report 2007*, p. 1,099 (24 casualties in 2006); *Landmine Monitor Report 2006*, p. 1,199 (two casualties in 2005 and no confirmed casualties in 2004); *Landmine Monitor Report 2004*, pp. 1,221–1,222 (one casualty in 2003; four casualties in 2002; three casualties in 2001; four casualties in 2000 in one incident); and *Landmine Monitor Report 2001*, p. 1,037 (51 military casualties in 2000–2001).

total number of mine/ERW casualties in Western Sahara is not known and many incidents may not be recorded; estimates of the number of casualties since 1975 range up to some 2,500 people.²¹ According to official Polisario estimates found in the ICRC annual report there were some 450 mine/ERW survivors from Western Sahara among the refugee population living in camps in Algeria.²² A Norwegian People's Aid (NPA) assessment in the Tindouf refugee camps in 2000 identified 320 landmine survivor amputees. The Saharawi Campaign to Ban Landmines (SCBL) registered 345 mine/ERW survivors from the refugee camps. The Moroccan Association of Mine Victims in Smara reported that in 2007 at least 100 mine survivors were living in Smara, in Moroccan-controlled Western Sahara.

Risk profile

Based on casualty and survey data the people most at risk of mine/ERW incidents are nomads with their herds, children playing, and people driving cars or riding camels. Mine/ERW contamination is concentrated around water holes, traditional settlement sites, and transport routes.²³

Program Management and Coordination

The UN Mission for the Referendum in Western Sahara (MINURSO) has established a mine action coordination center (MACC), which was upgraded from a mine action "cell" in February 2008. Western Sahara does not have official victim assistance or risk education coordination.

Data collection and management

The MACC began to collect mine/ERW casualty data in 2008, and data collection continued to improve in 2008–2009, though under-reporting likely continued.²⁴ Due to the lack of facilities—including hospitals—in Western Sahara, incidents in remote areas often go unreported. In addition, people who are injured by mines/ERW close to the vicinity of the buffer zone often do not seek medical assistance, due to the political situation.²⁵ As a result many of them unnecessarily die from their injuries.

As of June 2009, the MACC was not yet entering casualty data into the Information Management System for Mine Action (IMSMA). IMSMA was being adjusted to accept casualty data for 2009.²⁶ In October 2008, the MACC installed IMSMA at the Landmine Action office in Tifariti and provided training to both local and UK-based staff. The format of casualty data collection forms was finalized and they were being used by Landmine Action for entry of current incidents into IMSMA. No retrospective entry of casualty data had taken place as of August 2009. Landmine Action planned to work with the Chehid Cherif Landmine and War Victims Centre in Rabouni to verify casualty data at the center and enter it into IMSMA.²⁷

The Collective of Saharawi Human Rights Defenders El-Aaiun Western Sahara (Collectif des défenseurs saharouis des droits de l'homme El-Aaiun Sahara Occidental, CODESA) occasionally identified casualties reported in the media, but did not systematically report on casualties in 2008. In 2008, CODESA continued to operate informally, but a lack of legal status hindered its activities.²⁸ The SCBL did not provide casualty data to Landmine Monitor for 2008–2009.

Plans

Strategic mine action plans

A strategic mine action plan is in place, and as of June 2009, an operational plan for MACC had been completed as well.²⁹

Integration of mine action with reconstruction and development

From 2008–2009, Landmine Action conducted an assessment of how development could be supported in areas cleared of contamination by its clearance teams. The assessment identified the need to increase food security for semi-nomadic populations in the northern sector where water supplies are intermittent. Goat herders are said to be most affected by lack of water and take risks by entering known contaminated areas to reach water. Some have initiated their own agricultural schemes which face suspension in the dry season when water is insufficient and herders are forced to return to the refugee camps. A proposed project would build on current entrepreneurial efforts to facilitate access to water for herders, to be launched in areas where Landmine Action has cleared farmland.³⁰

Local ownership

Commitment to mine action and victim assistance

In early 1999, Morocco and Polisario signed bilateral military agreements in which both parties agreed to cooperate with MINURSO in the exchange of mine-related information, marking of mined areas, and the clearance and destruction of mines and UXO in the presence of MINURSO observers. These agreements do not cover minefields along the berm and minefields that Morocco regards as an integral part of its defenses.³¹

Mine action standards/Standing operating procedures

Landmine Action uses its own standing operating procedures and works in accordance with Memorandum of Understandings it signed with MINURSO and Polisario.³²

Demining and Battle Area Clearance

Landmine Action was the only international demining operator in Western Sahara in 2008. It conducted only battle area clearance (BAC) and explosive ordnance disposal in 2008, but was seeking funding in 2009 to equip and train teams to conduct mine clearance.³³

Battle area clearance in 2008

In January 2008, while its survey was ongoing, Landmine Action began clearance operations. In June 2008, it completed clearance of the village of Budib and conducted its first community handover to the local population.³⁴ Results of Landmine Action BAC in 2008 are summarized below.

BAC in 2008³⁵

Surface BAC* (m ²)	Sub-surface BAC (m ²)	Unexploded submunitions destroyed	Other UXO destroyed	Antipersonnel mines destroyed	Antivehicle mines destroyed
2,911,138	32,201	548	439	8	7

* Visual inspection

Risk Education

Moroccan authorities continued to report mine/ERW risk education (RE) in Moroccan-controlled Western Sahara in 2008—to 12,600 herders and nomads in 12 provinces³⁶ MINURSO provided improved safety training for UN staff.³⁷ No activities were identified in the Polisario-controlled part of Western Sahara.³⁸

RE was provided by the Moroccan Army, local authorities and representatives from rural communes, provincial health authorities, the provincial offices of the Moroccan Red Crescent Society, the Disabled Persons Support Association (Association d'Appui aux Personnes Handicapées), and the Moroccan Association of Mine Victims in 2008.³⁹

The Moroccan Army and its Royal Moroccan Gendarmerie (state police under the military) conducted an RE campaign which included marking with warning signs, providing information to locals regarding forthcoming large-scale demining operations, and informing local people when the land had been cleared. An annual RE campaign is conducted through public outreach including conferences, media, pamphlets, and school visits to reach people likely to enter mine-affected areas.⁴⁰ Local volunteers were trained to disseminate RE. There was no permanent capacity to implement RE and authorities had to continuously retrain RE volunteers.⁴¹

A number of organizations have reported providing RE in past years, including, the Moroccan Association of Mine Victims (based in Smara) in Moroccan-controlled Western Sahara in 2007, Landmine Action from 2006–2007, and the Saharawi Campaign to Ban Landmines from 2005–2007. From April 1998 to May 2000, NPA implemented a large-scale RE program for approximately 100,000 refugees in Western Sahara.

⁴¹ Interview with El Arbi Mrabet and Hamid Barez, Ministry of Interior, Rabat, 29 October 2008.

Victim Assistance

The total number of survivors is unknown; reporting has indicated that there are 450 survivors in the Rabouni refugee camps near Tindouf in southwestern Algeria and at least another 100 in Moroccan-controlled Western Sahara. Due to a lack of comprehensive data, these are likely significant underestimates.⁴²

People involved in mine/ERW incidents in remote areas continued to die from their wounds in the long periods before receiving medical attention.⁴³ There are no ambulances and survivors have to wait for a passing vehicle to take them to the nearest health facility, which may be hours away. MINURSO increased its emergency response capacity for UN personnel working in contaminated areas in Polisario-controlled areas.⁴⁴ On the Moroccan side of the berm, there are medical facilities in the towns of Dakhla, La'Youn, Ousserd, and Smara. Some survivors were also treated in nearby towns in Morocco.⁴⁵

Persons with disabilities are among the most vulnerable in the Saharawi refugee camps in Algeria. A continuing lack of adequate medical care and the absence of understanding about disability issues increased the vulnerability and distress of disabled refugees in the camps.⁴⁶

The Polisario authorities offer basic free healthcare for all Saharawis in each of the four refugee camps near Tindouf.⁴⁷ The refugee camps' health system consists of "regional hospitals" in camps and a referral hospital in Rabouni as well as a psychiatric hospital. Medical issues that cannot be treated in the camps are referred to nearby Tindouf, or more distant facilities if necessary. Medical facilities in the camps lacked resources, and services were dependent on international aid for medicines and materials. There was a lack of continuity of medical staff because qualified doctors and nurses work on a volunteer basis. Inadequate coordination between donors and humanitarian agencies contributing to the health system in the camps was reported in 2009.⁴⁸

The Chedid Cherif Landmine and War Victims Centre in the Rabouni refugee camp continued to provide rehabilitation and socio-economic assistance to mine/ERW survivors, but faced challenges in providing services due to a lack of resources.⁴⁹

In May 2008, the ICRC officially started producing and fitting prosthetic and orthotic appliances at the physical rehabilitation center established in the Chedid Cherif Landmine and War Victims Centre in 2007. ICRC services were directed to persons with disabilities, including mine/ERW survivors and other persons with disabilities.⁵⁰ The new center can produce 80–100 prostheses annually, as well as producing other mobility devices and providing physiotherapy. The ICRC began training nine locally-hired staff, five prosthetic-orthotic technicians, and four

⁴² Estimate based on official Polisario estimate of 450 mine/ERW survivors from Western Sahara amongst the refugee population living in camps in Algeria. ICRC, "Annual Report 2008," Geneva, 27 May 2009, p. 375; and Moroccan Association of Mine Victims reporting at least 100 mine survivors in Smara. See *Landmine Monitor Report 2008*, p. 1,124.

⁴⁷ See *Landmine Monitor Report 2008*, p. 1,125. The Saharawi refugee camps in Algeria have identical names to these towns in Moroccan-controlled Western Sahara, which may sometimes cause confusion as to the location of medical facilities.

⁴⁸ European Commission (EC), "Supporting document to the Commission Decision on the approval and financing of a 2009 GLOBAL PLAN For humanitarian actions from the budget of the European Communities in Algeria, ECHO/DZA/BUD/2009/01000," April 2009, p. 4, ec.europa.eu.

⁴⁹ Email from Gaici Nah Bachir, ASAVIM, 15 August 2009.

⁵⁰ ICRC, "Annual Report 2008," Geneva, 27 May 2009, p. 329.

physiotherapists to build the capacity and sustainability of the center, and provided management support.⁵¹ In 2008, 50 people benefited from services at the center, 18 receiving prostheses (94% of them for mine survivors). Other mobility devices were also produced and most beneficiaries received physiotherapy.⁵² An improvement in the manufacture of prostheses was noted following the increased ICRC support.⁵³

There is pervasive unemployment in the refugee camps. Mine/ERW survivors and other persons with disabilities are among the worst affected. There was no suitable work and most remained permanently unemployed.⁵⁴ Polisario authorities and partner organizations in the camps have reportedly made significant efforts to assist persons with disabilities in economic reintegration, through income-generating schemes including small shops and a bakery.⁵⁵ In 2008, the NGO Triangle Génération Humanitaire (TGH) continued to provide economic reintegration assistance to the elderly and to persons with disabilities through centers in the four refugee camps. For 2008, TGH project staff were not aware of any direct program beneficiaries who were mine/ERW survivors.⁵⁶ Schools for children with disabilities, including physical disabilities, are run by Polisario in all of the Saharawi refugee camps.⁵⁷ Psychological support for those in the refugee camps is inadequate and the mental health needs of refugees are not systematically addressed.⁵⁸

Morocco has reported that the military makes land and air facilities available to transfer mine/ERW survivors to the nearest hospital, where they can receive medical care free of charge. Hospitals near mine-affected areas had their capacity increased in 2008.⁵⁹ Other accounts from mine survivors' organizations have reported that mine/ERW survivors injured in areas of Moroccan-controlled Western Sahara need to pay for their own emergency transportation and medical costs at hospitals in both Western Sahara and Morocco.⁶⁰ An orthopedic center, including a prosthetics workshop and services for mine/ERW survivors, is connected to the in El Hassan hospital, La'Youn, in Moroccan-controlled Western Sahara.⁶¹ The ICRC Special Fund for the Disabled (SFD) had planned to provide assistance to the orthopedic center in La'Youn in 2008, but the plan was delayed due to "procedural obstacles."⁶²

Support for Mine Action

In 2008, Spain reported contributing US\$294,520 (€200,000) to mine action in Western Sahara, for unspecified mine action via the UN Voluntary Trust Fund for Assistance in Mine Clearance.⁶³ Reported mine action funding in 2008 was 67% less than reported in 2007. No international funding reported to Landmine Monitor since 2000 has specifically addressed VA needs in Western Sahara.

Landmine Action reported overall support for its programming in Western Sahara from Germany and Norway, as well as from UNMAS and the Diana, Princess of Wales Memorial Fund.⁶⁴

APPENDICES

18 September 1997

CONVENTION ON THE PROHIBITION OF THE USE, STOCKPILING, PRODUCTION AND TRANSFER OF ANTI-PERSONNEL MINES AND ON THEIR DESTRUCTION

Preamble

The States Parties,

Determined to put an end to the suffering and casualties caused by anti-personnel mines, that kill or maim hundreds of people every week, mostly innocent and defenceless civilians and especially children, obstruct economic development and reconstruction, inhibit the repatriation of refugees and internally displaced persons, and have other severe consequences for years after emplacement,

Believing it necessary to do their utmost to contribute in an efficient and coordinated manner to face the challenge of removing anti-personnel mines placed throughout the world, and to assure their destruction,

Wishing to do their utmost in providing assistance for the care and rehabilitation, including the social and economic reintegration of mine victims,

Recognizing that a total ban of anti-personnel mines would also be an important confidence-building measure,

Welcoming the adoption of the Protocol on Prohibitions or Restrictions on the Use of Mines, Booby-Traps and Other Devices, as amended on 3 May 1996, annexed to the Convention on Prohibitions or Restrictions on the Use of Certain Conventional Weapons Which May Be Deemed to Be Excessively Injurious or to Have Indiscriminate Effects, and calling for the early ratification of this Protocol by all States which have not yet done so,

Welcoming also United Nations General Assembly Resolution 51/45 S of 10 December 1996 urging all States to pursue vigorously an effective, legally-binding international agreement to ban the use, stockpiling, production and transfer of anti-personnel landmines,

Welcoming furthermore the measures taken over the past years, both unilaterally and multilaterally, aiming at prohibiting, restricting or suspending the use, stockpiling, production and transfer of anti-personnel mines,

Stressing the role of public conscience in furthering the principles of humanity as evidenced by the call for a total ban of anti-personnel mines and recognizing the efforts to that end undertaken by the International Red Cross and Red Crescent Movement, the International Campaign to Ban Landmines and numerous other non-governmental organizations around the world,

Recalling the Ottawa Declaration of 5 October 1996 and the Brussels Declaration of 27 June 1997 urging the international community to negotiate an international and legally binding agreement prohibiting the use, stockpiling, production and transfer of anti-personnel mines,

Emphasizing the desirability of attracting the adherence of all States to this Convention, and determined to work strenuously towards the promotion of its universalization in all relevant fora including, inter alia, the United Nations, the Conference on Disarmament, regional organizations, and groupings, and review conferences of the Convention on Prohibitions or Restrictions on the Use of Certain Conventional Weapons Which May Be Deemed to Be Excessively Injurious or to Have Indiscriminate Effects,

Basing themselves on the principle of international humanitarian law that the right of the parties to an armed conflict to choose methods or means of warfare is not unlimited, on the principle that prohibits the employment in armed conflicts of weapons, projectiles and materials and methods of warfare of a nature to cause superfluous injury or unnecessary suffering and on the principle that a distinction must be made between civilians and combatants,

Have agreed as follows:

Article 1

General obligations

1. Each State Party undertakes never under any circumstances:
 - a. To use anti-personnel mines;
 - b. To develop, produce, otherwise acquire, stockpile, retain or transfer to anyone, directly or indirectly, anti-personnel mines;
 - c. To assist, encourage or induce, in any way, anyone to engage in any activity prohibited to a State Party under this Convention.
2. Each State Party undertakes to destroy or ensure the destruction of all anti-personnel mines in accordance with the provisions of this Convention.

Article 2

Definitions

1. "Anti-personnel mine" means a mine designed to be exploded by the presence, proximity or contact of a person and that will incapacitate, injure or kill one or more persons. Mines designed to be detonated by the presence, proximity or contact of a vehicle as opposed to a person, that are equipped with anti-handling devices, are not considered anti-personnel mines as a result of being so equipped.
2. "Mine" means a munition designed to be placed under, on or near the ground or other surface area and to be exploded by the presence, proximity or contact of a person or a vehicle.
3. "Anti-handling device" means a device intended to protect a mine and which is part of, linked to, attached to or placed under the mine and which activates when an attempt is made to tamper with or otherwise intentionally disturb the mine.
4. "Transfer" involves, in addition to the physical movement of anti-personnel mines into or from national territory, the transfer of title to and control over the mines, but does not involve the transfer of territory containing emplaced anti-personnel mines.
5. "Mined area" means an area which is dangerous due to the presence or suspected presence of mines.

Article 3

Exceptions

1. Notwithstanding the general obligations under Article 1, the retention or transfer of a number of anti-personnel mines for the development of and training in mine detection, mine clearance, or mine destruction techniques is permitted. The amount of such mines shall not exceed the minimum number absolutely necessary for the above-mentioned purposes.
2. The transfer of anti-personnel mines for the purpose of destruction is permitted.

Article 4

Destruction of stockpiled anti-personnel mines

Except as provided for in Article 3, each State Party undertakes to destroy or ensure the destruction of all stockpiled anti-personnel mines it owns or possesses, or that are under its jurisdiction or control, as soon as possible but not later than four years after the entry into force of this Convention for that State Party.

Article 5

Destruction of anti-personnel mines in mined areas

1. Each State Party undertakes to destroy or ensure the destruction of all anti-personnel mines in mined areas under its jurisdiction or control, as soon as possible but not later than ten years after the entry into force of this Convention for that State Party.
2. Each State Party shall make every effort to identify all areas under its jurisdiction or control in which anti-personnel mines are known or suspected to be emplaced and shall ensure as soon as possible that all anti-personnel mines in mined areas under its jurisdiction or control are perimeter-marked, monitored and protected by fencing or other means, to ensure the effective exclusion of civilians, until all anti-personnel mines contained therein have been destroyed. The marking shall at least be to the standards set out in the Protocol on Prohibitions or Restrictions on the Use of Mines, Booby-Traps and Other Devices, as amended on 3 May 1996, annexed to the Convention on Prohibitions or Restrictions on the Use of Certain Conventional Weapons Which May Be Deemed to Be Excessively Injurious or to Have Indiscriminate Effects.
3. If a State Party believes that it will be unable to destroy or ensure the destruction of all anti-personnel mines referred to in paragraph 1 within that time period, it may submit a request to a Meeting of the States Parties or a Review Conference for an extension of the deadline for completing the destruction of such anti-personnel mines, for a period of up to ten years.
4. Each request shall contain:
 - a. The duration of the proposed extension;
 - b. A detailed explanation of the reasons for the proposed extension, including:
 - i. The preparation and status of work conducted under national demining programs;
 - ii. The financial and technical means available to the State Party for the destruction of all the anti-personnel mines; and
 - iii. Circumstances which impede the ability of the State Party to destroy all the anti-personnel mines in mined areas;
 - c. The humanitarian, social, economic, and environmental implications of the extension; and
 - d. Any other information relevant to the request for the proposed extension.

5. The Meeting of the States Parties or the Review Conference shall, taking into consideration the factors contained in paragraph 4, assess the request and decide by a majority of votes of States Parties present and voting whether to grant the request for an extension period.
6. Such an extension may be renewed upon the submission of a new request in accordance with paragraphs 3, 4 and 5 of this Article. In requesting a further extension period a State Party shall submit relevant additional information on what has been undertaken in the previous extension period pursuant to this Article.

Article 6

International cooperation and assistance

1. In fulfilling its obligations under this Convention each State Party has the right to seek and receive assistance, where feasible, from other States Parties to the extent possible.
2. Each State Party undertakes to facilitate and shall have the right to participate in the fullest possible exchange of equipment, material and scientific and technological information concerning the implementation of this Convention. The States Parties shall not impose undue restrictions on the provision of mine clearance equipment and related technological information for humanitarian purposes.
3. Each State Party in a position to do so shall provide assistance for the care and rehabilitation, and social and economic reintegration, of mine victims and for mine awareness programs. Such assistance may be provided, inter alia, through the United Nations system, international, regional or national organizations or institutions, the International Committee of the Red Cross, national Red Cross and Red Crescent societies and their International Federation, non-governmental organizations, or on a bilateral basis.
4. Each State Party in a position to do so shall provide assistance for mine clearance and related activities. Such assistance may be provided, inter alia, through the United Nations system, international or regional organizations or institutions, non-governmental organizations or institutions, or on a bilateral basis, or by contributing to the United Nations Voluntary Trust Fund for Assistance in Mine Clearance, or other regional funds that deal with demining.
5. Each State Party in a position to do so shall provide assistance for the destruction of stockpiled anti-personnel mines.
6. Each State Party undertakes to provide information to the database on mine clearance established within the United Nations system, especially information concerning various means and technologies of mine clearance, and lists of experts, expert agencies or national points of contact on mine clearance.
7. States Parties may request the United Nations, regional organizations, other States Parties or other competent intergovernmental or non-governmental fora to assist its authorities in the elaboration of a national demining program to determine, inter alia:
 - a. The extent and scope of the anti-personnel mine problem
 - b. The financial, technological and human resources that are required for the implementation of the program;
 - c. The estimated number of years necessary to destroy all anti-personnel mines in mined areas under the jurisdiction or control of the concerned State Party;
 - d. Mine awareness activities to reduce the incidence of mine-related injuries or deaths;
 - e. Assistance to mine victims;
 - f. The relationship between the Government of the concerned State Party and the relevant governmental, inter-governmental or non-governmental entities that will work in the implementation of the program.
8. Each State Party giving and receiving assistance under the provisions of this Article shall cooperate with a view to ensuring the full and prompt implementation of agreed assistance programs.

Article 7

Transparency measures

1. Each State Party shall report to the Secretary-General of the United Nations as soon as practicable, and in any event not later than 180 days after the entry into force of this Convention for that State Party on:
 - a. The national implementation measures referred to in Article 9;
 - b. The total of all stockpiled anti-personnel mines owned or possessed by it, or under its jurisdiction or control, to include a breakdown of the type, quantity and, if possible, lot numbers of each type of anti-personnel mine stockpiled;
 - c. To the extent possible, the location of all mined areas that contain, or are suspected to contain, anti-personnel mines under its jurisdiction or control, to include as much detail as possible regarding the type and quantity of each type of anti-personnel mine in each mined area and when they were emplaced;
 - d. The types, quantities and, if possible, lot numbers of all anti-personnel mines retained or transferred for the development of and training in mine detection, mine clearance or mine destruction techniques, or transferred for the purpose of destruction, as well as the institutions authorized by a State Party to retain or transfer anti-personnel mines, in accordance with Article 3;
 - e. The status of programs for the conversion or de-commissioning of anti-personnel mine production facilities;
 - f. The status of programs for the destruction of anti-personnel mines in accordance with Articles 4 and 5, including details of the methods which will be used in destruction, the location of all destruction sites and the applicable safety and environmental standards to be observed;
 - g. The types and quantities of all anti-personnel mines destroyed after the entry into force of this Convention for that State Party, to include a breakdown of the quantity of each type of anti-personnel mine destroyed, in accordance with Articles 4 and 5, respectively, along with, if possible, the lot numbers of each type of anti-personnel mine in the case of destruction in accordance with Article 4;
 - h. The technical characteristics of each type of anti-personnel mine produced, to the extent known, and those currently owned or possessed by a State Party, giving, where reasonably possible, such categories of information as may facilitate identification and clearance of anti-personnel mines; at a minimum, this information shall include the dimensions, fusing, explosive content, metallic content, colour photographs and other information which may facilitate mine clearance; and
 - i. The measures taken to provide an immediate and effective warning to the population in relation to all areas identified under paragraph 2 of Article 5.
2. The information provided in accordance with this Article shall be updated by the States Parties annually, covering the last calendar year, and reported to the Secretary-General of the United Nations not later than 30 April of each year.
3. The Secretary-General of the United Nations shall transmit all such reports received to the States Parties.

Article 8

Facilitation and clarification of compliance

1. The States Parties agree to consult and cooperate with each other regarding the implementation of the provisions of this Convention, and to work together in a spirit of cooperation to facilitate compliance by States Parties with their obligations under this Convention.

2. If one or more States Parties wish to clarify and seek to resolve questions relating to compliance with the provisions of this Convention by another State Party, it may submit, through the Secretary-General of the United Nations, a Request for Clarification of that matter to that State Party. Such a request shall be accompanied by all appropriate information. Each State Party shall refrain from unfounded Requests for Clarification, care being taken to avoid abuse. A State Party that receives a Request for Clarification shall provide, through the Secretary-General of the United Nations, within 28 days to the requesting State Party all information which would assist in clarifying this matter.
3. If the requesting State Party does not receive a response through the Secretary-General of the United Nations within that time period, or deems the response to the Request for Clarification to be unsatisfactory, it may submit the matter through the Secretary-General of the United Nations to the next Meeting of the States Parties. The Secretary-General of the United Nations shall transmit the submission, accompanied by all appropriate information pertaining to the Request for Clarification, to all States Parties. All such information shall be presented to the requested State Party which shall have the right to respond.
4. Pending the convening of any meeting of the States Parties, any of the States Parties concerned may request the Secretary-General of the United Nations to exercise his or her good offices to facilitate the clarification requested.
5. The requesting State Party may propose through the Secretary-General of the United Nations the convening of a Special Meeting of the States Parties to consider the matter. The Secretary-General of the United Nations shall thereupon communicate this proposal and all information submitted by the States Parties concerned, to all States Parties with a request that they indicate whether they favour a Special Meeting of the States Parties, for the purpose of considering the matter. In the event that within 14 days from the date of such communication, at least one-third of the States Parties favours such a Special Meeting, the Secretary-General of the United Nations shall convene this Special Meeting of the States Parties within a further 14 days. A quorum for this Meeting shall consist of a majority of States Parties.
6. The Meeting of the States Parties or the Special Meeting of the States Parties, as the case may be, shall first determine whether to consider the matter further, taking into account all information submitted by the States Parties concerned. The Meeting of the States Parties or the Special Meeting of the States Parties shall make every effort to reach a decision by consensus. If despite all efforts to that end no agreement has been reached, it shall take this decision by a majority of States Parties present and voting.
7. All States Parties shall cooperate fully with the Meeting of the States Parties or the Special Meeting of the States Parties in the fulfillment of its review of the matter, including any fact-finding missions that are authorized in accordance with paragraph 8.
8. If further clarification is required, the Meeting of the States Parties or the Special Meeting of the States Parties shall authorize a fact-finding mission and decide on its mandate by a majority of States Parties present and voting. At any time the requested State Party may invite a fact-finding mission to its territory. Such a mission shall take place without a decision by a Meeting of the States Parties or a Special Meeting of the States Parties to authorize such a mission. The mission, consisting of up to 9 experts, designated and approved in accordance with paragraphs 9 and 10, may collect additional information on the spot or in other places directly related to the alleged compliance issue under the jurisdiction or control of the requested State Party.
9. The Secretary-General of the United Nations shall prepare and update a list of the names, nationalities and other relevant data of qualified experts provided by States Parties and communicate it to all States Parties. Any expert included on this list shall be regarded as designated for all fact-finding missions unless a State Party declares its non-acceptance in writing. In the event of non-acceptance, the expert shall not participate in fact-finding missions on the territory or any other place under the jurisdiction or control of the objecting State Party, if the non-acceptance was declared prior to the appointment of the expert to such missions.

10. Upon receiving a request from the Meeting of the States Parties or a Special Meeting of the States Parties, the Secretary-General of the United Nations shall, after consultations with the requested State Party, appoint the members of the mission, including its leader. Nationals of States Parties requesting the fact-finding mission or directly affected by it shall not be appointed to the mission. The members of the fact-finding mission shall enjoy privileges and immunities under Article VI of the Convention on the Privileges and Immunities of the United Nations, adopted on 13 February 1946.
11. Upon at least 72 hours notice, the members of the fact-finding mission shall arrive in the territory of the requested State Party at the earliest opportunity. The requested State Party shall take the necessary administrative measures to receive, transport and accommodate the mission, and shall be responsible for ensuring the security of the mission to the maximum extent possible while they are on territory under its control.
12. Without prejudice to the sovereignty of the requested State Party, the fact-finding mission may bring into the territory of the requested State Party the necessary equipment which shall be used exclusively for gathering information on the alleged compliance issue. Prior to its arrival, the mission will advise the requested State Party of the equipment that it intends to utilize in the course of its fact-finding mission.
13. The requested State Party shall make all efforts to ensure that the fact-finding mission is given the opportunity to speak with all relevant persons who may be able to provide information related to the alleged compliance issue.
14. The requested State Party shall grant access for the fact-finding mission to all areas and installations under its control where facts relevant to the compliance issue could be expected to be collected. This shall be subject to any arrangements that the requested State Party considers necessary for:
 - a. The protection of sensitive equipment, information and areas;
 - b. The protection of any constitutional obligations the requested State Party may have with regard to proprietary rights, searches and seizures, or other constitutional rights; or
 - c. The physical protection and safety of the members of the fact-finding mission.In the event that the requested State Party makes such arrangements, it shall make every reasonable effort to demonstrate through alternative means its compliance with this Convention.
15. The fact-finding mission may remain in the territory of the State Party concerned for no more than 14 days, and at any particular site no more than 7 days, unless otherwise agreed.
16. All information provided in confidence and not related to the subject matter of the fact-finding mission shall be treated on a confidential basis.
17. The fact-finding mission shall report, through the Secretary-General of the United Nations, to the Meeting of the States Parties or the Special Meeting of the States Parties the results of its findings.
18. The Meeting of the States Parties or the Special Meeting of the States Parties shall consider all relevant information, including the report submitted by the fact-finding mission, and may request the requested State Party to take measures to address the compliance issue within a specified period of time. The requested State Party shall report on all measures taken in response to this request.
19. The Meeting of the States Parties or the Special Meeting of the States Parties may suggest to the States Parties concerned ways and means to further clarify or resolve the matter under consideration, including the initiation of appropriate procedures in conformity with international law. In circumstances where the issue at hand is determined to be due to circumstances beyond the control of the requested State Party, the Meeting of the States Parties or the Special Meeting of the States Parties may recommend appropriate measures, including the use of cooperative measures referred to in Article 6.
20. The Meeting of the States Parties or the Special Meeting of the States Parties shall make every effort to reach its decisions referred to in paragraphs 18 and 19 by consensus, otherwise by a two-thirds majority of States Parties present and voting.

Article 9*National implementation measures*

Each State Party shall take all appropriate legal, administrative and other measures, including the imposition of penal sanctions, to prevent and suppress any activity prohibited to a State Party under this Convention undertaken by persons or on territory under its jurisdiction or control.

Article 10*Settlement of disputes*

1. The States Parties shall consult and cooperate with each other to settle any dispute that may arise with regard to the application or the interpretation of this Convention. Each State Party may bring any such dispute before the Meeting of the States Parties.
2. The Meeting of the States Parties may contribute to the settlement of the dispute by whatever means it deems appropriate, including offering its good offices, calling upon the States parties to a dispute to start the settlement procedure of their choice and recommending a time-limit for any agreed procedure.
3. This Article is without prejudice to the provisions of this Convention on facilitation and clarification of compliance.

Article 11*Meetings of the States Parties*

1. The States Parties shall meet regularly in order to consider any matter with regard to the application or implementation of this Convention, including:
 - a. The operation and status of this Convention;
 - b. Matters arising from the reports submitted under the provisions of this Convention;
 - c. International cooperation and assistance in accordance with Article 6;
 - d. The development of technologies to clear anti-personnel mines;
 - e. Submissions of States Parties under Article 8; and
 - f. Decisions relating to submissions of States Parties as provided for in Article 5.
2. The First Meeting of the States Parties shall be convened by the Secretary-General of the United Nations within one year after the entry into force of this Convention. The subsequent meetings shall be convened by the Secretary-General of the United Nations annually until the first Review Conference.
3. Under the conditions set out in Article 8, the Secretary-General of the United Nations shall convene a Special Meeting of the States Parties.
4. States not parties to this Convention, as well as the United Nations, other relevant international organizations or institutions, regional organizations, the International Committee of the Red Cross and relevant non-governmental organizations may be invited to attend these meetings as observers in accordance with the agreed Rules of Procedure.

Article 12*Review Conferences*

1. A Review Conference shall be convened by the Secretary-General of the United Nations five years after the entry into force of this Convention. Further Review Conferences shall be convened by the Secretary-General of the United Nations if so requested by one or more States Parties, provided that the interval between Review Conferences shall in no case be

less than five years. All States Parties to this Convention shall be invited to each Review Conference.

2. The purpose of the Review Conference shall be:
 - a. To review the operation and status of this Convention;
 - b. To consider the need for and the interval between further Meetings of the States Parties referred to in paragraph 2 of Article 11;
 - c. To take decisions on submissions of States Parties as provided for in Article 5; and
 - d. To adopt, if necessary, in its final report conclusions related to the implementation of this Convention.
3. States not parties to this Convention, as well as the United Nations, other relevant international organizations or institutions, regional organizations, the International Committee of the Red Cross and relevant non-governmental organizations may be invited to attend each Review Conference as observers in accordance with the agreed Rules of Procedure.

Article 13

Amendments

1. At any time after the entry into force of this Convention any State Party may propose amendments to this Convention. Any proposal for an amendment shall be communicated to the Depositary, who shall circulate it to all States Parties and shall seek their views on whether an Amendment Conference should be convened to consider the proposal. If a majority of the States Parties notify the Depositary no later than 30 days after its circulation that they support further consideration of the proposal, the Depositary shall convene an Amendment Conference to which all States Parties shall be invited.
2. States not parties to this Convention, as well as the United Nations, other relevant international organizations or institutions, regional organizations, the International Committee of the Red Cross and relevant non-governmental organizations may be invited to attend each Amendment Conference as observers in accordance with the agreed Rules of Procedure.
3. The Amendment Conference shall be held immediately following a Meeting of the States Parties or a Review Conference unless a majority of the States Parties request that it be held earlier.
4. Any amendment to this Convention shall be adopted by a majority of two-thirds of the States Parties present and voting at the Amendment Conference. The Depositary shall communicate any amendment so adopted to the States Parties.
5. An amendment to this Convention shall enter into force for all States Parties to this Convention which have accepted it, upon the deposit with the Depositary of instruments of acceptance by a majority of States Parties. Thereafter it shall enter into force for any remaining State Party on the date of deposit of its instrument of acceptance.

Article 14

Costs

1. The costs of the Meetings of the States Parties, the Special Meetings of the States Parties, the Review Conferences and the Amendment Conferences shall be borne by the States Parties and States not parties to this Convention participating therein, in accordance with the United Nations scale of assessment adjusted appropriately.

2. The costs incurred by the Secretary-General of the United Nations under Articles 7 and 8 and the costs of any fact-finding mission shall be borne by the States Parties in accordance with the United Nations scale of assessment adjusted appropriately.

Article 15

Signature

This Convention, done at Oslo, Norway, on 18 September 1997, shall be open for signature at Ottawa, Canada, by all States from 3 December 1997 until 4 December 1997, and at the United Nations Headquarters in New York from 5 December 1997 until its entry into force.

Article 16

Ratification, acceptance, approval or accession

1. This Convention is subject to ratification, acceptance or approval of the Signatories.
2. It shall be open for accession by any State which has not signed the Convention.
3. The instruments of ratification, acceptance, approval or accession shall be deposited with the Depositary.

Article 17

Entry into force

1. This Convention shall enter into force on the first day of the sixth month after the month in which the 40th instrument of ratification, acceptance, approval or accession has been deposited.
2. For any State which deposits its instrument of ratification, acceptance, approval or accession after the date of the deposit of the 40th instrument of ratification, acceptance, approval or accession, this Convention shall enter into force on the first day of the sixth month after the date on which that State has deposited its instrument of ratification, acceptance, approval or accession.

Article 18

Provisional application

Any State may at the time of its ratification, acceptance, approval or accession, declare that it will apply provisionally paragraph 1 of Article 1 of this Convention pending its entry into force.

Article 19

Reservations

The Articles of this Convention shall not be subject to reservations.

Article 20

Duration and withdrawal

1. This Convention shall be of unlimited duration.
2. Each State Party shall, in exercising its national sovereignty, have the right to withdraw from this Convention. It shall give notice of such withdrawal to all other States Parties, to the Depositary and to the United Nations Security Council. Such instrument of withdrawal shall include a full explanation of the reasons motivating this withdrawal.
3. Such withdrawal shall only take effect six months after the receipt of the instrument of withdrawal by the Depositary. If, however, on the expiry of that six-month period, the withdrawing State Party is engaged in an armed conflict, the withdrawal shall not take effect before the end of the armed conflict.
4. The withdrawal of a State Party from this Convention shall not in any way affect the duty of States to continue fulfilling the obligations assumed under any relevant rules of international law.

Article 21

Depositary

The Secretary-General of the United Nations is hereby designated as the Depositary of this Convention.

Article 22

Authentic texts

The original of this Convention, of which the Arabic, Chinese, English, French, Russian and Spanish texts are equally authentic, shall be deposited with the Secretary-General of the United Nations.

GLOSSARY

Abandoned explosive ordnance – Explosive ordnance that has not been used during an armed conflict, that has been left behind or dumped by a party to an armed conflict, and which is no longer under its control. Abandoned explosive ordnance is included under the broader category of explosive remnants of war.

Accession – Accession is the way for a state to become a party to an international treaty through a single instrument that constitutes both signature and ratification.

Adherence – The act of becoming a party to a treaty. This can be through signature and ratification, or through accession.

Antihandling device – According to the Mine Ban Treaty, an antihandling device “means a device intended to protect a mine and which is part of, linked to, attached to or placed under the mine and which activates when an attempt is made to tamper with or otherwise intentionally disturb the mine.”

Antipersonnel mine – According to the Mine Ban Treaty, an antipersonnel mine “means a mine designed to be exploded by the presence, proximity or contact of a person and that will incapacitate, injure or kill one or more persons.”

Antivehicle mine – According to the Mine Ban Treaty, an antivehicle mine is a mine designed “to be detonated by the presence, proximity or contact of a vehicle as opposed to a person.”

Area cancellation – Area cancellation describes the process by which a suspected hazardous area is released based solely on the gathering of information that indicates that the area is not, in fact, contaminated. It does not involve the application of any mine clearance tools.

Area reduction – Area reduction describes the process by which one or more mine clearance tools (e.g. mine detection dogs, manual deminers or mechanical demining equipment) are used to gather information that locates the perimeter of a suspect hazardous area. Those areas falling outside this perimeter, or the entire area if deemed not to be mined, can be released.

Battle area clearance – The systematic and controlled clearance of dangerous areas where the explosive hazards are known not to include landmines.

Casualty – The person injured or killed in a landmine, ERW or IED incident, either through direct contact with the device or by being in its proximity.

Cluster munition – According to the Convention on Cluster Munitions a cluster munition is “A conventional munition that is designed to disperse or release explosive submunitions each weighing less than 20 kilograms, and includes those submunitions.” Cluster munitions consist of containers and submunitions. Launched from the ground or air, the containers open and disperse submunitions (bomblets) over a wide area. Bomblets are typically designed to pierce armor, kill personnel, or both.

Community-based rehabilitation – Programs in affected communities (often rural areas) that are designed to supplement facility-based programs in urban centers. These programs improve service delivery, equal opportunities, and protect human rights for a larger group of people with disabilities who have limited access to service, due to uneven service distribution, high treatment cost, and limited human resource capacity.

Community liaison – According to IMAS, “liaison with mine/ERW affected communities to exchange information on the presence and impact of mines and UXO, to create a reporting link with the mine action programme and develop risk reduction strategies. Community mine action liaison aims to ensure community needs and priorities are central to the planning, implementation and monitoring of mine action operations.”

Demining – The set of activities that lead to the removal of mine and ERW hazards, including survey, mapping, clearance, marking, and the handover of cleared land.

Explosive remnants of war – Under Protocol V to the Convention on Conventional Weapons, explosive remnants of war are defined as unexploded ordnance and abandoned explosive ordnance. Mines are explicitly excluded from the definition.

Explosive ordnance disposal – The detection, identification, evaluation, render safe, recovery, and disposal of explosive ordnance.

Failed cluster munition – A cluster munition that has been fired, dropped, launched, projected or otherwise delivered and which should have dispersed or released its explosive submunitions but failed to do so.

Improvised explosive device – A device placed or produced in an improvised manner incorporating explosives or noxious chemicals. An improvised explosive device (IED) may be victim-activated or command-detonated. Victim-activated IEDs are banned under the Mine Ban Treaty, but command-detonated IEDs are not.

IMAS – International mine action standards issued by the UN to improve safety and efficiency in mine action by providing guidance, establishing principles and, in some cases, defining international requirements and specifications.

IMSMA – The UN's preferred information system for the management of critical data in UN-supported field programs. IMSMA provides users with support for data collection, data storage, reporting, information analysis, and project management activities.

Landmine Impact Survey – A national or regional assessment of the socioeconomic impact on communities caused by the actual or perceived presence of mines and ERW, in order to assist the planning and prioritization of mine action programs and projects.

Land release – The set of activities and methodologies intended to release previously suspect hazardous areas with the minimum possible risk.

Mine action center – A body charged with coordinating day-to-day mine action operations, normally under the supervision of a national mine action authority. Some MACs also implement mine action activities.

Mine/ERW risk education – Activities which seek to reduce the risk of injury from mines and ERW by awareness-raising and promoting behavioral change, including public information dissemination, education and training and community mine action liaison.

National mine action authority – A governmental body, normally interministerial in nature, responsible for managing and regulating a national mine action program.

Non-state armed groups – For Landmine Monitor purposes, non-state armed groups include organizations carrying out armed rebellion or insurrection, as well as a broader range of non-state entities, such as criminal gangs and state-supported proxy forces.

Risk reduction – Those actions which lessen the probability and/or severity of physical injury to people, property, or the environment due to mines/ERW. Risk reduction can be achieved by physical measures such as clearance, fencing or marking, or through behavioral changes brought about by mine/ERW risk education.

Submunition – Any munition that, to perform its task, separates from a parent munition (cluster munition).

Survey – A study of the assessment of the location and impact of mines and ERW at the local or national level. General survey focuses on the location of mined and battle areas and the type of contamination they contain. A landmine impact survey also assesses the impact of explosive

contamination on nearby communities (see separate definition for landmine impact survey). Technical survey aims to confirm and identify the outer perimeters of the hazardous area using one or more demining tools and to gather other necessary information for clearance.

Unexploded cluster munitions – Submunitions that have failed to explode as intended, becoming unexploded ordnance.

Unexploded ordnance – Unexploded ordnance (UXO) refers to munitions that were designed to explode but for some reason failed to detonate; unexploded submunitions are known as “blinds” or “duds.”

Victim – The individual directly hit by a mine/ERW explosion, his or her family and community.

Victim assistance – Victim assistance includes, but is not limited to, casualty data collection, emergency and continuing medical care, physical rehabilitation, psychological support and social reintegration, economic reintegration, and laws and public policies to ensure the full and equal integration and participation of survivors, their families and communities in society.
